Subject: Re: FW: Infor for Upcoming Great Basin Federal Family Meeting

I have a FWS call at 3pm mtn to discuss the table and I'll need to explain the apparent BLM/USFS inconsistency. Brent, feel free to join the call with Robb and I if you want. Thanks all.

Dennis

On Thu, Aug 14, 2014 at 4:34 PM, Pyron, Jason <jason_pyron@fws.gov> wrote:
Robb,

Please take a look at the attached document that is being discussed by the Service in regards to the Fed Fam meeting next week. The document identifies several areas (green text) where the FS is inconsistent in ID with BLM proposed direction. Will you please call Dennis tomorrow morning to discuss this as it was "news" to me based on our conversations earlier this week here in Boise. I'm hoping that this is a pretty easy fix and just some missed communication based on your National template.

Thanks!
Jason

Folks,

As discussed just now on the FMT call, here's the GB roll up packet, minus the maps. I have extra hard copies of the maps here but am hoping R1 RO can more expeditiously provide same. Thanks.

Matt

Subject: Infor for Upcoming Great Basin Federal Family Meeting

Good Morning Noreen,

Attached you will find the information (navigation tool, meeting agenda, pop. summaries, acronyms, definitions, etc.) that will accompany the maps that Frank Quamen from the NOC will be providing you today. The population summaries are based on the information found in our Draft Preferred Alternatives as it relates to the threats identified in the COT Report. We will be providing this information (hard copy via mail) along with the maps to all participants who will be attending the Federal Family meeting. Please let me know if you have any questions.

Thanks, Kathy

1 - Informational Packet Navigation Tool

Each Informational Packet contains the following materials:

Ref #	Document Title	Packet Page Number
1	Informational Packet Navigation Tool	Pages 1-2
2	Great Basin Federal Family Meeting Agenda	Pages 3-9
3	Great Basin ADPP Map Packet (30 11X17 Total)	<i>Separate 11”X17” Packet</i>
4	Population Summary Tables (7 total)	Pages 11-32
5	Acronyms and Abbreviations List	Page 32
6	Land Use Plan Allocations Cheat Sheet	Pages 33-34

Great Basin Administrative Draft Proposed Plan (ADPP) Map Packet

- ✓ Map 1 in the separate Great Basin ADPP Map Packet is a reference map that depicts GRSG populations, sub-regional boundaries, and surface management.
- ✓ Map 2 is also a reference map depicting where the Priority Areas for Conservation (PACs), Preliminary Priority Habitat (PPH), and Preliminary General Habitat (PGH) (or other management area/habitat classifications) are located in the Great Basin Region.
- ✓ The following 28 maps display two sets of 14 ADPP land use plan allocations being applied to PPH and PGH in the Great Basin Region. The sets include one map highlighting the allocation decisions being applied in the PACs (maps on the left), and the other displaying the specific allocation being proposed for all PPH and PGH (maps on the right).

Population Summary Tables

- ✓ There are a total of seven population summary tables that are part of this informational packet. The tables are organized in two different ways: 1) by populations fully within a sub-region (a total of five tables), and 2) by populations that span across more than one sub-region (such as the Western Great Basin and Northern Great Basin Populations).
- ✓ Population Statistics: At the top of each table, there is a list of statistics relative to the population (or multiple populations that are solely within a sub-region). In order to provide context as to how the PACs correlate with the populations, this table provides the land status acre figures split by PPMA, PGMA, and Non-habitat for lands within the PACs and lands not within the PAC.
- ✓ Threats: The threats posed to each population are presented in the left-hand column of each table. The threats identified in this column are those threats cited as “present and widespread” in Table 2 of the USFWS’s 2013 Conservation Objectives Team (COT) Report. Although not identified as “present and widespread”, additional threats were addressed as they relate to the National Policy Team (NPT) allocation guidance.

Draft Internal Deliberative Document – Not for Distribution

- ✓ **Red text:** The red text indicates areas where the sub-regional ADPP allocation deviates from the NPT guidance provided to the sub-regional teams in April 2014. Rational as to why there is a deviation from the NPT guidance is also provided in red text in the right hand column of the table.
- ✓ **Green text:** The green text indicates areas where the Forest Service is deviating from the BLM's allocation or management direction to address that threat.
- ✓ **Purple text:** The purple text is only displayed in the Montana population for the Idaho/SW Montana ADDP and depicts where the BLM has different management decisions in Idaho and Montana.

Acronyms and Abbreviations List & BLM Land Use Plan (LUP) Allocations Cheat Sheet

Throughout the population summary tables, many sub-regional titles, allocation types, agency names, and other terms have been abbreviated. This list provides a description for all acronyms and abbreviations presented in the population summary tables. The BLM LUP Allocation Cheat Sheet lists all of the BLM LUP allocations specific to BLM program areas and provides a brief definition for each of these allocations (per BLM's Lands Use Planning Handbook H-1601-1).

Draft Internal Deliberative Document – Not for Distribution

Great Basin Region Federal Family Meeting Agenda

August 19-21, 2014 – BLM Oregon State Office, Portland, OR

Objectives of this Meeting

- Identify threats to Greater Sage-grouse (GRSG) for each PAC/population within the BLM/FS planning area as identified in the COT Report
- Determine how each BLM and FS plan addresses these threats through land use allocations and other conservation actions
- Discuss the adequacy of the land use allocation decisions and other conservation measures to address these threats and any changes in plans required to address inadequacies and/or inconsistencies in response
- Provide clear and specific guidance to develop draft final administrative plans that are adequate to address the threats to each GRSG population identified in the COT Report

DAY ONE – TUESDAY AUGUST 19, 2014

- 8:00 am **Welcome**
Jerry Perez, BLM Oregon State Director
- 8:05 am **Introductions**
Penny Mabie, Meeting Facilitator
- 8:10 am **Opening Remarks**
Neil Kornze, BLM Director
Noreen Walsh, USFWS Regional Director, Mountain-Prairie Region
Chris Iverson, USFS Deputy Regional Forester
Amy Lueders, BLM Nevada State Director
- 8:30 am **Process, Expectations, and Outcomes**
Jim Lyons, Deputy Assistant Secretary for Land and Minerals Management, DOI
Michael Bean, Counselor for Fish, Wildlife, and Parks, DOI
- 9:00 am **Agenda Review (Logistics)**
Penny Mabie, Meeting Facilitator
- 9:15 am **BLM Approach to Developing ADPP's**
Ed Roberson, BLM Assistant Director for Resources and Planning
- 9:25 am **Forest Service Approach to Developing their DPPA's**
Chris Iverson, USFS
- 9:40 am **Major Changes between BLM/FS DEIS' and ADPPs in Great Basin**
Lauren Mermejo, Great Basin Regional Project Manager
- 10:00 am 15 Minute Break**

Draft Internal Deliberative Document – Not for Distribution

10:15 am **5-Minute ADDP Overview by BLM State Directors**
NV - Amy Lueders, BLM NV State Director
CA - Jim Kenna, BLM CA State Director
OR - Jerry Perez, BLM OR State Director
UT - Juan Palma, BLM UT State Director
ID - Tim Murphy, BLM Acting ID State Director
MT - Jamie Connell, BLM MT State Director

11:00 am **Information Packet Orientation**
Frank Quamen, BLM-NOC Wildlife Biologist
Matt Mageletti, BLM- WO Planning

WAFWA Management Zone V

Review of Conservation Strategies for Populations solely within OR

- 11:15 am
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**
Jim Lyons - ASLM
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

12:00 pm 1 Hour Lunch

Review of Conservation Strategies for the Western Great Basin Population (NV/NE CA and OR)

- 1: 00 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**
Jim Lyons - ASLM
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each**

Draft Internal Deliberative Document – Not for Distribution

- PAC/population and remaining issues in question**
- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

3:00 pm **Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie

3:30 pm 15 Minute Break

WAFWA Management Zone III

Review of Conservation Strategies for Populations solely within Utah

- 3:45 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

5:45 pm **Close-out**
Penny Mabie, Meeting Facilitator

DAY TWO – WEDNESDAY AUGUST 20, 2014

8:00 am **Recap from day 1**
Penny Mabie, Meeting Facilitator

Continuation of WAFWA Management Zone III

Review of Conservation Strategies for Populations solely within Nevada

- 8:15 am ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
- ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
- ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

9:15 **Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie

9:45 am 15 Minute Break

WAFWA Management Zone IV

Review of Conservation Strategies for Populations solely within Idaho

- 10:00 am ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
- ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
- ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

12:00pm 1 Hour Lunch

Draft Internal Deliberative Document – Not for Distribution

Review of Conservation Strategies for Northern Great Basin Population (ID, NV/CA, and OR)

- 1:00 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population** *Frank Quamen/Matt Magaletti*
 - ✓ **Discuss proposed responses to each threat and rationale** *Matt Magaletti, State Directors, and Project Leads*
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns** *Meeting Principals (Facilitated by Penny Mabie)*
- 2:30 pm** **15 Minute Break**
- 2:45 pm
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans** *Meeting Principals (Facilitated by Penny Mabie)*
- 4:00 pm
- Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie
- 5:00 pm
- Close-out**
Penny Mabie, Meeting Facilitator

Draft Internal Deliberative Document – Not for Distribution

6 - BLM LAND USE PLANNING PROGRAM AREA

ALLOCATIONS/DESIGNATIONS CHEAT SHEET

(Per H-1601-1 BLM Land Use Planning Handbook)

Livestock Grazing

- **Available:** areas where livestock grazing would be permitted under the criteria set forth in 43 CFR 4130.2(a).
- **Not Available:** areas where livestock grazing would not be permitted due (but not limited to) conflicts with other land uses, terrain/soil/vegetation/watershed characteristics, the presence of undesirable vegetation, and the presence of resources that require special management.

Recreation and Visitor Services

- **Recreation Management Areas (RMAs):** areas where Recreation and Visitor Services (R&VS) objectives are recognized as a primary resource management consideration and specific management is required to protect the recreation opportunities.
- **Special Recreation Management Areas (SRMAs):** RMAs managed to protect and enhance a targeted set of activities, experiences, benefits, and desired recreation setting characteristics. The SRMAs may be subdivided into recreation management zones (RMZ) to further delineate specific recreation opportunities.
- **Extensive Recreation Management Areas (ERMAs):** areas managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. Management of ERMA areas is commensurate with the management of other resources and resource uses.
- **Public Lands Not Designated as RMAs:** area not designated as RMAs are managed to meet basic R&VS and resource stewardship needs. Recreation is not emphasized however recreation activities may occur. The R&VS are managed to allow recreation uses that are not in conflict with the primary uses of these lands.

Travel and Transportation

- **Open areas:** intensive OHV use areas where there are no special restrictions or where there are no compelling resource protection needs, user conflicts, or public safety issues to warrant limiting cross-country travel (see 43 CFR 8340.05).
- **Limited areas:** areas where OHV use must be restricted to meet specific resource management objectives. Examples of limitations include: number or type of vehicles; time or season of use; permitted or licensed use only; use limited to designated roads and trails; or other limitations if restrictions are necessary to meet resource management objectives, including certain competitive or intensive use areas that have special limitations (see 43 CFR 8340.05).
- **Closed areas:** areas closed to all vehicular use to protect resources, promote visitor safety, or reduce use conflicts (see 43 CFR 8340.05).

Lands and Realty (Land Tenure, ROWs, Solar and Wind)

- **Lands identified for disposal:** land or interest in lands that are available for disposal under a variety of disposal authorities, provided they meet the criteria outlined in FLPMA (Sales, Section 203, 43 U.S.C. 1713(a); Exchanges, Section 206, 43 U.S.C. 1716(a); and Reservation and Conveyance of Minerals, Section 209, 43 U.S.C. 1719(a)) or other statutes and regulations.
- **Lands identified for retention:** lands or interest in lands that will be retained under Federal ownership.
- **Lands identified for acquisition:** land or interest in lands that are suitable for acquisition under Federal ownership, based on acquisition criteria identified in the land use plan; FLPMA Section 205(b)).
- **Withdrawals (non-discretionary):** areas that have been transferred in total or partial jurisdiction to another Federal agency and/or areas closed (segregated) to operation of all or some of the public land laws and/or mineral laws. Withdrawals are only made by the President, the Secretary of the Interior, or other authorized officer of the Executive branch of the Federal government. BLM land use plans can only “recommend” areas for the Secretary of Interior to consider pursuing for withdrawal.
- **Utility corridors:** linear areas with the potential for at least one additional facility and thus can be considered a corridor (if not already designated) to minimize adverse environmental impacts and the proliferation of separate right-of-ways.
- **ROW Avoidance areas:** areas to be avoided but may be available for location of right-of-ways with special stipulations.
- **ROW Exclusion areas:** areas which are not available for location of right-of-ways under any conditions.

Coal

- **Unsuitable areas:** areas where coal leasing would not be permitted under the criteria set forth in 43 CFR 3461.5
- **Suitable areas:** areas found to be suitable for development by all mining methods or by only certain stipulated mining methods, such as surface or underground mining (see 43 CFR 3461).

Fluids (oil and gas, tar sands, and geothermal resources)

- **Open:** areas open to leasing with minor to no constraints, subject to existing laws, regulations, and formal orders; and the terms and conditions of the standard lease form.
- **Open with moderate constraints:** areas open to leasing, subject to moderate constraints. These are areas where it has been determined that moderately restrictive lease stipulations may be required to mitigate impacts. These stipulation include:
 - **Timing limitations (TL):** areas open to leasing but would be closed to surface disturbing activities during identified time frames. This stipulation

Draft Internal Deliberative Document – Not for Distribution

would not apply to operation and maintenance activities, including associated vehicle travel, unless otherwise specified.

- **Controlled Surface Use (CSU):** areas that are open to leasing but would require proposals for surface disturbing activities to be authorized only according to the controls or constraints specified.
- **Open with major constraints:** areas open to leasing, subject to major constraints. These are areas where it has been determined that highly restrictive lease stipulations are required to mitigate impacts.
 - **No Surface Occupancy (NSO):** areas open to leasing but surface disturbing activities cannot be conducted on the surface of the land. Access to oil and gas deposits would require horizontal drilling from outside the boundaries of the NSO areas. The NSO areas are avoidance areas for rights-of-way; no rights-of-ways would be granted in NSO areas unless there are no feasible alternatives.
- **Closed:** areas where it has been determined that other land uses or resource values cannot be adequately protected with even the most restrictive lease stipulations; appropriate protection can be ensured only by closing the lands to leasing.

Locatable Minerals

RMPs can only recommend areas for closure related to locatable exploration or development. Withdrawals are managed under the Lands and Realty program.

Mineral Materials

- **Open areas:** areas open to mineral material disposal (these areas are still subject to mitigation and RMP objectives).
- **Closed areas:** areas closed to mineral material disposal due to protection of natural resources within the planning area.

Non-energy Leasables

- **Open areas:** areas open to non-energy leasables (these areas are still subject to mitigation and RMP objectives).
- **Closed areas:** areas closed to non-energy leasables due to protection of natural resources within the planning area.

Wild Horse and Burro Management

- **Herd Areas (HAs) (non-discretionary):** areas of the public lands identified as being habitat used by wild horses and burros at the time of the passage of the Wild Horse and Burro Act, as amended (16 USC 1331).
- **Herd Management Areas (HMAs):** established only in HAs, within which wild horses and/or burros can be managed for the long term.
- **Herd Areas Not Designated as Herd Management Areas:** areas where horses/burros will be removed from all or part of a HA due to intermingled and unfenced lands within HAs where private landowners do not want to make them

available for wild horse or burro use; or essential habitat components are not available for wild horse or burro use within a HA.

- **Wild Horse and Burro Ranges:** all or portions of an HMA where there is a significant public value present, such as unique characteristics in a herd or an opportunity for public viewing.

Wilderness Characteristics

- **Lands with Wilderness Characteristics:** areas to be managed to protect or preserve wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive recreation).

Special Designations

- **Areas of Critical Environmental Concern (ACECs):** areas that require special management to prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems. To qualify, the resources at risk must have substantial significance or values beyond local concerns.
- **Wilderness Study Areas (non-discretionary):** roadless areas of five thousand acres, identified during the inventory required by section 201(a) of the Wilderness Act as having wilderness characteristics. These areas are required to be managed to maintain their wilderness characteristics until Congress decides whether it should either be designated as wilderness or should be released for other purposes.
- **Eligible wild and scenic river segments:** river segments that are free flowing and, with its adjacent land area, possess one or more outstandingly remarkable values.
- **Scenic and Back Country Byways (non-discretionary):** byways that traverse remote country, providing solitude and spectacular scenery in landscape settings.
- **National Scenic, Historic, and Recreation Trails (non-discretionary):** trail segments established and designated by either the Secretary of the Interior or the Secretary of Agriculture, subject to the consent of the Federal agency, State, political subdivision, or other appropriate administering agency having jurisdiction over the lands involved.

Visual Resource Management (VRM)

- **VRM Class I:** areas that preserve the existing character of the landscape.
- **VRM Class II:** areas that retain the existing character of the landscape. The level of change should be low.
- **VRM Class III:** areas that partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate
- **VRM Class IV:** areas that provide for management activities which require major modifications of the existing character of the landscape. The level of change to the characteristic landscape can be high.

John,

Here are a few documents that may be helpful – I’ve attached the proposed plan decisions (draft) and the supporting appendices that we released for Cooperating Agency review a short time ago. I am working to incorporate changes based on comments during that review – most of which are word smithing and not substantive changes.

I also located the response memos we provided to WO.

Hey Brent,

I am trying to get caught up a bit since it looks like I will be attending the Great Basin Fed. Fam. meeting with our SD for MT.

Wondering if you could send me the questions and responses for ID from the recent chapter 2 review to get started? Any other summary type docs you could share would be helpful too.

Thanks - John

Appendix A – Required Design Features and Best Management Practices

The following required design features (RDFs) and best management practices (BMPs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (Table A-1). These made be reviewed and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs and BMPs most relevant to that program; however, all relevant RDFs and BMPs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs and BMPs should be applied during implementation. The table identifies the specific measure (numbered) and its appropriate application – as an RDF – required all the time everywhere; as a BMP required when the applicable resources are present; and as a BMP when appropriate and application would reduce impacts and not conflict with other RDFs or BMPs. In some cases the BMPs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and were determined to be beneficial to achieving GRSG habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs or BMPs described here.

Table A-1. Required Design Features and Best Management Practices

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
General			
1. Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.			X
Wildfire Suppression			
2. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.	X		
3. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: http://web.blm.gov/internal/fire/fpfm/sg/index.html . Additional BLM sage-grouse information can be	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
found at: http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html .			
4. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through: <ul style="list-style-type: none"> • instructing resource advisors during preseason trainings; • qualification as resource advisors; • coordination with resource advisors during fire incidents; • contributing to incident planning with information such as habitat features or other key data useful in fire decision making 	X		
5. At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.	X		
6. If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.		X	
7. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.		X	
8. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.		X	
9. During periods of multiple fires, ensure line officers are involved in setting priorities.	X		
10. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.	X		
11. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
12. Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.	X		
13. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	X		
14. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.	X		
15. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.		X	
16. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.	X		
Fuels Management Unless otherwise specified as part of the land use plan consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs and BMP's.			
17. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	X		
18. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	X		
19. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).	X		
20. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	X		
21. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.	X		
22. Where applicable, incorporate roads and natural fuel breaks into fuel break design.		X	
23. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.	X		
24. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
activities.			
25. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by Core Management Zones or that reestablish continuity between Core Management Zones. Annual grasslands are a second priority for restoration when the sites are not adjacent to Core Management Zones, but within Important Management Zones. The third priority for annual grassland habitat restoration projects are sites within General Management Zones. The intent is to focus restoration outward from existing, intact habitat.	X		
26. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.	X		
27. Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	X		
28. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.		X	
29. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.		X	
30. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.			X
31. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near CMZ or priority restoration areas (such as where investments in restoration have already been made).	X		
32. Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.	X		
33. Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.		X	
34. Form partnerships with linear right-of-way holders to		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.			
35. Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).			X
36. Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.		X	
37. Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for reference. Offices will make these maps available to suppression resources for use in fire operations.	X		
Vegetation Treatment			
38. Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert 2005; VegSpec).	X		
39. Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).		X	
40. Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).			X
41. Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).			X
42. Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, churning or livestock trampling, and transplanting container or bare-root seedlings.			X
43. Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.		X	
44. Use site preparation techniques that retain existing desirable vegetation.	X		
45. Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.		X	
46. Utilize post-treatment control of annual grass and other invasive species.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
47. Utilize new tools and use of new science and research as it becomes available.	X		
<p>48. Give higher priority to vegetation rehabilitation or manipulation projects that include:</p> <ul style="list-style-type: none"> • Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009). • Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.). • Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order: <ul style="list-style-type: none"> • Recently burned native areas • Native grassland with suitable forb component • Nonnative grassland with suitable forb component • Recently converted annual grass areas • Native grassland • Nonnative grassland • Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique. • Cooperative efforts that may improve GRSG habitat quality over multiple ownerships. • Projects that may provide connectivity between suitable habitats or expand existing good quality habitats. • Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 ($\leq 10\%$ conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 ($>30\%$). • Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat. 	X		
Lands and Realty			

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
49. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.		X	
50. Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	X		
51. Place infrastructure in already disturbed locations where the habitat has not been fully restored.		X	
52. Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.		X	
53. Co-locate linear facilities within one mile of existing linear facilities.		X	
54. Micro-site linear facilities to reduce impacts to sage-grouse habitats.	X		
55. Locate staging areas outside the Core Management Zones to the extent possible.	X		
56. Consider colocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering co-locating with other ROW.			X
57. Restrict the construction of tall facilities and fences to the minimum number and amount needed.	X		
58. Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.	X		
59. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.		X	
60. Construction and development activities should conform to seasonal restrictions.	X		
Fluid Mineral Leasing			
61. Use directional drilling and/or multi well-pads to reduce surface disturbance.	X		
62. Apply a phased development approach with concurrent reclamation.	X		
63. Place liquid gathering facilities outside of CMZs. Have no tanks at well locations within CMZs to minimize truck traffic and perching and nesting sites for ravens and raptors.	X		
64. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).			X
65. Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	X		
66. Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.	X		
67. Equip tanks and other above-ground facilities with		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
structures or devices that discourage nesting of raptors and corvids.			
68. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)		X	
69. Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).		X	
<p>70. Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:</p> <ul style="list-style-type: none"> • Overbuild size of ponds for muddy and non-vegetated shorelines. • Build steep shorelines to decrease vegetation and increase wave actions. • Avoid flooding terrestrial vegetation in flat terrain or low lying areas. • Construct dams or impoundments that restrict down slope seepage or overflow. • Line the channel where discharge water flows into the pond with crushed rock. • Construct spillway with steep sides and line it with crushed rock. • Treat waters with larvicides to reduce mosquito production where water occurs on the surface 		X	
71. In CMZ, limit noise from discretionary activities to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.	X		
72. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.			X
73. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats in Core and Important Management Zones.	X		
74. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.	X		
75. Limit noise sources that would be expected to negatively impact populations in Core and Important Management Zones and continue to support the establishment of ambient baseline noise levels for occupied leks in Core Management Zones.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
76. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.	X		
77. As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.	X		
78. Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).			X
79. Require sage-grouse-safe fences.			X
80. Locate new compressor stations outside Core Management Zones and design them to reduce noise that may be directed towards Core Management Zones.	X		
81. Clean up refuse (Bui et al. 2011).	X		
82. Locate man camps outside of priority sage-grouse habitats.	X		
83. Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.			X
84. Use only closed-loop systems for drilling operations and no reserve pits.	X		
85. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	X		
Roads			
86. Utilize existing roads, or realignments of existing routes to the extent possible.	X		
87. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	X		
88. Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	X		
89. Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.			X
90. Coordinate road construction and use among ROW or SUA holders.	X		
91. Construct road crossings at right angles to ephemeral drainages and stream crossings.			X
92. Use dust abatement on roads and pads.	X		
93. Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
Roads Specific to Core and Important Management Zones			
94. Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.	X		
95. Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	X		
96. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	X		
Reclamation Activities			
97. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	X		
98. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.		X	
99. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	X		
100. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	X		
101. Irrigate interim reclamation if necessary for establishing seedlings more quickly.		X	
102. Utilize mulching techniques to expedite reclamation and to protect soils.		X	
Grazing Required Design Features			
103. Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	X		
104. Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	X		
105. Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet management objectives.		X	
106. Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-grouse habitat objectives. Where constructing fences or exclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.		X	
107. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.			
108. Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.	X		
109. When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.		X	
110. Design new spring developments in GRSG habitat to maintain or enhance the free flowing characteristics of springs and wet meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRSG habitat where necessary.		X	
111. Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRSG and other wildlife.		X	
West Nile Virus Required Design Features			
112. Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.	X		
113. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.	X		
114. Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.	X		
115. For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.	X		
116. Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the wetland at the spring source with a fence is an option to consider.			X

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
117. Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.		X	
118. Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.		X	
119. Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or minimize pooling of water that is attractive to breeding mosquitoes.	X		
120. Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.		X	
121. Install and maintain float valves on stock tank fill pipes to minimize overflow	X		
122. Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.	X		
123. Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NTT report page 61).	X		
124. Consider removing and controlling trees and shrubs to reduce shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.			X
125. Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.			X
126. Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.		X	
127. On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.			X
128. Line the overflow of a dam's spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.		X	
129. Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.		X	
130. During confirmed West Nile virus outbreaks in sage-			X

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
grouse habitat, consider larvicide applications.			
Travel Management Required Design Features			
131. Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs	X		
Recreation Required Design Features			
132. Direct use away from GRSG priority areas as described in the Wildfire and Invasive Species Assessments.	X		
133. Eliminate or minimize external food sources for corvids.		X

DRAFT

1 **Appendix B – Seasonal Timing Restriction**

2

3 During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-
4 May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of
5 occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse.

DRAFT

Idaho and Southwest Montana GRSG Buffers and Seasonal Restrictions Summary

Impacts	Causes ¹	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
Incidental disturbance to individual GRSG within all habitat types during all seasons			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting⁴ habitat			

during the nesting season			
	<p>Anthropogenic activities such as the use of heavy equipment² or targeted grazing in nesting habitat³ for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events</p>	<p>BMP Core, Important, General: Avoid these activities within nesting habitat during the nesting³ season.</p>	<p>Application of the seasonal nesting habitat restriction would avoid and minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.</p>
	<p>Bedding Sheep & Associated Camps</p>	<p>BMP: Core, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas³.</p>	<p>Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).</p>
	<p>Fences</p>	<p>Existing Fences: RDF: Core and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing fences to reduce collision risk within areas that have a high probability of fence strikes (per</p>	<p>Application of these measures would avoid/minimize the loss of birds to fence strikes.</p>

		Stevens et al. 2012 model or latest science).	
		New Fences: RDF: Core and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	
Permanent functional or physical loss of a lek or declining attendance at lek⁴			
	Unleased fluid minerals	Stipulation: Core, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek. Stipulation: Core, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting ³ and winter ³ habitat.	This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of 1.54 pad/sq km (1 pad/247 ac) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential

			impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.
	Commercial solar development	<p>RDF: Core-No commercial solar development.</p> <p>RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek⁴.</p> <p>BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek⁴.</p>	No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).
	Roads	<p>BMP: Core, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks⁴.</p>	<p>Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow access to private lands or per ROW need). If we buffer roads in the Core or Important Zone via a</p>

			<p>large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.</p>
	<p>Commercial/ industrial Pipelines (oil, gas, slurry, and similar)</p>	<p>BMP: Core, Important, General. minimize removal of sagebrush within 0.6 miles of leks⁴.</p>	<p>Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:</p> <p>BACKGROUND INFORMATION: From Colorado GRSG Conservation Plan Appendix B: [Lek Habitat (March through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male</p>

			<p>GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do</p>
--	--	--	--

			<p>not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover. Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiller- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	<p>Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)</p>	<p>BMP Core, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek⁴ or ensure they are out of the viewshed of the lek.</p>	<p>This is a catch all to reduce impact of miscellaneous structures where possible (some are tall⁵, such as water windmill, some are small, but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on</p>

			<p>biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all in Core, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the “viewshed” caveat can help with siting in cases where topography or such screens view of the activity or structure.</p>
	<p>Campgrounds and other developed recreation facilities (trailheads etc.)</p>	<p>BMP: Core, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.</p>	<p>Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSG avoidance threshold 2.5 km from any single development at patch scale.</p>
	<p>OHV Play or Open Areas</p>	<p>RDF-Core and Important; BMP for General. No new Open or Play areas.</p>	<p>Rationale is to reduce risk for further noise, habitat loss, fire risk in the Core, Important and General zones.</p>
	<p>Solid Minerals</p>		<p>These measures for solid minerals are intended to reduces noise and human disturbance to lekking</p>

			<p>birds. Siting/ avoidance buffers not realistic due to the nature of mineral deposits.</p>
		<p>Locatables-BMP Core, Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks⁴ during the lekking season.</p>	<p>Regulations 43 CFR 3809.420 performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.</p>
		<p>Salables- RDF: Core: Do not construct new salable development within 0.8 mile (1.3 km) of leks⁴.</p>	<p><u>Salables</u>- No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Core and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.</p>

		<p>Leasables-non-energy (e.g., phosphate)-</p> <p>RDF-Core and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Core, Important, General- On existing leases avoid disturbance to leks⁴ during the lekking season</p>	<p><u>Leasables:</u></p> <p>None presently known in Core based on current mapping, but Core RDF included in case of a trigger trip and re-delineation of IDswMT subregional management zones.</p> <p>In “Important” there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Zones in case of trigger trip and IDswMT Management Zone re-delineation and since there are some KPLAs in the General Management Zone. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as road access, placement of facilities, etc.. However, “exclusion” buffers are not realistic given the nature of the</p>
--	--	--	---

			location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.
	Wind development (commercial)	<p>RDF: Core-No commercial wind development .</p> <p>BMP: Important and General: Avoid wind development in nesting and/or winter habitat.</p>	<p><u>Wind</u>: Labeau et al. (2014) stated that erecting wind turbines at least 5 km from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.</p>
	Communication Towers	<p>RDF: Core -Do not allow communication tower construction within 3 miles (5 km) of a lek⁴ unless needed to address public safety needs.</p> <p>BMP- Important and General-- Avoid communication tower construction within 3 miles (5 km) of a lek⁴ unless needed to address public safety needs.</p>	<p>Johnson et al. (2011 pg. 427) noted "Analogously, across all management zones there was a steady downward pattern of trends of lek counts as the number of towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."</p>
	Transmission Lines	<p>RDF: Core, Important, General: Do not allow transmission line construction within 600 m of a</p>	<p>A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported</p>

		lek. BMP Core, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.	by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.
	Distribution Lines	BMP: Core, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible	600 m, based on Gillan et al. BMP as this may not always be feasible.
Temporary functional loss of a lek⁴. SEASONAL RESTRICTION			
	Anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking season.	RDF: Core and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season ³ . BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season ³ .	Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km (~ 1 mile) from grouse leks. . IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.
	Sheep Bedding & Sheep Camps	BMP Core, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek	No literature. BMP based on biology team consensus.

		during the lekking season.	
	Organized Recreational Events	RDF Core and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season. BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
Permanent functional or physical loss of nesting or winter habitat.			
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSg habitat objectives appropriate to the seasonal habitat ³ .	Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSg individuals or the associated populations. More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.
	Roads	BMP: Core, Important, General: Avoid construction of new paved or high volume traffic gravel roads	See citations used for permanent loss of leks, above.

		within 0.8 mile (1.3 km) of nesting habitat.	
	Unleased Fluid Minerals	Stipulation: Core, Important, General: Limit average well pad density to no more than 1/640 acres within nesting ³ and winter ³ habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Core-No commercial solar development. RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek ⁴ . BMP-Important: Avoid placing new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek ⁴ .	See citations used for permanent loss of leks, above.
	Campgrounds	BMP-Core, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Core and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.
	Wind Development (commercial)	RDF Core. No commercial wind development .	See citations used for permanent loss of leks, above.

		BMP: Important: Avoid wind development in nesting habitat	
Temporary functional loss of winter habitat			
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Core, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season. BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

1
2 ¹ Land use allocations or activities provided below are examples, but are not limited to those listed.

3
4 ² Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large
5 trucks, excavators, backhoes cranes.

6
7 ³ As per Habitat Objectives table. Based on local GRSG seasonal use dates. Lekking ~ March 1-May 2⁵ depending on elevation; Nesting /early
8 brood ~April 1-June 30; Winter ~December 1-February 28. Source-Modified from ISAC 2006.

9
10 ⁴ Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at
11 the site specific scale during project-level NEPA.

12
13 ⁵ Definition of “tall structure”: Any structure that has the potential to disrupt lekking or nesting GRSG and/or decrease the use of an area. This
14 includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

Draft Greater Sage-Grouse Wildland Fire and Invasive Species Assessment

This Page Intentionally Blank

K. GRSG Wildland Fire & Invasive Species Assessment

The following process is a suggestion for a consistent approach in conducting an assessment of the GRSG habitat and wildfire threat at the local planning area level. Variations to this approach may be made based on ID team discussion or unique issues in a given planning area. This example format is intended to portray the degree of specificity required for offices which will complete these assessments. Note that this process has similarities to watershed analysis and ecoregional assessments, and as such these documents may prove useful where they exist.

K.1 Introduction

Greater Sage-Grouse (GRSG) Wildfire and Invasive Species Habitat Assessments (hereafter referred to as “stepdown assessments”) are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment opportunities for fuels management, fire management, and restoration. Priority areas are spatial delineations where treatments, management actions, or other emphasis should be placed due to factors such as habitat quality, threats, or opportunities to protect, enhance, and restore GRSG habitat. The stepdown assessments will serve as a bridge between RMPs and project level planning, and will position planning efforts to conduct project-scale NEPA following RMP Records of Decision.

The stepdown assessment process involves four steps, beginning with characterization of the planning area and concluding with spatial delineation of priority areas. The content and methods used by Forest Service (FS) and the Bureau of Land Management (BLM) in these documents should be consistent to ensure that priority areas are defined using similar criteria. These criteria and methods should be narratively described such that the US Fish and Wildlife Service (FWS) and other audiences can understand the factors considered.

K.2 Step 1: Characterization of Greater Sage-Grouse Habitat

The purpose of this step is to broadly establish context of the planning area and sage-grouse habitat.

K.2.1 Location and Spatial Extent

Describe the location of the planning area, and the relationship of GRSG habitat within the planning area.

K.2.2 Relationship to the Larger Scale Setting

How does the planning area lie within the larger context of GRSG habitat?

K.2.3 Quantifying Habitat within Planning Area

Brief description of GRSG habitat described in terms of acreage, habitat classes (e.g., PPH, PGH, and/or PACs)

Note: A summary map showing the planning area with habitat features is appropriate in Step 1. A tabular summary may also be included.

K.3 Step 2: Issues and Key Management Questions

The purpose of this step is to devise management questions related to the issues of fuels management, fire management, and restoration. Note that this step should not answer each management question. Rather, management questions are answered in Step 4 through specific, quantified data.

K.3.1 Overview

In coordination with state wildlife agencies, the FWS, and your interdisciplinary team, develop an introductory section here which describes why fire or vegetation conditions pose a threat to GRSG in the local planning area. Describe where fire or vegetation conditions are a significant threat to GRSG habitat, and where fire, fuels, and restoration activities may help enhance habitat. In a brief paragraph or two, summarize the relationships between wildland fire, fuels management and invasives/restoration in the planning area. Examples would include annual grass/wildfire cycle, juniper encroachment into GRSG habitat, recently disturbed areas, etc.

K.3.2 Key Management Questions

Issue #1: Fuels Management

In narrative format, develop management questions such as:

1. Based on fire risk to important GRSG habitats, what types of fuels treatments should be implemented that will reduce the risk? Where should fuels treatments be prioritized, and what's the amount of treatment acres/miles needed for long-term enhancement and protection of GRSG habitat?
2. Based on opportunities for fire to improve/restore GRSG habitats, what types of fuels treatments should be implemented that will increase ability to allow fire? Where should fuels treatments be prioritized, and what amount of treatment is needed for long-term enhancement and protection of GRSG habitat?
3. What fuel reduction techniques will be most effective; including, but not limited to grazing, prescribed fire, chemical, biological and mechanical treatments?
4. What are the criteria for defining priority fuels management areas (example would be the intersection of high burn probability, PPH, lek locations, and established GRSG population)?
5. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries?
6. Are there areas where fuel treatments help restore GRSG habitat as well as reduce risk?

Issue #2: Fire Management

In narrative format, develop management questions such as:

1. Where is the greatest wildfire risk, considering trends in fire occurrence, fuel conditions, and highly valued GRSG habitat?
2. Where will fire suppression resources be most successful to mitigate the risk and protect GRSG Habitats?
3. Where do opportunities exist that could enhance or improve suppression capability in important GRSG habitats?
 - a. For example, increased water availability through installation of heli wells or water storage tanks.
 - b. Decreased response time through pre-positioned resources or staffing remote stations.
4. Where should wildfire be managed to achieve Land Use Plan (LUP) objectives for improving or restoring GRSG habitat (limiting juniper expansion)?
5. What are the criteria for defining priority fire management areas? An example would be the intersection of PPH, lek locations, and high burn probability.
6. How can fire management be coordinated across jurisdictional boundaries to reduce risk or to improve GRSG habitat?

Issue #3: Restoration

In narrative format, develop management questions such as:

1. Are there opportunities for restoration treatments to protect, enhance or maintain GRSG habitat? Assume that funding is not a constraint, and describe which sites are biologically suitable for restoration to GRSG habitat in a reasonable period.
2. Considering the entire planning area, what are the site conditions, such as dominant vegetation, elevation, or precipitation zones, where restoration efforts have been proven to be most successful in the recent past? An example would be mountain sagebrush sites over 5000' in elevation, and in a 16" or greater precipitation zone.
3. What are the criteria for defining priority restoration areas? An example would be recent burns, moderately disturbed sites, or recovering allotment pastures which have not crossed ecological thresholds or become highly degraded. These may or may not be covered by existing ESR plans.
4. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries?

K.4 Step 3: Current Conditions and Trends

The purpose of this step is to develop information relevant to the issues and key questions identified in Step 2. It provides a snapshot of the present condition, statement of causal factors, and a summary of the trends which are occurring.

K.4.1 Biological Summary of Vegetation, Invasive Species, and Fire Regimes

[In this introductory section, provide a general biological summary of the planning area. Provide a narrative description of ecological trends, including description of plant communities, fire regimes, and other dominant biological factors affecting GRSG habitat.]

- Describe how fire has influenced current vegetation patterns. Are there large areas of even-aged communities, fine-scale mosaics, annual grass monocultures?
- Describe if fire regimes are intact, or if they are altered. If they are altered, describe why. Use fire regime variables such as fire frequency, severity, or size to elucidate your points.
- Describe dominant cover types making up the planning area. These can be broad seral stage groupings, general lifeforms, or more fine-scale information such as plant associations, habitat types, or ecological systems. Note: this information should be available in the RMP or FMP.
- What has been the impact of fire exclusion (e.g., increased conifer encroachment, decadent shrub communities, etc)?
- What is the current extent of annual grasses and other invasive species?
- What are the effects of invasive species on land health? On trends in plant succession? On fire regimes?

K.4.2 Fuels Management

- Describe current fuels management practices within the planning area (what are the types of fuels treatments commonly applied to which management issues) ?
- How has past fuels management influenced today's planning area (e.g., creation of mosaics, protecting certain features, increasing invasives, etc)?
- What are causal factors which have created a need for fuels management practices?
- What are the trends in the fuels management program related to budget or capability?

K.4.3 Fire Management

- Describe the current fire suppression workload.

- Describe fire occurrence trends (include discussion of fire size, numbers of starts, ignition locations)
- Describe causal factors influencing suppression effectiveness.
- Describe suppression capabilities. Discuss types and numbers of resources within office, through interagency agreements, and through resource sharing

K.4.4 Restoration

- Describe invasive species which are present in the planning area
- Describe landscape conditions which may be suitable for restoration within the planning area, and the results of recent restoration efforts in the planning area
- Describe invasive species occurrence
- Describe causal factors influencing restoration needs.

K.4.5 Methodology

- What are the analysis methods to be utilized and analysis assumptions?

K.4.6 Use of Best Available Science

- Describe data sets used, such as the FSIM layer, local data, etc. [Many data sets being used in RMPs will also be applicable to stepdown assessments].
- What are the elements of science used?

K.5 Step 4: Identification of Treatment Opportunities, Priority Areas, and Actions

The purpose of this step is to utilize the information from steps 2 and 3 in order to quantify the overall need for treatment or other actions. Specifically, this step should spatially identify and quantify priority areas, using the criteria established in Step 2. Next, this step should identify treatment opportunities which fall within priority areas. Furthermore, treatments should be prioritized and an implementation schedule developed, reflecting the reality that not every acre in need of treatment can receive action within the planning horizon.

K.5.1 Fuels Management

- Spatially delineate priority areas for fuels management, based upon criteria established in Step 2. Fuels priority areas should be delineated by type, such as:
 - Linear fuel break along roads
 - Other linear fuel breaks to create anchor points
 - Prescribed burning
 - Mechanical (e.g., conifer removal)
 - Other mechanical, biological, or chemical treatment

- Quantify the number of acres of needed fuels treatments.
- If they exist, spatially delineate areas where fuel treatments would increase the ability to use fire to improve/enhance GRSG habitat?
 - Include tables, maps or appropriate info.
- Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of fuels treatments.
- Quantify a projected level of treatment within fuels management priority areas.
- Identify treatments to be planned within fuels management priority areas.
- Include a priority or implementation schedule for proposed treatments.

K.5.2 Fire Management

- Spatially delineate priority areas for fire suppression, based upon criteria established in Step 2. Priority areas for fire management should be delineated by type, such as:
 - Initial attack priority areas;
 - Resource pre-positioning and movement priority areas;
 - Remote station staffing priority areas, if appropriate
 - Include tables, maps or other supporting information
- Quantify the number of acres of GRSG habitats for aggressive initial attack that were identified at highest risk from losing key habitat components.
- Quantify the number and type of suppression resources that will be staged or otherwise pre-positioned, as well as the associated conditions, in order to enhance initial attack capabilities.
- Spatially delineate areas where opportunities exist to enhance or improve suppression capability.
 - Include tables, maps or other supporting information.
- Spatially delineate areas where wildfire can be managed to achieve RMP objectives.
 - Include tables, maps or appropriate info.
- Quantify the number of acres within fire management priority areas
- Include a priority or implementation schedule for fire suppression proposed actions.

K.5.3 Restoration

- Spatially delineate priority areas for restoration, using criteria established in Step 2. Priority areas for restoration should be delineated by type, such as:
 - Seeding priority areas (aerial, drill, broadcast, or other);
 - Invasive species priority areas (herbicide, mechanical, biological, combination);
 - Priority areas requiring combinations of treatments (e.g., herbicide followed by seeding).
 - Include tables, maps or appropriate info.
- Identify locations where post-fire restoration treatments should be focused.
 - Include tables, maps or appropriate info.
- Spatially identify invasive species occurrence
- Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of restoration treatments.
- Quantify the projected level of treatment within restoration priority areas.
- Identify treatments to be planned within restoration priority areas.
- Include a priority or implementation schedule for proposed restoration treatments.

K.5.4 Annual Treatment Needs

1. Based on the information above and within the planning area, what are the annual needs based on the key questions and summary statements?

K.5.5 Annual Treatment Abilities

1. Putting GRSG habitat protection and enhancement into perspective with other high valued resources and important land management goals, how does the annual need relate to capabilities?
2. What are the realistic annual expectations in fire management, fuels management, and restoration for the next 5 years?

Appendix B

Fuels Management Required Design Features for Sage-Grouse Conservation

1. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.
2. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.
3. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).
4. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.
5. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.
6. Where applicable, incorporate roads and natural fuel breaks into fuel break design.
7. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.
8. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression activities.
9. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by preliminary priority habitat (PPH) or that reestablish continuity between priority habitats. Annual grasslands are a second priority for restoration when the sites are not adjacent to PPH, but within two miles of PPH. The third priority for annual grassland habitat restoration projects are sites beyond two miles of PPH. The intent is to focus restoration outward from existing, intact habitat.
10. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.
11. Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.

12. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.
13. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.
14. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.
15. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near PPH or important restoration areas (such as where investments in restoration have already been made).

Appendix C Fire Operations Required Design Features for Sage-Grouse Conservation

1. Compile District/Forest level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each District/Forest, which will be aggregated into a state-wide document.
2. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.
3. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through:
 - instructing resource advisors during preseason trainings;
 - qualification as resource advisors;
 - coordination with resource advisors during fire incidents;
 - contributing to incident planning with information such as habitat features or other key data useful in fire decision making
4. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.
5. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.
6. During periods of multiple fires, ensure line officers are involved in setting priorities.
7. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.
8. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.
9. Minimize unnecessary cross-country vehicle travel during fire operations in sage-grouse habitat.
10. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.

11. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.
12. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.
13. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.

INTRODUCTION

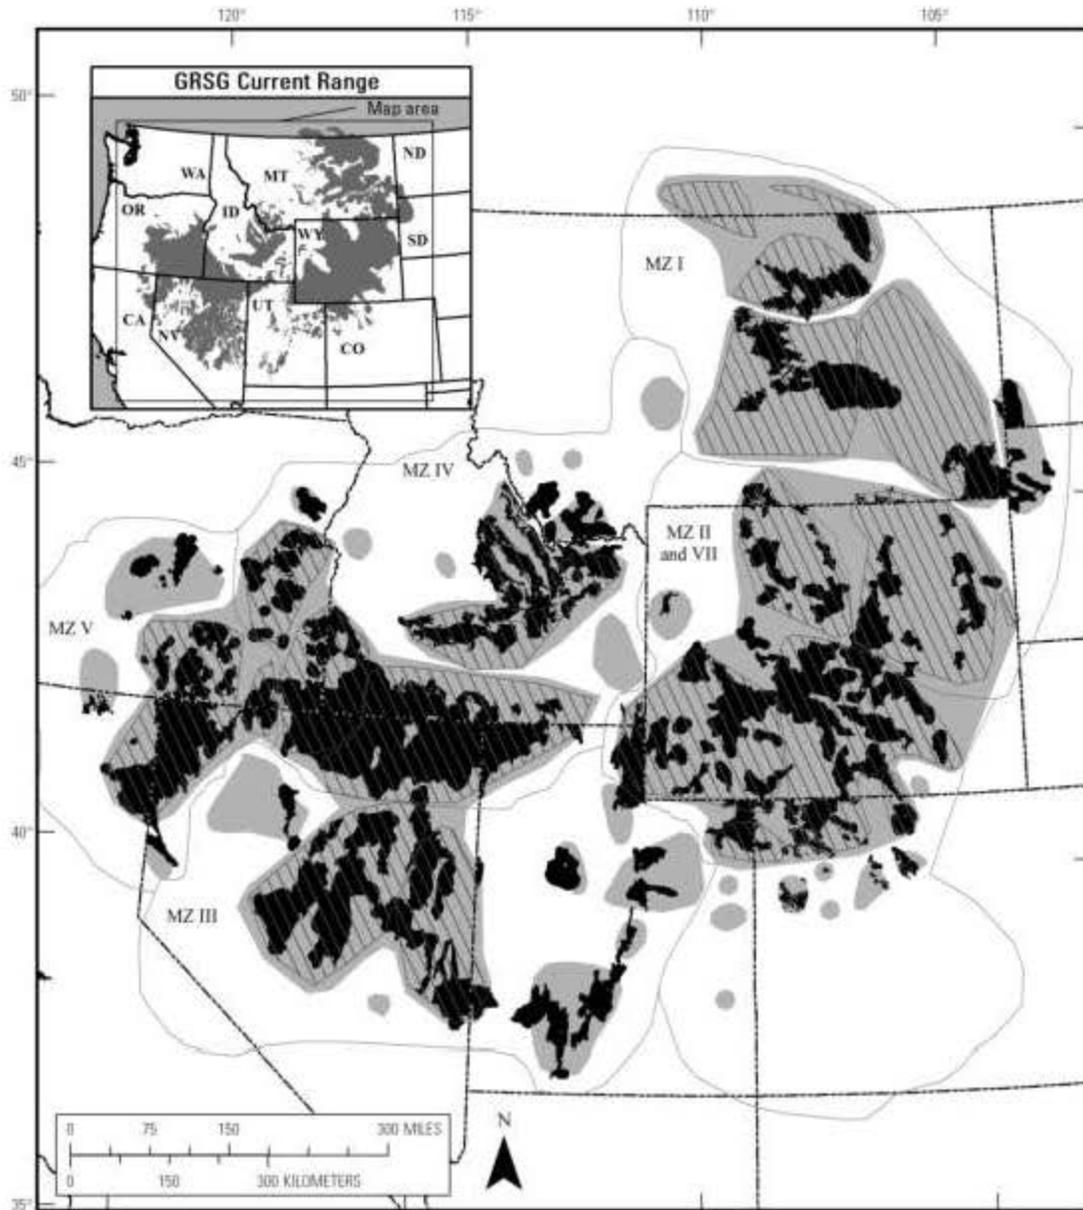

The purpose of this U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) Greater Sage-Grouse Monitoring Framework (hereafter, monitoring framework) is to describe the methods to monitor habitats and evaluate the implementation and effectiveness of the BLM's national planning strategy (attachment to BLM Instruction Memorandum 2012-044), the BLM resource management plans (RMPs), and the USFS's land management plans (LMPs) to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR part 209, published July 1, 2010) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations based on the sensitivity of the resource to the decisions involved. Therefore, the BLM and the USFS will use the methods described herein to collect monitoring data and to evaluate implementation and effectiveness of the Greater Sage-Grouse (GRSG) (hereafter, sage-grouse) planning strategy and the conservation measures contained in their respective land use plans (LUPs). A monitoring plan specific to the Environmental Impact Statement, land use plan, or field office will be developed after the Record of Decision is signed. For a summary of the frequency of reporting, see Attachment A, An Overview of Monitoring Commitments. Adaptive management will be informed by data collected at any and all scales.

To ensure that the BLM and the USFS are able to make consistent assessments about sage-grouse habitats across the range of the species, this framework lays out the methodology—at multiple scales—for monitoring of implementation and disturbance and for evaluating the effectiveness of BLM and USFS actions to conserve the species and its habitat. Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. Implementation monitoring results will allow the BLM and the USFS to evaluate the extent that decisions from their LUPs to conserve sage-grouse and their habitat have been implemented. State fish and wildlife agencies will collect population monitoring information, which will be incorporated into effectiveness monitoring as it is made available.

This multiscale monitoring approach is necessary, as sage-grouse are a landscape species and conservation is scale-dependent to the extent that conservation actions are implemented within seasonal habitats to benefit populations. The four orders of habitat selection (Johnson 1980) used in this monitoring framework are described by Connelly et al. (2003) and were applied specifically to the scales of sage-grouse habitat selection by Stiver et al. (*in press*) as first order (broad scale), second order (mid scale), third order (fine scale), and fourth order (site scale). Habitat selection and habitat use by sage-grouse occur at multiple scales and are driven by multiple environmental and behavioral factors. Managing and monitoring sage-grouse habitats are complicated by the differences in habitat selection across the range and habitat use by individual birds within a given season. Therefore, the tendency to look at a single indicator of habitat suitability or only one scale limits managers' ability to identify the threats to sage-grouse

and to respond at the appropriate scale. For descriptions of these habitat suitability indicators for each scale, see “Sage-Grouse Habitat Assessment Framework: Multiscale Habitat Assessment Tool” (HAF; Stiver et al. *in press*).

Monitoring methods and indicators in this monitoring framework are derived from the current peer-reviewed science. Rangewide, best available datasets for broad- and mid-scale monitoring will be acquired. If these existing datasets are not readily available or are inadequate, but they are necessary to inform the indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions, the BLM and the USFS will strive to develop datasets or obtain information to fill these data gaps. Datasets that are not readily available to inform the fine- and site-scale indicators will be developed. These data will be used to generate monitoring reports at the appropriate and applicable geographic scales, boundaries, and analysis units: across the range of sage-grouse as defined by Schroeder et al. (2004), and clipped by Western Association of Fish and Wildlife Agencies (WAFWA) Management Zone (MZ) (Stiver et al. 2006) boundaries and other areas as appropriate for size (e.g., populations based on Connelly et al. 2004). (See Figure 1, Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.) This broad- and mid-scale monitoring data and analysis will provide context for RMP/LMP areas; states; GRSG Priority Habitat, General Habitat, and other sage-grouse designated management areas; and Priority Areas for Conservation (PACs), as defined in “Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report” (Conservation Objectives Team [COT] 2013). Hereafter, all of these areas will be referred to as “sage-grouse areas.”

Figure 1. Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.

This monitoring framework is divided into two sections. The broad- and mid-scale methods, described in Section I, provide a consistent approach across the range of the species to monitor implementation decisions and actions, mid-scale habitat attributes (e.g., sagebrush availability and habitat degradation), and population changes to determine the effectiveness of the planning strategy and management decisions. (See Table 1, Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.) For sage-grouse habitat at the fine and site scales, described in Section II, this monitoring framework describes a consistent approach (e.g., indicators and methods) for monitoring sage-grouse seasonal habitats. Funding, support, and dedicated personnel for broad- and mid-scale monitoring will be renewed annually through the normal budget process. For an overview of BLM and USFS multiscale monitoring commitments, see Attachment A.

Table 1. Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.

Implementation		Habitat		Population (State Wildlife Agencies)
<i>Geographic Scales</i>		Availability	Degradation	Demographics
Broad Scale: From the range of sage-grouse to WAFWA Management Zones	BLM/USFS National planning strategy goal and objectives	Distribution and amount of sagebrush within the range	Distribution and amount of energy, mining, and infrastructure facilities	WAFWA Management Zone population trend
Mid Scale: From WAFWA Management Zone to populations; PACs	RMP/LMP decisions	Mid-scale habitat indicators (HAF; Table 2 herein, e.g., percent of sagebrush per unit area)	Distribution and amount of energy, mining, and infrastructure facilities (Table 2 herein)	Individual population trend

I. BROAD AND MID SCALES

First-order habitat selection, the broad scale, describes the physical or geographical range of a species. The first-order habitat of the sage-grouse is defined by populations of sage-grouse associated with sagebrush landscapes, based on Schroeder et al. 2004, and Connelly et al. 2004, and on population or habitat surveys since 2004. An intermediate scale between the broad and mid scales was delineated by WAFWA from floristic provinces within which similar environmental factors influence vegetation communities. This scale is referred to as the WAFWA Sage-Grouse Management Zones (MZs). Although no indicators are specific to this scale, these MZs are biologically meaningful as reporting units.

Second-order habitat selection, the mid-scale, includes sage-grouse populations and PACs. The second order includes at least 40 discrete populations and subpopulations (Connelly et al. 2004). Populations range in area from 150 to 60,000 mi² and are nested within MZs. PACs range from 20 to 20,400 mi² and are nested within population areas.

Other mid-scale landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*) will also be assessed. The methods used to calculate these metrics will be derived from existing literature (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011).

A. Implementation (Decision) Monitoring

Implementation monitoring is the process of tracking and documenting the implementation (or the progress toward implementation) of RMP/LMP decisions. The BLM and the USFS will monitor implementation of project-level and/or site-specific actions and authorizations, with their associated conditions of approval/stipulations for sage-grouse, spatially (as appropriate) within Priority Habitat, General Habitat, and other sage-grouse designated management areas, at a minimum, for the planning area. These actions and authorizations, as well as progress toward completing and implementing activity-level plans, will be monitored consistently across all planning units and will be reported to BLM and USFS headquarters annually, with a summary report every 5 years, for the planning area. A national-level GRSG Land Use Plan Decision Monitoring and Reporting Tool is being developed to describe how the BLM and the USFS will consistently and systematically monitor and report implementation-level activity plans and implementation actions for all plans within the range of sage-grouse. A description of this tool for collection and reporting of tabular and spatially explicit data will be included in the Record of Decision or approved plan. The BLM and the USFS will provide data that can be integrated with other conservation efforts conducted by state and federal partners.

B. Habitat Monitoring

The U.S. Fish and Wildlife Service (USFWS), in its 2010 listing decision for the sage-grouse, identified 18 threats contributing to the destruction, modification, or curtailment of sage-grouse habitat or range (75 FR 13910 2010). The BLM and the USFS will, therefore, monitor the relative extent of these threats that remove sagebrush, both spatially and temporally, on all lands within an analysis area, and will report on amount, pattern, and condition at the appropriate and applicable geographic scales and boundaries. These 18 threats have been aggregated into three broad- and mid-scale measures to account for whether the threat predominantly removes sagebrush or degrades habitat. (See Table 2, Relationship between the 18 threats and the three habitat disturbance measures for monitoring.) The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Energy and Mining Density (facilities and locations per unit area)

These three habitat disturbance measures will evaluate disturbance on all lands, regardless of land ownership. The direct area of influence will be assessed with the goal of accounting for actual removal of sagebrush on which sage-grouse depend (Connelly et al. 2000) and for habitat degradation as a surrogate for human activity. Measure 1 (sagebrush availability) examines where disturbances have removed plant communities that support sagebrush (or have broadly removed sagebrush from the landscape). Measure 1, therefore, monitors the change in sagebrush availability—or, specifically, where and how much of the sagebrush community is available within the range of sage-grouse. The sagebrush community is defined as the ecological systems that have the capability of supporting sagebrush vegetation and seasonal sage-grouse habitats within the range of sage-grouse (see Section I.B.1., Sagebrush Availability). Measure 2 (see Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (see Section I.B.3., Energy and Mining Density) focus on where habitat degradation is occurring by using the footprint/area of direct disturbance and the number of facilities at the mid scale to identify the relative amount of degradation per geographic area of interest and in areas that have the capability of supporting sagebrush and seasonal sage-grouse use. Measure 2 (habitat degradation) not only quantifies footprint/area of direct disturbance but also establishes a surrogate for those threats most likely to have ongoing activity. Because energy development and mining activities are typically the most intensive activities in sagebrush habitat, Measure 3 (the density of active energy development, production, and mining sites) will help identify areas of particular concern for such factors as noise, dust, traffic, etc. that degrade sage-grouse habitat.

Table 2. Relationship between the 18 threats and the three habitat disturbance measures for monitoring.

Note: Data availability may preclude specific analysis of individual layers. See the detailed methodology for more information.

USFWS Listing Decision Threat	Sagebrush Availability	Habitat Degradation	Energy and Mining Density
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X		
Invasive Species	X		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and saleable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

The methods to monitor disturbance found herein differ slightly from methods used in Manier et al. 2013, which provided a baseline environmental report (BER) of datasets of disturbance across jurisdictions. One difference is that, for some threats, the BER data were for federal lands only. In addition, threats were assessed individually, using different assumptions from those in this monitoring framework about how to quantify the location and magnitude of threats. The methodology herein builds on the BER methodology and identifies datasets and procedures to use the best available data across the range of the sage-grouse and to formulate a consistent approach to quantify impact of the threats through time. This methodology also describes an approach to combine the threats and calculate each of the three habitat disturbance measures.

B.1. Sagebrush Availability (Measure 1)

Sage-grouse populations have been found to be more resilient where a percentage of the landscape is maintained in sagebrush (Knick and Connelly 2011), which will be determined by sagebrush availability. Measure 1 has been divided into two submeasures to describe sagebrush availability on the landscape:

Measure 1a: the current amount of sagebrush on the geographic area of interest, and

Measure 1b: the amount of sagebrush on the geographic area of interest compared with the amount of sagebrush the landscape of interest could ecologically support.

Measure 1a (the current amount of sagebrush on the landscape) will be calculated using this formula: [the existing updated sagebrush layer] divided by [the geographic area of interest]. The appropriate geographic areas of interest for sagebrush availability include the species' range, WAFWA MZs, populations, and PACs. In some cases these sage-grouse areas will need to be aggregated to provide an estimate of sagebrush availability with an acceptable level of accuracy.

Measure 1b (the amount of sagebrush for context within the geographic area of interest) will be calculated using this formula: [existing sagebrush divided by [pre-EuroAmerican settlement geographic extent of lands that could have supported sagebrush]. This measure will provide information to set the context for a given geographic area of interest during evaluations of monitoring data. The information could also be used to inform management options for restoration or mitigation and to inform effectiveness monitoring.

The sagebrush base layer for Measure 1 will be based on geospatial vegetation data adjusted for the threats listed in Table 2. The following subsections of this monitoring framework describe the methodology for determining both the current availability of sagebrush on the landscape and the context of the amount of sagebrush on the landscape at the broad and mid scales.

a. Establishing the Sagebrush Base Layer

The current geographic extent of sagebrush vegetation within the rangewide distribution of sagegrouse populations will be ascertained using the most recent version of the Existing Vegetation Type (EVT) layer in LANDFIRE (2013). LANDFIRE EVT was selected to serve as the sagebrush base layer for five reasons: 1) it is the only nationally consistent vegetation layer that has been updated multiple times since 2001; 2) the ecological systems classification within LANDFIRE EVT includes multiple sagebrush type classes that, when aggregated, provide a more accurate (compared with individual classes) and seamless sagebrush base layer across jurisdictional boundaries; 3) LANDFIRE performed a rigorous accuracy assessment from which to derive the rangewide uncertainty of the sagebrush base layer; 4) LANDFIRE is consistently used in several recent analyses of sagebrush habitats (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011); and 5) LANDFIRE EVT can be compared against the geographic extent of lands that are believed to have had the capability of supporting sagebrush vegetation pre-EuroAmerican settlement [LANDFIRE Biophysical Setting (BpS)]. This fifth reason provides a reference point for understanding how much sagebrush currently remains in a defined geographic area of interest compared with how much sagebrush existed historically (Measure 1b). Therefore, the BLM and the USFS have determined that LANDFIRE provides the best available data at broad and mid scales to serve as a sagebrush base layer for monitoring changes in the geographic extent of sagebrush. The BLM and the USFS, in addition to aggregating the sagebrush types into the sagebrush base layer, will aggregate the accuracy assessment reports from LANDFIRE to document the cumulative accuracy for the sagebrush base layer. The BLM—through its Assessment, Inventory, and Monitoring (AIM) program and, specifically, the BLM’s landscape monitoring framework (Taylor et al. 2014)—will provide field data to the LANDFIRE program to support continuous quality improvements of the LANDFIRE EVT layer. The sagebrush layer based on LANDFIRE EVT will allow for the mid-scale estimation of the existing percent of sagebrush across a variety of reporting units. This sagebrush base layer will be adjusted by changes in land cover and successful restoration for future calculations of sagebrush availability (Measures 1a and 1b).

This layer will also be used to determine the trend in other landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*). In the future, changes in sagebrush availability, generated annually, will be included in the sagebrush base layer. The landscape metrics will be recalculated to examine changes in pattern and abundance of sagebrush at the various geographic boundaries. This information will be included in effectiveness monitoring (See Section I.D., Effectiveness Monitoring).

Within the USFS and the BLM, forest-wide and field office–wide existing vegetation classification mapping and inventories are available that provide a much finer level of data than what is provided through LANDFIRE. Where available, these finer-scale products will be useful for additional and complementary mid-scale indicators and local-scale analyses (see Section II,

Fine and Site Scales). The fact that these products are not available everywhere limits their utility for monitoring at the broad and mid scale, where consistency of data products is necessary across broader geographies.

Data Sources for Establishing and Monitoring Sagebrush Availability

There were three criteria for selecting the datasets for establishing and monitoring the change in sagebrush availability (Measure 1):

- Nationally consistent dataset available across the range
- Known level of confidence or accuracy in the dataset
- Continual maintenance of dataset and known update interval

Datasets meeting these criteria are listed in Table 3, Datasets for establishing and monitoring changes in sagebrush availability.

LANDFIRE Existing Vegetation Type (EVT) Version 1.2

LANDFIRE EVT represents existing vegetation types on the landscape derived from remote sensing data. Initial mapping was conducted using imagery collected in approximately 2001. Since the initial mapping there have been two update efforts: version 1.1 represents changes before 2008, and version 1.2 reflects changes on the landscape before 2010. Version 1.2 will be used as the starting point to develop the sagebrush base layer.

Sage-grouse subject matter experts determined which of the ecological systems from the LANDFIRE EVT to use in the sagebrush base layer by identifying the ecological systems that have the capability of supporting sagebrush vegetation and that could provide suitable seasonal habitat for the sage-grouse. (See Table 4, Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.) Two additional vegetation types that are not ecological systems were added to the EVT: *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance. These alliances have species composition directly related to the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system, both of which are ecological systems in LANDFIRE BpS. In LANDFIRE EVT, however, in some map zones, the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system were named *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance, respectively.

Table 3. Datasets for establishing and monitoring changes in sagebrush availability.

Dataset	Source	Update Interval	Most Recent Version Year	Use
BioPhysical Setting v1.1	LANDFIRE	Static	2008	Denominator for sagebrush availability
Existing Vegetation Type v1.2	LANDFIRE	Static	2010	Numerator for sagebrush availability
Cropland Data Layer	National Agricultural Statistics Service	Annual	2012	Agricultural updates; removes existing sagebrush from numerator of sagebrush availability
National Land Cover Dataset Percent Imperviousness	Multi-Resolution Land Characteristics Consortium (MRLC)	5-Year	2011 (next available in 2016)	Urban area updates; removes existing sagebrush from numerator of sagebrush availability
Fire Perimeters	GeoMac	Annual	2013	< 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability
Burn Severity	Monitoring Trends in Burn Severity	Annual	2012 (2-year delay in data availability)	> 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability except for unburned sagebrush islands

Table 4. Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Mixed Low Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia bigelovii</i> <i>Artemisia nova</i> <i>Artemisia frigida</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Columbia Plateau Low Sagebrush Steppe	<i>Artemisia arbuscula</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i>

Columbia Plateau Scabland Shrubland	<i>Artemisia rigida</i>
Columbia Plateau Steppe and Grassland	<i>Artemisia</i> spp.
Great Basin Xeric Mixed Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longicaulis</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Shrubland	<i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Steppe	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>tripartita</i> <i>Artemisia frigida</i>
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Woodland and Shrubland	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i>
Inter-Mountain Basins Mixed Salt Desert Scrub	<i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia spinescens</i>
Inter-Mountain Basins Montane Sagebrush Steppe	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia nova</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>spiciformis</i>
Inter-Mountain Basins Semi-Desert Shrub-Steppe	<i>Artemisia tridentata</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Northwestern Great Plains Mixed Grass Prairie	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia frigida</i>
Northwestern Great Plains Shrubland	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Rocky Mountain Gambel Oak-Mixed Montane Shrubland	<i>Artemisia tridentata</i>
Rocky Mountain Lower Montane-Foothill Shrubland	<i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia frigida</i>
Western Great Plains Floodplain Systems	<i>Artemisia cana</i> ssp. <i>cana</i>
Western Great Plains Sand Prairie	<i>Artemisia cana</i> ssp. <i>cana</i>
Wyoming Basins Dwarf Sagebrush Shrubland and Steppe	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>rupicola</i>
<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
<i>Quercus gambelii</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i>

Accuracy and Appropriate Use of LANDFIRE Datasets

Because of concerns over the thematic accuracy of individual classes mapped by LANDFIRE, all ecological systems listed in Table 4 will be merged into one value that represents the sagebrush base layer. With all ecological systems aggregated, the combined accuracy of the sagebrush base layer (EVT) will be much greater than if all categories were treated separately.

LANDFIRE performed the original accuracy assessment of its EVT product on a map zone basis. There are 20 LANDFIRE map zones that cover the historical range of sage-grouse as defined by Schroeder (2004). (See Attachment B, User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones.) The aggregated sagebrush base layer for monitoring had user accuracies ranging from 57.1% to 85.7% and producer accuracies ranging from 56.7% to 100%.

LANDFIRE EVT data are not designed to be used at a local level. In reports of the percent sagebrush statistic for the various reporting units (Measure 1a), the uncertainty of the percent sagebrush will increase as the size of the reporting unit gets smaller. LANDFIRE data should never be used at the 30m pixel level (900m² resolution of raster data) for any reporting. The smallest geographic extent for using the data to determine percent sagebrush is at the PAC level; for the smallest PACs, the initial percent sagebrush estimate will have greater uncertainties compared with the much larger PACs.

Agricultural Adjustments for the Sagebrush Base Layer

The dataset for the geographic extent of agricultural lands will come from the National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL) (<http://www.nass.usda.gov/research/Cropland/Release/index.htm>). CDL data are generated annually, with estimated producer accuracies for “large area row crops ranging from the mid 80% to mid-90%,” depending on the state (http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3_18.0). Specific information on accuracy may be found on the NASS metadata website (<http://www.nass.usda.gov/research/Cropland/metadata/meta.htm>). CDL provided the only dataset that matches the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in this monitoring framework and represents the best available agricultural lands mapping product.

The CDL data contain both agricultural classes and nonagricultural classes. For this effort, and in the baseline environmental report (Manier et al. 2013), nonagricultural classes were removed from the original dataset. The excluded classes are:

Barren (65 & 131), Deciduous Forest (141), Developed/High Intensity (124), Developed/Low Intensity (122), Developed/Med Intensity (123), Developed/Open Space (121), Evergreen Forest (142), Grassland Herbaceous (171), Herbaceous Wetlands (195), Mixed Forest (143), Open

Water (83 & 111), Other Hay/Non Alfalfa (37), Pasture/Hay (181), Pasture/Grass (62), Perennial Ice/Snow (112), Shrubland (64 & 152), Woody Wetlands (190).

The rule set for adjusting the sagebrush base layer for agricultural lands (and for updating the base layer for agricultural lands in the future) is that once an area is classified as agriculture in any year of the CDL, those pixels will remain out of the sagebrush base layer even if a new version of the CDL classifies that pixel as one of the nonagricultural classes listed above. The assumption is that even though individual pixels may be classified as a nonagricultural class in any given year, the pixel has not necessarily been restored to a natural sagebrush community that would be included in Table 4. A further assumption is that once an area has moved into agricultural use, it is unlikely that the area would be restored to sagebrush. Should that occur, however, the method and criteria for adding pixels back into the sagebrush base layer would follow those found in the sagebrush restoration monitoring section of this monitoring framework (see Section I.B.1.b., Monitoring Sagebrush Availability).

Urban Adjustments for the Sagebrush Base Layer

The National Land Cover Database (NLCD) (Fry et al. 2011) includes a percent imperviousness dataset that was selected as the best available dataset to be used for urban adjustments and monitoring. These data are generated on a 5-year cycle and are specifically designed to support monitoring efforts. Other datasets were evaluated and lacked the spatial specificity that was captured in the NLCD product. Any new impervious pixel in NLCD will be removed from the sagebrush base layer through the monitoring process. Although the impervious surface layer includes a number of impervious pixels outside of urban areas, this is acceptable for the adjustment and monitoring for two reasons. First, an evaluation of national urban area datasets did not reveal a layer that could be confidently used in conjunction with the NLCD product to screen impervious pixels outside of urban zones. This is because unincorporated urban areas were not being included, thus leaving large chunks of urban pixels unaccounted for in this rule set. Second, experimentation with setting a threshold on the percent imperviousness layer that would isolate rural features proved to be unsuccessful. No combination of values could be identified that would result in the consistent ability to limit impervious pixels outside urban areas. Therefore, to ensure consistency in the monitoring estimates, all impervious pixels will be used.

Fire Adjustments for the Sagebrush Base Layer

Two datasets were selected for performing fire adjustments and updates: GeoMac fire perimeters and Monitoring Trends in Burn Severity (MTBS). An existing data standard in the BLM requires that all fires of more than 10 acres are to be reported to GeoMac; therefore, there will be many small fires of less than 10 acres that will not be accounted for in the adjustment and monitoring attributable to fire. Using fire perimeters from GeoMac, all sagebrush pixels falling

within the perimeter of fires less than 1,000 acres will be used to adjust and monitor the sagebrush base layer.

For fires greater than 1,000 acres, MTBS was selected as a means to account for unburned sagebrush islands during the update process of the sagebrush base layer. The MTBS program (<http://www.mtbs.gov>) is an ongoing, multiyear project to map fire severity and fire perimeters consistently across the United States. One of the burn severity classes within MTBS is an unburned to low-severity class. This burn severity class will be used to represent unburned islands of sagebrush within the fire perimeter for the sagebrush base layer. Areas within the other severity classes within the fire perimeter will be removed from the base sagebrush layer during the update process. Not all wildfires, however, have the same impacts on the recovery of sagebrush habitat, depending largely on soil moisture and temperature regimes. For example, cooler, moister sagebrush habitat has a higher potential for recovery or, if needed, restoration than does the warmer, dryer sagebrush habitat. These cooler, moister areas will likely be detected as sagebrush in future updates to LANDFIRE.

Conifer Encroachment Adjustment for the Sagebrush Base Layer

Conifer encroachment into sagebrush vegetation reduces the spatial extent of sage-grouse habitat (Davies et al. 2011, Baruch-Mordo et al. 2013). Conifer species that show propensity for encroaching into sagebrush vegetation resulting in sage-grouse habitat loss include various juniper species, such as Utah juniper (*Juniperus osteosperma*), western juniper (*Juniperus occidentalis*), Rocky Mountain juniper (*Juniperus scopulorum*), pinyon species, including singleleaf pinyon (*Pinus monophylla*) and pinyon pine (*Pinus edulis*), ponderosa pine (*Pinus ponderosa*), lodgepole pine (*Pinus contorta*), and Douglas fir (*Pseudotsuga menziesii*) (Gruell et al. 1986, Grove et al. 2005, Davies et al. 2011).

A rule set for conifer encroachment was developed to adjust the sagebrush base layer. To capture the geographic extent of sagebrush that is likely to experience conifer encroachment, ecological systems within LANDFIRE EVT version 1.2 (NatureServe 2011) were identified if they had the capability of supporting both the conifer species (listed above) and sagebrush vegetation. Those ecological systems were deemed to be the plant communities with conifers most likely to encroach into sagebrush vegetation. (See Table 5, Ecological systems with conifers most likely to encroach into sagebrush vegetation.) Sagebrush vegetation was defined as including sagebrush species or subspecies that provide habitat for the Greater Sage-Grouse and that are included in the HAF. (See Attachment C, Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers.) An adjacency analysis was conducted to identify all sagebrush pixels that were directly adjacent to these conifer ecological systems, and these pixels were removed from the sagebrush base layer.

Table 5. Ecological systems with conifers most likely to encroach into sagebrush vegetation.

EVT Ecological Systems	Coniferous Species and Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus osteosperma</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia bigelovii</i> <i>Artemisia pygmaea</i>
Columbia Plateau Western Juniper Woodland and Savanna	<i>Juniperus occidentalis</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia rigida</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
East Cascades Oak-Ponderosa Pine Forest and Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i> <i>Artemisia tridentata</i> <i>Artemisia nova</i>
Great Basin Pinyon-Juniper Woodland	<i>Pinus monophylla</i> <i>Juniperus osteosperma</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Northern Rocky Mountain Ponderosa Pine Woodland and Savanna	<i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Rocky Mountain Foothill Limber Pine-Juniper Woodland	<i>Juniperus osteosperma</i> <i>Juniperus scopulorum</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i>
Rocky Mountain Poor-Site Lodgepole Pine Forest	<i>Pinus contorta</i> <i>Pseudotsuga menziesii</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i>
Southern Rocky Mountain Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus monosperma</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Southern Rocky Mountain Ponderosa Pine Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i>

	<i>Pinus edulis</i> <i>Pinus contorta</i> <i>Juniperus</i> spp. <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
--	---

Invasive Annual Grasses Adjustments for the Sagebrush Base Layer

There are no invasive species datasets from 2010 to the present (beyond the LANDFIRE data) that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in the determination of the sagebrush base layer. For a description of how invasive species land cover will be incorporated in the sagebrush base layer in the future, see Section I.B.1.b., Monitoring Sagebrush Availability.

Sagebrush Restoration Adjustments for the Sagebrush Base Layer

There are no datasets from 2010 to the present that could provide additions to the sagebrush base layer from restoration treatments that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated); therefore, no adjustments were made to the sagebrush base layer calculated from the LANDFIRE EVT (version 1.2) attributable to restoration activities since 2010. Successful restoration treatments before 2010 are assumed to have been captured in the LANDFIRE refresh.

b. Monitoring Sagebrush Availability

Monitoring Sagebrush Availability

Sagebrush availability will be updated annually by incorporating changes to the sagebrush base layer attributable to agriculture, urbanization, and wildfire. The monitoring schedule for the existing sagebrush base layer updates is as follows:

2010 Existing Sagebrush Base Layer = [Sagebrush EVT] minus [2006 Imperviousness Layer] minus [2009 and 2010 CDL] minus [2009/10 GeoMac Fires that are less than 1,000 acres] minus [2009/10 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter] minus [Conifer Encroachment Layer]

2012 Existing Sagebrush Update = [2010 Existing Sagebrush Base Layer] minus [2011 Imperviousness Layer] minus [2011 and 2012 CDL] minus [2011/12 GeoMac Fires < 1,000 acres] minus [2011/12 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter]

Monitoring Existing Sagebrush post 2012 = [Previous Existing Sagebrush Update Layer] minus [Imperviousness Layer (if new data are available)] minus [Next 2 years of CDL] minus [Next 2 years of GeoMac Fires < 1,000 acres] minus [Next 2 years of MTBS Fires that are greater than

1,000 acres, excluding unburned sagebrush islands within the perimeter] plus
[restoration/monitoring data provided by the field]

Monitoring Sagebrush Restoration

Restoration after fire, after agricultural conversion, after seedings of introduced grasses, or after treatments of pinyon pine and/or juniper are examples of updates to the sagebrush base layer that can add sagebrush vegetation back into sagebrush availability in the landscape. When restoration has been determined to be successful through rangewide, consistent, interagency fine- and site-scale monitoring, the polygonal data will be used to add sagebrush pixels back into the broad- and mid-scale sagebrush base layer.

Measure 1b: Context for Monitoring the Amount of Sagebrush in a Geographic Area of Interest

Measure 1b describes the amount of sagebrush on the landscape of interest compared with the amount of sagebrush the landscape of interest could ecologically support. Areas with the potential to support sagebrush were derived from the BpS data layer that describes sagebrush pre-EuroAmerican settlement (v1.2 of LANDFIRE).

The identification and spatial locations of natural plant communities (vegetation) that are believed to have existed on the landscape (BpS) were constructed based on an approximation of the historical (pre-EuroAmerican settlement) disturbance regime and how the historical disturbance regime operated on the current biophysical environment. BpS is composed of map units that are based on NatureServe (2011) terrestrial ecological systems classification.

The ecological systems within BpS used for this monitoring framework are those ecological systems that are capable of supporting sagebrush vegetation and of providing seasonal habitat for sage-grouse (Table 4). Ecological systems selected included sagebrush species or subspecies that are included in the HAF and listed in Attachment C.

The BpS layer does not have an associated accuracy assessment, given the lack of any reference data. Visual inspection of the BpS data, however, reveals inconsistencies in the labeling of pixels among LANDFIRE map zones. The reason for these inconsistencies is that the rule sets used to map a given ecological system will vary among map zones based on different physical, biological, disturbance, and atmospheric regimes of the region. These variances can result in artificial edges in the map. Metrics will be calculated, however, at broad spatial scales using BpS potential vegetation type, not small groupings or individual pixels. Therefore, the magnitude of these observable errors in the BpS layer will be minor compared with the size of the reporting units. Since BpS will be used to identify broad landscape patterns of dominant vegetation, these inconsistencies will have only a minor impact on the percent sagebrush availability calculation. *As with the LANDFIRE EVT, LANDFIRE BpS data are not designed to be used at a local level. LANDFIRE data should never be used at the 30m pixel level for reporting.*

In conclusion, sagebrush availability data will be used to inform effectiveness monitoring and initiate adaptive management actions as necessary. The 2010 estimate of sagebrush availability will serve as the base year, and an updated estimate for 2012 will be reported in 2014 after all datasets become available. The 2012 estimate will capture changes attributable to wildfire, agriculture, and urban development. Subsequent updates will always include new fire and agricultural data and new urban data when available. Restoration data that meet the criteria for adding sagebrush areas back into the sagebrush base layer will be factored in as data allow. Given data availability, there will be a 2-year lag (approximately) between when the estimate is generated and when the data used for the estimate become available (e.g., the 2014 sagebrush availability will be included in the 2016 estimate).

Future Plans

Geospatial data used to generate the sagebrush base layer will be available through the BLM's EGIS web portal and geospatial gateway or through the authoritative data source. Legacy datasets will be preserved so that trends may be calculated. Additionally, accuracy assessment data for all source datasets will be provided on the portal either spatially, where applicable, or through the metadata. Accuracy assessment information was deemed vital to help users understand the limitation of the sagebrush estimates; it will be summarized spatially by map zone and will be included in the portal.

LANDFIRE plans to begin a remapping effort in 2015. This remapping has the potential to improve the overall quality of data products greatly, primarily through the use of higher-quality remote sensing datasets. Additionally, the BLM and the Multi-Resolution Land Characteristics Consortium (MRLC) are working to improve the accuracy of vegetation map products for broad- and mid-scale analyses through the Grass/Shrub mapping effort. The Grass/Shrub mapping effort applies the Wyoming multiscale sagebrush habitat methodology (Homer et al. 2009) to depict spatially the fractional percent cover estimates for five components rangewide and West-wide. These five components are percent cover of sagebrush vegetation, percent bare ground, percent herbaceous vegetation (grass and forbs combined), annual vegetation, and percent shrubs. A benefit of the design of these fractional cover maps is that they facilitate monitoring "within" class variation (e.g., examination of declining trend in sagebrush cover for individual pixels). This "within" class variation can serve as one indicator of sagebrush quality that cannot be derived from LANDFIRE's EVT information. The Grass/Shrub mapping effort is not a substitute for fine-scale monitoring but will leverage fine-scale data to support the validation of the mapping products. An evaluation will be conducted to determine if either dataset is of great enough quality to warrant replacing the existing sagebrush layers. At the earliest, this evaluation will occur in 2018 or 2019, depending on data availability.

B.2. Habitat Degradation Monitoring (Measure 2)

The measure of habitat degradation will be calculated by combining the footprints of threats identified in Table 2. The footprint is defined as the direct area of influence of “active” energy and infrastructure; it is used as a surrogate for human activity. Although these analyses will try to summarize results at the aforementioned meaningful geographic areas of interest, some may be too small to report the metrics appropriately and may be combined (smaller populations, PACs within a population, etc.). Data sources for each threat are found in Table 6, Geospatial data sources for habitat degradation. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and to calculate trends in habitat degradation to inform adaptive management. A 5-year summary report will be provided to the USFWS.

a. Habitat Degradation Datasets and Assumptions

Energy (oil and gas wells and development facilities)

This dataset will compile information from three oil and gas databases: the proprietary IHS Enerdeq database, the BLM Automated Fluid Minerals Support System (AFMSS) database, and the proprietary Platts (a McGraw-Hill Financial Company) GIS Custom Data (hereafter, Platts) database of power plants. Point data from wells active within the last 10 years from IHS and producing wells from AFMSS will be considered as a 5-acre (2.0ha) direct area of influence centered on the well point, as recommended by the BLM WO-300 (Minerals and Realty Management). Plugged and abandoned wells will be removed if the date of well abandonment was before the first day of the reporting year (i.e., for the 2015 reporting year, a well must have been plugged and abandoned by 12/31/2014 to be removed). Platts oil and gas power plants data (subset to operational power plants) will also be included as a 5-acre (2.0ha) direct area of influence.

Additional Measure: Reclaimed Energy-related Degradation. This dataset will include those wells that have been plugged and abandoned. This measure thereby attempts to measure energy-related degradation that has been reclaimed but not necessarily fully restored to sage-grouse habitat. This measure will establish a baseline by using wells that have been plugged and abandoned within the last 10 years from the IHS and AFMSS datasets. Time lags for lek attendance in response to infrastructure have been documented to be delayed 2–10 years from energy development activities (Harju et al. 2010). Reclamation actions may require 2 or more years from the Final Abandonment Notice. Sagebrush seedling establishment may take 6 or more years from the point of seeding, depending on such variables as annual precipitation, annual temperature, and soil type and depth (Pyke 2011). This 10-year period is conservative and assumes some level of habitat improvement 10 years after plugging. Research by Hemstrom et al. (2002), however,

proposes an even longer period—more than 100 years—for recovery of sagebrush habitats, even with active restoration approaches. Direct area of influence will be considered 3 acres (1.2ha) (J. Perry, personal communication, February 12, 2014). This additional layer/measure could be used at the broad and mid scale to identify areas where sagebrush habitat and/or potential sagebrush habitat is likely still degraded. This layer/measure could also be used where further investigation at the fine or site scale would be warranted to: 1) quantify the level of reclamation already conducted, and 2) evaluate the amount of restoration still required for sagebrush habitat recovery. At a particular level (e.g., population, PACs), these areas and the reclamation efforts/success could be used to inform reclamation standards associated with future developments. Once these areas have transitioned from reclamation standards to meeting *restoration* standards, they can be added back into the sagebrush availability layer using the same methodology as described for adding restoration treatment areas lost to wildfire and agriculture conversion (see Monitoring Sagebrush Restoration in Section I.B.1.b., Monitoring Sagebrush Availability). This dataset will be updated annually from the IHS dataset.

Energy (coal mines)

Currently, there is no comprehensive dataset available that identifies the footprint of active coal mining across all jurisdictions. Therefore, point and polygon datasets will be used each year to identify coal mining locations. Data sources will be identified and evaluated annually and will include at a minimum: BLM coal lease polygons, U.S. Energy Information Administration mine occurrence points, U.S. Office of Surface Mining Reclamation and Enforcement coal mining permit polygons (as available), and U.S. Geological Survey (USGS) Mineral Resources Data System mine occurrence points. These data will inform where active coal mining may be occurring. Additionally, coal power plant data from Platts power plants database (subset to operational power plants) will be included. Aerial imagery will then be used to digitize manually the active coal mining and coal power plants surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active coal mine and power plant direct area of influence. Coal mine location data source and imagery date will be documented for each digitized coal polygon at the time of creation. Subsurface facility locations (polygon or point location as available) will also be collected if available, included in density calculations, and added to the active surface activity layer as appropriate (if an actual direct area of influence can be located).

Energy (wind energy facilities)

This dataset will be a subset of the Federal Aviation Administration (FAA) Digital Obstacles point file. Points where “Type_” = “WINDMILL” will be included. Direct area of influence of these point features will be measured by converting to a polygon dataset as a direct area of

influence of 3 acres (1.2ha) centered on each tower point. See the BLM’s “Wind Energy Development Programmatic Environmental Impact Statement” (BLM 2005). Additionally, Platts power plants database will be used for transformer stations associated with wind energy sites (subset to operational power plants), also with a 3-acre (1.2ha) direct area of influence.

Energy (solar energy facilities)

This dataset will include solar plants as compiled with the Platts power plants database (subset to operational power plants). This database includes an attribute that indicates the operational capacity of each solar power plant. Total capacity at the power plant was based on ratings of the in-service unit(s), in megawatts. Direct area of influence polygons will be centered over each point feature representing 7.3ac (3.0ha) per megawatt of the stated operational capacity, per the report of the National Renewable Energy Laboratory (NREL), “Land-Use Requirements for Solar Power Plants in the United States” (Ong et al. 2013).

Energy (geothermal energy facilities)

This dataset will include geothermal wells in existence or under construction as compiled with the IHS wells database and power plants as compiled with the Platts database (subset to operational power plants). Direct area of influence of these point features will be measured by converting to a polygon dataset of 3 acres (1.2ha) centered on each well or power plant point.

Mining (active developments; locatable, leasable, saleable)

This dataset will include active locatable mining locations as compiled with the proprietary InfoMine database. Aerial imagery will then be used to digitize manually the active mining surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active mine direct area of influence. Mine location data source and imagery date will be documented for each digitized polygon at the time of creation. Currently, there are no known compressive databases available for leasable or saleable mining sites beyond coal mines. Other data sources will be evaluated and used as they are identified or as they become available. Point data may be converted to polygons to represent direct area of influence unless actual surface disturbance is available.

Infrastructure (roads)

This dataset will be compiled from the proprietary Esri StreetMap Premium for ArcGIS. Dataset features that will be used are: Interstate Highways, Major Roads, and Surface Streets to capture most paved and “crowned and ditched” roads while not including “two-track” and 4-wheel-drive routes. These minor roads, while not included in the broad- and mid-scale monitoring, may support a volume of traffic that can have deleterious effects on sage-grouse leks. It may be

appropriate to consider the frequency and type of use of roads in a NEPA analysis for a proposed project. This fine- and site-scale analysis will require more site-specific data than is identified in this monitoring framework. The direct area of influence for roads will be represented by 240.2ft, 84.0ft, and 40.7ft (73.2m, 25.6m, and 12.4m) total widths centered on the line feature for Interstate Highways, Major Roads, and Surface Streets, respectively (Knick et al. 2011). The most current dataset will be used for each monitoring update. *Note: This is a related but different dataset than what was used in BER (Manier et al. 2013). Individual BLM/USFS planning units may use different road layers for fine- and site-scale monitoring.*

Infrastructure (railroads)

This dataset will be a compilation from the Federal Railroad Administration Rail Lines of the USA dataset. Non-abandoned rail lines will be used; abandoned rail lines will not be used. The direct are of influence for railroads will be represented by a 30.8ft (9.4m) total width (Knick et al. 2011) centered on the non-abandoned railroad line feature.

Infrastructure (power lines)

This line dataset will be derived from the proprietary Platts transmission lines database. Linear features in the dataset attributed as “buried” will be removed from the disturbance calculation. Only “In Service” lines will be used; “Proposed” lines will not be used. Direct area of influence will be determined by the kV designation: 1–199 kV (100ft/30.5m), 200–399 kV (150ft/45.7m), 400–699 kV (200ft/61.0m), and 700-or greater kV (250ft/76.2m) based on average right-of-way and structure widths, according to BLM WO-300 (Minerals and Realty Management).

Infrastructure (communication towers)

This point dataset will be compiled from the Federal Communications Commission (FCC) communication towers point file; all duplicate points will be removed. It will be converted to a polygon dataset by using a direct area of influence of 2.5 acres (1.0ha) centered on each communication tower point (Knick et al. 2011).

Infrastructure (other vertical structures)

This point dataset will be compiled from the FAA’s Digital Obstacles point file. Points where “Type_” = “WINDMILL” will be removed. Duplicate points from the FCC communication towers point file will be removed. Remaining features will be converted to a polygon dataset using a direct area of influence of 2.5 acres (1.0ha) centered on each vertical structure point (Knick et al. 2011).

Other Developed Rights-of-Way

Currently, no additional data sources for other rights-of-way have been identified; roads, power lines, railroads, pipelines, and other known linear features are represented in the categories

described above. The newly purchased IHS data do contain pipeline information; however, this database does not currently distinguish between above-ground and underground pipelines. If additional features representing human activities are identified, they will be added to monitoring reports using similar assumptions to those used with the threats described above.

b. Habitat Degradation Threat Combination and Calculation

The threats targeted for measuring human activity (Table 2) will be converted to direct area of influence polygons as described for each threat above. These threat polygon layers will be combined and features dissolved to create one overall polygon layer representing footprints of active human activity in the range of sage-grouse. Individual datasets, however, will be preserved to indicate which types of threats may be contributing to overall habitat degradation.

This measure has been divided into three submeasures to describe habitat degradation on the landscape. Percentages will be calculated as follows:

Measure 2a. Footprint by geographic area of interest: Divide area of the active/direct footprint by the total area of the geographic area of interest (% disturbance in geographic area of interest).

Measure 2b. Active/direct footprint by historical sagebrush potential: Divide area of the active footprint that coincides with areas with historical sagebrush potential (BpS calculation from habitat availability) within a given geographic area of interest by the total area with sagebrush potential within the geographic area of interest (% disturbance on potential historical sagebrush in geographic area of interest).

Measure 2c. Active/direct footprint by current sagebrush: Divide area of the active footprint that coincides with areas of existing sagebrush (EVT calculation from habitat availability) within a given geographic area of interest by the total area that is current sagebrush within the geographic area of interest (% disturbance on current sagebrush in geographic area of interest).

B.3. Energy and Mining Density (Measure 3)

The measure of density of energy and mining will be calculated by combining the locations of energy and mining threats identified in Table 2. This measure will provide an estimate of the intensity of human activity or the intensity of habitat degradation. The number of energy facilities and mining locations will be summed and divided by the area of meaningful geographic areas of interest to calculate density of these activities. Data sources for each threat are found in Table 6. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed

below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and 5-year (or longer) trends in habitat degradation.

Table 6. Geospatial data sources for habitat degradation (Measure 2).

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source
Energy (oil & gas)	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300
Energy (coal)	Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resources Data System	Polygon area (digitized)	Esri/Google Imagery
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Energy (wind)	Wind Turbines	Federal Aviation Administration	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	3.0ac (1.2ha)	BLM WO-300
Energy (solar)	Fields/Power Plants	Platts (power plants)	7.3ac (3.0ha)/MW	NREL
Energy (geothermal)	Wells	IHS	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Mining	Locatable Developments	InfoMine	Polygon area (digitized)	Esri Imagery
Infrastructure (roads)	Surface Streets (Minor Roads)	Esri StreetMap Premium	40.7ft (12.4m)	USGS
	Major Roads	Esri StreetMap Premium	84.0ft (25.6m)	USGS
	Interstate Highways	Esri StreetMap Premium	240.2ft (73.2m)	USGS
Infrastructure (railroads)	Active Lines	Federal Railroad Administration	30.8ft (9.4m)	USGS
Infrastructure (power lines)	1-199kV Lines	Platts (transmission lines)	100ft (30.5m)	BLM WO-300
	200-399 kV Lines	Platts (transmission lines)	150ft (45.7m)	BLM WO-300
	400-699kV Lines	Platts (transmission lines)	200ft (61.0m)	BLM WO-300
	700+kV Lines	Platts (transmission lines)	250ft (76.2m)	BLM WO-300
Infrastructure (communication)	Towers	Federal Communications Commission	2.5ac (1.0ha)	BLM WO-300

a. Energy and Mining Density Datasets and Assumptions

Energy (oil and gas wells and development facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (coal mines)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (wind energy facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (solar energy facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (geothermal energy facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Mining (active developments; locatable, leasable, saleable)

(See Section I.B.2., Habitat Degradation Monitoring.)

b. Energy and Mining Density Threat Combination and Calculation

Datasets for energy and mining will be collected in two primary forms: point locations (e.g., wells) and polygon areas (e.g., surface coal mining). The following rule set will be used to calculate density for meaningful geographic areas of interest including standard grids and per polygon:

- 1) Point locations will be preserved; no additional points will be removed beyond the methodology described above. Energy facilities in close proximity (an oil well close to a wind tower) will be retained.
- 2) Polygons will not be merged, or features further dissolved. Thus, overlapping facilities will be retained, such that each individual threat will be a separate polygon data input for the density calculation.
- 3) The analysis unit (polygon or 640-acre section in a grid) will be the basis for counting the number of mining or energy facilities per unit area. Within the analysis unit, all point features will be summed, and any individual polygons will be counted as one (e.g., a coal mine will be counted as one facility within population). Where polygon features overlap multiple units (polygons or pixels), the facility will be counted as one in each unit where the polygon occurs (e.g., a polygon crossing multiple 640-acre

sections would be counted as one in each 640-acre section for a density per 640-acre-section calculation).

- 4) In methodologies with different-sized units (e.g., MZs, populations, etc.) raw facility counts will be converted to densities by dividing the raw facility counts by the total area of the unit. Typically this will be measured as facilities per 640 acres.
- 5) For uniform grids, raw facility counts will be reported. Typically this number will also be converted to facilities per 640 acres.
- 6) Reporting may include summaries beyond the simple ones above. Zonal statistics may be used to smooth smaller grids to help display and convey information about areas within meaningful geographic areas of interest that have high levels of energy and/or mining activity.
- 7) Additional statistics for each defined unit may also include adjusting the area to include only the area with the historical potential for sagebrush (BpS) or areas currently sagebrush (EVT).

Individual datasets and threat combination datasets for habitat degradation will be available through the BLM's EGIS web portal and geospatial gateway. Legacy datasets will be preserved so that trends may be calculated.

C. Population (Demographics) Monitoring

State wildlife management agencies are responsible for monitoring sage-grouse populations within their respective states. WAFWA will coordinate this collection of annual population data by state agencies. These data will be made available to the BLM according to the terms of the forthcoming Greater Sage-Grouse Population Monitoring Memorandum of Understanding (MOU) (2014) between WAFWA and the BLM. The MOU outlines a process, timeline, and responsibilities for regular data sharing of sage-grouse population and/or habitat information for the purposes of implementing sage-grouse LUPs/amendments and subsequent effectiveness monitoring. Population areas were refined from the "Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report" (COT 2013) by individual state wildlife agencies to create a consistent naming nomenclature for future data analyses. These population data will be used for analysis at the applicable scale to supplement habitat effectiveness monitoring of management actions and to inform the adaptive management responses.

D. Effectiveness Monitoring

Effectiveness monitoring will provide the data needed to evaluate BLM and USFS actions toward reaching the objective of the national planning strategy (BLM IM 2012-044)—to conserve sage-grouse populations and their habitat—and the objectives for the land use planning

area. Effectiveness monitoring methods described here will encompass multiple larger scales, from areas as large as the WAFWA MZ to the scale of this LUP. Effectiveness data used for these larger-scale evaluations will include all lands in the area of interest, regardless of surface ownership/management, and will help inform where finer-scale evaluations are needed, such as population areas smaller than an LUP or PACs within an LUP (described in Section II, Fine and Site Scales). Data will also include the trend of disturbance within these areas of interest to inform the need to initiate adaptive management responses as described in the land use plan.

Effectiveness monitoring reported for these larger areas provides the context to conduct effectiveness monitoring at finer scales. This approach also helps focus scarce resources to areas experiencing habitat loss, degradation, or population declines, without excluding the possibility of concurrent, finer-scale evaluations as needed where habitat or population anomalies have been identified through some other means.

To determine the effectiveness of the sage-grouse national planning strategy, the BLM and the USFS will evaluate the answers to the following questions and prepare a broad- and mid-scale effectiveness report:

- 1) Sagebrush Availability and Condition:
 - a. What is the amount of sagebrush availability and the change in the amount and condition of sagebrush?
 - b. What is the existing amount of sagebrush on the landscape and the change in the amount relative to the pre-EuroAmerican historical distribution of sagebrush (BpS)?
 - c. What is the trend and condition of the indicators describing sagebrush characteristics important to sage-grouse?
- 2) Habitat Degradation and Intensity of Activities:
 - a. What is the amount of habitat degradation and the change in that amount?
 - b. What is the intensity of activities and the change in the intensity?
 - c. What is the amount of reclaimed energy-related degradation and the change in the amount?
- 3) What is the population estimation of sage-grouse and the change in the population estimation?
- 4) How are the BLM and the USFS contributing to changes in the amount of sagebrush?
- 5) How are the BLM and the USFS contributing to disturbance?

The compilation of broad- and mid-scale data (and population trends as available) into an effectiveness monitoring report will occur on a 5-year reporting schedule (see Attachment A), which may be accelerated to respond to critical emerging issues (in consultation with the USFWS and state wildlife agencies). In addition, effectiveness monitoring results will be used to identify emerging issues and research needs and inform the BLM and the USFS adaptive

management strategy (see the adaptive management section of this Environmental Impact Statement).

To determine the effectiveness of the sage-grouse objectives of the land use plan, the BLM and the USFS will evaluate the answers to the following questions and prepare a plan effectiveness report:

- 1) Is this plan meeting the sage-grouse habitat objectives?
- 2) Are sage-grouse areas within the LUP meeting, or making progress toward meeting, land health standards, including the Special Status Species/wildlife habitat standard?
- 3) Is the plan meeting the disturbance objective(s) within sage-grouse areas?
- 4) Are the sage-grouse populations within this plan boundary and within the sage-grouse areas increasing, stable, or declining?

The effectiveness monitoring report for this LUP will occur on a 5-year reporting schedule (see Attachment A) or more often if habitat or population anomalies indicate the need for an evaluation to facilitate adaptive management or respond to critical emerging issues. Data will be made available through the BLM's EGIS web portal and the geospatial gateway.

Methods

At the broad and mid scales (PACs and above) the BLM and the USFS will summarize the vegetation, disturbance, and (when available) population data. Although the analysis will try to summarize results for PACs within each sage-grouse population, some populations may be too small to report the metrics appropriately and may need to be combined to provide an estimate with an acceptable level of accuracy. Otherwise, they will be flagged for more intensive monitoring by the appropriate landowner or agency. The BLM and the USFS will then analyze monitoring data to detect the trend in the amount of sagebrush; the condition of the vegetation in the sage-grouse areas (MacKinnon et al. 2011); the trend in the amount of disturbance; the change in disturbed areas owing to successful restoration; and the amount of new disturbance the BLM and/or the USFS has permitted. These data could be supplemented with population data (when available) to inform an understanding of the correlation between habitat and PACs within a population. This overall effectiveness evaluation must consider the lag effect response of populations to habitat changes (Garton et al. 2011).

Calculating Question 1, National Planning Strategy Effectiveness: The amount of sagebrush available in the large area of interest will use the information from Measure 1a (I.B.1., Sagebrush Availability) and calculate the change from the 2012 baseline to the end date of the reporting period. To calculate the change in the amount of sagebrush on the landscape to compare with the historical areas with potential to support sagebrush, the information from Measure 1b (I.B.1., Sagebrush Availability) will be used. To calculate the trend in the condition of sagebrush at the mid scale, three sources of data will be used: the BLM's Grass/Shrub mapping effort (Future Plans in Section I.B.1., Sagebrush Availability); the results from the calculation of the landscape

indicators, such as patch size (described below); and the BLM's Landscape Monitoring Framework (LMF) and sage-grouse intensification effort (also described below). The LMF and sage-grouse intensification effort data are collected in a statistical sampling framework that allows calculation of indicator values at multiple scales.

Beyond the importance of sagebrush availability to sage-grouse, the mix of sagebrush patches on the landscape at the broad and mid scale provides the life requisite of space for sage-grouse dispersal needs (see the HAF). The configuration of sagebrush habitat patches and the land cover or land use between the habitat patches at the broad and mid scales also defines suitability. There are three significant habitat indicators that influence habitat use, dispersal, and movement across populations: the size and number of habitat patches, the connectivity of habitat patches (linkage areas), and habitat fragmentation (scope of unsuitable and non-habitats between habitat patches). The most appropriate commercial software to measure patch dynamics, connectivity, and fragmentation at the broad and mid scales will be used, along with the same data layers derived for sagebrush availability.

The BLM initiated the LMF in 2011 in cooperation with the Natural Resources Conservation Service (NRCS). The objective of the LMF effort is to provide unbiased estimates of vegetation and soil condition and trend using a statistically balanced sample design across BLM lands. Recognizing that sage-grouse populations are more resilient where the sagebrush plant community has certain characteristics unique to a particular life stage of sage-grouse (Knick and Connelly 2011, Stiver et al. *in press*), a group of sage-grouse habitat and sagebrush plant community subject matter experts identified those vegetation indicators collected at LMF sampling points that inform sage-grouse habitat needs. The experts represented the Agricultural Research Service, BLM, NRCS, USFWS, WAFWA, state wildlife agencies, and academia. The common indicators identified include: species composition, foliar cover, height of the tallest sagebrush and herbaceous plant, intercanopy gap, percent of invasive species, sagebrush shape, and bare ground. To increase the precision of estimates of sagebrush conditions within the range of sage-grouse, additional plot locations in occupied sage-grouse habitat (Sage-Grouse Intensification) were added in 2013. The common indicators are also collected on sampling locations in the NRCS National Resources Inventory Rangeland Resource Assessment (<http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/nra/nri/?&cid=stelprdb1041620>).

The sage-grouse intensification baseline data will be collected over a 5-year period, and an annual sage-grouse intensification report will be prepared describing the status of the indicators. Beginning in year 6, the annual status report will be accompanied with a trend report, which will be available on an annual basis thereafter, contingent on continuation of the current monitoring budget. This information, in combination with the Grass/Shrub mapping information, the mid-scale habitat suitability indicator measures, and the sagebrush availability information will be used to answer Question 1 of the National Planning Strategy Effectiveness Report.

Calculating Question 2, National Planning Strategy Effectiveness: Evaluations of the amount of habitat degradation and the intensity of the activities in the area of interest will use the information from Measure 2 (Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (Section I.B.3., Energy and Mining Density). The field office will collect data on the amount of reclaimed energy-related degradation on plugged and abandoned and oil/gas well sites. The data are expected to demonstrate that the reclaimed sites have yet to meet the habitat restoration objectives for sage-grouse habitat. This information, in combination with the amount of habitat degradation, will be used to answer Question 2 of the National Planning Strategy Effectiveness Report.

Calculating Question 3, National Planning Strategy Effectiveness: The change in sage-grouse estimated populations will be calculated from data provided by the state wildlife agencies, when available. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 3 of the National Planning Strategy Effectiveness Report.

Calculating Question 4, National Planning Strategy Effectiveness: The estimated contribution by the BLM or the USFS to the change in the amount of sagebrush in the area of interest will use the information from Measure 1a (Section I.B.1., Sagebrush Availability). This measure is derived from the national datasets that remove sagebrush (Table 3). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for this measure in the geographic areas of interest. This information will be used to answer Question 4 of the National Planning Strategy Effectiveness Report.

Calculating Question 5, National Planning Strategy Effectiveness: The estimated contribution by the BLM or the USFS to the change in the amount of disturbance in the area of interest will use the information from Measure 2a (Section I.B.2., Monitoring Habitat Degradation) and Measure 3 (Section I.B.3., Energy and Mining Density). These measures are all derived from the national disturbance datasets that degrade habitat (Table 6). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for these two measures in the geographic areas of interest. This information will be used to answer Question 5 of the National Planning Strategy Effectiveness Report.

Answers to the five questions for determining the effectiveness of the national planning strategy will identify areas that appear to be meeting the objectives of the strategy and will facilitate identification of population areas for more detailed analysis. Conceptually, if the broad-scale monitoring identifies increasing sagebrush availability and improving vegetation conditions, decreasing disturbance, and a stable or increasing population for the area of interest, there is evidence that the objectives of the national planning strategy to maintain populations and their habitats have been met. Conversely, where information indicates that sagebrush is decreasing and vegetation conditions are degrading, disturbance in sage-grouse areas is increasing, and/or

populations are declining relative to the baseline, there is evidence that the objectives of the national planning strategy are not being achieved. Such a determination would likely result in a more detailed analysis and could be the basis for implementing more restrictive adaptive management measures.

With respect to the land use plan area, the BLM and the USFS will summarize the vegetation, disturbance, and population data to determine if the LUP is meeting the plan objectives. Effectiveness information used for these evaluations includes BLM/USFS surface management areas and will help inform where finer-scale evaluations are needed, such as seasonal habitats, corridors, or linkage areas. Data will also include the trend of disturbance within the sage-grouse areas, which will inform the need to initiate adaptive management responses as described in the land use plan.

Calculating Question 1, Land Use Plan Effectiveness: The condition of vegetation and the allotments meeting land health standards (as articulated in “BLM Handbook 4180-1, Rangeland Health Standards”) in sage-grouse areas will be used to determine the LUP’s effectiveness in meeting the vegetation objectives for sage-grouse habitat set forth in the plan. The field office/ranger district will be responsible for collecting this data. In order for this data to be consistent and comparable, common indicators, consistent methods, and an unbiased sampling framework will be implemented following the principles in the BLM’s AIM strategy (Taylor et al. 2014; Toevs et al. 2011; MacKinnon et al. 2011), in the BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005), and in the HAF (Stiver et al. *in press*) or other approved WAFWA MZ-consistent guidance to measure and monitor sage-grouse habitats. This information will be used to answer Question 1 of the Land Use Plan Effectiveness Report.

Calculating Question 2, Land Use Plan Effectiveness: Sage-grouse areas within the LUP that are achieving land health stands (or, if trend data are available, that are making progress toward achieving them)—particularly the Special Status Species/wildlife habitat land health standard—will be used to determine the LUP’s effectiveness in achieving the habitat objectives set forth in the plan. Field offices will follow directions in “BLM Handbook 4180-1, Rangeland Health Standards,” to ascertain if sage-grouse areas are achieving or making progress toward achieving land health standards. One of the recommended criteria for evaluating this land health standard is the HAF indicators.

Calculating Question 3, Land Use Plan Effectiveness: The amount of habitat disturbance in sage-grouse areas identified in this LUP will be used to determine the LUP’s effectiveness in meeting the plan’s disturbance objectives. National datasets can be used to calculate the amount of disturbance, but field office data will likely increase the accuracy of this estimate. This information will be used to answer Question 3 of the Land Use Plan Effectiveness Report.

Calculating Question 4, Land Use Plan Effectiveness: The change in estimated sage-grouse populations will be calculated from data provided by the state wildlife agencies, when available, and will be used to determine LUP effectiveness. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 4 of the Land Use Plan Effectiveness Report.

Results of the effectiveness monitoring process for the LUP will be used to inform the need for finer-scale investigations, initiate adaptive management actions as described in the land use plan, initiate causation determination, and/or determine if changes to management decisions are warranted. The measures used at the broad and mid scales will provide a suite of characteristics for evaluating the effectiveness of the adaptive management strategy.

II. FINE AND SITE SCALES

Fine-scale (third-order) habitat selected by sage-grouse is described as the physical and geographic area within home ranges during breeding, summer, and winter periods. At this level, habitat suitability monitoring should address factors that affect sage-grouse use of, and movements between, seasonal use areas. The habitat monitoring at the fine and site scale (fourth order) should focus on indicators to describe seasonal home ranges for sage-grouse associated with a lek or lek group within a population or subpopulation area. Fine- and site-scale monitoring will inform LUP effectiveness monitoring (see Section I.D., Effectiveness Monitoring) and the hard and soft triggers identified in the LUP's adaptive management section.

Site-scale habitat selected by sage-grouse is described as the more detailed vegetation characteristics of seasonal habitats. Habitat suitability characteristics include canopy cover and height of sagebrush and the associated understory vegetation. They also include vegetation associated with riparian areas, wet meadows, and other mesic habitats adjacent to sagebrush that may support sage-grouse habitat needs during different stages in their annual cycle.

As described in the Conclusion (Section III), details and application of monitoring at the fine and site scales will be described in the implementation-level monitoring plan for the land use plan. The need for fine- and site-scale-specific habitat monitoring will vary by area, depending on proposed projects, existing conditions, habitat variability, threats, and land health. Examples of fine- and site-scale monitoring include: habitat vegetation monitoring to assess current habitat conditions; monitoring and evaluation of the success of projects targeting sage-grouse habitat enhancement and/or restoration; and habitat disturbance monitoring to provide localized disturbance measures to inform proposed project review and potential mitigation for project impacts. Monitoring plans should incorporate the principles outlined in the BLM's AIM strategy (Toevs et al. 2011) and in "AIM-Monitoring: A Component of the Assessment, Inventory, and Monitoring Strategy" (Taylor et al. 2014). Approved monitoring methods are:

- “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011);
- The BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005); and,
- “Sage-Grouse Habitat Assessment Framework: Multiscale Assessment Tool” (Stiver et al. *in press*).

Other state-specific disturbance tracking models include: the BLM’s Wyoming Density and Disturbance Calculation Tool (<http://ddct.wygisc.org/>) and the BLM’s White River Data Management System in development with the USGS. Population monitoring data (in cooperation with state wildlife agencies) should be included during evaluation of the effectiveness of actions taken at the fine and site scales.

Fine- and site-scale sage-grouse habitat suitability indicators for seasonal habitats are identified in the HAF. The HAF has incorporated the Connelly et al. (2000) sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA MZ adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat (see Section I.D., Effectiveness Monitoring).

III. CONCLUSION

This Greater Sage-Grouse Monitoring Framework was developed for all of the Final Environmental Impact Statements involved in the sage-grouse planning effort. As such, it describes the monitoring activities at the broad and mid scales and provides a guide for the BLM and the USFS to collaborate with partners/other agencies to develop the land use plan- specific monitoring plan.

IV. THE GREATER SAGE-GROUSE DISTURBANCE AND MONITORING SUBTEAM MEMBERSHIP

Gordon Toevs (BLM -WO)	Robin Sell (BLM-CO)
Duane Dippon (BLM-WO)	Paul Makela (BLM-ID)
Frank Quamen (BLM-NOC)	Renee Chi (BLM-UT)
David Wood (BLM-NOC)	Sandra Brewer (BLM-NV)
Vicki Herren (BLM-NOC)	Glenn Frederick (BLM-OR)
Matt Bobo (BLM-NOC)	Robert Skorkowsky (USFS)
Michael “Sherm” Karl (BLM-NOC)	Dalinda Damm (USFS)
Emily Kachergis (BLM-NOC)	Rob Mickelsen (USFS)
Doug Havlina (BLM-NIFC)	Tim Love (USFS)
Mike Pellant (BLM-GBRI)	Pam Bode (USFS)
John Carlson (BLM-MT)	Lief Wiechman (USFWS)
Jenny Morton (BLM -WY)	Lara Juliusson (USFWS)

Attachment A. An Overview of Monitoring Commitments

	Broad and Mid Scales					Fine and Site Scales
	Implementation	Sagebrush Availability	Habitat Degradation	Population	Effectiveness	
How will the data be used?	Track and document implementation of land use plan decisions and inform adaptive management	Track changes in land cover (sagebrush) and inform adaptive management	Track changes in disturbance (threats) to sage-grouse habitat and inform adaptive management	Track trends in sage-grouse populations (and/or leks; as determined by state wildlife agencies) and inform adaptive management	Characterize the relationship among disturbance, implementation actions, and sagebrush metrics and inform adaptive management	Measure seasonal habitat, connectivity at the fine scale, and habitat conditions at the site scale, calculate disturbance, and inform adaptive management
Who is collecting the data?	BLM FO and USFS Forest	NOC and NIFC	National datasets (NOC), BLM FOs, and USFS Forests as applicable	State wildlife agencies through WAFWA	Comes from other broad- and mid-scale monitoring types, analyzed by the NOC	BLM FO and SO, USFS Forests and RO (with partners)
How often are the data collected, reported, and made available to USFWS?	Collected and reported annually; summary report every 5 years	Updated and changes reported annually; summary report every 5 years	Collected and changes reported annually; summary report every 5 years	State data reported annually per WAFWA MOU; summary report every 5 years	Collected and reported every 5 years (coincident with LUP evaluations)	Collection and trend analysis ongoing, reported every 5 years or as needed to inform adaptive management
What is the spatial scale?	Summarized by LUP with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by MZ and LUP with flexibility for reporting by other units (e.g., PAC)	Variable (e.g., projects and seasonal habitats)
What are the potential personnel and budget impacts?	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	At a minimum, current skills and capacity must be maintained; data management costs are TBD	At a minimum, current skills and capacity must be maintained; data layer purchase cost are TBD	No additional personnel or budget impacts for the BLM or the USFS	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment

Who has primary and secondary responsibilities for reporting?	1) BLM FO & SO; USFS Forest & RO 2) BLM & USFS Planning	1) NOC 2) WO	1) NOC 2) BLM SO, USFS RO, & appropriate programs	1) WAFWA & state wildlife agencies 2) BLM SO, USFS RO, NOC	1) Broad and mid scale at the NOC, LUP at BLM SO, USFS RO	1) BLM FO & USFS Forests 2) BLM SO & USFS RO
What new processes/tools are needed?	National implementation datasets and analysis tools	Updates to national land cover data	Data standards and rollup methods for these data	Standards in population monitoring (WAFWA)	Reporting methodologies	Data standards data storage; and reporting

FO (field office); NIFC (National Interagency Fire Center); NOC (National Operations Center); RO (regional office); SO (state office); TBD (to be determined); WO (Washington Office)

Attachment B. User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones

LANDFIRE Map Zone Name	User Accuracy	Producer Accuracy	% of Map Zone within Historical Schroeder
Wyoming Basin	76.9%	90.9%	98.5%
Snake River Plain	68.8%	85.2%	98.4%
Missouri River Plateau	57.7%	100.0%	91.3%
Grand Coulee Basin of the Columbia Plateau	80.0%	80.0%	89.3%
Wyoming Highlands	75.3%	85.9%	88.1%
Western Great Basin	69.3%	75.4%	72.9%
Blue Mountain Region of the Columbia Plateau	85.7%	88.7%	72.7%
Eastern Great Basin	62.7%	80.0%	62.8%
Northwestern Great Plains	76.5%	92.9%	46.3%
Northern Rocky Mountains	72.5%	89.2%	42.5%
Utah High Plateaus	81.8%	78.3%	41.5%
Colorado Plateau	65.3%	76.2%	28.8%
Middle Rocky Mountains	78.6%	73.3%	26.4%
Cascade Mountain Range	57.1%	88.9%	17.3%
Sierra Nevada Mountain Range	0.0%	0.0%	12.3%
Northwestern Rocky Mountains	66.7%	60.0%	7.3%
Southern Rocky Mountains	58.6%	56.7%	7.0%
Northern Cascades	75.0%	75.0%	2.6%
Mogollon Rim	66.7%	100.0%	1.7%
Death Valley Basin	0.0%	0.0%	1.2%

There are two anomalous map zones with 0% user and producer accuracies, attributable to no available reference data for the ecological systems of interest.

User accuracy is a map-based accuracy that is computed by looking at the reference data for a class and determining the percentage of correct predictions for these samples. For example, if I select any sagebrush pixel on the classified map, what is the probability that I'll be standing in a sagebrush stand when I visit that pixel location in the field? **Commission Error** equates to including a pixel in a class when it should have been excluded (i.e., commission error = $1 - \text{user's accuracy}$).

Producer accuracy is a reference-based accuracy that is computed by looking at the predictions produced for a class and determining the percentage of correct predictions. In other words, if I know that a particular area is sagebrush (I've been out on the ground to check), what is the probability that the digital map will correctly identify that pixel as sagebrush? **Omission Error** equates to excluding a pixel that should have been included in the class (i.e., omission error = $1 - \text{producer's accuracy}$).

Attachment C. Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers

- *Artemisia arbuscula* subspecies *longicaulis*
- *Artemisia arbuscula* subspecies *longiloba*
- *Artemisia bigelovii*
- *Artemisia nova*
- *Artemisia papposa*
- *Artemisia pygmaea*
- *Artemisia rigida*
- *Artemisia spinescens*
- *Artemisia tripartita* subspecies *rupicola*
- *Artemisia tripartita* subspecies *tripartita*
- *Tanacetum nuttallii*
- *Artemisia cana* subspecies *bolanderi*
- *Artemisia cana* subspecies *cana*
- *Artemisia cana* subspecies *viscidula*
- *Artemisia tridentata* subspecies *wyomingensis*
- *Artemisia tridentata* subspecies *tridentata*
- *Artemisia tridentata* subspecies *vaseyana*
- *Artemisia tridentata* subspecies *spiciformis*
- *Artemisia tridentata* subspecies *xericensis*
- *Artemisia tridentata* variety *pauciflora*
- *Artemisia frigida*
- *Artemisia pedatifida*

1 **Appendix F – Idaho Key Habitat Map Update Process**
2

3 As directed in IM ID-2013-010, Idaho BLM annually updates the Key Habitat map. The purpose
4 of this Instruction Memorandum (IM) is to request updates to the Idaho Sage-grouse Habitat
5 Planning Map. The update is needed to reflect habitat changes resulting from wildfire,
6 succession, and vegetation treatments that occurred or were observed since the last update. This
7 update is also intended to capture additional edits recommended by the field offices, sage-grouse
8 Local Working Groups (LWG), or agency partners in sage-grouse conservation.
9

10 **Factors to Consider During Edits:** The following factors are applicable to land of any
11 ownership status for which the Bureau of Land Management (BLM) data are available, or for
12 which data or other information are provided by non-BLM partners. If such new data are
13 unavailable, or not provided by partners, retain the existing spatial data in the dataset:
14

- 15 1. Wildfires that have occurred in the most recent calendar year fire season on land
16 administered by the BLM and on land not administered by the BLM.
17
- 18 2. Vegetation management projects that have been completed within key habitat or
19 potential restoration areas of sage-grouse planning areas. This includes activities
20 such as burned area rehabilitation seeding projects, sagebrush thinning/reduction,
21 conifer thinning/reduction, restoration of annual grasslands, new fuel breaks, etc.
22 However, only consider those treatment areas completed and where a change in
23 habitat classification has occurred (e.g., from annual grassland to perennial
24 grassland; perennial grassland to key habitat, etc.). Areas planned for treatment
25 or in the process of treatment (e.g., cheatgrass chemical treatment is completed,
26 but seeding is pending) should not be included until an observed change in habitat
27 category is achieved.
28
- 29 3. Changes in habitat status resulting from vegetation succession, such as perennial
30 grasslands that have transitioned to key habitat due to increased sagebrush cover.
31
- 32 4. Habitat mapping errors or omissions that have been identified in the existing
33 Idaho Sage-grouse Habitat Planning Map and other edits recommended by sage-
34 grouse conservation partners, as appropriate. For this item, it is crucial that BLM
35 field office biologists or an alternate staff specialist coordinate closely with their
36 agency partners, especially the UFSFS and the Idaho Department of Fish and
37 Game (IDFG), to actively solicit and resolve additional suggested edits that we
38 may not be aware of. Those edits must also be incorporated into the respective
39 BLM office’s update submission. This is vital to ensure that the update is
40 completed efficiently and as collaboratively as possible.
41
- 42 5. Since the Idaho Sage-grouse Habitat Planning Map is intended for use by all
43 conservation partners in Idaho, it is important that we maintain a seamless
44 coverage across land ownerships. In that regard, when editing, do not clip out
45 BLM (or non-BLM land) on the basis of land ownership. Rather, make edits
46 based on vegetation boundaries only, using the best available information and

- 47 professional judgment. If you have uncertainties about accuracies for certain
48 areas, document that in the metadata as appropriate.
49
- 50 6. Based on discussions during map updates in recent years, we will again use a 10.0
51 acre minimum polygon size for wildfires since data are readily available to that
52 scale. For vegetation treatments, we will also use a minimum area of 10 acres.
53 For sagebrush or other vegetation patches (e.g., key habitat, perennial grassland,
54 annual grassland, conifer encroachment), delineate habitat to the extent you have
55 data, recognizing that some offices may have more recent, finer resolution data
56 than others.
57
- 58 7. Areas that have recently burned, for which the field has little or no information as
59 to habitat status, should be classified as “recent burn.” Efforts to document the
60 general habitat status in these areas should be made the following field season if
61 possible, in preparation for the next map update. The field may also attribute
62 2013 fires as perennial grassland or annual grassland, as appropriate.
63
- 64 8. Sage-grouse habitat polygon descriptions relevant to this IM include key habitat,
65 perennial grassland, annual grassland, and conifer encroachment potential
66 restoration areas.
67
- 68 o Key habitat includes areas of generally intact sagebrush that provide sage-
69 grouse habitat during some portion of the year.
 - 70 o Perennial grassland can be reclassified as key habitat once average
71 sagebrush canopy cover is at least 10 percent.
 - 72 o Annual grassland areas may be reclassified as perennial grassland once a
73 restoration, fuels treatment or related project, such as an Emergency
74 Stabilization and Rehabilitation (ES&R) seeding, is considered successful
75 (i.e., seeded perennial species have successfully established).
 - 76 o Conifer encroachment areas may be reclassified as key habitat following
77 treatment of conifers if sagebrush cover is at least 10 percent and there is a
78 perennial understory. They can also be reclassified as perennial
79 grasslands if native perennial herbaceous species are dominant or if an
80 associated restoration seeding is successful.
81
- 82 9. Field offices must ensure that original project-level data utilized in this update,
83 including Global Positioning System data files, spatial, tabular and metadata
84 associated with specific vegetation treatments, restoration projects, ES&R
85 projects, etc., are archived at the field level and readily accessible in the event of
86 future data calls.
87

Appendix G

Part I – Baseline Map and Description of Development

Part II - Adaptive Management - Soft Trigger Considerations and Implementation Actions

The Sage-Grouse Implementation Task Force would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force - aided by the technical expertise of IDF&G - will assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider possible changes in management to the CMA. As to the IMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met

- ✓ Increase monitoring and evaluation of sage-grouse populations in Core Management Area (area of concern).
- ✓ Implement Core Management Area management strategy in corresponding Important Management Area of the same Conservation Area.
- ✓ Implement Core Management Area RDFs in corresponding Important Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Core Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Core Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Core Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Core Management Area criteria for all primary threats, and/or all secondary threats to the Important Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Management Area (e.g. direct resources from other parts of the state to the area of concern).

Part III – Livestock Grazing Management Response

If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:

- 48
- 49 1. Employ grazing management systems that ensure adequate nesting and early brood rearing
- 50 habitat within the breeding landscape.
- 51 2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock
- 52 distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding,
- 53 salting, and water-source management (e.g., turning troughs/pipelines on/off, extending
- 54 pipelines/moving troughs) in grazing programs.
- 55 3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to
- 56 avoid breeding season of use of occupied sage-grouse habitat.
- 57 4. Modify authorized seasons of use within grazing permits to provide greater flexibility in
- 58 managing livestock for the benefit of sage-grouse.
- 59 5. Where appropriate, maintain residual herbaceous vegetation at the end of the
- 60 growing/grazing season to contribute to nesting and brood-rearing habitat during the
- 61 coming nesting season. Table 5.
- 62 6. Insure that permittees are informed of management and movement requirements related to
- 63 avoidance of recent burns, rehabilitation seedings or other restoration sites.
- 64 7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes
- 65 vegetative structure and composition appropriate to the site. In some cases enclosure fencing
- 66 may be a viable option. However, recognize the availability and quality of desired herbaceous
- 67 species may be improved by periodic grazing use of the enclosure.
- 68 8. Implement management actions (grazing decisions, allotment management
- 69 plan/conservation plan development, or other agreements) to modify grazing management
- 70 to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by
- 71 providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use
- 72 over time that best promotes management objectives. During drought periods, prioritize
- 73 evaluating effects of drought in the CMA relative to grouse needs for food and cover.
- 74 Ensure that post-drought management allows for vegetation recovery that meets sage-grouse
- 75 needs in priority sage-grouse habitat areas.
- 76 9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with
- 77 reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-
- 78 grouse breeding habitat, b) where feasible use salts or mineral supplements to improve
- 79 management of livestock for the benefit of sage-grouse habitat.
- 80 10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible,
- 81 place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills,
- 82 etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful
- 83 consideration, based on local conditions, should also be given to the placement of new
- 84 fences or structures near other important seasonal habitats (winter-use areas, movement
- 85 corridors etc.) to reduce potential impacts.
- 86 11. New spring developments in sage-grouse habitat should be designed to maintain or enhance
- 87 the free-flowing characteristics of springs and wet meadows. Analyze developed springs,
- 88 seeps and associated pipelines to determine if modifications are necessary to maintain the
- 89 continuity of the predevelopment riparian area within priority sage-grouse habitat. Make
- 90 modifications where necessary, considering impacts to other water users when such
- 91 considerations are neutral or beneficial to sage-grouse.
- 92 12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with
- 93 ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do
- 94 not use floating boards or similar objects, as these are too unstable and are ineffective. Use
- 95 BMPs to mitigate potential impacts from West Nile virus.

- 13. When placing new water developments in sage-grouse breeding habitat, choose sites and designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
- 14. Avoid new water developments in higher quality native breeding/early brood habitats that have not had significant prior grazing use except in situations in which water developments may aid in better livestock distribution across the allotment and will not adversely impact the species.
- 15. Identify and when feasible, establish strategically located forage reserves focusing on areas unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
- 16. Monitor for, and treat invasive species associated with, existing range improvements.
- 17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds optimal characteristics to promote grass and forb understory growth. These projects should only be undertaken where it can be achieved without negatively impacting the species.

Adaptive Grazing Management Response

BLM will individually analyze those allotments and pastures within the relevant Conservation Area. Given limited agency resources, prioritization will be given to areas that have the potential to provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on allotments within the CMA that have declining sage-grouse populations. Following those permits within the CMA, resources will be further prioritized to allotments within the IMA with breeding habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward will be a lower priority for permit renewal and the adaptive assessment process. The assessment/determination process for sage-grouse pursuant to Standard 8 will consider published characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation, habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models that describe vegetation and other physical attributes for sage-grouse. The related characteristics within the categories shown below will also be included. These characteristics indicate the ability of a given area to provide sage-grouse habitat.

Category 1: The grazing allotment (or any pasture/significant area therein) has the existing vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological potential to provide sage-grouse habitat.

Where an allotment or pasture meets one of these Categories above, the GRSG Habitat Management Objectives will be incorporated into relevant resource management plans as the desired conditions with the understanding that these desired conditions may not be achievable:

- (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- (b) due to causal events unrelated to existing livestock grazing.

Allotments will only be managed for the primary seasonal habitat that it has the potential to support. Typically, summer habitats will be managed to provide the conditions described in Table 3; winter Table 4; and breeding habitats in Table 5. Based on these habitat characteristics, BLM will conduct fine and site scale-habitat assessments to help inform grazing management. Where necessary, a determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will be conducted at a resolution sufficient to document the habitat condition. This determination will include consideration of local spatial and inter-annual variability. A determination of issues

144 attributable to livestock grazing management shall not result from one year of data at a specific
145 location within an allotment. If the process and conditions outlined above demonstrate that
146 livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed
147 permits will include measures to achieve desired habitat conditions. These measures must be tailored
148 to address the specific management issues associated with seasonal habitat limitations identified in
149 the fine-scale assessments.

150

151

DRAFT

1 **Appendix H – Anthropogenic Disturbance**

2
3 **Disturbance Density Calculation**

4
5 **GRSG Local/Site Disturbance Calculation**

- 6
7 • **All sub-regions:** Agreed to use the same types of disturbances for fine/site scale monitoring
8 as were used for broad and mid-scale analysis. Would use local data and/or more current
9 satellite imagery if available. Recognize that site specific data, where available, provide a
10 more accurate measure of land cover, disturbance and conifer encroachment than Landfire.
11 In the long-term, ensure fine/site scale monitoring provides results that can be used across
12 the GRSG range and “rolled up” for reporting purposes. In the short term (<5 years),
13 locally derived vegetation data may not be available or easily rolled up, so use of seamless
14 land cover data such as Sagestitch is recommended.

15
16 Great Basin sub-regions agreed to use the same type of data sets as used for broad and mid-scale to
17 monitor local/site level conditions. Supplement with local data where available and/or more
18 accurate. The following data layers or local surrogate would be used.

- 19
20 1. Energy (oil and gas wells and development facilities) Based on local info, actual footprint;
21 see NOC language for certain exceptions.
22 2. Energy (coal mines) Actual footprint
23 3. Energy (wind towers) Based on local info, actual footprint
24 4. Energy (solar fields) Based on local info, actual footprint
25 5. Energy (geothermal) Based on local info, actual footprint
26 6. Mining (active developments; locatable, leasable, saleable) Based on local info, actual
27 footprint
28 7. Infrastructure (roads) actual footprint; see road attachment for specific guidance
29 8. Infrastructure (railroads) abandoned railroads are NOT a disturbance
30 9. Infrastructure (power lines) Using NOC guidance, apply these widths:
31 <100 kV: use ROW width
32 100-199kV: 100 ft
33 200-399kV:150 ft
34 400-699kV: 200 ft
35 700-799kV: 250 ft
36 10. Infrastructure (communication towers, fire lookouts, met towers) Based on local info, actual
37 footprint
38 11. Other developed rights-of-ways
39
40

41 The National Monitoring Framework lists the data sets by threat. These are:
 42

FWS Listing Decision Threat	Sagebrush Habitat Availability	Habitat Degradation (Human Activities)	Density of Energy and Mining Facilities
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X*		
Invasive Species	X*		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X*	

43
 44 The following data sets would *not* be used to calculate anthropogenic disturbance, but would be
 45 used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the
 46 landscape within biologically significant units. Use best available data, where Landfire or Sagestitch
 47 could be used for biophysical setting (bps), compared to existing vegetation type.

- 48
 49 1. Habitat treatments
 50 2. Wildfire
 51 3. Invasive plants
 52 4. Conifer encroachment
 53 5. Agriculture
 54 6. Urbanization, Ex-urban and rural development
 55

56 **Biologically Significant Unit:**

- 57
 58 - Idaho proposes use of Priority (Core) and Important management areas that generally match
 59 PACs, but also anticipates assessing disturbance at other scales including nesting and winter
 60 habitat, 5 km lek neighborhood, Conservation Areas and/or at the project-scale, depending on
 61 need.
 62
 63
 64 • For all subregions, data from these units would be rolled up to the PAC and WAFWA
 65 Management Zone, to meet FWS needs. In addition, units must be edge matched/aligned
 66 with neighboring states. All sub-regions acknowledge there may be locally important
 67 biologically significant units smaller than PACs which may or may not be rolled up to PAC
 68 level. The Subregions also acknowledge that assessing disturbance at larger scales such as
 69 certain PACs, or via rollup of data, provides a baseline metric for future comparison, but
 70 dilution may likely mask disturbance concerns occurring at more local scales.

71
 72
 73 ***Travel and Transportation Disturbance in Sage-Grouse Habitat***
 74
 75

76 The following would count as disturbance:

- 77 Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
 78 Linear transportation features identified as primitive roads, temporary routes, or
 79 administrative routes that have a functional classification and a maintenance intensity of level
 80 3 or 5

81
 82 Non-Disturbance
 83

84 The following items would not count as disturbance:

- 85 Linear transportation features identified as trails.
 86 Linear transportation features identified as primitive roads, temporary routes, or
 87 administrative routes that have a maintenance intensity of either level 0 or 1.

88 Linear transportation features identified as primitive routes.
89 Linear disturbances.
90
91

DRAFT

92 *Travel and Transportation Management Definitions*

93

94 **Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and
95 are maintained for regular and continuous use.

96

97 **Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles.
98 They do not normally meet any design standards.

99

100 **Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for
101 historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-
102 clearance vehicles.

103

104 **Linear Disturbances** are human-made linear features that are not part of the designated
105 transportation network are identified as “Transportation Linear Disturbances.” These may include
106 engineered (planned) as well as unplanned single and two-track linear features that are not part of
107 the BLM’s transportation system.

108 **Primitive Routes** are any transportation linear feature located within a WSA or lands with
109 wilderness characteristics designated for protection by a land use plan and not meeting the
110 wilderness inventory road definition.

111

112 **Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or
113 acquired for the development, construction or staging of a project or event that has a finite lifespan.
114 Temporary routes are not intended to be part of the permanent or designated transportation
115 network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes
116 should be constructed to minimum standards necessary to accommodate the intended use; the intent
117 is that the project proponent (or their representative) will reclaim the route once the original project
118 purpose or need has been completed. Temporary routes are considered emergency, single use or
119 permitted activity access. Unless they are specifically intended to accommodate public use, they
120 should not be made available for that use. A temporary route will be authorized or acquired for the
121 specific time period and duration specified in the written authorization (permit, ROW, lease,
122 contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and
123 soil erosion from occurring by providing adequate drainage and re-vegetation.

124

125 **Administrative routes** are those that are limited to authorized users (typically motorized access).
126 These are existing routes that lead to developments that have an administrative purpose, where the
127 agency or permitted user must have access for regular maintenance or operation. These authorized
128 developments could include such items as power lines, cabins, weather stations, communication
129 sites, spring

130

131 *Maintenance Intensities*

132

133 **Level 0**

134

135 Maintenance Description:

136 Existing routes that will no longer be maintained and no longer be declared a route. Routes
137 identified as Level 0 are identified for removal from the Transportation System entirely.

138

139 Maintenance Objectives:

- 140 • No planned annual maintenance.
- 141 • Meet identified environmental needs.
- 142 • No preventative maintenance or planned annual maintenance activities.

143
144 **Level 1**

145
146 Maintenance Description:
147 Routes where minimum (low intensity) maintenance is required to protect adjacent lands and
148 resource values. These roads may be impassable for extended periods of time.

- 149
150 Maintenance Objectives:
- 151 • Low (Minimal) maintenance intensity.
 - 152 • Emphasis is given to maintaining drainage and runoff patterns as needed to protect
153 adjacent lands. Grading, brushing, or slide removal is not performed unless route bed
154 drainage is being adversely affected, causing erosion.
 - 155 • Meet identified resource management objectives.
 - 156 • Perform maintenance as necessary to protect adjacent lands and resource values.
 - 157 • No preventative maintenance.
 - 158 • Planned maintenance activities limited to environmental and resource protection.
 - 159 • Route surface and other physical features are not maintained for regular traffic.

160
161 **Level 3**

162
163 Maintenance Description:
164 Routes requiring moderate maintenance due to low volume use (for example, seasonally or
165 year-round for commercial, recreational, or administrative access). Maintenance Intensities
166 may not provide year-round access but are intended to generally provide resources
167 appropriate to keep the route in use for the majority of the year.

- 168
169 Maintenance Objectives:
- 170 • Medium (Moderate) maintenance intensity.
 - 171 • Drainage structures will be maintained as needed. Surface maintenance will be conducted
172 to provide a reasonable level of riding comfort at prudent speeds for the route conditions
173 and intended use. Brushing is conducted as needed to improve sight distance when
174 appropriate for management uses. Landslides adversely affecting drainage receive high
175 priority for removal; otherwise, they will be removed on a scheduled basis.
 - 176 • Meet identified environmental needs.
 - 177 • Generally maintained for year-round traffic.
 - 178 • Perform annual maintenance necessary to protect adjacent lands and resource values.
 - 179 • Perform preventative maintenance as required to generally keep the route in acceptable
180 condition.
 - 181 • Planned maintenance activities should include environmental and resource protection
182 efforts, annual route surface.
 - 183 • Route surface and other physical features are maintained for regular traffic.

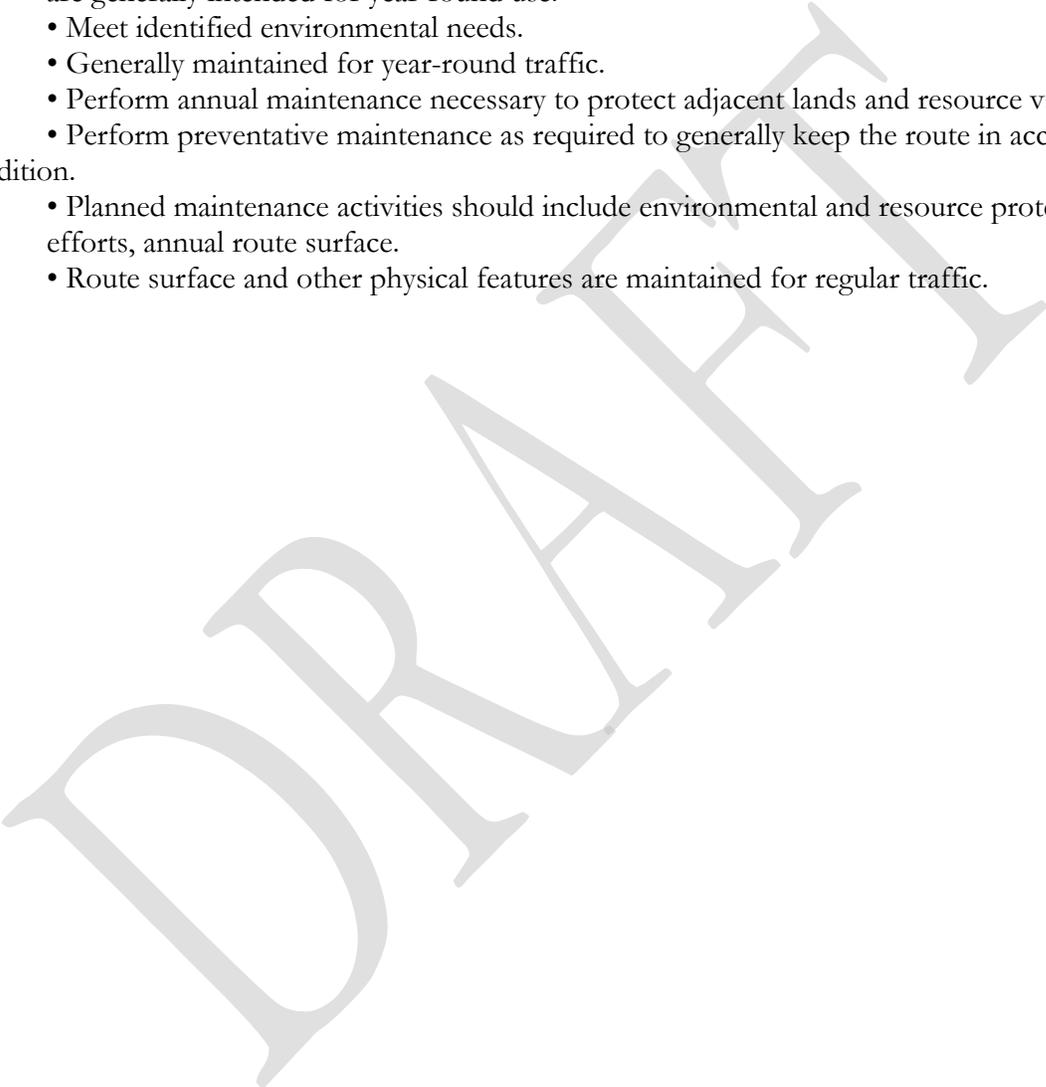

184
185 **Level 5**

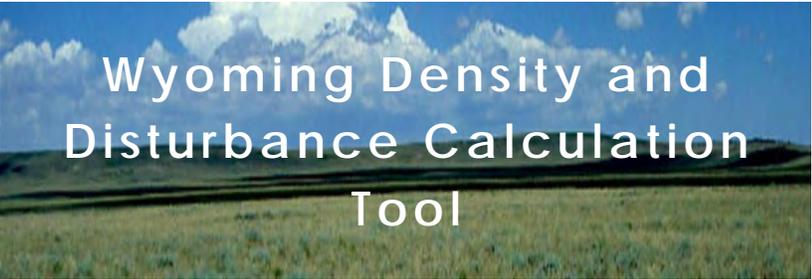

186
187 Maintenance Description:

188 Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or
189 significant use. Also may include route identified through management objectives as
190 requiring high intensities of maintenance or to be maintained open on a year-round basis.
191

192 Maintenance Objectives:

- 193 • High (Maximum) maintenance intensity.
- 194 • The entire route will be maintained at least annually. Problems will be repaired as
195 discovered. These routes may be closed or have limited access due to weather conditions but
196 are generally intended for year-round use.
- 197 • Meet identified environmental needs.
- 198 • Generally maintained for year-round traffic.
- 199 • Perform annual maintenance necessary to protect adjacent lands and resource values.
- 200 • Perform preventative maintenance as required to generally keep the route in acceptable
201 condition.
- 202 • Planned maintenance activities should include environmental and resource protection
203 efforts, annual route surface.
- 204 • Route surface and other physical features are maintained for regular traffic.

Wyoming Density and Disturbance Calculation Tool

Project Development

Create New Project

● Create the Project

- From the **Application Home** Screen
 1. Enter the Project Name
 2. Enter the Project Description
 3. Enter the Proposed Start of Construction
 4. Enter the Proposed End of Construction
 5. Click **Add Project** button

The screenshot shows a web form titled "Create New Project". It contains the following fields and controls:

- Project Name:** A text input field.
- Project Description:** A larger text area for detailed information.
- Proposed Start of Construction:** A date input field with a calendar icon.
- Proposed End of Construction:** A date input field with a calendar icon.
- Project ID:** A text input field containing the value "20120606_1".
- Project Status:** A dropdown menu with "DDCT Development" selected.
- Planner:** A text input field containing the value "Web App Example".
- Buttons:** "Add Project Data" and "Cancel" buttons are located at the bottom of the form.

● The Next Steps

- Move onto the Add/Edit/Upload Stage
 1. Select the **Add/Edit/Upload** radio button
 2. Press the **Go** button

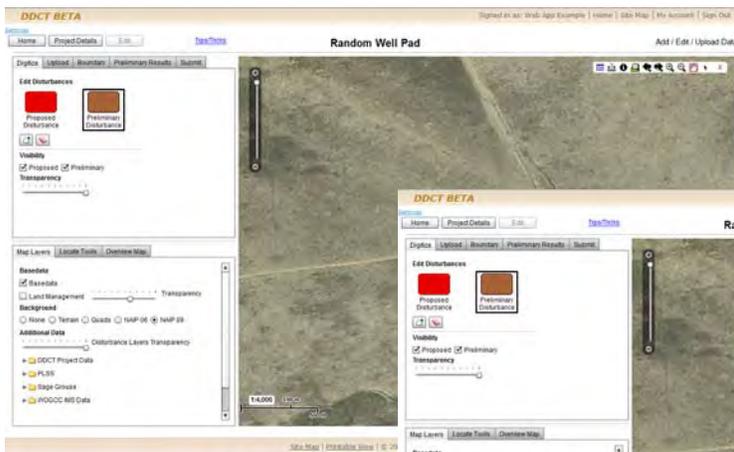

The screenshot shows a "Next Steps" form with the following elements:

- Next Steps:** A section header.
- Radio Buttons:** Two radio buttons are present: "Add/Edit/Upload Data" (which is selected) and "Some Other Time".
- GO..:** A button located below the radio buttons.

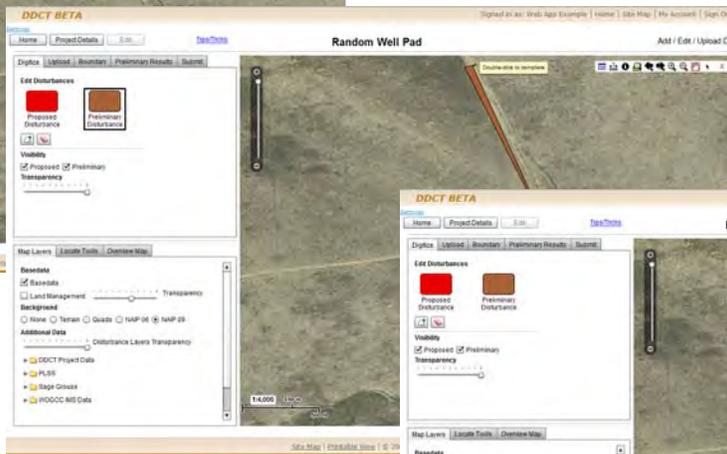

Create and Edit Features Using the Online Tool

Digitizing Features using the Online Tool

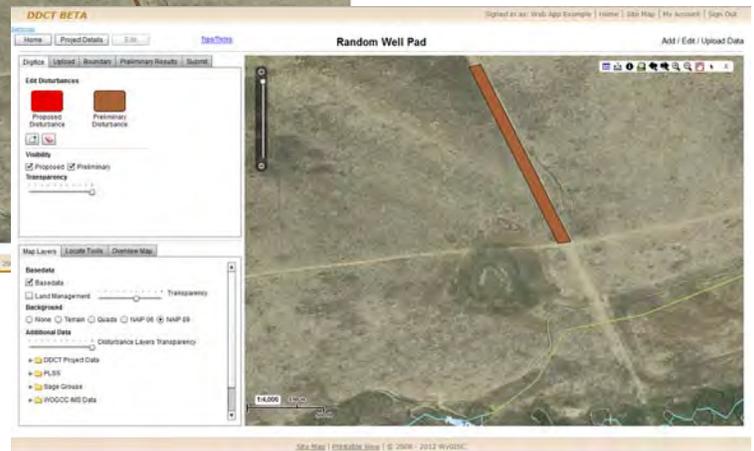

With the **Digitize** tab selected

1. Zoom into area of interest
2. Select either **Proposed Disturbance** or **Preliminary Disturbance**
3. In the map view window, click on one edge of the feature you want to digitized to start the process

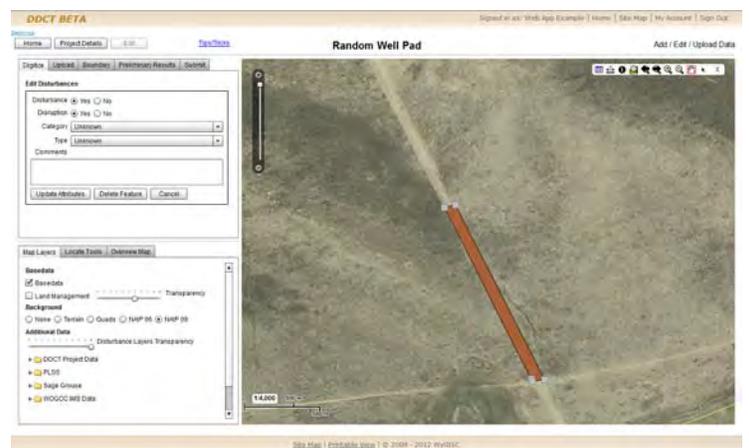

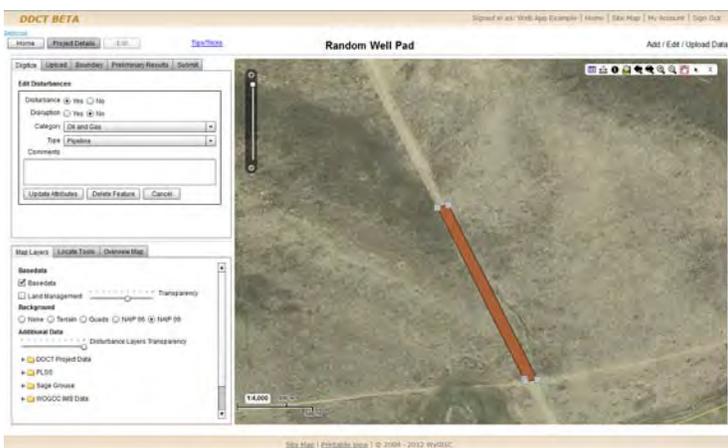

4. Keep clicking along the edge of the feature until the entire outline is created
5. Double click to finish the process

Editing Features using the Online Tool

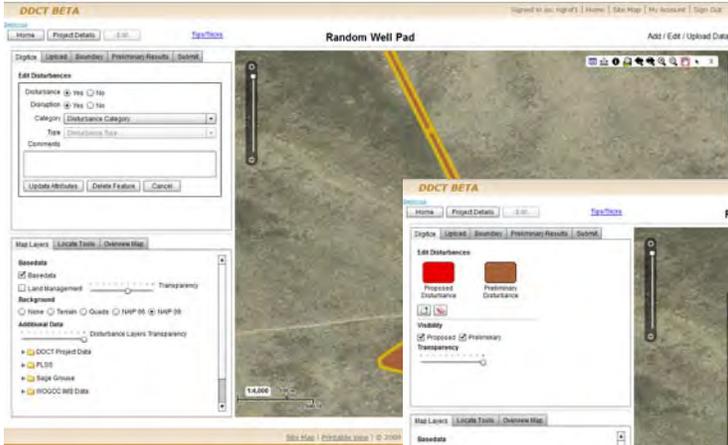

With the **Digitize** tab selected

1. Select either **Proposed Disturbance** or **Preliminary Disturbance**
2. In the map view window, click on the feature you want to edit to open the **Edit Disturbances** sub-tab
3. Select whether the feature is a Disturbance and/or Disruption
4. Select the Category and Type of disturbance
5. Enter any comments in the comments box (optional)
6. Click the **Update Feature** button to finish the process

● **Selecting Multiple Features using the Online Tool**

➤ With the **Digitize** tab selected

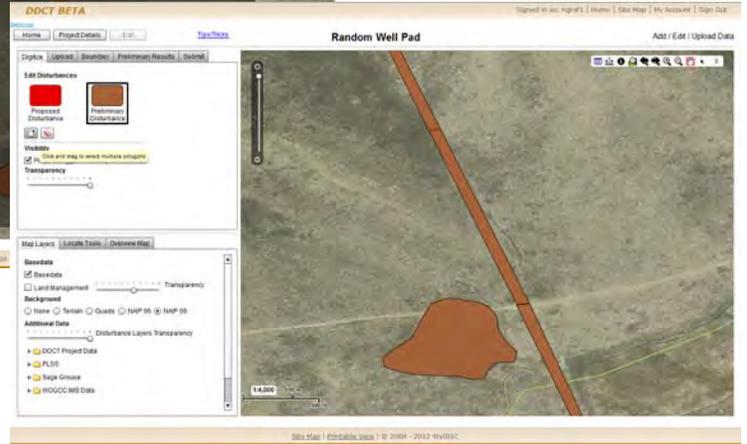

1. Click on the **Select Multiple Feature** tool
2. Use the mouse to draw a box around the features desired for selection

3. The selected features will have a yellow inner glow

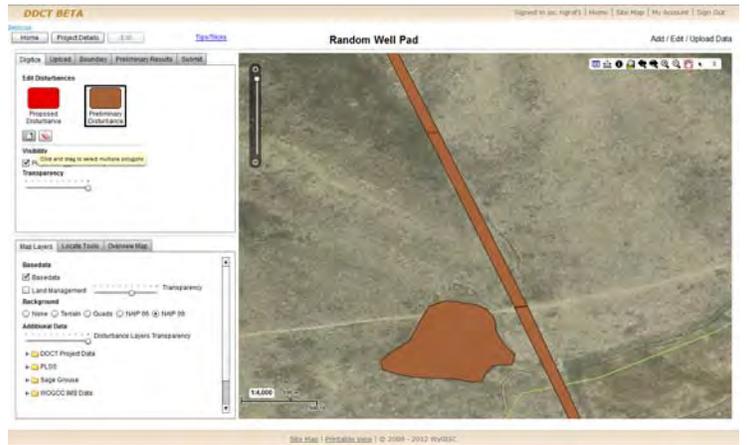

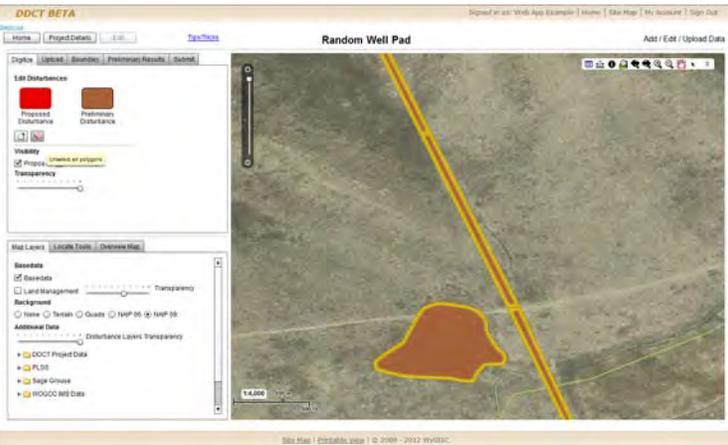

4. Any attribute changes or deleting of features will apply to all selected features

● **Clearing a Multiple Selection**

➤ With the **Digitize** tab selected

➔ Click on the **Clear Selected Features** button

Create Features Using the Upload Tool

Upload Proposed Project Area or Disturbance(s)

➤ With the **Upload** tab selected

1. Select the **Upload Shapefile** button
2. In the Upload Shapefile Dialog window Press the **Select Files** button
3. In the Select file(s) to upload by ddct.wygis.org dialog window

navigate to where the shapefile is stored and use the **shift** key to select all files associated with the shapefile. Press **Save** to close the window

4. Press the **Next** button
5. Select whether the shapefile is a **Proposed Disturbance** or **Existing Disturbance** and click the **Upload Shapefile** button
6. When red text that says "upload complete. Continue to Step 3" appears, the upload has been successful, press the **Next** button

7. Select the fields that contain the Disturbance/Disruption/Category/Type/Comments Information

- Attribute fields are listed in alphabetical order, **not** in the order they appear in the feature

- If no field contains the information, leave the dropdown blank
- If the shapefile contains no pertinent attribute information select the check box at the bottom

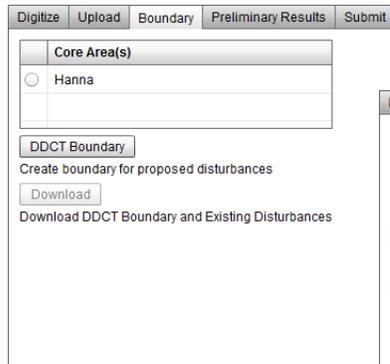

8. Press the **Next** button
9. Press the **Write to DB** button to finalize the upload
10. Press the **Done** button to finish the process

DDCT Assessment Area

Generate the boundary

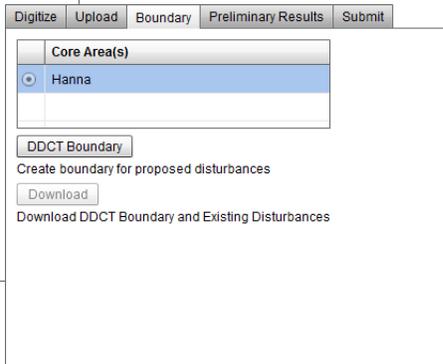

With the **Boundary** tab selected

1. Select the radio button next to the name of the **Core Area(s)** to be used in the DDCT process

2. Press the **DDCT Boundary** button

3. Wait until the boundary generation process has run, the screen will refresh when the process is complete

Download the boundary (If desired)

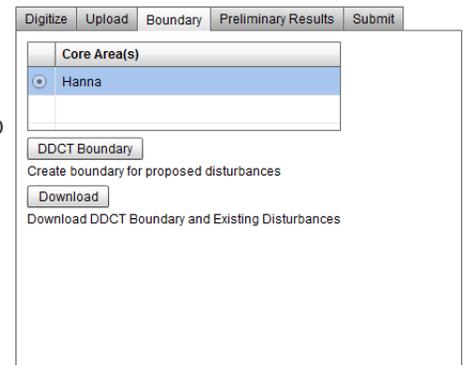

With the **Boundary** tab selected

1. Click the **Download** button

2. The download will be emailed to email address on file for the user and contain an attachment called WyGISC.zip

3. The WyGISC.zip contains an esri® File Geodatabase that contains the following features:

- ddctBoundary – The DDCT boundary
- ExistingDisturbance – Statewide Disturbance clipped to the DDCT boundary
- MapGrids – Grid covering the DDCT boundary used to create a Mapbook for the project
- PrelimDisturbance* – Preliminary Disturbance for the project area, entered by the user
- ProposedDisturbance – The proposed project boundary entered by the user

*if no Preliminary Disturbances have been created or uploaded, no PrelimDisturbance layer is included in the download

Technical Review

● Overview of the Technical Review Process

- After the project has been submitted for Technical Review
 1. Project is reviewed by the Data and Application Steward to ensure that all disturbances have been accounted for
 2. There are two possible results of the technical review
 - Disturbances need revision
 - All disturbances are accounted for and mapped correctly

● Revision Process

- Overview of Revision Process
 - ➔ Project is moved back to the **DDCT Development** stage
 - ➔ Proponent receives a series of PDF maps highlighting the areas of concern
 - ➔ Proponent can either manually correct the problems using the online tool, or upload corrected disturbance data
 - ➔ Once the concerns have been addressed the project is then re-submitted for **Technical Review**

● All Disturbances Mapped Correctly

- Overview of the Technical to Policy Review transition
 - ➔ Role of the Data and Application Steward:
 - Take the disturbances from the Preliminary layer and incorporate them into the Statewide Disturbance Data layer
 - Change the project status to Technical Review Complete
 - Notify the proponent that the Technical Review is complete
 - ➔ Role of the Proponent

1 **Appendix J – Mitigation**

2
3 **Part I – Regional Mitigation Strategy**

4
5 The BLM/USFS will achieve no net unmitigated loss for authorized land uses within greater
6 sage-grouse priority and general habitat. No net unmitigated loss means that impacts from
7 authorized land uses will be fully offset to benefit the species. Mitigation will follow the
8 regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20;
9 e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If
10 impacts to greater sage-grouse or its habitat from authorized land uses remain after applying
11 avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation
12 projects will be used to fully offset those residual impacts in order to achieve the no net
13 unmitigated loss standard. Any compensatory mitigation will be durable, timely, and in addition
14 to that which would have resulted without the compensatory mitigation (see glossary).

15
16 The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team,
17 will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the
18 NEPA decision making process including the application of the mitigation hierarchy to address
19 impacts within that Zone. A robust and transparent Regional Mitigation Strategy will contribute
20 to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and
21 compensating for residual impacts to greater sage-grouse and its habitat.

22
23 The BLM’s Regional Mitigation Manual MS-1794 serves as a framework for developing and
24 implementing a Regional Mitigation Strategy. The following sections provide additional
25 guidance specific to the development and implementation of a WAFWA Management Zone
26 Regional Mitigation Strategy.

27
28 Developing a WAFWA Management Zone Regional Mitigation Strategy

29
30 The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team,
31 will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the
32 application of the mitigation hierarchy to address impacts within that Zone. The Strategy should
33 consider any State-level greater sage-grouse mitigation guidance that is consistent with the
34 requirements identified in this Appendix. The Regional Mitigation Strategy should be developed
35 in a transparent manner, based on the best science available and standardized metrics.

36
37 As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater
38 Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater
39 sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be
40 developed within one year of the issuance of the Record of Decision.

41
42 The Regional Mitigation Strategy should include mitigation guidance on avoidance,
43 minimization, and compensation, as follows:

- 44
45 • Avoidance

- 46 ○ Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface
47 occupancy areas) already included in laws, regulations, policies, and/or land use plans
48 (e.g. Resource Management Plans, Forest Plans, State Plans); and,
- 49 ○ Include any potential, additional avoidance actions (e.g. additional avoidance best
50 management practices) with regard to greater sage-grouse conservation.
- 51 ● Minimization
- 52 ○ Include minimization actions (e.g. required design features, best management
53 practices) already included in laws, regulations, policies, land use plans, and/or land-
54 use authorizations; and,
- 55 ○ Include any potential, additional minimization actions (e.g. additional minimization
56 best management practices) with regard to greater sage-grouse conservation.
- 57 ● Compensation
- 58 ○ Include discussion of impact/project valuation, compensatory mitigation options,
59 siting, compensatory project types and costs, monitoring, reporting, and program
60 administration. Each of these topics is discussed in more detail below.
- 61 ■ Residual Impact and Compensatory Mitigation Project Valuation Guidance
- 62 ○ A common standardized method should be identified for estimating
63 the value of the residual impacts and value of the compensatory
64 mitigation projects.
- 65 ○ This method should consider the quality of habitat, scarcity of the
66 habitat, and the size of the impact/project.
- 67 ○ For compensatory mitigation projects, consideration of durability (see
68 glossary), timeliness (see glossary), and the potential for failure may
69 require an upward adjustment of the valuation.
- 70 ○ The resultant compensatory mitigation project will, after application of the
71 above guidance, result in proactive conservation measures for Greater Sage-
72 grouse (consistent with BLM Manual 6840 – Special Status Species
73 Management, section .02).
- 74 ■ Compensatory Mitigation Options
- 75 ○ Options for implementing compensatory mitigation should be
76 identified, such as:
- 77 ■ Utilizing certified mitigation/conservation bank or credit
78 exchanges.
- 79 ■ Contributing to an existing mitigation/conservation fund.
- 80 ■ Authorized-user conducted mitigation projects.
- 81 ○ For any compensatory mitigation project, the investment must be
82 additional (i.e. additionality: the conservation benefits of
83 compensatory mitigation are demonstrably new and would not have
84 resulted without the compensatory mitigation project).
- 85 ■ Compensatory Mitigation Siting
- 86 ○ Sites should be in areas that have the potential to yield the greatest
87 conservation benefit to the greater sage-grouse, regardless of land
88 ownership.
- 89 ○ Sites should be durable (see glossary).
- 90 ○ Sites identified by existing plans and strategies (e.g. fire restoration
91 plans, invasive species strategies, healthy land focal areas) should be

92 considered, if those sites have the potential to yield the greatest benefit
93 to greater sage-grouse and are durable.

- 94 ■ Compensatory Mitigation Project Types and Costs
 - 95 ○ Project types should be identified that help reduce threats to greater
 - 96 sage-grouse (e.g. protection, conservation, and restoration projects).
 - 97 ○ Each project type should have a goal and measurable objectives.
 - 98 ○ Each project type should have associated monitoring and maintenance
 - 99 requirements, for the duration of the impact.
 - 100 ○ To inform contributions to a mitigation/conservation fund, expected
 - 101 costs for these project types (and their monitoring and maintenance),
 - 102 within the WAFWA Management Zone, should be identified.
- 103 ■ Compensatory Mitigation Compliance and Monitoring
 - 104 ○ Mitigation projects should be inspected to ensure they are
 - 105 implemented as designed, and if not, there should be methods to
 - 106 enforce compliance.
 - 107 ○ Mitigation projects should be monitored to ensure that the goals and
 - 108 objectives are met and that the benefits are effective for the duration of
 - 109 the impact.
- 110 ■ Compensatory Mitigation Reporting
 - 111 ○ Standardized, transparent, scalable, and scientifically-defensible
 - 112 reporting requirements should be identified for mitigation projects.
 - 113 ○ Reports should be compiled, summarized, and reviewed in the
 - 114 WAFWA Management Zone in order to determine if greater sage-
 - 115 grouse conservation has been achieved and/or to support adaptive
 - 116 management recommendations.
- 117 ■ Compensatory Mitigation Program Implementation Guidelines
 - 118 ○ Guidelines for implementing the State-level compensatory mitigation
 - 119 program should include holding and applying compensatory mitigation
 - 120 funds, operating a transparent and credible accounting system,
 - 121 certifying mitigation credits, and managing reporting requirements.
 - 122

123 Incorporating the Regional Mitigation Strategy into Land Use Authorization Analyses

124
125 The BLM/USFS will include the avoidance, minimization, and compensatory recommendations
126 from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for
127 authorized land uses that may impact greater sage-grouse or its habitat.

128 129 Implementing a Compensatory Mitigation Program

130
131 The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to
132 achieve the greatest conservation benefit, as identified in the Regional Mitigation Strategy. In
133 order to align with existing compensatory mitigation efforts, this compensatory mitigation
134 program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field
135 Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

136

137 To ensure transparent and effective management of the compensatory mitigation funds, the
138 BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-
139 level compensatory mitigation funds, within one year of the issuance of the Record of Decision.
140 The selection of the third-party compensatory mitigation administrator will conform to all
141 relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making
142 decisions that affect Federal lands.

143

144 **Glossary Terms**

145

146 **Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and
147 would not have resulted without the compensatory mitigation project. (BLM Manual Section
148 1794).

149

150 **Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of
151 an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the
152 proposed action to a different time or location.)

153

154 **Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing
155 substitute resources or environments. (40 CFR 1508.20)

156

157 **Compensatory mitigation projects:** Specific, on-the-ground actions to improve and/or protect
158 habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements).

159

160 **Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will
161 occur.

162

163 **Durability (protective and ecological):** The administrative, legal, and financial assurances that
164 secure and protect the conservation status of a compensatory mitigation site, and the ecological
165 benefits of a compensatory mitigation project, for at least as long as the associated impacts
166 persist. (BLM Manual Section 1794).

167

168 **Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action
169 and its implementation. (40 CFR 1508.20 (b))

170

171 **Residual impacts:** Impacts from an authorized land use that remain after applying avoidance
172 and minimization mitigation; also referred to as unavoidable impacts.

173

174 **Timeliness:** The conservation benefits from compensatory mitigation accruing as early as
175 possible or before impacts have begun. (BLM Manual Section 1794).

176

177

Part II – Idaho Mitigation Framework

FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE PROJECTS ON SAGE-GROUSE AND THEIR HABITATS

**Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory Committee¹
December 6, 2010**

INTRODUCTION

The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting program for sagebrush steppe habitats in Idaho and recommendations for policy consideration” (Measure 6.2.4). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the Mitigation Subcommittee to complete this task.¹ The Mitigation Subcommittee met several times from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse participants.

This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of an Idaho-based program to compensate for the impacts of infrastructure projects on sagegrouse and their habitats. This program – called the Mitigation Framework – would serve as a science-based “mitigation module” that project developers and government regulators could use to achieve compensatory mitigation objectives called for in project plans and permits. While compensatory mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not be considered a substitute for first avoiding and then minimizing impacts.

In addition, it is important to recognize that federal and state regulatory or land-management agencies, and county or local governments may also require additional stipulations, conditions of approval or other requirements as well as on-site mitigation, in accordance with applicable law, regulation or policy.

This document proposes a general outline or “skeleton” of policies and procedures for such a program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to foster a dialogue among SAC members, spot important issues and points of agreement, and assess the level of support for developing a functioning mitigation program for Idaho sagegrouse and their habitats.

¹ Subcommittee participants: John Robison and Lara Rozzelle, Idaho Conservation League; Brett Dumas, Idaho Power Company; Paul Makela and Tom Rinkes, BLM; Don Kemner, Idaho Department of Fish and Game; Will Whelan and Trish Klahr, The Nature Conservancy; Rich Rayhill, Ridgeline Energy, LLC; Lisa LaBolle and Kirsten Sikes, Idaho Office of Energy Resources; Nate Fisher, Idaho Office of Species Conservation; John Romero, Citizen at Large.

EXECUTIVE SUMMARY

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state’s sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an “in-lieu fee” approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species’ status; and
- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

262 The Mitigation Framework would be established through a memorandum of agreement (MOA)
263 among entities that have the capacity and commitment to assist in its implementation. Such parties
264 may include land and wildlife management agencies, counties, tribes, participating private
265 infrastructure development companies, and non-governmental organizations. The MOA would
266 define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based
267 compensatory mitigation program.

268
269 The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team
270 and program administrator to steer the mitigation program and ensure strong oversight; (2)
271 technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a
272 science-based statewide strategy to guide the selection of mitigation actions that will receive funding;
273 (4) provisions that the costs of operating the program will be borne by infrastructure developers that
274 use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the
275 implementation and effectiveness of mitigation actions funded by the Mitigation Framework
276 program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat
277 in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.

278
279 This framework provides only a general outline of a proposed Idaho-based compensatory mitigation
280 program. It is intended to assess the level of support for crafting the agreements and completing the
281 technical tasks needed to bring the Mitigation Framework into being.

282
283 **DISCUSSION**

284
285 I. The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse
286 Conservation

287
288 **A. Mitigation Basics**

289
290 Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid,
291 minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the
292 environment. See 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental
293 Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all
294 phases of project planning and implementation.

295
296 The focus of this report is on compensatory mitigation – also known as “biodiversity
297 offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for
298 residual project impacts that are not avoided or minimized by providing substitute resources
299 or habitats, often at a different location than the project area. For instance, a project
300 developer may fund the restoration of a particular type of habitat in order to replace or
301 “offset” similar habitat that is lost as a result of project construction.

302
303 This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this
304 approach, a project developer provides funding to a compensatory mitigation program
305 administrator who then distributes the funds to the appropriate government agency,
306 foundation or other organization for performance of mitigation actions. In an in-lieu fee
307 program, the responsibility for actually delivering the compensatory mitigation is transferred
308 from the developer to the program administrator once the developer provides the necessary
309 funds to the in-lieu fee program. It is important to emphasize that compensatory mitigation

310 does not relieve project developers and permitting agencies of their obligation to avoid and
311 minimize environmental impacts. This Framework endorses the principle known as the
312 “mitigation hierarchy,” which holds that decision makers should consider the elements of
313 environmental mitigation in the following order of priority:

- 314 1. Avoid environmental impacts through project siting and design;
- 315 2. Minimize the impacts during construction, operation, maintenance, and
316 decommissioning by implementing appropriate conservation measures related to
317 timing and conduct of project activities;
- 318 3. Restore areas that have been disturbed or otherwise rectify on-site project-related
319 impacts to the greatest extent practicable; and
- 320 4. Compensate for residual impacts (direct and indirect effects that are not mitigated
321 on-site) by providing replacement habitats or other benefits.
322

323 This means that compensatory mitigation is addressed only after efforts to avoid, minimize,
324 and mitigate the impacts have been addressed. It also should be noted that significant
325 impacts to habitat areas that support special functions and values for sage-grouse may simply
326 not be replaceable through mitigation and therefore the best course may be to avoid those
327 areas altogether.
328

329 **B. Need for an Idaho Compensatory Mitigation Program**

330 In recent years, the state of Idaho has seen an increase in the number of major infrastructure
331 projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals
332 involve high voltage transmission lines that would cross over hundreds of miles of sage-
333 grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect
334 large areas of sagegrouse habitat. Where these projects are located at least partially on
335 federally managed public lands they will be required by federal law to go through an
336 extensive environmental review process under NEPA before relevant federal permits are
337 issued. The NEPA process requires the permitting agencies to consider the projects’
338 environmental effects (both positive and negative), alternatives, and potential mitigation
339 measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.
340

341 Even after efforts are taken to avoid and minimize impacts, it is possible that some of these
342 infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse
343 mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The
344 extent to which project developers and regulators adopt compensatory mitigation as a means
345 to offset these impacts is not fully known. However, it is likely that at least some developers
346 and regulators will seek to implement compensatory mitigation to benefit sage-grouse and
347 their habitats. Energy companies and other developers face daunting challenges in carrying
348 out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation
349 actions requires a major effort. Actually implementing sagebrush restoration and
350 enhancement projects is even more difficult and expensive – typically involving years of
351 effort and a significant risk of failure. Delivering this type of technically complex
352 environmental mitigation may be well outside the core business of many infrastructure
353 developers.
354

355 **C. Advantages of the Mitigation Framework**

358
359 The Mitigation Framework proposes to respond to these challenges by creating a statewide
360 program to deliver scientifically sound compensatory mitigation for multiple projects.
361 Project developers and regulators would no longer have to design, fund and implement their
362 own mitigation programs. Instead, they would have the option of contributing money to a
363 central fund overseen by agencies with expertise in habitat management and non-
364 governmental partners with similar experience. This approach to compensatory mitigation
365 offers three major advantages. The first advantage stems from the increased efficiency of an
366 Idaho-wide mitigation program compared with fragmented, project-by-project mitigation
367 programs. Mitigation efforts require a significant investment in planning, administration,
368 project oversight, and monitoring. The Mitigation Framework would consolidate these
369 functions, thus avoiding needless duplication. The second advantage is that a state mitigation
370 fund can be used for sage-grouse conservation more strategically and at a greater scale than
371 project-by-project mitigation. As described in more detail below, the Mitigation Framework
372 would fund sage-grouse habitat protection and restoration projects in accordance with a
373 statewide strategy that uses landscape-scale analyses to identify the specific measures and
374 habitats that will provide the greatest benefit for Idaho sagegrouse populations. This Idaho-
375 based mitigation strategy will be integrated with other conservation strategies throughout the
376 range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole.
377 Third, this method can engage the capacity and competence of natural resources agencies,
378 local governments, private companies, and non-governmental organizations. The Mitigation
379 Framework proposes to enlist these entities in shaping Idaho’s strategy, developing criteria
380 for use of the fund, and proposing and implementing habitat protection and restoration
381 projects. The benefits of the Mitigation Framework can be summarized as follows:

382
383 *Benefits for Project Developers:*

384
385 An efficient and reliable mechanism for meeting compensatory mitigation objectives and
386 permit conditions; and Increased certainty regarding project costs.

387
388 *Benefits for Regulatory Agencies:*

389
390 Increased certainty that in-lieu fees will result in strategic “on-the-ground” mitigation actions
391 that benefit sage-grouse.

392
393 *Benefits for Sage-Grouse:*

394
395 Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and
396 offset impacts and habitat losses associated with infrastructure development will be
397 implemented.

398
399 **D. Ensuring Accountability**

400
401 In-lieu fee compensatory mitigation does pose one potentially significant drawback that must
402 be acknowledged and addressed: a poorly designed program may lack accountability for
403 delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project
404 developer contribute to an in-lieu fee mitigation account does not by itself compensate for
405 the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-

406 conceived habitat protection and restoration projects are planned, funded, implemented,
407 monitored, and successful in achieving stated objectives. The Mitigation Framework seeks to
408 ensure accountability by adopting a series of rigorous and transparent procedures. As
409 described below, the Framework would: (1) ensure that program administration and
410 monitoring functions are adequately funded; (2) provide technically sound guidelines for
411 estimating the costs of delivering compensatory mitigation; (3) establish a sciencebased
412 statewide strategy to guide the program; (4) develop project selection criteria and a request
413 for proposals based on the strategy; (5) require monitoring of the implementation and
414 effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation
415

416 Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of
417 the program. Taken together, these procedures provide a high degree of certainty that the
418 Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting
419 compensatory mitigation for sage-grouse. As described in greater detail in Section E, below,
420 project developers that seek to use the Mitigation Framework will need to show two things.
421 First, they will need to show that their projects' impacts on sage-grouse and their habitats
422 have been evaluated using a scientifically sound process. Second, they will need to show that
423 their contributions to the mitigation fund reflect the Mitigation Framework's compensation
424 guidelines to ensure that funding will be adequate to offset project impacts. Having
425 demonstrated those things, the project developers should then be able to rely on their in-lieu
426 fee contribution to the mitigation account as satisfying their compensatory mitigation
427 objectives or obligations.
428

429 **II. Core Elements of Idaho Sage-Grouse Mitigation Program**

430 **A. Program Objectives**

- 431 • Provide a credible, efficient, transparent, and flexible mechanism to implement
432 compensatory mitigation;
- 433 • Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-
434 grouse and their habitats;
- 435 • Provide increased certainty for developers and agencies;
- 436 • Involve private and public partners in crafting solutions;
- 437 • Provide developers the opportunity to offset project impacts on sage-grouse and sage-
438 grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in
439 future reviews of the species' status; and
- 440 • Evaluate issues based on best available scientific information while acknowledging and
441 responding to scientific uncertainty.
442

443 **B. Scope**

444 The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their
445 habitats in Idaho. The initial focus of the Mitigation Framework is on sage-grouse. However,
446 this program can be readily adapted to provide compensatory mitigation for other sagebrush
447 obligate and associate species, such as pygmy rabbits, if project developers and regulators call for
448 such mitigation.
449
450
451
452

453 Whether this Framework is suited for mitigation of impacts to a broader suite of species or
454 natural features has not been evaluated. It should be noted that some subcommittee members
455 expect to advocate in other forums that compensatory mitigation should extend beyond
456 sagegrouse. The Mitigation Framework focuses on infrastructure projects because this type of
457 development is the most likely to give rise to compensatory mitigation under existing
458 environmental policies. As used here, the term “infrastructure” refers to building structures that
459 significantly disturb sage-grouse habitat, including but not limited to projects for electricity
460 transmission, energy generation, pipeline conveyance, transportation, communications, and
461 similar purposes. The Mitigation Framework is not intended to apply to existing projects that are
462 not changing in scope or to the renewal of on-going activities, such as grazing permits. In
463 addition, the Framework is not suited to projects with minor impacts because their contributions
464 to the mitigation program would be too small to justify the effort needed to establish and
465 administer inlieu fee payments.

466 **C. Integration with Environmental Review Procedures**

467
468 The Mitigation Framework does not alter the legal standards or procedures for review and
469 approval of infrastructure projects. Rather, the Framework offers an option that project
470 developers and/or regulators may choose for implementing mitigation plans and agency permit
471 conditions. The Mitigation Framework is intended to complement the environmental review
472 process conducted pursuant to NEPA and other federal environmental laws as well as county
473 land use planning authorities. Many energy and other infrastructure projects undergo review and
474 approval at the county level. The issues examined and the level of environmental analysis varies
475 widely among individual counties and individual developers. If a county or developer decides to
476 address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for
477 meeting compensatory mitigation objectives that may arise from the county permitting process.
478
479

480 **D. Mitigation Strategy**

481
482 The next step focuses on the Mitigation Team’s task of developing a statewide, science-based
483 strategy that will guide the use of the mitigation fund. The mitigation program strategy would
484 establish priorities for the use of compensatory mitigation funding based on factors/risks
485 identified in the U.S. Fish and Wildlife Service’s 12-Month Findings for Petitions to List Greater
486 Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the
487 Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation
488 priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in
489 Idaho based on best available science. In setting priorities, the strategy considers species and
490 community size, landscape condition, and regional context. The strategy is responsive to the
491 threats and risks described in the sage-grouse 12- month findings. The strategy will also generally
492 describe the types of mitigation actions, project specifications, and best practices that are likely
493 to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both
494 implementation and effectiveness monitoring requirements for mitigation actions funded
495 through the program. The Mitigation Framework’s strategy will draw heavily from the State of
496 Idaho’s sage-grouse conservation plan but has a narrower focus. It is intended to provide the
497 specific guidance on program priorities, accepted mitigation measures, and geographic areas of
498 emphasis that potential mitigation project sponsors will need to know when they apply for
499 funds. The strategy plays a crucial role in steering mitigation funding to those activities and
500 places that can provide the most effective benefits for Idaho sage-grouse populations consistent

501 with strategies to increase the viability of the species throughout its range. To this end, the
502 strategy will address one of the major policy questions that arise in the design of compensatory
503 mitigation systems: how closely should the mitigation actions be linked to the type and location
504 of the habitat that was originally affected by the infrastructure project. Stated in the alternative,
505 does removal of the mitigation action from the area of impact improve the effectiveness of or
506 benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this
507 link by favoring “in-kind” and “on-site” compensatory mitigation over “out-of-kind” and “off-
508 site” compensatory mitigation. The subcommittee members generally favor an approach that
509 allows funding to flow to the projects and locations within Idaho that will provide the greatest
510 overall positive impact on sage-grouse populations. The Mitigation Framework calls for a
511 monitoring program that would assess habitat gains provided by mitigation actions and compare
512 them with the mitigation objectives of the participating infrastructure projects. The nature and
513 purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

514
515 Once the strategy is complete, the Mitigation Team will develop project ranking criteria and
516 procedures that will guide the selection of the mitigation actions that will receive funding. The
517 goal is to fund projects that provide high quality, lasting benefits based on landscape scale
518 analyses that actually compensate for project impacts.

519
520 **E. Compensation Guidelines**

521
522 The Mitigation Framework Program will develop guidelines that may be used by developers
523 and/or regulators to determine the cost of meeting their compensatory mitigation objectives.
524 These compensatory mitigation objectives determine the extent of compensatory mitigation for
525 each project and are generally incorporated into project plans or permits. The compensation
526 guidelines will provide transparent, technically sound principles for determining how much it
527 costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent
528 best estimates of the true cost of implementing the mitigation actions needed to meet each
529 project’s compensatory mitigation objectives. The guidelines may be used by the project
530 developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that
531 the developer will contribute to the mitigation fund. Specific valuation methods will be
532 developed at a later time and will likely draw from compensatory mitigation systems used
533 elsewhere in the West. Although the details have yet to be worked out, the following outline
534 illustrates the core concepts and principles (shown in bold lettering) that are likely to be
535 employed by the MOA parties in setting the Mitigation Framework’s in-lieu fee structure.

- 536 • A common unit of measurement would be established for describing and tracking both the
537 project impacts and the benefits of any compensatory mitigation actions. This unit of
538 measurement can be a physical unit such as “acres impacted” or more specifically “acres of
539 summer brood rearing habitat impacted” or “habitat units” lost.
- 540 • While the “common unit of measurement” noted above addresses the area of habitat
541 impacted and mitigated, habitat compensation ratios are used to address the quality of the
542 habitat affected by the infrastructure project. These ratios could specify the number of acres
543 of mitigation required per acre of impacted habitat based on the size, habitat
544 quality/condition and function of the impacted habitat; for more critical or important
545 habitat, more mitigation acres might be required. Thus, habitats with higher quality and
546 importance could have higher compensation ratios.

- 547 • Several factors are taken into account in calculating how much it will cost to actually
548 compensate for the acres or habitat units. The recommended approach is to evaluate on the
549 costs of implementing a conceptual portfolio of potential mitigation actions or offset
550 activities that provide benefits for sage-grouse. This portfolio of model projects would
551 include a balanced mix of accepted habitat protection and restoration measures reflecting the
552 types of projects expected to be funded by the mitigation program (in accordance with the
553 strategy discussed above). Examples of projects in this portfolio may include such actions as
554 restoring sagebrush canopy and a native understory on recently burned land, improving
555 riparian areas and wet meadows in early brood-rearing habitat, conservation easements to
556 prevent habitat loss, and land management practices that improve sage-grouse habitat.
557 Project costs include the full range of expenses needed to complete all phases of the
558 mitigation action, including administration and monitoring. The average costs of these
559 model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee
560 calculation.
- 561 • In addition, the in-lieu fee should also be adjusted to take into consideration the issue of lag
562 time –the time between when habitat is lost at the impacted site relative to when habitat
563 functions are gained at the compensation site.
- 564 • The fee also needs to account for contingencies associated with delivering compensatory
565 mitigation, including an estimate of the risk of failure (i.e., the probability that offsite
566 mitigation will not result in any measureable conservation outcomes) for each mitigation site
567 or project.
- 568 • In addition to the fee calculated above, costs for establishing and operating the program,
569 including travel, technical consultation and monitoring of program effectiveness must be
570 included. This overhead fee could range from 5-15% depending on the size and complexity
571 of the proposed mitigation program.

572
573 **F. Program Structure and Oversight**

574
575 The Mitigation Framework would be established through a memorandum of agreement (MOA)
576 among the entities that would participate in its implementation. The MOA would define the
577 specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based
578 compensatory mitigation program. The MOA would serve as a joint powers agreement for state
579 and local government parties. The MOA would establish the following administrative structure
580 for the Mitigation Framework:

- 581
582 1. Core Team: A core group would oversee the Mitigation Framework program and provide
583 policy-level guidance for the Science Team and Fund Administrator, described below. The
584 Core Team would be composed of three to seven representatives of diverse perspectives
585 among the MOA signatories.
- 586
587 2. Science Team: A team of experts drawn from MOA signatories and other targeted
588 organizations will administer the science-based and technical aspects of the program. The
589 Science Team would consist of several individuals with expertise in relevant areas such as
590 habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-
591 grouse ecology, project development, and mitigation policy.

593 The Team would focus on developing the policies and statewide strategy that will guide the
594 program, making requests for mitigation project proposals (RFPs), ranking mitigation
595 proposals that will receive funding, tracking monitoring reports and project benefits, and
596 evaluating program success.

597
598 3. Program Administrator: A program administrator will be responsible for fund
599 management and administrative tasks. The program administrator will provide administrative
600 support for the Mitigation Team, manage the mitigation account, and administer grants,
601 contracts, and other agreements.

602 4. Advisory Committee: A broader advisory committee consisting of agencies, companies
603 and organizations with the skills and commitment that will provide useful advice to the Core
604 Team regarding the implementation of the Mitigation Framework. The specific make up of
605 each of these groups will be determined at a later time. Potential participants in the
606 Mitigation Framework include but are not limited to representatives of:

607
608 ***State of Idaho:***

United States:

609
610 Department of Fish and Game
611 Management
612 Office of Energy Resources
613 Office of Species Conservation
614 Idaho Department of Lands
615 Service

Bureau of Land
U.S. Fish and Wildlife Service
U.S. Forest Service
Natural Resources Cons.

616
617 ***Energy Companies:***

Non-Governmental Organizations:

618
619 Idaho Power
620 Ridgeline Energy
621 Conservancy
622
623 Idaho Tribes
624 Idaho Sage-Grouse Advisory Committee
625 interests)
626 Sage-Grouse Local Working Groups

Idaho Conservation League
The Nature

Idaho Counties
Public Land Users (e.g., grazing

627
628 **G. Funding the Mitigation Program**

629
630 The costs of administering the program will be sustained by the project developers that seek
631 compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers
632 contribute to the mitigation account will be applied for program administration. As noted
633 above, protecting and restoring sagebrush habitats are time consuming and expensive
634 undertakings. Ensuring that these activities are conducted with strong oversight should be
635 viewed as an exceptionally wise investment.

636
637 **III. Mitigation Program Steps**

638
639 The Mitigation Framework envisions a five-step process for developing, implementing, and
640 monitoring compensatory mitigation.

A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework’s success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts. For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications. Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer’s in-lieu fee contribution.

B. Step 2 – Determine the In-lieu Fee Contribution

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

C. Step 3 – Commitment of Mitigation Funds by Project Developer

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties’ respective responsibilities, including the project developer’s commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer’s funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include “conditions” as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable. Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator. After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions

688 At least at annual intervals, the Mitigation Team will issue an RFP that invite private
689 companies, non-governmental organizations, and agencies to submit proposals for sage-
690 grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide
691 guidance to mitigation project sponsors on program priorities and criteria. These priorities
692 and criteria will be drawn from the mitigation program strategy including identification of
693 geographic areas where mitigation might provide the greatest benefits as well as
694 identification of the threats that present the highest risk to the species or its core habitat.
695 The Mitigation Team should also reach out to federal, state, and local agencies, non-
696 governmental organizations and the general public in order to facilitate discussion, engage
697 stakeholders, raise awareness of the program and generate responses to the RFP. The RFP
698 will solicit project proposals that contain an operation or implementation plan and address at
699 least the following elements:

- 700
- 701 • Geographic area;
 - 702 • Threats addressed and how the mitigation action project will offset impacts resulting
703 from those threats;
 - 704 • An analysis of current sage-grouse conditions in the area;
 - 705 • Resource goals and objectives the mitigation action project will seek to provide;
 - 706 • A description of any coordination with federal, state, tribal and local resource
707 management and regulatory authorities or other stakeholder involvement required to
708 complete the mitigation action (e.g., requirement for NEPA compliance or county
709 permit);
 - 710 • A description of recent or proposed projects and events in the vicinity of the
711 proposed project, if any, such as fire rehabilitation treatments, restoration or
712 enhancement treatments or other activities that complement the effectiveness or
713 intent of the proposed, mitigation action;
 - 714 • A description of the long term protection, management, stewardship for the project
715 being implemented, and the entity responsible for these activities; and
 - 716 • A commitment to periodic evaluation and reporting on the progress of the project in
717 meeting stated goals and objectives, including a process for adaptively redirecting the
718 project if necessary.
- 719

720 When selecting projects, the Mitigation Team will estimate the biological benefits of the
721 projects activities, the likely success of those activities, the duration of benefit expected and
722 measure those benefits in relation to the strategy and RFP objectives. Mitigation Team and
723 the program administrator will work together on continuing program administration and
724 oversight including annual reporting of program activities, expenditures, and benefits. An
725 annual program report will describe program activities, budget, and assessment of whether
726 the mitigation strategy and associated projects are benefitting sage-grouse and at what level
727 or scale. The Mitigation Team and/or Program Administrator should implement a
728 monitoring program to measure and validate whether project-specific objectives have been
729 met. Monitoring is required of all compensatory mitigation actions to determine if the
730 project is meeting its performance standards and objectives. As mentioned above, at regular
731 intervals, the total habitat and/or population gains provided by the programs will be
732 compared with the habitat/population losses associated with the participating infrastructure
733 projects. The purpose of this comparison is to evaluate the mitigation program and make

734 any necessary program adjustments – particularly if the monitoring shows that the mitigation
735 benefits are not compensating for habitat losses. This comparison will not be a basis for
736 imposing new, unexpected requirements on the infrastructure project developers.
737

738 **CONCLUSION**

739
740 The framework of policies, principles and procedures outlined above are meant to start a dialogue
741 among parties engaged in sage-grouse conservation and infrastructure development. If these parties
742 agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based
743 compensatory mitigation program, then this framework will mark the beginning of an inclusive
744 effort to fill in the details and complete the tasks needed to bring such a program into being. We
745 have confidence in our collective ability to create a compensatory mitigation program that will
746 benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho’s sage-
747 grouse.
748

749
750

DRAFT

751 **Part III –**

752

753 **IDAHO AND SOUTHWESTERN MONTANA SUBREGION-NO NET**
754 **UNMITIGATED LOSS PROCESS**

755

756 **Introduction**

757

758 The No Net Unmitigated Loss strategy is a means of assuring that proposed anthropogenic
759 activities, when approved and implemented will not result in long-term degradation of Greater
760 Sage-Grouse habitat or population and will have a net conservation benefit to the species. The
761 attached ‘flow chart’ identifies a screening process for review of proposed anthropogenic
762 activities. The goal of the process is to provide a consistent approach regardless of the
763 administrative location of the project and to ensure that authorization of these projects will not
764 contribute to the decline of the species. Though the initial Steps (1-6) are done prior to initiating
765 the NEPA process, the authorized officer must ensure that appropriate documentation regarding
766 the rationale and conclusion for each is included in the administrative record.

767

768 The flow chart provides for a sequential screening of proposals. However, Steps 2-6 can be done
769 concurrently. Steps 7-12 are related to project implementation.

770

771 **Step 1**

772

773 This screening process is initiated upon formal submittal of a proposal for authorization for use
774 of federal lands (BLM or Forest Service). The actual documentation would include, at a
775 minimum, a description of the location, scale of the project, and timing of the disturbance and
776 would be consistent with existing protocol and procedures for the specific type of use. It is
777 anticipated that the proposals would be submitted by a third party.

778

779 **Step 2**

780

781 This initial review would evaluate whether the proposal would be allowed as prescribed in the
782 Greater-Sage-Grouse Land Use Plan Amendment. For example, certain activities are prohibited
783 in suitable habitat, such as wind or solar energy development. If the proposal is an activity that is
784 specific prohibited, the submitter would be informed that the proposal is being rejected since it
785 would not be consistent with the Land Use Plan, regardless of the design of the project.

786

787 In addition to consistency with program allocations, the Land Use Plan identifies a limit on the
788 amount of disturbance that is allowed within a ‘biological significant unit’ (BSU). If current
789 disturbance within the affected unit exceeds this threshold, the project should be deferred until
790 such time as the amount of disturbance within the area has been reduced, through restoration or
791 other management actions.

792

793 **Step 3**

794

795 In reviewing a proposal, determine if the project will have a direct or indirect impact on
796 population or habitat (PPH or PGH). This can be done by:

- 797 1. Reviewing Greater Sage-Grouse Habitat maps.
798 2. Reviewing the 'Base Line Environment Report' (USGS) which identifies the area of
799 direct and indirect effects for various anthropogenic activities.
800 3. Consultation with agency, Fish and Wildlife Service, or State Agency wildlife
801 biologist.
802 4. Reviewing the standard and guidelines in the plan amendments (such as buffer
803 distances for the proposed activity).
804 5. Other methods
805

806 If the proposal will not have a direct or indirect impact on either the habitat or population,
807 proceed with the appropriate process for review, decision, and implementation of the project.
808

809 **Step 4**

810
811 If the project could have a direct or indirect impact of sage-grouse habitat or population, evaluate
812 whether the proposal can be relocated so as to not have the indirect or direct impact and still
813 achieve the intent of the proposal. This Step does not consider redesign of the project as a means
814 of not having direct or indirect impacts but rather authorization of the project in a physical
815 location that will not impact Greater Sage-grouse. If the project can be relocated so as to not
816 have an impact on sage-grouse and still achieve objectives of the proposal, inform applicant and
817 proceed with the appropriate process for review, decision, and implementation of the relocated
818 project.
819

820 **Step 5**

821
822 If the preliminary review of the proposal concludes that there may be impacts to sage-grouse
823 habitat and/or population, and the project cannot be effectively relocated to eliminate these
824 impacts; evaluate whether the agency has the authority to modified or deny the project. If the
825 agency does NOT have the discretionary authority to modify or deny the proposal, proceed with
826 the authorization process (NEPA) and include appropriate mitigation requirements that minimize
827 impacts to sage-grouse habitat and populations. Mitigations could include a combination of
828 actions such as timing of disturbance, design modifications of the proposal, site disturbance
829 restoration, and compensatory mitigation actions.
830

831 **Step 6**

832
833 If the agency has the discretionary authority to deny the project and after careful screening of the
834 proposal (Steps 1-4) has determined that direct and indirect cannot be eliminated, evaluate the
835 proposal to determine if the adverse impacts can be mitigated. If the impacts cannot be
836 effectively mitigated within the BSU, reject or defer the proposal. The criteria for determining
837 this situation would include but not limited to:

- 838 • Natural disturbance within the BSU is significant and additional activities within the area
839 would adversely impact the species.
840
- 841 • The current trend within the BSU is down and additional impacts, whether mitigated or
842 not, could lead to further decline of the species or habitat.

- The proposed mitigation has proven to be ineffective or is unproven in terms of science based approach.
- The additional impacts, after applying effective mitigation, would exceed the disturbance threshold for the BSU.
- The project would impact habitat that has been determined, through monitoring, to be a limiting factor for species sustainability within the BSU.
- Other site specific criteria that determined the project would lead to a downward trend to the current species population or habitat with the BSU.

If the project can be mitigated to provide for a net conservation benefit to the species, proceed with the design of the mitigation plan and authorization (NEPA) of the Project. The authorization process could identify issues that may require additional mitigation or denial/deferring of the project based on site specific impacts to the Greater Sage-grouse.

DRAFT

**No Net Unmitigated Loss
Draft Decision Flow Chart
March 14, 2014**

¹ In determining if the Proposal disturbance can be mitigated, the result of the mitigation action has to produce a net beneficial conservation value for sage-grouse. Additional process details are being developed for this step in coordination with the FWS and SETT in Nevada.

² Off-site mitigation projects mitigate by:
 ≠ Protective actions for future natural disturbance (i.e. fuel breaks, green strips) and/or
 ≠ restoration of legacy natural or anthropogenic disturbances

³ Process to coordinate with the State on application of Conservation Credits is in process.

⁴ All Monitor is done in accordance with established protocols and incorporated into future Mitigation Plans. Results will feedback into the determination on whether future proposals can be mitigated in Step 6.

Appendix L – Travel Management Planning Guidelines:

- Among other designation criteria from 43 CFR 8342.1(b), “areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- During subsequent travel management planning, all routes would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive GRSG habitat.
- During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating route designations and/or closures.
- During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure.
- During subsequent travel management planning, routes that are duplicative, parallel, or redundant would be considered for closure.
- During subsequent travel management planning, seasonal restrictions on OHV use would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, consider limiting over snow vehicle (OSV) travel to designated routes, consider seasonal closures in GRSG wintering areas from November 1 through March 31 or define Designation Criteria (i.e. minimization criteria) to regulate over snow vehicle traffic.
- During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only.
- During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan.
- During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances.
- During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (After 10:00 AM to 7:00 PM) to reduce impacts on GRSG during breeding and nesting periods.

49
50
51
52

Over-snow vehicle – a motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

DRAFT

1 **Idaho and Southwestern Montana**
2 **Recommendation for Proposed Plan Amendment**

3
4 **1. Summary Description of Plan**

- 5 1.1. Maintain and/or increase the abundance, distribution and connectivity of GRSG by
6 conserving, enhancing and restoring GRSG habitat to maintain resilient populations
7 by reducing, eliminating or minimizing threats to GRSG habitats.
- 8 1.2. Comply with existing laws, regulations and policies.
- 9 1.3. Recognize valid existing rights.
- 10 1.4. BLM and FS would coordinate with the States of Idaho and Montana, as
11 appropriate, during implementation activities including the evaluation of
12 disturbance threshold, adaptive management triggers and mitigation.
- 13 1.5. The Idaho and Southwestern Montana Sub-Region would be divided into 5
14 Conservation Areas over which the disturbance threshold and adaptive management
15 triggers would apply. These areas are the West Owyhee, Desert, Mountain Valleys,
16 Southern and Southwestern Montana (Map 1).
- 17 1.6. The Conservation Areas would be categorized into management zones – Core,
18 Important and General, with the exception of the Southwestern Montana
19 Conservation Area which does not contain Important Management Zones (Map 2).
- 20 1.7. Adaptive Management: Idaho: actions would engage when population decline by 10
21 percent or a combined 10 percent loss nesting and/or wintering habitat within Core
22 or Important Management Zones within a Conservation Area is lost (Soft Trigger),
23 and when 20 percent of the population or nesting and wintering habitat within Core
24 or Important Management Zones within a Conservation Area is lost (Hard Trigger)
25 Montana: Adaptive management in Montana is linked with the state evaluation
26 framework.
- 27 1.8. Additional anthropogenic disturbance (AD-1) would be significantly limited in Core
28 Management Zones with specific exceptions (AD-3 & AD-4); it would be limited
29 unless consistent with specific criteria in Important Management Zones (AD-4) and
30 would be avoided in General Management Zones.
- 31 1.9. Anthropogenic disturbance (AD-1) would be contained within a 3 percent total
32 disturbance cap as applied to the biologically significant unit (the biologically
33 significant unit (BSU) is defined as the nesting and wintering habitat within Core
34 and Important Management Zones within a Conservation Area), including existing
35 anthropogenic disturbance. In Montana surface disturbance will be calculated
36 through the state surface disturbance analysis process on a project by project basis.
- 37 1.10. Mitigation would be required for all anthropogenic disturbance activities within
38 GRSG habitat. Within Core Management Zones a standard of no net unmitigated
39 loss would be required.
- 40 1.11. BLM and Forest Service would set up a Mitigation Board at the State level with state
41 involvement to develop a Mitigation Strategy and oversee the application of
42 mitigation at the site-specific level.
- 43 1.12. BLM and Forest Service would complete Wildfire and Invasive Species
44 Assessments at the local level to identify priority areas of habitat, and wildfire and
45 invasive species concern. These assessments would support and include the
46 development of fuels, restoration and rehabilitation strategies to use during
47 implementation level activities.

48 **Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary¹**

Solar/Wind/Nuclear/Hydropower		
Core	Important	General
Exclusion (LR-2)	Avoidance (LR-2)	Open (LR-2)
Commercial Service Airports		
Core	Important	General
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills		
Core	Important	General
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
Utility Corridors		
Core	Important	General
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Core (LR-7)	Same as Core (LR-7)
High-Voltage Transmission and Major Pipeline ROWs		
Core	Important	General
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
Other (Minor) Rights-of-Way and Land Use Authorizations/Permits		

¹ The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

Core	Important	General
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
Land Tenure Adjustments		
Core	Important	General
Retention with exceptions for exchange; available for exchange with no net loss of GRSG within Core and Important. Not available for disposal. (LR-13)	Same as Core (LR-13)	Available for exchange subject to existing land use plan conformance (No Action)
Fluid Mineral Resource Allocation (Includes Geothermal)		
Core	Important	General
Idaho: Low or no potential areas Closed Moderate to High potential areas Open subject to No Surface Occupancy Montana: Open subject to NSO. (FLM-1)	Idaho: Open subject to No Surface Occupancy Montana: Not Applicable (FLM-1)	Idaho and Montana: Open subject to CSU (FLM-1)
Non-Energy Leasables		
Core	Important	General
Known Phosphate Leasing Areas (KPLAs) are Open – Not Applicable, No KPLAs in Core Closed to leasing outside KPLAs (NEL-1)	KPLAs are Open Open with standard and additional stipulations for leasing outside KPLAs. (NEL-1)	KPLAs are Open to leasing with standard stipulations (NEL-1)
Mineral Materials (Salable Minerals)		
Core	Important	General
Closed to new site authorizations. Existing sites Open to new sales subject to RDFs, buffers and seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to criteria. Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)
Travel Management		
Core	Important	General

2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance in to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management zones and associated management to maintain a resilient population and to designate strategically located adjacent zones to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
 - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
 - b. Increasing the amount, condition and connectivity of seasonal habitats.
 - c. Protecting or improving GRSG migration/movement corridors.
 - d. Reducing conifer encroachment within GRSG seasonal habitats.
 - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
 - f. Reducing the extent of annual grasslands adjacent to Core and Important Management Zones.
- Decadal treatment objectives by population area are identified in Table 1.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward 70% of lands within CMZs and IMZs capable of producing sagebrush at 10-30% canopy cover and less than 10% conifer canopy cover.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species.

Table 2. Seasonal Habitat Desired Conditions for Greater Sage-Grouse

ATTRIBUTE	INDICATOR	DESIRED CONDITION
Lek Habitat	Proximity of trees ^{9,16}	<Trees (e.g. juniper) none to uncommon within 3 km of occupied leks
	Proximity of sagebrush to leks ¹⁶	Adjacent protective sagebrush cover within 100 m of an occupied lek ¹⁶
Nesting Habitat	Apply indicators to areas within 10 km of occupied leks, that have the ecological capability to provide sagebrush cover.	
	Seasonal habitat needed ¹⁰	>80% of the landscape in sagebrush cover
	Sagebrush canopy cover ^{2,10,11,13}	15-25%
	Sagebrush height ¹⁰	
	Arid sites ³	12-31 inches (30-80cm)
	Mesic sites ⁴	16-31 inches (40-80cm)
	Predominant sagebrush shape ¹⁶	>50% in spreading shape ⁵
	Perennial grass cover ^{2,10}	
	Arid sites ³	≥10%
Mesic sites ⁴	≥15%	
Perennial grass height ^{10,11,13,16}	≥7 inches ¹⁰	
Perennial forb canopy cover ^{2,10}		
Arid sites ³	≥5%	
Mesic sites ⁴	≥10%	
BROOD-REARING/SUMMER¹ (July-October)¹ (Apply to all habitat outside of nesting/breeding and winter)		
Cover	Seasonal habitat needed ¹⁰	>40% of the landscape in sagebrush cover
	Sagebrush canopy cover ^{2,10}	10-25%
	Sagebrush height ¹⁰	40-80cm
	Perennial grass canopy cover ^{2,10}	>15%
	Upland and riparian perennial forb availability ^{2,16}	Preferred forbs are common with several preferred species present ^{7,8}

² These acreage figures represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

	Riparian meadow habitat function	>80% relative composition ^a of riparian herbaceous species ⁹
WINTER¹ November-March¹ (Apply to areas of low snow accumulation)		
Cover and Food	Seasonal habitat needed ¹⁰	>80%
	Sagebrush canopy cover above snow ^{2, 10}	>10%
	Sagebrush height above snow ¹⁰	>25cm

¹ Seasonal dates can be adjusted by local unit according to geographic region.
² Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present.
³ 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (HAF 2014).
⁴ ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (HAF 2014).
⁵ Sagebrush plants that are more tree or columnar-shaped do not provide the protective cover of sagebrush with a spreading shape (HAF 2014).
⁷ Preferred forbs are listed in HAF Table III-2 (HAF 2014). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.
⁸ Cover may be higher according to local riparian classifications.

Forest Service Maximum Allowable Use Levels for GRSG Habitat

Seasonal Habitat	Allowable Use of Key Species
Nesting/Breeding ¹	Residual perennial grass height: Grazing post nesting/breeding season: 4 in. ^{15,16} Grazing during nesting/breeding season ^a : 7 in. ^{10,15,16}
	^a Average, assuming current vegetation composition has the capability. ≤35% shrub species
Brood-Rearing /Summer	≤40% herbaceous species ¹⁷
	≤35% woody species
	Average stubble height 4 inches (depending on site capability and potential) for herbaceous riparian vegetation ¹⁷
Winter	≤35% shrub species

102 1-Grass heights only apply in nesting habitats with sufficient sagebrush cover (15-25%) to support
103 nesting.

- 104 **3. General Direction (GD)**
- 105 **3.1.** GD-1: Comply with state and federal laws, regulations, policies, and standards, including
- 106 FLPMA multiple use mandates and NFMA regulations.
- 107 **3.2.** GD-2: Implement actions (day-to-day management, monitoring, and administrative
- 108 functions) that stem directly from regulations, policy, and law, which are considered in
- 109 conformance with the LUPA that are not specifically addressed in the plan amendment.
- 110 **3.3.** GD-3: Preserve and recognize valid existing rights, which include any leases, claims, or
- 111 other use authorizations established before a new or modified authorization, change in land
- 112 designation, or new or modified regulation is approved. Activities on existing mineral leases
- 113 are managed through terms, conditions and stipulations on the leases, and through specific
- 114 operating conditions included in operating plan approvals for the duration of the lease.
- 115 **3.4.** GD-4: Allowable uses and management actions from the existing LUPs that remain valid
- 116 and do not require amending are carried forward.
- 117 **3.5.** GD-5: Sustain habitat in sufficient quantities and quality for resilient plant and wildlife
- 118 populations.
- 119 **3.6.** GD-6: Provide for human safety and property protection from wildfire.
- 120 **3.7.** GD-7: Ensure that existing utility corridors would remain unchanged.
- 121 **3.8.** GD-8: Limit all Forest Service-administered lands to designated routes.
- 122 **3.9.** GD-9: Existing requirements regarding site-specific environmental analysis, public
- 123 involvement, consultation with tribes and other agencies, or compliance with applicable
- 124 laws without waiver are maintained.
- 125 **3.10.** GD-10: Appropriate, site-specific analysis as described in NEPA and any requisite
- 126 site specific decision making (i.e., 43 CFR Subpart 4160, or 36 CFR Part 251) would be
- 127 conducted prior to approving proposed management actions.
- 128 **3.11.** GD-11: Impacts analysis on other sagebrush steppe species and impacts on state
- 129 endowment trust lands managed by the Idaho Department of Lands would be analyzed
- 130 during site-specific project NEPA review.
- 131 **3.12.** GD-12: Activities not specifically addressed by the plan amendment would still be
- 132 subject to the allowances and restrictions of the applicable land use plans.
- 133 **3.13.** GD-13: Information in the Management Plan and Conservation Strategies for Sage-
- 134 Grouse in Montana would be considered when designing projects that may affect sensitive
- 135 species or federally listed species in Montana.
- 136 **3.14.** GD-14: Any oil and gas leasing decisions would be consistent with the BLM and
- 137 Forest Service requirements for leasing decisions as found in 43 CFR Part 3101 and 36 CFR
- 138 228.102, respectively.
- 139 **3.15.** GD-15: In conjunction with plan evaluation, re-evaluate management zones,
- 140 required design features and other protective stipulations as new science, information and
- 141 data regarding the habitats and behavior of the species is obtained. Incorporate these
- 142 findings as part of plan maintenance.
- 143 **3.16.** GD-16: Incorporate required design features (RDFs) as described in Appendix A in
- 144 the development of project or proposal implementation, reauthorizations or new
- 145 authorizations and suppression activities.
- 146 **3.17.** GD-17: Incorporate best management practices as described in Appendix A, as
- 147 applicable and appropriate in the design and development of implementation activities and
- 148 projects.
- 149 **3.18.** GD-18: Conduct implementation and project activities consistent with seasonal
- 150 habitat restrictions described in Appendix B.

151
152
153
154
155
156
157
158

- 3.19.** GD-19: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.
- 3.20.** GD-20: Consistent with regulations, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs that would result in full rehabilitation to restore lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work.

REVIEW

159 **4. Coordination**

- 160 4.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and
161 monitor activities to achieve desired conditions and to maximize the utilization of available
162 funding opportunities. Coordination efforts could include: adjacent landowners, federal
163 and state agencies, local governments, tribes, communities, other agencies, resource
164 advisory groups and non-governmental organizations.
- 165 4.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to
166 establish the State of Idaho as a cooperating agency during implementation of the final
167 decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and
168 Task Team. Montana BLM will participate as appropriate on Montana's Sage-grouse
169 Oversight Team to facilitate coordinated and implementation of BLM's final decision and
170 Montana's forthcoming sage-grouse conservation strategy.
- 171 4.3. CC-3: The BLM and Forest Service would consider any recommendations from the
172 Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation
173 Task Force.
- 174 4.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana
175 and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse
176 Oversight Team regarding proposed management changes, the implementation of
177 conservation measures, mitigation, and site-specific monitoring, related to adaptive
178 management and livestock grazing (Appendix O).
- 179 4.5. CC-5: At the state level, BLM and Forest Service would consider recommendations from
180 the Governor in the decision process recognizing that the BLM and Forest Service have the
181 final decision making authority and responsibility on federal lands under their appropriate
182 jurisdiction.
- 183 4.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP,
184 USFWS, and other conservation partners in collaborative efforts with adjacent states
185 (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG
186 habitat and population status and trends within the broader USFWS PACs and make
187 appropriate recommendations for GRSG conservation at broader scales.
- 188 4.7. CC-7: At the state level, BLM and Forest Service would coordinate with appropriate
189 WAFWA Sage-grouse Technical Committee to develop consistent population and habitat
190 monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 191 4.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies
192 to ensure that local air quality is not significantly impacted by BLM and Forest Service
193 activities.
- 194
195

5. Greater Sage-Grouse Management Areas

5.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karas Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry's Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

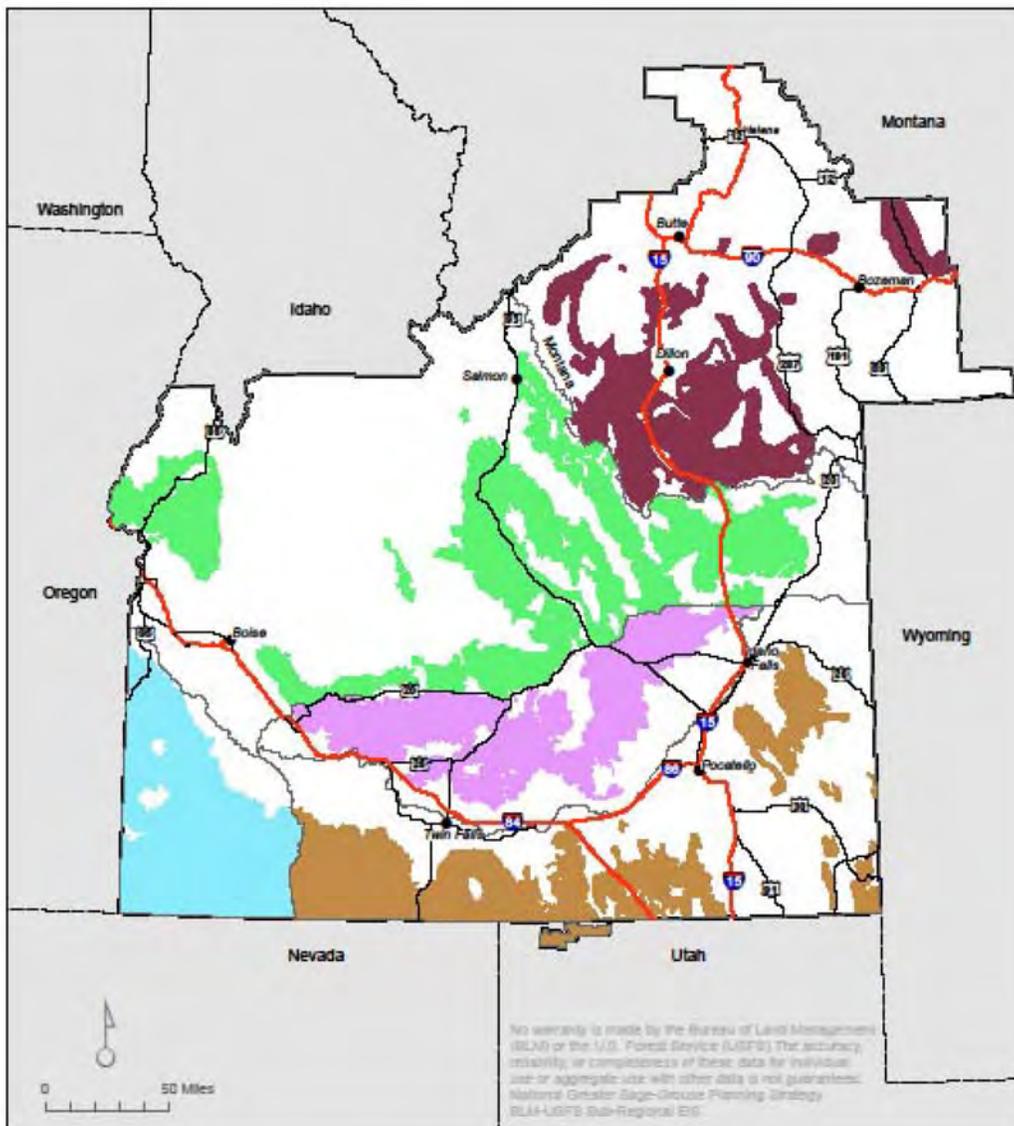

Southwestern Montana – located in southwestern Montana - encompassing the Dillon and Butte BLM Field Office boundaries.

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

5.2. MA-2: Within each Conservation Area (CA) designate GRSG Management Zones: Core, Important and General Management Zones (Map 2). **Core Management Zones (CMZs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The CMZ encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Core Management Zones include adequate area to accommodate continuation of existing land uses and landowner activities. **Important Management Zones (IMZs)** contain additional high value habitat and populations that provide a management buffer for the CMZ, connect patches of CMZ. The IMZ encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations

- 243 (Priority Areas for Conservation (PACs)). The IMZs are typically adjacent to CMZs but
244 generally reflect somewhat lower GRSG population status and/or reduced habitat value due
245 to disturbance, habitat fragmentation or other factors. There are no IMZs designated within
246 the Southwestern Montana CA. **General Management Zones (GMZs)** encompass habitat
247 that is outside of CMZs or IMZs. It is generally characterized by more marginal habitat and
248 few, if any, occupied leks or other important seasonal use areas.
- 249 **5.3.** MA-3: Annually prioritize Conservation Areas at the state scale considering results of the
250 annual adaptive regulatory trigger evaluations relative to implementation of restoration and
251 mitigation activities.
- 252 **5.4.** MA-4: Prioritize activities to protect, enhance and restore GRSG habitats (i.e. suppression
253 activities, fuels management activities, vegetation treatments, invasive species treatments,
254 etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of
255 engaging adaptive management), followed by Core Management Zones, then Important
256 Management Zones then General Management Zones within the Conservation Areas. Local
257 priority areas within these zones will be further refined as a result of completing the GRSG
258 Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could
259 include projects outside GRSG habitat when those projects would provide a benefit to
260 GRSG habitat.
- 261 **5.5.** MA-5: The management zone map and biologically significant unit baseline map would be
262 re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years).
263 This re-evaluation could indicate the need to adjust Core, Important or General
264 Management Zones or the habitat baseline. These adjustments could occur upon
265 completion of the appropriate analysis (plan amendment) to review the allocation decisions
266 based on the map.
- 267 **5.6.** MA-6: The appropriateness of specific project proposals or management activities within
268 the management zone designations (Core, Important, General) would be assessed
269 individually during project-level NEPA analysis. This evaluation is necessary since
270 designations of Core, Important and General Management Zones were derived at a broad
271 scale with additional refinements relative to boundaries and management consideration;
272 locally GRSG habitat suitability and vegetation characteristics vary.
- 273

274 6. Adaptive Management

- 275 6.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers,
276 evaluated within a Conservation Area, to determine an appropriate management response.
- 277 6.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan
278 (Appendix E) to determine when adaptive regulatory triggers have been met.
- 279 6.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through
280 use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to
281 track and identify habitat changes to assess the habitat trigger in the adaptive management
282 approach. Key habitat map updates are made each winter by BLM in coordination with the
283 FS and Idaho Department of Fish and Game (IDFG), using the process described in
284 Appendix F.
- 285 6.4. AM-4: BLM and Forest Service would utilize population information collected and
286 maintained by the Idaho Department of Fish and Game to track and identify population
287 changes to assess the population trigger in the adaptive management approach...
- 288 6.5. AM-5: Twice each year the applicable monitoring information would be reviewed to
289 determine if any adaptive management criteria have been met.
- 290 6.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships
291 within the biologically significant units (BSU). The BSU is defined as the nesting and
292 wintering habitat within Core and Important Management Zones within a Conservation
293 Area.
- 294 6.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
295 A 20 percent combined loss of nesting and/or wintering habitat within CMZ within
296 a CA compared to the 2011 biologically significant unit (BSU) baseline (Map 3) (The
297 BSU is defined as the nesting and wintering habitat within Core and Important
298 Management Zones within a Conservation Area, inclusive of all ownerships and is
299 used in the evaluation of the adaptive regulatory triggers and the anthropogenic
300 disturbance threshold); or
301 A 20 percent combined loss of nesting and/or wintering habitat within IMZ within a
302 CA compared to the 2011 BSU baseline.
- 303 6.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
304 A 10 percent combined loss of nesting and/or wintering habitat within CMZ within
305 a CA compared to the 2011 BSU baseline; or
306 A 10 percent combined loss of nesting and/or wintering habitat within IMZ within a
307 CA compared to the 2011 BSU baseline.
- 308 6.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
309 A 20 percent decline in maximum number of males counted and a finite rate of change
310 significantly below 1.0 within CMZ within a CA over a period of 3 consecutive years
311 compared to the 2009-2011 baseline; or
312 A 20 percent decline in maximum number of males counted and a finite rate of change
313 significantly below 1.0 within IMZ within a CA over a period of 3 consecutive years
314 compared to the 2009-2011 baseline.
- 315 6.10. AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
316 A 10 percent decline in maximum number of males counted and a finite rate of
317 change below 1.0 within CMZ within a CA over a period of 3 years when compared
318 to the average finite rate of change from 2009-2011; or

- 319 A 10 percent decline in maximum number of males counted and a finite rate of
320 change below 1.0 within IMZ within a CA over a period of 3 years when compared
321 to the average finite rate of change from 2009-2011.
- 322 **6.11.** AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been
323 met then the Implementation Team would engage to identify implementation level
324 actions that may be appropriate to consider.
- 325 **6.12.** AM-12: When any of the Adaptive Regulatory Criteria for Soft Triggers have been
326 met the Implementation Team would evaluate causal factors and recommend
327 additional potential implementation level activities Appendix G.
- 328 **6.13.** AM-13: When any of the Adaptive Regulatory Criteria for Hard Triggers have been
329 met due to loss of habitat then CMZ management actions would be applied to the
330 IMZ within that CA.
- 331 **6.14.** AM-14: If an adaptive regulatory trigger is tripped and livestock grazing is identified
332 as a probable limiting factor then adjustments would follow the Adaptive Grazing
333 Management Response described in Appendix G.
- 334 **6.15.** AM-15: Remove any adaptive management response when the habitat or population
335 information shows a return to or an exceedance of baseline values within the
336 associated CA.
- 337 **6.16.** Montana Adaptive Management:
338

339 **7. Anthropogenic Disturbance**

340 **7.1.** Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as
341 calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the
342 nesting and wintering habitat within Core and Important Management Zones within a
343 Conservation Area, inclusive of all ownerships. Anthropogenic disturbance excludes habitat
344 disturbance from wildfire and includes activities described in Appendix H. For Idaho this
345 disturbance is measured by direct footprint or by ROW width for linear features. For
346 Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool
347 process described in Appendix I.

348 **7.2.** AD-2: New anthropogenic disturbances within winter and nesting habitat within Core or
349 Important management zones within a CA where the disturbance threshold is already
350 exceeded from any source or where the proposed development would result in the
351 threshold being exceeded would not be allowed until enough habitat has been restored to
352 maintain the area under this threshold (subject to valid existing rights).

353 **7.3.** AD-3: Core Management Zone: Anthropogenic Disturbance Exception Criteria – in
354 addition to the Core and Important Management Zone Anthropogenic Disturbance
355 Development Criteria (AD-4), the following criteria must all be met in the screening and
356 assessment process:

- 357 a. The population trend for the GRSG within the associated Conservation Area is
358 stable or increasing over a three-year period and the population levels are not
359 currently engaging the adaptive management triggers (this applies strictly to new
360 authorizations; renewals and amendments of existing authorizations would not be
361 subject to this criteria when it can be shown that long-term impacts from those
362 renewals or amendments would be substantially the same as the existing
363 development);
- 364 b. The development with associated mitigation would not result in a net loss of GRSG
365 habitat and would provide a net conservation benefit of the respective Core
366 Management Zone;
- 367 c. The project would not likely result in a net loss of GRSG habitat or habitat
368 fragmentation or other impacts causing a decline in the population of the species
369 within the relevant CA;
- 370 d. The project is developed pursuant to a valid existing authorization;
- 371 e. The project is an incremental upgrade/capacity increase of existing development;
- 372 f. Cannot be reasonably accomplished outside of the Core Management Zone;
- 373 g. Can be co-located within the footprint of existing infrastructure (proposed actions
374 would not increase the 2011 authorized footprint and associated impacts more than
375 fifty percent (50%), depending on industry practice.
- 376 h. Development would follow the required design features (RDF) and best
377 management practices (BMPs) as described in Appendix A;
- 378 i. The project would not exceed the disturbance threshold (AD-1).
- 379 j. The project has been reviewed by the State Implementation Team and
380 recommended for consideration by the Idaho Governor.

381 **7.4.** AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development
382 Criteria – the following criteria must be met in the screening and assessment process:

- 383 a. The project cannot reasonably be achieved, technically or economically, outside of
384 this management zone; and

- 385 b. The project is co-located within the footprint for existing infrastructure, to the
- 386 extent practicable. In the event co-location is not practicable, the siting should best
- 387 reduce cumulative impacts and/or impacts on other high value natural, cultural, or
- 388 societal resources; and
- 389 c. The project does not result in a net loss of GRSG habitat or habitat fragmentation
- 390 or other impacts causing a decline in the population of the species within the
- 391 relevant CA; and
- 392 d. The project design mitigates unavoidable impacts through appropriate
- 393 compensatory mitigation; and
- 394 e. The project complies with the applicable RDFs and BMPs as described in
- 395 Appendix A.
- 396 f. The project would not exceed the disturbance threshold (AD-1).
- 397 **7.5. AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading**
- 398 **ROWs is preferred over the creation of new ROWs or the construction of new facilities in**
- 399 **all management zones.**
- 400 **7.6. AD-6: Construction activities and other short-term anthropogenic disturbances would be**
- 401 **carried out subject to seasonal and timing restrictions Appendix B.**
- 402

REVIEW

403 **8. Mitigation**

- 404 **8.1.** Mitigation (MIT)-1: BLM and USFS would establish an inter-agency GRSG Conservation
405 Board at the state level (both Idaho and Montana) to oversee GRSG Conservation.
- 406 **8.2.** MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Board would
407 develop a State Mitigation Strategy. In Idaho this strategy would be consistent with the
408 Idaho Mitigation Framework (Appendix J).
- 409 **8.3.** MIT-3: Mitigate impacts from anthropogenic developments (Appendix H) to GRSG
410 habitats by first avoidance of impacts, minimizing impacts and then compensating for
411 impacts.
- 412 **8.4.** MIT-4: Mitigate anthropogenic development (Appendix H) impacts to CMZs to a no net
413 loss standard (Appendix K) through application of appropriate mitigation in accordance
414 with the Mitigation Framework (Appendix L), referred to as no unmitigated loss.
- 415 **8.5.** MIT-5: Mitigate anthropogenic development (Appendix H) impacts to GRSG habitat
416 through application of appropriate mitigation in accordance with the Mitigation Framework
417 (Appendix L).
- 418

REVIEW

419 **9. Wildfire Preparedness/Prevention**

- 420 **9.1.** Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland
421 Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 422 **9.2.** WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the
423 existing coordinated inter-agency approach to fire restrictions based upon National Fire
424 Danger Rating System thresholds (fuel conditions, drought conditions, and predicted
425 weather patterns).
- 426 **9.3.** WFP-3: Annually incorporate into existing fire management plans results and updates from
427 the Wildfire and Invasive Species Habitat Assessments described in Appendix D, to
428 communicate/explain the resource value of GRSG habitat, including fire prevention
429 messages and actions to reduce human-caused ignitions.
- 430 **9.4.** WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative,
431 interagency organization dedicated to achieving consistent implementation of the goals,
432 actions, and policies in the National Fire Plan and the Federal Wildland Fire Management
433 Policy.
- 434 **9.5.** WFP-5: Continue annual coordination meetings held between cooperating agencies that
435 have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations
436 and other stakeholders into this coordination. Discuss priority suppression areas and
437 distribute maps showing priority suppression areas at both the Conservation Area and the
438 local office levels as based on the adaptive management strategy and Wildfire and Invasive
439 Species Assessments.
- 440 **9.6.** WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat
441 and sagebrush management issues as related to wildfire suppression.
- 442 **9.7.** WFP-7: As part of the Wildfire and Invasive Species Assessments, identify roads, trails, and
443 recreational use areas with high frequency of human caused fires within or adjacent to the
444 Core or Important Management Zones. Consider these areas during annual fire restriction
445 evaluations, and as appropriate, through site specific management.
- 446 **9.8.** WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention
447 programs to reduce human caused ignitions.
- 448 **9.9.** WFP-9: Implement activities identified within the Wildfire and Invasive Species
449 Assessments.
- 450

451 **10. Wildfire Suppression**

452 **10.1.**WFS-1: Complete Wildland Fire and Invasive Species Assessments as described within
453 Appendix D within 1 year of the Record of Decision and incorporate results into
454 appropriate Fire Management Plans as they are completed. Wildfire and Invasive Species
455 Habitat Assessments are interdisciplinary evaluations of the threats posed by wildfire and
456 invasive species, as well as identification of priority areas/treatment opportunities for fuels
457 management, fire management, and restoration. These assessments identify priority areas
458 and describe strategies for fuels management, suppression and restoration activities.

459 **10.2.** WFS-2: As part of the Wildfire and Invasive Species Assessments incorporate a
460 wildfire response time analysis focusing on response time to identified priority areas within
461 Core and Important Management Zones or on those fires that have the potential to impact
462 Core and Important Management Zones. Incorporate findings into Unit Initial Attack
463 program

464 **10.3.** WFS-3: As part of the Wildfire and Invasive Species Assessment incorporate a water
465 capacity analysis for suppression purposes, including potential private water sources.
466 Provide water availability to respond to fire in or threatening CMZ and IMZ during initial
467 attack.

468 **10.4.** WFS-4: During high fire danger conditions, stage initial attack and secure additional
469 resources closer to priority areas identified in the Wildfire and Invasive Species
470 Assessments, based on anticipated fires and weather conditions, with particular
471 consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure
472 quicker response times in or near GRSG habitat.

473 **10.5.** WFS-5: Utilize a full range of fire management strategies and tactics through
474 strategic wildfire suppression planning consistent with appropriate management response
475 and within acceptable risk levels, to achieve resource objectives for GRSG habitat
476 consistent with land use plan direction. Utilizing both direct and indirect attack as
477 appropriate to limit the overall amount of GRSG habitat burned. This could include
478 suppressing fires in intact sagebrush habitats; limiting fire growth in General Management
479 Zones when suppression resources are available or managing wildfire for resource benefit in
480 areas of conifer (juniper) encroachment.

481 **10.6.** WFS-6: Suppression priorities: Firefighter and public safety followed by property are
482 the highest priority for protection during suppression activities. Maintaining GRSG habitat
483 will be prioritized immediately after human life and property, commensurate with
484 threatened and endangered species habitat or other critical habitats to be protected.

485 **10.7.** WFS-7: Ensure close coordination with federal and state firefighters including the
486 Rangeland Fire Protection Associations during suppression activities.

487

488 **11. Fuels Management**

- 489 **11.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and
490 spread of unwanted wildfires and provide anchor points or control lines for the
491 containment of wildfires during suppression activities with an emphasis on maintaining,
492 protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and
493 strategically and effectively reduce wildfire threats in the greatest area.
- 494 **11.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to
495 match expected potential for the ecological site and consistent with GRSG habitat
496 objectives unless fuels management objectives requires additional reduction in sagebrush
497 cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel
498 management treatments against the additional loss of sagebrush cover on the local
499 landscape in the NEPA process.
- 500 **11.3.** FM-3: Apply appropriate seasonal restrictions for implementing fuels management
501 treatments according to the type of seasonal habitats present. Allow no treatments in
502 known winter range unless the treatments are designed to strategically reduce wildfire risk
503 around and/or in the winter range and would protect, maintain, increase, or enhance winter
504 range habitat quality. Ensure chemical applications are utilized where they would assist in
505 success of fuels treatments. Strategically place treatments on a landscape scale to prevent
506 fire from spreading into Core Management Zones or WUI.
- 507 **11.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain
508 and protect GRSG habitat informed by the Wildfire and Invasive Species Assessments
509 completed as described in Appendix D.
- 510 **11.5.** FM-5: When developing the fuels management strategy as part of the Wildfire and Invasive
511 Species Assessment described in Appendix D consider up-to-date fuels profiles; land use
512 plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological
513 factors; active vegetation management steps to provide critical breaks in fuel continuity
514 where appropriate; incorporate a comparative risk analysis with regard to the risk of
515 increased habitat fragmentation from a proposed action versus the risk of large scale
516 fragmentation posed by wildfires if the action is not taken.
- 517 **11.6.** FM-6: Fuel treatments will be designed though an interdisciplinary process to expand,
518 enhance, maintain, and protect GRSG habitat which considers a full range of fuel reduction
519 techniques, including: grazing, targeted grazing, prescribed fire, chemical, biological and
520 mechanical treatments.
- 521 **11.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as
522 vegetated fuel breaks in appropriate areas.
- 523 **11.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located
524 adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be
525 placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster
526 suppression options to protect existing intact habitat.
- 527 **11.9.** FM-9: Strategically pre-treat areas to reduce fine fuels.
- 528 **11.10.** FM-10: Protect seeding efforts from subsequent fire events.
- 529 **11.11.** FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to
530 reduce the potential start and spread of unwanted wildfires may be implemented
531 within existing grazing authorizations if feasible such as through temporary non-
532 renewable authorizations, or through contracts, agreements or other appropriate
533 means separate from existing grazing authorizations and permits.

- 534 **11.12.** FM-12: Targeted grazing to achieve fuels management objectives should conform to
535 the following criteria:
- 536 • Targeted grazing should be implemented strategically on the landscape, and
537 directly involve the minimum footprint and grazing intensity required to meet fuels
538 management objectives.
 - 539 • Allow conformance to the applicable Standards for Rangeland Health and
540 Guidelines for Livestock Grazing Management (Idaho or Montana) at the
541 assessment scale.
 - 542 • Where feasible and applicable coordinate with the grazing permittee to
543 strategically reduce fuels through livestock management within the Mandatory Terms
544 and Conditions of the applicable grazing authorizations
- 545 **11.13.** FM-13: Prioritize the use of native seeds for fuels management treatment based on
546 availability, adaptation (site potential), and probability of success. Where probability
547 of success or native seed availability is low or non-economical, nonnative seeds may
548 be used to meet GRSG habitat objectives to trend toward restoring the fire regime.
549 When reseeding, use fire resistant native and nonnative species, as appropriate, to
550 provide for fuel breaks.
- 551 **11.14.** FM-14: Maintain effectiveness of fuels projects to ensure long-term success,
552 including persistence of seeded species and/or other treatment components while
553 maintaining the integrity of adjacent vegetation.
554

- 555 **12. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**
556 **12.1.** ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of
557 the Wildfire and Invasive Species Assessment process described in Appendix D to
558 determine if rehabilitation actions are needed, based on ecological potential, and direct
559 emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency
560 Restoration (BAER) (FS) actions after fire.
- 561 **12.2.** ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans
562 based on site potential and in accordance with the Restoration/Rehabilitation
563 Strategy developed as a result of the Wildfire and Invasive Species Assessments.
- 564 **12.3.** ESR-3: Adjust management activities, as appropriate to ensure successful
565 establishment of vegetation from ESR and rehabilitation informed through the
566 evaluation of measurable groundcover and vegetation objectives such as plant vigor,
567 seed production and growing season conditions.
- 568 **12.4.** ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas
569 to mitigate the effect of the burn on local GRSG populations.
570

REVIEW

571 **13. Habitat Restoration and Vegetation Management**

572 **13.1.** VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential
573 to improve GRSG habitat using a full array of treatment activities as appropriate, including
574 chemical, mechanical and seeding treatments.

575 **13.2.** VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance
576 sagebrush cover or to promote diverse and healthy grass and forb understory to
577 achieve the greatest improvement in GRSG habitat based on Wildfire and Invasive
578 Species Assessments, HAF assessments, other vegetative assessment data and local,
579 site specific factors that indicate sagebrush canopy cover or herbaceous conditions
580 do not meet habitat management objectives (i.e. is minimal or exceeds optimal
581 characteristics). This may necessitate the use of prescribed fire as a site preparation
582 technique to remove annual grass residual growth prior to the use of herbicides in
583 the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but
584 such efforts will be carefully planned and coordinated to minimize impacts to sage-
585 grouse seasonal habitats.

586 **13.3.** VEG-3: Require use of native seeds for restoration based on availability, adaptation
587 (ecological site potential), and probability of success (Richards et al. 1998). Non-
588 native seeds may be used as long as they support GRSG habitat objectives (Pyke
589 2011) to increase probability of success, when adapted seed availability is low or to
590 compete with invasive species especially on harsher sites.

591 **13.4.** VEG-4: Implement management changes in restoration and rehabilitation areas, as
592 necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and
593 to ensure long-term persistence of improved GRSG habitat (Eiswerth and
594 Shonkwiler 2006). Management changes could be considered during livestock
595 grazing permit renewals, travel management planning, and renewal or reauthorization
596 of rights-of-way.

597 **13.5.** VEG-5: Consider establishing seed harvest areas that are managed for seed
598 production (Armstrong 2007) to provide a reliable source of locally adapted seed to
599 use during rehabilitation and restoration activities.

600 **13.6.** VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years
601 when preferred native seed is in short supply. This may require reallocation of native
602 seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Core or
603 Important Management Zones to those inside it. Where probability of success or
604 native seed availability is low, nonnative seeds may be used as long as they meet
605 GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate
606 sagebrush species/subspecies and important understory plants, relative to site
607 potential, shall be the highest priority for rehabilitation efforts.

608 **13.7.** VEG-7: During land health assessments evaluate the compatibility of existing
609 nonnative seedings for GRSG habitat to keep as a component of a grazing system,
610 development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or
611 during restoration development. If nonnative seedings do not contribute to a
612 grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks,
613 evaluate the nonnative seedings in and adjacent to CMZ to determine if they should
614 be diversified with or converted to native grasses, forbs, and shrubs, including
615 sagebrush.

616 **13.8.** VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer
617 encroachment areas. Refrain from using prescribed fire and conducting removal

projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).

REVIEW

627 **14. Invasive Species**

628 **14.1.** Invasive Species (INV)-1: Incorporate results of the Wildfire and Invasive Species
629 Assessments into projects and activities addressing invasive species.

630 **14.2.** INV-2: Implement noxious weed and invasive species control using integrated weed
631 management actions per national guidance and local weed management plans for
632 Cooperative Weed Management Areas in cooperation with State and Federal
633 agencies, affected counties, and adjoining private lands owners.

634 **14.3.** INV-3: Conduct integrated weed management actions for noxious and invasive weed
635 populations that are impacting or threatening GRSG habitat quality using a variety of
636 eradication and control techniques including chemical, mechanical and other
637 appropriate means.

638 **14.4.** INV-4: Require project proponent to ensure that treatments of noxious weeds and
639 invasive species on disturbed project construction areas are completed for at least 3
640 years.

641

REVIEW

642 **15. Lands and Realty / Infrastructure**

643 **15.1.** Lands and Realty (LR)-1: Core: Designate and manage Core Management Zones as ROW
644 avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions (Appendix
645 A, B & C). Important: Designate and manage Important Management Zones as ROW
646 avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions. General:
647 Designate and manage General Management Zones as open with proposals subject to
648 RDFs, BMPs, buffers and seasonal timing restrictions.

649 **15.2.** LR-2: Core: Designate and manage Core Management Zones as exclusion areas for
650 utility scale (20 MW) Wind and Solar testing and development, nuclear and
651 hydropower energy development. Important: Designate and manage Important
652 Management Zones as avoidance areas for Wind and Solar testing and development,
653 nuclear and hydropower development. General: Designate and manage General
654 Management Zones as open for Wind and Solar testing and development and
655 nuclear and hydropower development subject to RDFs, BMPs, buffers and seasonal
656 timing restrictions.

657 **15.3.** LR-3: Core: Development of commercial service airports and facilities (as defined by
658 FAA 2014 – publically owned airports that have at least 2,500 passenger boardings
659 each calendar year and receive scheduled passenger service) would not be allowed
660 within Core Management Zones. Important and General Management Zones are
661 Avoidance and Open respectively for these types of ROW applications as described
662 in LR-1.

663 **15.4.** LR-4: Core: Development of new landfills would not be allowed within Core
664 Management Zones. Important and General Management Zones are Avoidance and
665 Open respectively for these types of ROW applications as described in LR-1.

666 **15.5.** LR-5: Core Management Zones: Rights-of-way for development of new or amended
667 ROWs and land use authorizations, not excluded, would only be considered when
668 consistent with the Anthropogenic Disturbance Exception Criteria (AD-3).
669 Important: Rights-of-way for development of new or amended ROWs and land use
670 authorizations, not excluded, could be considered consistent with the Important
671 Management Zones Anthropogenic Disturbance Development Criteria. (AD-4).
672 General: New ROW and land use authorizations could be considered.

673 **15.6.** LR-6: If the project is an incremental upgrade/capacity increase of existing
674 development - the existing transmission line must be removed within a specified
675 amount of time after the new line is installed and energized.

676 **15.7.** LR-7: Existing designated corridors, including Section 368 Corridors, will remain
677 Open (subject to the ongoing settlement agreement).

678 **15.8.** LR-8: Process unauthorized use. If the use is subsequently authorized, it would be
679 authorized consistent with direction for the Management Zones within which it is
680 located and the RDFs, BMPs, buffers and seasonal timing restrictions. If the use is
681 not subsequently authorized the site would be reclaimed by removing these features
682 and restoring the habitat.

683 **15.9.** LR-9: Land use authorizations that are temporary in nature would be subject to
684 seasonal or timing restrictions and mitigation requirements regarding habitat loss as
685 needed.

686 **15.10.** LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or
687 amendments to existing water facilities which include additional structures to
688 improve fish passage or benefits to fisheries (new diversions, fish screens) would be

- 689 allowed on a case-by-case bases subject to RDFs and BMPs to reduce impacts to
690 GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 691 **15.11.** LR-11: When a ROW grant expires, is relinquished, or terminated, the lease holder
692 would be required to reclaim the site by removing overhead lines and other
693 infrastructure and to eliminate avian predator nesting opportunities provided by
694 anthropogenic development on public lands associated with the now void ROW
695 grant (e.g., remove powerline and communication facilities no longer in service).
- 696 **15.12.** LR-12: Work with ROW holders to retrofit existing towers with perch deterrents or
697 other anti-perching devices, where appropriate, to limit GRSG predation.
- 698 **15.13.** LR-13: Land tenure adjustments would be subject to the following disposal,
699 exchange, and acquisition criteria, which include retaining lands with GRSG habitat.
700 Retention of areas with GRSG would reduce the likelihood of habitat conversion to
701 agriculture, urbanization, or other uses that would remove sagebrush habitat and
702 potentially impact sensitive plants. Criteria:
- 703 a. Lands within Core and Important Management Zones would not be available
704 for disposal (Appendix M).
 - 705 b. Acquire habitat within Core and Important Management Zones, when
706 possible (i.e. willing landowner), and retain ownership of habitat within all Zones,
707 except if a land exchange would allow for additional or more contiguous federal
708 ownership patterns.
 - 709 c. Lands within Core and Important Management Zones would be retained
710 unless exchange of those lands would increase the extent or provide for connectivity
711 of Core or Important Management Zones.
 - 712 d. Evaluate potential land exchanges containing historically low-quality GRSG
713 habitat that may be too costly to restore in exchange for lands of higher quality
714 habitat, lands that connect seasonal GRSG habitats or lands providing for threatened
715 and endangered species. These potential exchanges should lead to an increase in the
716 extent or continuity of or provide for improved connectivity of Core Management
717 Zones. Higher priority will be given to exchanges for those in-tact areas of
718 sagebrush that will contribute to the expansion of sagebrush areas within Core
719 Management Zones currently in public ownership. Lower priority would be given to
720 other lands that would promote enhancement in the Core and Important
721 Management Zones.
 - 722 e. Identify lands for acquisition that increase the extent of or provide for
723 connectivity of Core Management Zones.
- 724

725 16. Minerals

726 16.1. Fluid Minerals

727 **16.1.1.** Fluid Minerals (FLM)-1: Idaho: Areas within Core Management Zones with no or
728 low potential for fluid mineral development (oil and gas or geothermal) would be
729 closed. Areas within Core Management Zones with moderate to high potential for
730 development and Important Management Zones would be open to mineral leasing and
731 development subject to no surface occupancy, in accordance with the Anthropogenic
732 Disturbance Exceptions (Core – AD-3) and the Anthropogenic Disturbance
733 Development Criteria (Important – AD-4) subject to RDFs, BMPs, buffers, timing
734 restrictions and standard stipulations. General Management Zones would be open to
735 mineral leasing and development subject to CSU which includes RDFs, BMPs, buffers,
736 seasonal timing restrictions and standard stipulations. Montana: Areas within Core
737 Management Zones would be open to leasing subject to no surface occupancy. No
738 waivers, exceptions or modifications would be allowed unless approved by the State
739 Director. General Management Zones would be open to leasing subject to CSU which
740 includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations.

741 **16.1.2.** FLM-2: Core Management Zones: Waivers, exemptions or modifications to the
742 NSO stipulation could be considered upon recommendation from the Governor
743 through the Implementation Task Force during the federal site-specific NEPA analysis
744 based on Core Management Zone Anthropogenic Disturbance Exception Criteria
745 (AD-3). Important Management Zones: Waivers, exceptions or modifications to the
746 NSO stipulation could be considered upon recommendation from the Governor
747 through the Implementation Task Force during the federal site-specific NEPA analysis
748 based on the Important Management Zone Anthropogenic Disturbance Development
749 Criteria (AD-4). In the event a waiver, exception or modification were allowed
750 development would still be subject to CSU which includes RDFs, BMPs, buffers,
751 seasonal timing restrictions and standard stipulations.

752 **Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

753
754 A waiver is a permanent exemption from a lease stipulation, the stipulation would no
755 longer apply anywhere within the lease. Waivers require a 30-day public review and are
756 approved and signed by the State Director.

757
758 An exception is a one-time exemption for a particular site within the lease; exceptions
759 are determined on a case-by-case basis; the stipulation continues to apply to all other
760 sites within the lease. An exception is a limited type of waiver.

761
762 A modification is a change to the provisions of a lease stipulation, either temporarily or
763 for the term of the lease. Depending on the specific modification, the stipulation may
764 or may not apply to all sites within the lease to which the restrictive criteria are applied.

765 **16.1.3.** FLM-3: Incorporate required design features, best management practices appropriate
766 to the management area, buffers and seasonal timing restrictions as conditions of
767 approval into any post-lease activities.

768 **16.1.4.** FLM-4: Complete a Master Development Plan on leases where a producing field is
769 proposed to be developed.

770 **16.1.5.** FLM-5: Encourage unitization when deemed necessary for proper development and
771 operation of an area (with strong oversight and monitoring). The unitization must be

772 designed in a manner to minimize adverse impacts on GRSG according to the Federal
773 Lease Form, 3100-11, Sections 4 and 6.

774 **16.2. Unleased Fluid Minerals**

775 **16.2.1.** FLM-6: Allow temporary geophysical exploration, subject to site-specific RDFs,
776 BMPs, buffers, seasonal restrictions, and daily timing restrictions.

777 **16.2.2.** FLM-7: Parcels nominated for lease in Core or Important Management Zones would
778 be evaluated to determine whether they meet the Anthropogenic Disturbance
779 Exception (AD-3 for CMZ) or Anthropogenic Disturbance Development Criteria
780 (AD-4) for IMZ), prior to lease offering. Parcels which do not meet the criteria would
781 not be offered for lease.

782 **16.3. Locatable Minerals**

783 **16.3.1.** Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in
784 all management zones.

785 **16.3.2.** LOC-2: Apply reasonable and appropriate Conditions of Approval to prevent
786 unnecessary or undue degradation of GRSG habitat when a Plan of Operations is
787 submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36
788 CFR 228.5(a)(3) on National Forest System lands).

789 **16.4. Salable Minerals**

790 **16.4.1.** Salable Minerals (SAL)-1: Core: No new site authorizations would be approved.
791 Important: New site authorizations could be considered consistent with the
792 Anthropogenic Disturbance Development Criteria (AD-4) subject to RDFs, BMPs,
793 buffers and seasonal timing restrictions. Sales from existing community pits within
794 CMZ and IMZ would be subject to seasonal timing restrictions. General: Open to new
795 site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing
796 sites Open to new sales subject to seasonal timing restrictions.

797 **16.4.2.** SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat
798 management objectives.

799 **16.4.3.** SAL-3: Require reclamation bonding that would require restoration of GRSG habitat
800 on new site authorizations for mineral material pits in IMZ (this would not apply to
801 free use permits issued to a government entity such as a county road district, but would
802 apply to non-profit entities).

803 **16.5. Non-Energy Solid Mineral Leasable Minerals**

804 **16.5.1.** Non Energy Leasables (NEL)-1: Core and Important Management Zones: Areas
805 within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing. CMZ
806 areas outside KPLAs are closed to leasing and prospecting. IMZ areas outside of
807 KPLAs are open to leasing in accordance to the Anthropogenic Disturbance
808 Development Criteria (AD-4) subject to the anthropogenic disturbance cap (AD-1),
809 RDFs, BMPs, buffers and seasonal timing restrictions. Exceptions may be made for
810 lease modifications and fringe leases where valid existing rights may be affected.
811 General Management Zones: Lands are available for leasing, exploration activities and
812 initial mine development subject to RDFs, BMPs, buffers, timing restrictions (seasonal
813 and daily) and standard stipulations.

814 **16.5.2.** NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy
815 mineral leases when exploration activities or initial mine development is proposed, as
816 appropriate.

817 **16.5.3.** NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-
818 energy mineral leases.

826
827
828
829

16.6. Mineral Split Estate

16.6.1. Mineral Split Estate (MSE)-1: In coordination with surface land owner, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in the management zone where the federal government owns the mineral estate and the surface is non-federal ownership.

16.6.2. MSE-2: Recommend to the state regulatory entity to apply a timing restriction stipulation, COAs, and buffer restricts around occupied leks, when concurring to the approval of authorizations for mineral-related surface disturbance on lands in GRSG habitat where the federal government owns the surface and the mineral estate is in non-federal ownership.

REVIEW

830 **17. Range Management/Livestock Grazing**

831 17.1. Range Management (RM)-1: Continue to make GRSG habitat available for livestock
832 grazing. Active AUMs for livestock grazing would remain the same, though the number of
833 AUMs available on an allotment may be adjusted based on site-specific conditions to meet
834 management objectives during term permit renewals, AMP development, or other
835 appropriate implementation planning. Additionally, temporary adjustments can be made
836 annually to livestock numbers, the number of AUMs, season of use in accordance with
837 applicable regulations.

838 17.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing
839 permits consistent with management zone prioritization (MA-4), unless other higher
840 priority considerations exist such as threatened, endangered and proposed species
841 habitat that livestock grazing could affect. Where possible, conduct land health
842 assessments at the watershed, or other meaningful landscape-scale.

843 17.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage
844 livestock operations that utilize mixed federal, private and/or state land to be
845 managed at the landscape scale to benefit GRSG and their habitat across land
846 ownerships.

847 17.4. RM-4: CMZ & IMZ: During the land health assessment process, identify the type(s)
848 of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat
849 assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or
850 Forest Service approved methodology, in accordance with current policy and
851 guidance to determine whether vegetation structure, condition and composition are
852 meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2;
853 Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state
854 and transition models to inform desired habitat conditions and expected responses
855 to management changes for the land unit being assessed.

856 17.5. RM-5: When modifying grazing management, analyze indirect effects to habitat,
857 including changes in fuel loading and wildfire behavior.

858 17.6. RM-6: When livestock management practices are determined to not be compatible
859 with meeting or making progress towards achievable habitat objectives following
860 consultation, cooperating and coordination with permittees and interested publics,
861 implement changes in grazing management through grazing authorization
862 modifications, or allotment management plan implementation. Potential
863 modifications include, but are not limited to, changes in:

- 864 1) Season or timing of use;
- 865 2) Numbers of livestock;
- 866 3) Distribution of livestock use;
- 867 4) Duration and/or level of use;
- 868 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
- 869 6) Voluntary measures such as temporary non-use; and
- 870 7) Grazing schedules (including rest or deferment).

871 17.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration
872 and rehabilitation efforts in sage-grouse habitat areas.

873 17.8. RM-8: CMZ & IMZ - When an allotment becomes vacant or grazing preference is
874 relinquished, consider voluntary retirement of the allotment or grazing preference in
875 whole or in part, or converting the area to a forage reserve/buffer when doing so
876 would maintain or enhance sage-grouse habitat. GMZ - When an allotment

- 877 becomes vacant or grazing preference is relinquished, consider converting it to a
878 forage reserve/buffer to use during fire rehabilitation or restoration efforts
879 elsewhere, when such actions would result in a net benefit to GRSG habitat and
880 other priority resources.
- 881 **17.9.** RM-9: CMZ & IMZ - Where practical, design pasture rotations to utilize exotic
882 perennial grass seedings and/or annual grasslands, during GRSG nesting season
883 annually or periodically.
- 884 **17.10.** RM-10: Evaluate the locations where salt/supplements are placed. In coordination
885 with the permittee, have salt/supplements placed in areas which would reduce
886 impacts to GRSG habitat (e.g., existing disturbed areas).
- 887 **17.11.** RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit
888 disturbance of occupied leks when trailing livestock across BLM- and Forest Service
889 -administered lands in the spring. Work with permittees in locating over-nighting,
890 watering and bedding locations to minimize impacts to seasonal habitats.
- 891 **17.12.** RM-12: Design any new structural range improvements, following cooperation,
892 consultation and coordination with permittees, to minimize and/or mitigate effects
893 to GRSG habitat. Any new structural range improvements are subject to RDFs
894 (Appendix A). Structural range improvement in this context, include, but are not
895 limited to: fences, exclosures, corrals or other livestock handling structures;
896 pipelines, troughs, storage tanks (including moveable tanks used in livestock water
897 hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 898 **17.13.** RM-13: During the land health assessment and grazing permit renewal process,
899 evaluate existing livestock management range improvements with respect to their
900 effect on GRSG habitat. Consider removal of projects that are not needed for
901 effective livestock management, are no longer in working condition, and/or
902 negatively affect GRSG habitat, with the exception of functional projects needed for
903 management of habitat for other threatened, endangered or proposed species or
904 other sensitive resources.
- 905 **17.14.** RM-14: Prioritize removal, modification or marking of fences or other structures in
906 areas of high collision risk following cooperation, consultation and coordination with
907 permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens
908 et al. 2012).
909

910 **18. Wild Horses and Burros**

- 911 **18.1.** Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans
912 and Forest Service Wild Horse Territory Plans to incorporate GRSG habitat objectives and
913 management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 914 **18.2.** WHB-2: When evaluating AML on HMAs within CMZ, evaluate indicators that
915 address structure/condition/composition of vegetation and measurements specific
916 to achieving GRSG habitat objectives.
- 917 **18.3.** WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG
918 habitat to determine whether vegetation characteristics are meeting appropriate
919 seasonal habitat objectives.
- 920 **18.4.** WHB-4: CMZ: Do not expand HMAs. IMZ: Analysis of proposed additions to
921 existing HMA boundaries should consider the direct, indirect and cumulative
922 impacts on GRSG habitat, including the need for additional infrastructure such as
923 boundary fencing, and consider alternative areas outside of CMZ and IMZ.
924

REVIEW

925 **19. Travel Management**

- 926 **19.1.** Travel Management (TM) -1: Limit motorized travel within Idaho BLM Field
927 Offices to existing roads, primitive roads, and trails. This excludes areas previously
928 designated as open through an affirmative land use plan decision or currently under
929 review for designation as open, currently being analyzed in ongoing RMP revision
930 efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. The initial
931 designation would be “limited to existing roads, primitive roads and trails”; this
932 designation would change to “limited to designated roads, primitive roads and trails”,
933 in areas where travel management plans are completed.
- 934 **19.2.** TM-2: Close areas adversely affected by off-highway vehicles immediately to the
935 type(s) of vehicle causing the adverse effect until the adverse effects are eliminated
936 and measures implemented to prevent recurrence when the authorized officer
937 determines that off-road vehicles are causing or will cause considerable adverse
938 effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical
939 resources, threatened or endangered species, wilderness suitability, other authorized
940 uses, or other resources. This may include closure or specific routes or areas. (43
941 CFR 8341.2)
- 942 **19.3.** TM-3: Develop Travel Management Plans for each Field Office as described in the
943 BLM Travel Management Handbook 8342.1 and according to the travel
944 management planning guidelines (Appendix N).
- 945 **19.4.** TM-4: During subsequent travel management planning design and designate a travel
946 system to minimize adverse effects on GRSG. Locate areas and trails to minimize
947 harassment of wildlife or significant disruption of wildlife habitats. Give special
948 attention to protect endangered or threatened species and their habitats. Allow for
949 route upgrade, closure of existing routes, and creation of new routes to help protect
950 habitat and meet user group needs, thereby reducing the potential for pioneering
951 unauthorized routes. The emphasis of the comprehensive travel and transportation
952 planning within Core Management Zones would be placed on having a neutral or
953 positive effect on GRSG habitat.
- 954 **19.5.** TM-5: Conduct road maintenance activities to avoid disturbance during specific
955 times at different seasons – see seasonal and timing restrictions section.
956

957 **20. Recreation**

958 **20.1.** REC-1: Manage existing recreation uses and sites to minimize adverse effects on
959 GRSG or their habitat through incorporation of RDFs, BMPs, buffers and seasonal
960 restrictions.

961 **20.2.** REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails,
962 trailheads, staging areas) within CMZs and IMZs unless the development would have
963 a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation,
964 diverting use away from critical areas, etc.); or the new construction replaces existing
965 facilities and reduces impacts from the existing facilities as in TM-4, or unless the
966 development is required for visitor safety or resource protection.
967

REVIEW

968 **21. Monitoring**

- 969 **21.1.** Monitoring (MON)-1: Annually complete a review of Wildfire and Invasive Species
970 assessment implementation efforts within GRSG habitat with appropriate USFWS
971 and state agency personnel.
- 972 **21.2.** MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 973 **21.3.** MON-3: Monitor invasive vegetation post vegetation management treatment
- 974 **21.4.** MON-4: Monitor project construction areas for noxious weed and invasive species
975 for at least 3 years, unless control is achieved earlier.
- 976 **21.5.** MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to
977 annually assess GRSG population and habitat status in the context of the adaptive
978 management triggers.
- 979 **21.6.** MON-6: Continue to support updates to the Key Habitat map to track vegetation
980 changes in relation to GRSG habitat on a yearly basis, until such a time this process
981 is replaced. The process used to update the Key Habitat Map is described in
982 Appendix F.
- 983 **21.7.** MON-7: Monitor GRSG habitat as described in the monitoring framework plan
984 (Appendix E) in coordination with IDFG and MT FWP.

EMS TRANSMISSION Memorandum

To: Edwin L. Roberson
Assistant Director, Resources and Planning (AD-200)

From: Timothy M. Murphy 
Acting State Director, BLM Idaho

Jamie E. Connell
State Director, BLM Montana¹

Subject: Idaho and Southwestern Montana Subregional Administrative Draft Proposed Plan Update

I. INTRODUCTION

This memo documents the key elements, allocations, and disturbance considerations in the Idaho and Southwestern Montana (IDswMT) Subregional Greater Sage-grouse (GRSG) Land Use Plan Amendment and Final Environmental Impact Statement (FEIS) Administrative Draft Proposed Plan (ADPP) in response to WO Memo from Ed Roberson (1610 (210) of May 12, 2014). It has been reviewed and concurred with by the State Director in Montana/Dakotas.

The IDswMT effort includes portions of three states (Idaho, Montana, and Utah) and would amend 29 BLM and US Forest Service (USFS) land use plans. The planning area encompasses slightly more than 49 million acres of which 18.1 million acres are identified as GRSG habitat across all ownerships. BLM administered public lands comprise 9.3 million acres (roughly 50%) and USFS lands comprise 1.9 million areas (roughly 10%) of the total GRSG habitat within the subregion. Most of the subregion is located within WAFWA MZ IV with a small portion of southeast Idaho contained within WAFWA MZ II. The primary ongoing threats to GRSG are loss of habitat resulting from wildfire and spread of cheatgrass; of substantially less concern is loss of habitat due to infrastructure and oil and gas development. The ADPP addresses all of the applicable threats identified by population in the Fish and Wildlife Service (FWS) Conservation Objectives Team (COT) report (Table 1).

¹ This memorandum is a coordinated response from both Idaho and Montana BLM. It has been developed in coordination with the Montana BLM and has been concurred with by the Montana State Director.

II. COORDINATION

The ADPP has been developed in close coordination with BLM, USFS, FWS, the State of Idaho through the Governor's Office of Species Conservation and GRSG Task Force and the Idaho Department of Fish and Game and the State of Montana through Montana Fish Wildlife and Parks. The ADPP addresses the objectives described in the COT report and required policies and directives. The FWS provided the final COT threat assessment table as part of their public comments and the BLM held subsequent cooperating agency meetings with FWS, USFS and the State of Idaho to discuss, clarify and resolve the concerns identified in their letter and COT threat assessment table. The BLM has addressed all the concerns identified by FWS and have provided additional conservation measures or additional clarity to existing conservation measures in the ADPP (Table 2).

The State of Montana has prepared a draft strategy that has been reviewed. The Governor of Montana has yet to issue an expected Sage-Grouse Conservation Executive Order that would outline how the State of Montana would address GRSG conservation; therefore, it is not possible at this time to fully determine how the ADPP would compare with the potential State regulatory mechanisms or management actions to protect and conserve GRSG and their habitat. The Montana portion of the planning effort has also been coordinated with the other BLM plans in Montana to ensure some level of consistency within Montana. The ADPP (which applies to federal lands) remains flexible to provide cooperative landscape-level management for the conservation of GRSG which transcends ownership boundaries when coupled with the pending Executive Order from the Governor of Montana (which is anticipated to apply to all land ownerships whenever a state authorization is required).

III. KEY ELEMENTS

The primary threat to GRSG that the IDswMT effort responds to is wildfire. In coordination with the State of Idaho and FWS, the IDswMT ADPP identifies and maps three management zones (Core (ID & MT), Important (ID only) and General (ID & MT))² within five conservation areas (Map 1) which are responsive to the stochastic nature of wildfire and provide protections for GRSG and their habitat. Management actions for fuels and suppression management, in addition to those identified for inclusion from the Fire and Invasives Analysis Team have been included to further respond to the threat of wildfire. The ADPP also includes an adaptive management strategy and a mitigation strategy which utilizes the State of Idaho Mitigation Framework. For the SW Montana portion of the plan these components would be consistent with the Montana strategy.

The ADPP includes allocation decisions (Table 1) and program conservation measures to respond to GRSG threats, including required design features, best management practices, activity, and development buffers for GRSG leks and seasonal or timing restrictions.

The focus of the ADPP, including the delineation of three management zones, is to retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats and across broader habitat areas. Core Management Zones (CMZ) are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key metapopulations

² Within the subregion management areas have been delineated into three zones – Core, Important and General, only two of which occur in Montana – Core and General.

within the subregion (Garton et al. 2011). These areas encompass all the seasonal habitats necessary to support approximately 73% of the breeding males (and by association the entire population) in Idaho. The Important Management Zones (IMZ) are delineated to provide protection to seasonal habitats adjacent to the CMZs and support approximately 22% of the breeding males (and by association the entire population) in Idaho. The two management zones encompass the FWS identified priority areas for conservation (PAC) and include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas.

The areas identified in the IDswMT subregion include the seasonal habitats relied upon by roughly 95% of the entire GRSG population in the subregion as contrasted with adjacent states where roughly 70-80% of the entire GRSG populations are included within areas identified for primary focus on threat amelioration. The IDswMT ADPP provides threat amelioration management on an additional 1 million acres (243k of Core and 795k of Important) and 3.8% of the breeding males (and population – 687 males and 39 leks) than just those areas identified by USFWS as the most important areas needed for maintaining GRSG representation, redundancy, and resilience across the landscape (USFWS 2013) (Map 2).

While CMZ is equivalent in concept and direction as Priority in the National Policy Team guidance (NPT) (May 1, 2014) and General Management Zones are the equivalent to General areas, the NPT does not have a similar designation as IMZ included within the IDswMT ADPP. This zone is a foundational component of the IDswMT ADPP and directly supports to adaptive management approach which is to adjust threat amelioration management into additional areas if further declines in populations or habitat occur. In coordination efforts with the State of Idaho, this three-tiered management approach was initially developed through the Governor's GRSG Task Force and is supported by State and County representatives on that Task Force. This acceptance in those arenas is helping to support development of the State's management approach for State and private lands within Idaho, consistent with the federal lands.

This three-tiered approach is not consistent with the NPT guidance. With several deviations CMZ allocation management in the IDswMT is consistent with the NPT guidance, in the event that adaptive management triggers are engaged then management in IMZs would then become reflective of Priority management, until that occurrence, IMZs are managed in a more protective approach than typically described for General.

IV. RESPONSE TO FWS COMMENTS ON DRAFT EIS

In the Service's comment letter on the Draft EIS (January 31, 2014) an evaluation of the co-preferred alternatives and their consistency with the COT report was described. The BLM, USFS, FWS and the State of Idaho have worked together over the last several months to reconcile the two co-preferred alternatives into on cohesive approach that responds to the concerns raised by FWS and further refines the approaches previously described in the Draft EIS.

V. CROSS JURISDICTIONAL ISSUES

Management direction within the subregion for Idaho and Montana has been coordinated across state boundaries with Wyoming, Utah, Nevada and Oregon. Allocation level decisions are mostly consistent across those boundaries with some discrepancy adjacent to Wyoming where there are some areas of

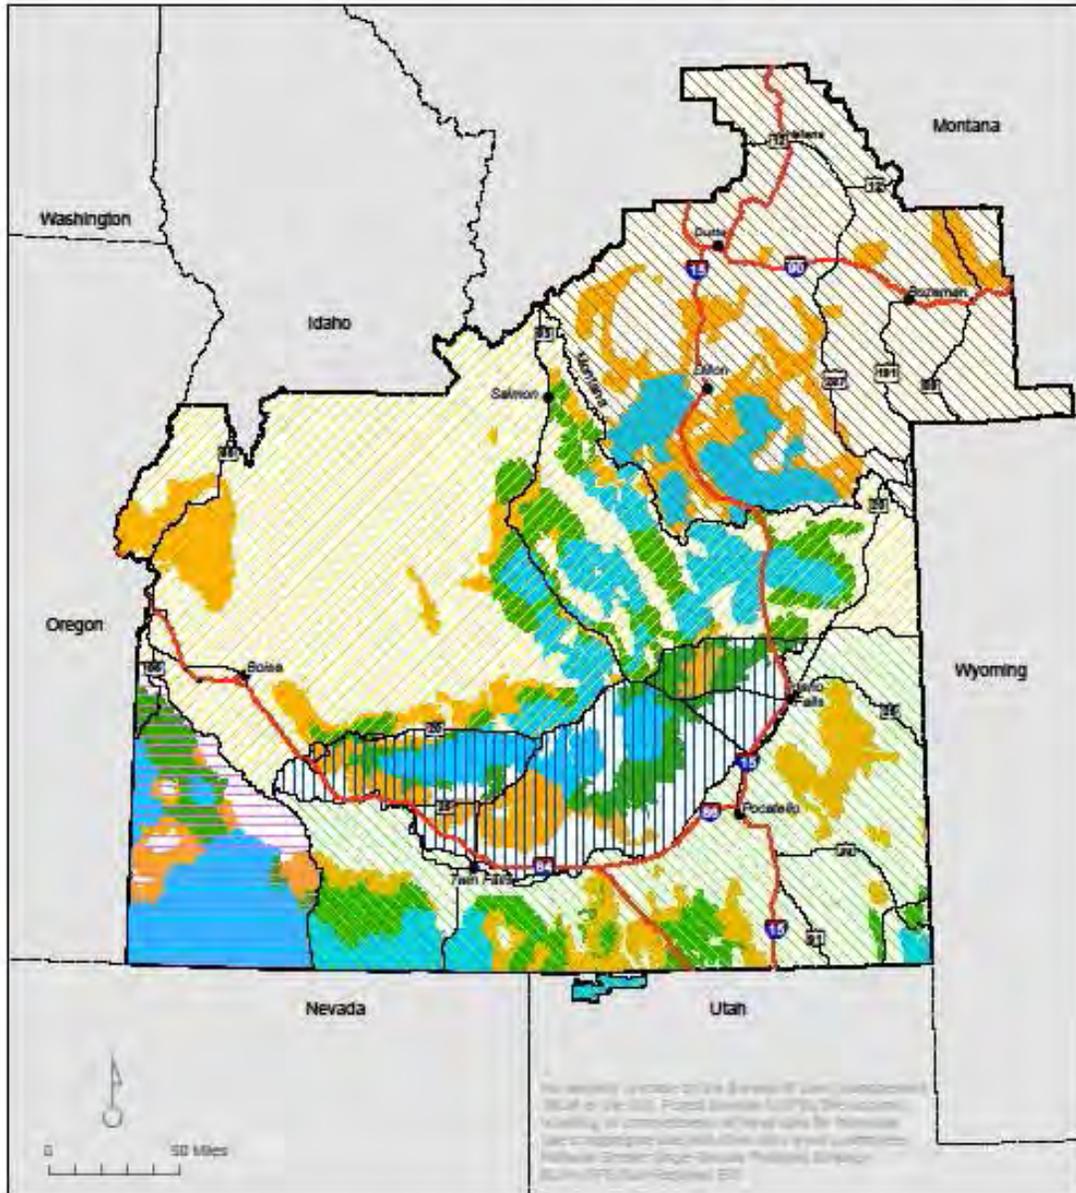

Core Management Zones in Idaho where across the border Wyoming identifies General management areas. There are some similar minor concerns with Utah. Core zones in Idaho and Priority areas in Nevada and Oregon largely match across the boundary and address the same allocation management in those areas.

Other Montana BLM planning efforts have incorporated mitigation and adaptive management approaches. The direction in the Southwestern Montana portion of the Final EIS for these components will differ from Idaho in order to maintain consistency with other Montana BLM plans.

VI. AREAS OF DISAGREEMENT

None.

**Table 1. Allocation/Disturbance Checklist
Idaho and SW Montana EIS - Administrative Draft Proposed Plan**

Allocations/ Disturbance	Consistent with NPT Table	Rationale for Change
Solar/Wind Energy Development ROW	All Core ³ : (Core is analogous to Priority) Consistent with Priority guidance.	General areas are not identified as avoidance; however, required design features, lek buffers and timing restrictions would be required and would limit and eliminate impacts to the limited GRSG habitat contained in this zone (<5% of leks and males).
	All Important: Consistent with General guidance as long as population numbers and habitat availability do not engage an adaptive management trigger. If an adaptive trigger is engaged consistent with Priority.	
	All General: Inconsistent	
High-Voltage Transmission and Major Pipeline ROW ⁴	All Core: Consistent with Priority guidance with very limited exception opportunity.	General areas are not identified as avoidance; however, required design features, lek buffers and timing restrictions would be required and would limit and eliminate impacts to the limited GRSG habitat contained in this zone (<5% of leks and males).
	All Important: Consistent with Priority guidance with limited exception opportunity as long as population numbers and habitat availability do not engage an adaptive management trigger. If an adaptive trigger is engaged even more limitation to the exceptions would apply the same as Core.	
	All General: Inconsistent with guidance, Consistent with COT reduction of threats.	
Other (Minor) ROWs and Land Use Authorizations/Permits	All Core: Consistent with Priority guidance.	
	All Important: Consistent with Priority guidance.	
	All General: Consistent with General guidance.	
Fluid Mineral Resource Allocation (Including Geothermal)	Idaho Core: Inconsistent with guidance. Montana Core: Consistent with Rocky Mountain guidance.	Idaho: Oil and Gas: Core areas with low to no potential, which is most of the subregion, are closed. Core areas with moderate to high potential, which are

³ Idaho portion of the plan identifies three (3) management delineations – Core, Important and General. Core areas are contained within the boundaries of the USFWS Priority Areas for Conservation (PAC) and make up roughly 66% of those areas. The remaining 33% of the PACs and other areas beyond the PACs are identified as Important Management Areas. This further refinement of management areas is **NOT** consistent with the NPT guidance. The Montana portion of the plan identifies two (2) management delineations – Core and General. Important direction does not apply to any areas in SW Montana. Direction for SW Montana in Core and General management areas as the same as for Idaho unless noted separately in the table.

⁴ Coordination across state boundaries for utility corridors is yet to be completed.

Allocations/ Disturbance	Consistent with NPT Table	Rationale for Change
	All Important: Consistent with General guidance, includes additional restrictions to development.	within WAFWA MZ II and adjacent to Wyoming General areas are open, consistent with Wyoming General management (160k acres). Geothermal: Core areas with low or no potential are closed. Core areas with moderate to high potential are open. All Core, Important and General areas would implement required design features, lek buffers and timing restrictions to reduce and eliminate impacts to GRSG. Reasonably foreseeable development scenarios show limited, if any, development likely in the next 10-15 years. This direction is consistent with the COT in reducing the minimal threat that is present.
	All General: Consistent	
Non-Energy Leasable Materials	All Core: Consistent All Important: Consistent All General: Consistent	All Known Phosphate Leasing Areas are outside of GRSG identified Core and Important management zones.
Mineral Materials (Salable Minerals)	All Core: Consistent with Priority guidance. All Important: Consistent with General guidance with stringent limitation criteria. All General: Consistent	Core areas are closed to new mineral material site authorizations and open for sales from within existing sites subject to required design features and seasonal timing restrictions. Important and General areas are open to new mineral material site authorizations subject to required design features, lek buffers and timing restrictions to reduce impacts to GRSG. No differentiation was made between free use and commercial use permits with regard to use of existing sites.
Disturbance (3 %) WY only (5%)	Idaho Core: Consistent with scale of application, Inconsistent with specific biologically significant unit identified. Montana Core: Consistent with other Montana plans. All Important: Consistent with scale of application, Inconsistent with specific biologically significant unit identified. All General: N/A	A 3% disturbance cap is applied to seasonal habitats of highest concern - nesting and wintering habitat - within Core and Important Management Areas.

Table 2. ADPP Response to FWS Comments

USFWS Concern	Resolution
Consistency across subregional boundaries	The BLM and FS have coordinated across subregional boundaries to further develop consistent approaches, or to clearly describe the rationale for the threat response where inconsistencies exist. Allocation level decisions are consistent across subregional boundaries; some conservation measures vary based on relative threats and habitat conditions/usage.
Disturbance Caps and no unmitigated loss	Disturbance caps have been included and further description of no net unmitigated loss has been included as part of the ADPP. A consistent approach and scale to measuring disturbance has been included with emphasis on seasonal habitats of concern in the Idaho and southwestern Montana subregion.
Adaptive Management Hard and Soft Triggers and an Implementation Team	Adaptive management hard and soft triggers as well as an Implementation Team to help assess these triggers in coordination with the State of Idaho has been included in the ADPP.
Lek buffers and noise protective measures	Buffers and their applicability have been further refined and defined in conjunction with FWS as have appropriate noise protective measures which are now included as required design features.
Implementation and Effectiveness Monitoring	These monitoring components have been further described at the broad, mid and fine scales and are included in the ADPP.
Mitigation	Additional description of how mitigation is included as components of project proposals and stepped forward through use of the state mitigation strategies is included in the ADPP. Decision to develop a mitigation board and develop a state specific mitigation strategy consistent with and in conjunction with WAFWA MZ strategies is also included in the ADPP.
Certainty of Effective Implementation (specificity)	Management actions and conservation measures have been refined to more clearly articulate the intent and direction to support the specificity needed by the Service to ensure certainty of implementation.
Impacts Analysis	Work is ongoing to augment the initial impacts analysis described in the Draft EIS. Additional work is being completed to delineate effects with specific regard to priority areas for conservation and the identified threats. This work will be complete in the Final EIS.
Priority Areas for Conservation and Mapping	Further refinement of the GRSG management areas, consistent with the COT and biologically meaningful units has occurred in coordination with the State of Idaho, FWS, BLM and FS. This management area delineation is a foundational component of the Idaho and southwestern Montana ADPP.
Infrastructure	Further refinement and definition of infrastructure criteria with respect to effects on GRSG habitat has been included and describes the application of these criteria in relation to COT objectives in the ADPP.
Wildfire/Invasives	The ADPP includes application of the Wildfire and Invasives Assessment process and other work developed by the Fire and Invasives Assessment Team to address fire concerns. In addition several components of the Idaho State Plan have been incorporated into the ADPP which further prioritize and address wildfire concerns.

Ed's questions regarding ID-BLM Response to NPT 6/4/14

In preparation for our discussion later today, I wanted to provide you with some of the concerns we would like to go over with you and your team regarding the info memo you sent us on 5/29/14. Hopefully you can provide us with some clarification/rationale on a few inconsistencies with the NPT allocation recommendations.

For Priority Habitat (Core/Important):

What is your rationale for managing medial (important) habitat as a ROW avoidance area, instead of managing it as a ROW exclusion area for wind/solar?

Idaho is only closing areas to fluid mineral development that are low potential. What is the biological rationale for opening moderate and high potential areas for development? Are you applying NSO to any core (priority) areas?

Are core and important areas closed to non-energy leasables?

For mineral materials, what is the rationale for leaving medial (important) areas open? For existing sites, are they subject to the 3% disturbance cap and no net unmitigated loss?

For General Habitat

What is your rationale for not managing general habitat as a ROW avoidance area for solar/wind?

What is your rationale for not managing general habitat as a ROW avoidance area for high-voltage transmission ROWs?

Adaptive Management

Is BLM Idaho's adaptive management strategy consistent with the AM sideboards? How does the AM strategy apply to other allocation categories other than ROWs?

Disturbance

What do you mean when you say that BLM Idaho is “inconsistent with specific biological units.” The NPT guidance allowed the sub-regions to provide for their own unit, as long as information could be aggregated up to the PAC level. Also – you state that the cap is only subject to “seasonal habitats of highest concern” – does this mean that you are not applying the cap to all general and priority (core, important, and general)? Who makes the determination of what is of a “highest concern?”

Will the no net unmitigated loss be applied to core, important, and general habitat?

How much medial (important) habitat lies within the PAC boundaries?

Cross-Jurisdictional Coordination

Are there any inconsistencies with how the Forest Service plans to manage their priority and general habitat areas?

Have you resolved all of the FWS stop-light matrix concerns (shifting reds to yellows or greens)?

I look forward to our discussion. After we discuss these questions and reconcile these issues, we can confirm that the data you sent to the NOC is ready for the roll-up or you can send any changes in data on to the NOC.

Memorandum

To: Ed Roberson, Assistant Director, Resources and Planning (AD-200)

From: Tim Murphy, Acting State Director, BLM Idaho

Subject: Supplemental Update for Idaho and Southwestern Montana Subregional Administrative Draft Proposed Plan

Date: June 4, 2014

I. INTRODUCTION

This memorandum documents additional descriptions and rationale in support of the May 28, 2014, update memorandum for the Idaho and Southwestern Montana (IDswMT) Administrative Draft Proposed Plan (ADPP). This document is organized by the questions and concerns that have been identified and further descriptions are included to responding to those concerns.

II. THREE MANAGEMENT ZONES

The Idaho portion of the ADPP delineates three management zones – Core, Important and General. These management zones represent a continuum of management restrictions/protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy contained within the ADPP.

Core Management Zones contain 65% of the occupied leks; 73% of the breeding males; and compose 66% of the USFWS priority areas for conservation (PACs). They are the most restrictive and management direction within these areas consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

Important Management Zones contain 22% of the breeding males. They compose 33% of the PAC areas plus over 1 million additional acres supporting 4% of the breeding males outside of PAC areas. Core and Important Management Zones support approximately 95% of the population in Idaho.

General Management Zones contain less than 5% of the population and represent the least intact and least productive habitats for GRSG.

Any proposed development within Important Management Zones would be required to meet the following Anthropogenic Disturbance Development Criteria:

- a. The project does not result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and
- b. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
- c. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation;

JUNE 4, 2014

- e. The project complies with the applicable RDFs as described; and
- f. The project would not exceed the disturbance threshold

The restrictions/protections from development in Core Zones, coupled with the stringent development criteria associated with proposals in Important Zones effectively pushes development to areas outside Core and Important Zones (i.e. the PAC areas); or maintains the standard that any development within Important Zones would not impact the GRSG population and any impacts to habitat would be mitigated.

III. CORE and IMPORTANT ZONES

Rationale for managing Important Zones as ROW avoidance areas for Wind and Solar development.

Core Zones exclude the highest potential areas for these types of developments within GRSG habitat. Any proposed development in Important Zones must comply with the Development Criteria (previous); if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

Biological rationale for opening moderate and high potential areas for fluid mineral development development.

Areas of moderate to high fluid mineral potential would be open in Core and Important Zones, subject to a no surface occupancy restriction which is consistent with the NPT guidance. Areas of low or no potential within Core Zones would be closed – this is more restrictive/protective of GRSG habitat than the NPT guidance.

Core and Important Zones closed to non-energy leasables

Non-energy leasable areas in Idaho are associated with phosphate mining. Areas with this potential have been inventoried and identified as Known Phosphate Leasing Areas (KPLAs) which are the only areas currently open for phosphate leasing. There are no KPLAs within Core or Important Zones, so Core and Important Zones are closed to non-energy leasables.

Rationale for leaving Important Zones open for mineral materials

Core Zones are closed to new site authorizations. Any new site development in Important Zones must comply with the Development Criteria (previous) including the disturbance cap; if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required. Sales from existing pits would be subject to seasonal timing restrictions and required design features.

IV. GENERAL ZONES

Rationale for not managing as a ROW avoidance area for solar/wind

General Management Zones contain less than 5% of the population and represent the least intact and productive habitats for GRSG. Presence of a developable resource within General Zones is sparse to non-existent. Any proposed development in General Zones is guided by application of lek buffers, required design features and appropriate seasonal or timing restrictions to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

Rationale for not managing as a ROW avoidance area for high-voltage transmission ROWs

General Management Zones contain less than 5% of the population and represent the least intact and least productive habitats for GRSG. Any proposed development in General Zones is guided by application of lek

JUNE 4, 2014

buffers, required design features and appropriate seasonal or timing restrictions to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

V. ADAPTIVE MANAGEMENT

BLM Idaho's adaptive management strategy consistency with the AM sideboards

The adaptive management strategy included with the ADPP includes adaptive changes that adjustment management of Important Zones. It provides for more restrictive management when a trigger is engaged and it also provides for removing this restrictive management when habitat and populations recover to pre-trigger levels. The concept that an adaptive trigger can only be used to adjust management in a more restrictive direction even if habitat and populations have recovered and would no longer meet the trigger criteria is not consistent with Idaho's incentive-based strategy.

The additional component presented in the National Policy Team guidance of adjusting management to a more restrictive alternative if necessary requires additional discussion with FS, FWS, and our State partners.

VI. DISTURBANCE

Biological significant units that could be aggregated up to the PAC level

Idaho BLM has worked with our partners (FS, FWS and State of Idaho) to define the biologically significant unit for analysis of the disturbance cap/threshold as the nesting and wintering habitat within Core or Important Zones by Conservation Area. This delineation recognizes the strategic importance and value of biologically limiting seasonal habitats and the desire to push development away from and limit additional development within those areas.

This calculation can be aggregated to the PAC level consistent with the National Policy Team guidance.

VII. CROSS-JURISDICTIONAL COORDINATION

Inconsistencies with Forest Service plans

BLM and FS have been coordinating closely through the development of the ADPP. The FS is currently finalizing the FS ADPP and while initial indications are toward consistency there may be several areas requiring further discussion. These discussions are pending until the FS has completed their initial ADPP development.

Resolution of FWS COT consistency

In the Service's comment letter on the Draft EIS (January 31, 2014) an evaluation of the co-preferred alternatives and their consistency with the COT report was described. The BLM, FS, FWS and the State of Idaho have worked together over the last several months to reconcile the two co-preferred alternatives into one cohesive approach that responds to the concerns raised by FWS and further refines the approaches previously described in the Draft EIS. All of the concerns identified by FWS as documented on the COT evaluation table (i.e. stop-light matrix) have been resolved. As a point of clarification this table did not identify any significant areas of concern of inconsistency (red) based on evaluation of the co-preferred alternatives described in the Draft EIS. Several areas of concern were identified (yellow) and these have been resolved by further augmenting of direction in the ADPP.

Appendix A – Required Design Features and Best Management Practices

The following required design features (RDFs) and best management practices (BMPs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (Table A-1). These made be reviewed and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs and BMPs most relevant to that program; however, all relevant RDFs and BMPs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs and BMPs should be applied during implementation. The table identifies the specific measure (numbered) and its appropriate application – as an RDF – required all the time everywhere; as a BMP required when the applicable resources are present; and as a BMP when appropriate and application would reduce impacts and not conflict with other RDFs or BMPs. In some cases the BMPs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and were determined to be beneficial to achieving GRSG habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs or BMPs described here.

Table A-1. Required Design Features and Best Management Practices

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
General			
1. Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.			X
Wildfire Suppression			
2. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.	X		
3. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: http://web.blm.gov/internal/fire/fpfm/sg/index.html . Additional BLM sage-grouse information can be	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
found at: http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html .			
4. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through: <ul style="list-style-type: none"> • instructing resource advisors during preseason trainings; • qualification as resource advisors; • coordination with resource advisors during fire incidents; • contributing to incident planning with information such as habitat features or other key data useful in fire decision making 	X		
5. At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.	X		
6. If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.		X	
7. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.		X	
8. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.		X	
9. During periods of multiple fires, ensure line officers are involved in setting priorities.	X		
10. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.	X		
11. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
12. Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.	X		
13. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	X		
14. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.	X		
15. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.		X	
16. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.	X		
Fuels Management Unless otherwise specified as part of the land use plan consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs and BMP's.			
17. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	X		
18. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	X		
19. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).	X		
20. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	X		
21. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.	X		
22. Where applicable, incorporate roads and natural fuel breaks into fuel break design.		X	
23. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.	X		
24. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
activities.			
25. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by Core Management Zones or that reestablish continuity between Core Management Zones. Annual grasslands are a second priority for restoration when the sites are not adjacent to Core Management Zones, but within Important Management Zones. The third priority for annual grassland habitat restoration projects are sites within General Management Zones. The intent is to focus restoration outward from existing, intact habitat.	X		
26. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.	X		
27. Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	X		
28. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.		X	
29. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.		X	
30. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.			X
31. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near CMZ or priority restoration areas (such as where investments in restoration have already been made).	X		
32. Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.	X		
33. Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.		X	
34. Form partnerships with linear right-of-way holders to		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.			
35. Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).			X
36. Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.		X	
37. Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for reference. Offices will make these maps available to suppression resources for use in fire operations.	X		
Vegetation Treatment			
38. Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert 2005; VegSpec).	X		
39. Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).		X	
40. Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).			X
41. Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).			X
42. Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, churning or livestock trampling, and transplanting container or bare-root seedlings.			X
43. Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.		X	
44. Use site preparation techniques that retain existing desirable vegetation.	X		
45. Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.		X	
46. Utilize post-treatment control of annual grass and other invasive species.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
47. Utilize new tools and use of new science and research as it becomes available.	X		
48. Give higher priority to vegetation rehabilitation or manipulation projects that include: <ul style="list-style-type: none"> • Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009). • Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.). • Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order: <ul style="list-style-type: none"> • Recently burned native areas • Native grassland with suitable forb component • Nonnative grassland with suitable forb component • Recently converted annual grass areas • Native grassland • Nonnative grassland • Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique. • Cooperative efforts that may improve GRSG habitat quality over multiple ownerships. • Projects that may provide connectivity between suitable habitats or expand existing good quality habitats. • Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 ($\leq 10\%$ conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 ($>30\%$). • Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat. 	X		
Lands and Realty			

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
49. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.		X	
50. Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	X		
51. Place infrastructure in already disturbed locations where the habitat has not been fully restored.		X	
52. Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.		X	
53. Co-locate linear facilities within one mile of existing linear facilities.		X	
54. Micro-site linear facilities to reduce impacts to sage-grouse habitats.	X		
55. Locate staging areas outside the Core Management Zones to the extent possible.	X		
56. Consider collocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering collocating with other ROW.			X
57. Restrict the construction of tall facilities and fences to the minimum number and amount needed.	X		
58. Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.	X		
59. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.		X	
60. Construction and development activities should conform to seasonal restrictions.	X		
Fluid Mineral Leasing			
61. Use directional drilling and/or multi well-pads to reduce surface disturbance.	X		
62. Apply a phased development approach with concurrent reclamation.	X		
63. Place liquid gathering facilities outside of CMZs. Have no tanks at well locations within CMZs to minimize truck traffic and perching and nesting sites for ravens and raptors.	X		
64. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).			X
65. Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	X		
66. Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.	X		
67. Equip tanks and other above-ground facilities with		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
structures or devices that discourage nesting of raptors and corvids.			
68. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)		X	
69. Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).		X	
<p>70. Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:</p> <ul style="list-style-type: none"> • Overbuild size of ponds for muddy and non-vegetated shorelines. • Build steep shorelines to decrease vegetation and increase wave actions. • Avoid flooding terrestrial vegetation in flat terrain or low lying areas. • Construct dams or impoundments that restrict down slope seepage or overflow. • Line the channel where discharge water flows into the pond with crushed rock. • Construct spillway with steep sides and line it with crushed rock. • Treat waters with larvicides to reduce mosquito production where water occurs on the surface 		X	
71. In CMZ, limit noise from discretionary activities to not less than 10 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.	X		
72. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.			X
73. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce functionality of habitats in Core and Important Management Zones.	X		
74. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.	X		
75. Limit noise sources that would be expected to negatively impact populations in Core and Important Management Zones and continue to support the establishment of ambient baseline noise levels for occupied leks in Core Management Zones.	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
76. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.	X		
77. As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.	X		
78. Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).			X
79. Require sage-grouse-safe fences.			X
80. Locate new compressor stations outside Core Management Zones and design them to reduce noise that may be directed towards Core Management Zones.	X		
81. Clean up refuse (Bui et al. 2011).	X		
82. Locate man camps outside of priority sage-grouse habitats.	X		
83. Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.			X
84. Use only closed-loop systems for drilling operations and no reserve pits.	X		
85. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	X		
Roads			
86. Utilize existing roads, or realignments of existing routes to the extent possible.	X		
87. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	X		
88. Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	X		
89. Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.			X
90. Coordinate road construction and use among ROW or SUA holders.	X		
91. Construct road crossings at right angles to ephemeral drainages and stream crossings.			X
92. Use dust abatement on roads and pads.	X		
93. Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.		X	

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
Roads Specific to Core and Important Management Zones			
94. Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.	X		
95. Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	X		
96. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	X		
Reclamation Activities			
97. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	X		
98. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.		X	
99. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	X		
100. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	X		
101. Irrigate interim reclamation if necessary for establishing seedlings more quickly.		X	
102. Utilize mulching techniques to expedite reclamation and to protect soils.		X	
Grazing Required Design Features			
103. Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	X		
104. Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	X		
105. Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet management objectives.		X	
106. Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-grouse habitat objectives. Where constructing fences or exclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.		X	
107. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations)	X		

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.			
108. Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.	X		
109. When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.		X	
110. Design new spring developments in GRSG habitat to maintain or enhance the free flowing characteristics of springs and wet meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRSG habitat where necessary.		X	
111. Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRSG and other wildlife.		X	
West Nile Virus Required Design Features			
112. Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.	X		
113. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.	X		
114. Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.	X		
115. For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.	X		
116. Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the wetland at the spring source with a fence is an option to consider.			X

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
117. Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.		X	
118. Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.		X	
119. Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or minimize pooling of water that is attractive to breeding mosquitoes.	X		
120. Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.		X	
121. Install and maintain float valves on stock tank fill pipes to minimize overflow	X		
122. Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.	X		
123. Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NTT report page 61).	X		
124. Consider removing and controlling trees and shrubs to reduce shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.			X
125. Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.			X
126. Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.		X	
127. On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.			X
128. Line the overflow of a dam's spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.		X	
129. Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.		X	
130. During confirmed West Nile virus outbreaks in sage-			X

Measure	Required Design Feature	BMP Required when the resources/values are present	BMP Applied if appropriate
grouse habitat, consider larvicide applications.			
Travel Management Required Design Features			
131. Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs	X		
Recreation Required Design Features			
132. Direct use away from GRSG priority areas as described in the Wildfire and Invasive Species Assessments.	X		
133. Eliminate or minimize external food sources for corvids.		X	

23

DRAFT

1 **Appendix B – Seasonal Timing Restriction**

2

3 During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-
4 May 15 in higher elevations), project activities will be avoided to the extent possible within 1 km (0.62 mile) of
5 occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse.

DRAFT

Idaho and Southwest Montana GRSB Buffers and Seasonal Restrictions Summary

Impacts	Causes ¹	Minimization Measures Seasonal/Timing Restrictions & Buffers	Rationale
Incidental disturbance to individual GRSB within all habitat types during all seasons			
	Public or administrative activities that include incidental foot, aerial, horseback, or other similar travel.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Livestock grazing activities (except where specifically noted below).	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
	Public vehicle travel not otherwise restricted in Travel Management Plans; or administrative vehicle travel on existing routes for maintenance of existing infrastructure, facilities, or vegetation projects; or non-organized/non-permitted activities.	None.	Impacts from these type of activities are immeasurable and would not warrant any minimization measures.
Loss (i.e. death) of nests/eggs, chicks and/or adults that may occur within the nesting⁴ habitat			

during the nesting season			
	<p>Anthropogenic activities such as the use of heavy equipment² or targeted grazing in nesting habitat³ for: 1) implementation of fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events</p>	<p>BMP Core, Important, General: Avoid these activities within nesting habitat during the nesting³ season.</p>	<p>Application of the seasonal nesting habitat restriction would avoid and minimize the loss of nests/chicks/hens. This is a BMP since the impact is loss of individual grouse and is small scale and not population-scale. Disallowing infrastructure maintenance or construction in nesting habitat outright may not be realistic as an RDF. Impacts may be able to be offset via appropriate mitigation.</p>
	<p>Bedding Sheep & Associated Camps</p>	<p>BMP: Core, Important, General: During the nesting season, locate bedding areas and camps outside of sagebrush areas³.</p>	<p>Application of the seasonal nesting habitat restriction would avoid/minimize the loss of nests/chicks by focusing bedding and camps in areas not meeting nest habitat characteristics for sagebrush cover (i.e., use areas less than 15% canopy cover).</p>
	<p>Fences</p>	<p>Existing Fences: RDF: Core and Important; BMP for General- Where consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management, move, modify (e.g. lay down fences) or mark existing fences to reduce collision risk within areas that have a high probability of fence strikes (per</p>	<p>Application of these measures would avoid/minimize the loss of birds to fence strikes.</p>

		Stevens et al. 2012 model or latest science).	
		New Fences: RDF: Core and Important; BMP for General- Do not construct new fences within areas of high collision risk unless marked or modified, consistent with policy, laws and/or regulations relative to Wilderness, Wilderness Study Areas and Visual Resource Management .	
Permanent functional or physical loss of a lek or declining attendance at lek⁴			
	Unleased fluid minerals	Stipulation: Core, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek. Stipulation: Core, Important, General: Limit average well pad density to no more than 1 per 640 acres within nesting ³ and winter ³ habitat.	This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of 1.54 pad/sq km (1 pad/247 ac) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential

			impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.
	Commercial solar development	<p>RDF: Core-No commercial solar development.</p> <p>RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek⁴.</p> <p>BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek⁴.</p>	No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).
	Roads	BMP: Core, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks ⁴ .	Patricelli et al. 2012 (Recommendations for interim protections in WY) recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. We apply it here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/access or to allow access to private lands or per ROW need). If we buffer roads in the Core or Important Zone via a

			<p>large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.</p>
	<p>Commercial/ industrial Pipelines (oil, gas, slurry, and similar)</p>	<p>BMP: Core, Important, General. minimize removal of sagebrush within 0.6 miles of leks⁴.</p>	<p>Application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in vicinity of lek, that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below:</p> <p>BACKGROUND INFORMATION: From Colorado GRSG Conservation Plan Appendix B: [Lek Habitat (March through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male</p>

			<p>GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported that male dispersal distances to day-use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do</p>
--	--	--	--

			<p>not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover. Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).]</p> <p>Study locations noted above: Carr-Colorado; Wallestad and Schladweiller- Montana; Emmons-Colorado; Schoenberg- Colorado; Rothenmaier –unable to locate Univ. WY Thesis but study area not defined.</p>
	<p>Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)</p>	<p>BMP Core, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek⁴ or ensure they are out of the viewshed of the lek.</p>	<p>This is a catch all to reduce impact of miscellaneous structures where possible (some are tall⁵, such as water windmill, some are small, but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on</p>

			<p>biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all in Core, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance. Adding the “viewshed” caveat can help with siting in cases where topography or such screens view of the activity or structure.</p>
	<p>Campgrounds and other developed recreation facilities (trailheads etc.)</p>	<p>BMP: Core, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.</p>	<p>Biology team discussion. No literature specific to this issue. Aldrich (2012) mentions GRSG avoidance threshold 2.5 km from any single development at patch scale.</p>
	<p>OHV Play or Open Areas</p>	<p>RDF-Core and Important; BMP for General. No new Open or Play areas.</p>	<p>Rationale is to reduce risk for further noise, habitat loss, fire risk in the Core, Important and General zones.</p>
	<p>Solid Minerals</p>		<p>These measures for solid minerals are intended to reduces noise and human disturbance to lekking</p>

			birds. Siting/ avoidance buffers not realistic due to the nature of mineral deposits.
		Locatables-BMP Core, Important, General: Access roads and associated infrastructure not on the mining claim-Avoid disturbance to leks ⁴ during the lekking season.	Regulations 43 CFR 3809.420 performance standards, speak to T/E, and habitat. As a BMP, it provides an opportunity to work with the developer where we can, such as routing access roads etc., siting of facilities/infrastructure etc., that are off the claim, that we have some discretion with.
		Salables- RDF: Core: Do not construct new salable development within 0.8 mile (1.3 km) of leks ⁴ .	<u>Salables</u> - No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose RDF for Core and BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.

		<p>Leasables-non-energy (e.g., phosphate)-</p> <p>RDF-Core and Important: New phosphate leasing is administratively unavailable.</p> <p>BMP-Core, Important, General- On existing leases avoid disturbance to leks⁴ during the lekking season</p>	<p><u>Leasables:</u></p> <p>None presently known in Core based on current mapping, but Core RDF included in case of a trigger trip and re-delineation of IDswMT subregional management zones.</p> <p>In “Important” there is only one such area with existing lease and Known Phosphate Lease Areas (KPLAs), just west of Bear. It is Federal mineral/private surface. No interest in surface mining but there is interest by a company in underground development. Company is proposing facilities on surface, but working with IDFG locally. Lek within .3 mile.</p> <p>BMP for lek disturbance for all Management Zones in case of trigger trip and IDswMT Management Zone re-delineation and since there are some KPLAs in the General Management Zone. Working with proponent to reduce lek disturbance is realistic and may take on different forms, such as road access, placement of facilities, etc.. However, “exclusion” buffers are not realistic given the nature of the</p>
--	--	--	---

			location of solid mineral deposits (i.e., cannot site elsewhere). For these, incorporation of appropriate mitigation, in addition to the lek BMP may need to be a primary focus.
	Wind development (commercial)	<p>RDF: Core-No commercial wind development .</p> <p>BMP: Important and General: Avoid wind development in nesting and/or winter habitat.</p>	<p><u>Wind</u>: Labeau et al. (2014) stated that erecting wind turbines at least 5 km from nesting and brood rearing habitat should reduce negative impacts, at least in the short term. However putting a 5 km (3 mile) buffer around leks in Important habitat, would create a defacto closure for the most part, inconsistent with the intent of the Important designation. Hence BMP to avoid placement in nesting or winter habitat.</p>
	Communication Towers	<p>RDF: Core -Do not allow communication tower construction within 3 miles (5 km) of a lek⁴ unless needed to address public safety needs.</p> <p>BMP- Important and General-- Avoid communication tower construction within 3 miles (5 km) of a lek⁴ unless needed to address public safety needs.</p>	<p>Johnson et al. (2011 pg. 427) noted "Analogously, across all management zones there was a steady downward pattern of trends of lek counts as the number of towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."</p>
	Transmission Lines	<p>RDF: Core, Important, General: Do not allow transmission line construction within 600 m of a</p>	<p>A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported</p>

		lek. BMP Core, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.	by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.
	Distribution Lines	BMP: Core, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible	600 m, based on Gillan et al. BMP as this may not always be feasible.
Temporary functional loss of a lek⁴. SEASONAL RESTRICTION			
	Anthropogenic activities that result in noise or visual disturbance that may lead to sustained avoidance of the lek during a particular lekking season.	RDF: Core and Important- No repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season ³ . BMP-General: Avoid repeated or sustained behavioral disturbance (e.g., visual, noise, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season ³ .	Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km (~ 1 mile) from grouse leks. . IDswMT biology team recommended a more conservative approach to managing disturbance to minimize risk of disturbance.
	Sheep Bedding & Sheep Camps	BMP Core, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek	No literature. BMP based on biology team consensus.

		during the lekking season.	
	Organized Recreational Events	RDF Core and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season. BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.	Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.
Permanent functional or physical loss of nesting or winter habitat.			
	Anthropogenic development or activities that result in loss of habitat or constant or repeated noise levels or objects on the landscape that result in permanent avoidance of the habitat.	Ensure > 80% of the landscape is functionally and physically meeting GRSG habitat objectives appropriate to the seasonal habitat ³ .	Impacts resulting from loss of habitat vary depending on the extent of the habitat lost. Minimal loss of habitat (e.g. removal of small amounts of sagebrush cover) would not likely result in any measurable impacts to GRSG individuals or the associated populations. More extensive loss of habitat may result in increased probability of population level impacts, and trigger trips, through the increased probability that leks will no longer persist.
	Roads	BMP: Core, Important, General: Avoid construction of new paved or high volume traffic gravel roads	See citations used for permanent loss of leks, above.

		within 0.8 mile (1.3 km) of nesting habitat.	
	Unleased Fluid Minerals	Stipulation: Core, Important, General: Limit average well pad density to no more than 1/640 acres within nesting ³ and winter ³ habitat.	See citations used for permanent loss of leks, above.
	Commercial Solar	RDF: Core-No commercial solar development. RDF: Important: Do not allow facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek ⁴ . BMP-Important: Avoid placing new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek ⁴ .	See citations used for permanent loss of leks, above.
	Campgrounds	BMP-Core, Important, General. Avoid development of new campgrounds or recreation facilities in nesting habitat.	See citations used for permanent loss of leks, above.
	OHV Play and Open areas	RDF-Core and Important. No new Open or Play areas. BMP-General: Avoid new Open or Play areas	See citations used for permanent loss of leks, above.
	Wind Development (commercial)	RDF Core. No commercial wind development .	See citations used for permanent loss of leks, above.

		BMP: Important: Avoid wind development in nesting habitat	
Temporary functional loss of winter habitat			
	Anthropogenic activities that result in noise or visual disturbance that may lead to avoidance of a particular wintering area during a particular wintering season.	RDF: Core, Important- No repeated or sustained disturbance from construction activities in winter habitat during the wintering season. BMP General: Avoid repeated or sustained disturbance from construction activities in winter habitat during the wintering season.	No known buffer. Biology team recommendation.

1
2 ¹ Land use allocations or activities provided below are examples, but are not limited to those listed.

3
4 ² Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large
5 trucks, excavators, backhoes cranes.

6
7 ³ As per Habitat Objectives table. Based on local GRSG seasonal use dates. Lekking ~ March 1-May 2⁵ depending on elevation; Nesting /early
8 brood ~April 1-June 30; Winter ~December 1-February 28. Source-Modified from ISAC 2006.

9
10 ⁴ Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at
11 the site specific scale during project-level NEPA.

12
13 ⁵ Definition of “tall structure”: Any structure that has the potential to disrupt lekking or nesting GRSG and/or decrease the use of an area. This
14 includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

Draft Greater Sage-Grouse Wildland Fire and Invasive Species Assessment

This Page Intentionally Blank

K. GRSG Wildland Fire & Invasive Species Assessment

The following process is a suggestion for a consistent approach in conducting an assessment of the GRSG habitat and wildfire threat at the local planning area level. Variations to this approach may be made based on ID team discussion or unique issues in a given planning area. This example format is intended to portray the degree of specificity required for offices which will complete these assessments. Note that this process has similarities to watershed analysis and ecoregional assessments, and as such these documents may prove useful where they exist.

K.1 Introduction

Greater Sage-Grouse (GRSG) Wildfire and Invasive Species Habitat Assessments (hereafter referred to as “stepdown assessments”) are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment opportunities for fuels management, fire management, and restoration. Priority areas are spatial delineations where treatments, management actions, or other emphasis should be placed due to factors such as habitat quality, threats, or opportunities to protect, enhance, and restore GRSG habitat. The stepdown assessments will serve as a bridge between RMPs and project level planning, and will position planning efforts to conduct project-scale NEPA following RMP Records of Decision.

The stepdown assessment process involves four steps, beginning with characterization of the planning area and concluding with spatial delineation of priority areas. The content and methods used by Forest Service (FS) and the Bureau of Land Management (BLM) in these documents should be consistent to ensure that priority areas are defined using similar criteria. These criteria and methods should be narratively described such that the US Fish and Wildlife Service (FWS) and other audiences can understand the factors considered.

K.2 Step 1: Characterization of Greater Sage-Grouse Habitat

The purpose of this step is to broadly establish context of the planning area and sage-grouse habitat.

K.2.1 Location and Spatial Extent

Describe the location of the planning area, and the relationship of GRSG habitat within the planning area.

K.2.2 Relationship to the Larger Scale Setting

How does the planning area lie within the larger context of GRSG habitat?

K.2.3 Quantifying Habitat within Planning Area

Brief description of GRSG habitat described in terms of acreage, habitat classes (e.g., PPH, PGH, and/or PACs)

Note: A summary map showing the planning area with habitat features is appropriate in Step 1. A tabular summary may also be included.

K.3 Step 2: Issues and Key Management Questions

The purpose of this step is to devise management questions related to the issues of fuels management, fire management, and restoration. Note that this step should not answer each management question. Rather, management questions are answered in Step 4 through specific, quantified data.

K.3.1 Overview

In coordination with state wildlife agencies, the FWS, and your interdisciplinary team, develop an introductory section here which describes why fire or vegetation conditions pose a threat to GRSG in the local planning area. Describe where fire or vegetation conditions are a significant threat to GRSG habitat, and where fire, fuels, and restoration activities may help enhance habitat. In a brief paragraph or two, summarize the relationships between wildland fire, fuels management and invasives/restoration in the planning area. Examples would include annual grass/wildfire cycle, juniper encroachment into GRSG habitat, recently disturbed areas, etc.

K.3.2 Key Management Questions

Issue #1: Fuels Management

In narrative format, develop management questions such as:

1. Based on fire risk to important GRSG habitats, what types of fuels treatments should be implemented that will reduce the risk? Where should fuels treatments be prioritized, and what's the amount of treatment acres/miles needed for long-term enhancement and protection of GRSG habitat?
2. Based on opportunities for fire to improve/restore GRSG habitats, what types of fuels treatments should be implemented that will increase ability to allow fire? Where should fuels treatments be prioritized, and what amount of treatment is needed for long-term enhancement and protection of GRSG habitat?
3. What fuel reduction techniques will be most effective; including, but not limited to grazing, prescribed fire, chemical, biological and mechanical treatments?
4. What are the criteria for defining priority fuels management areas (example would be the intersection of high burn probability, PPH, lek locations, and established GRSG population)?
5. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries?
6. Are there areas where fuel treatments help restore GRSG habitat as well as reduce risk?

Issue #2: Fire Management

In narrative format, develop management questions such as:

1. Where is the greatest wildfire risk, considering trends in fire occurrence, fuel conditions, and highly valued GRSG habitat?
2. Where will fire suppression resources be most successful to mitigate the risk and protect GRSG Habitats?
3. Where do opportunities exist that could enhance or improve suppression capability in important GRSG habitats?
 - a. For example, increased water availability through installation of heli wells or water storage tanks.
 - b. Decreased response time through pre-positioned resources or staffing remote stations.
4. Where should wildfire be managed to achieve Land Use Plan (LUP) objectives for improving or restoring GRSG habitat (limiting juniper expansion)?
5. What are the criteria for defining priority fire management areas? An example would be the intersection of PPH, lek locations, and high burn probability.
6. How can fire management be coordinated across jurisdictional boundaries to reduce risk or to improve GRSG habitat?

Issue #3: Restoration

In narrative format, develop management questions such as:

1. Are there opportunities for restoration treatments to protect, enhance or maintain GRSG habitat? Assume that funding is not a constraint, and describe which sites are biologically suitable for restoration to GRSG habitat in a reasonable period.
2. Considering the entire planning area, what are the site conditions, such as dominant vegetation, elevation, or precipitation zones, where restoration efforts have been proven to be most successful in the recent past? An example would be mountain sagebrush sites over 5000' in elevation, and in a 16" or greater precipitation zone.
3. What are the criteria for defining priority restoration areas? An example would be recent burns, moderately disturbed sites, or recovering allotment pastures which have not crossed ecological thresholds or become highly degraded. These may or may not be covered by existing ESR plans.
4. Are there opportunities to utilize a coordinated approach across jurisdictional boundaries?

K.4 Step 3: Current Conditions and Trends

The purpose of this step is to develop information relevant to the issues and key questions identified in Step 2. It provides a snapshot of the present condition, statement of causal factors, and a summary of the trends which are occurring.

K.4.1 Biological Summary of Vegetation, Invasive Species, and Fire Regimes

[In this introductory section, provide a general biological summary of the planning area. Provide a narrative description of ecological trends, including description of plant communities, fire regimes, and other dominant biological factors affecting GRSG habitat.]

- Describe how fire has influenced current vegetation patterns. Are there large areas of even-aged communities, fine-scale mosaics, annual grass monocultures?
- Describe if fire regimes are intact, or if they are altered. If they are altered, describe why. Use fire regime variables such as fire frequency, severity, or size to elucidate your points.
- Describe dominant cover types making up the planning area. These can be broad seral stage groupings, general lifeforms, or more fine-scale information such as plant associations, habitat types, or ecological systems. Note: this information should be available in the RMP or FMP.
- What has been the impact of fire exclusion (e.g., increased conifer encroachment, decadent shrub communities, etc)?
- What is the current extent of annual grasses and other invasive species?
- What are the effects of invasive species on land health? On trends in plant succession? On fire regimes?

K.4.2 Fuels Management

- Describe current fuels management practices within the planning area (what are the types of fuels treatments commonly applied to which management issues)?
- How has past fuels management influenced today's planning area (e.g., creation of mosaics, protecting certain features, increasing invasives, etc)?
- What are causal factors which have created a need for fuels management practices?
- What are the trends in the fuels management program related to budget or capability?

K.4.3 Fire Management

- Describe the current fire suppression workload.

- Describe fire occurrence trends (include discussion of fire size, numbers of starts, ignition locations)
- Describe causal factors influencing suppression effectiveness.
- Describe suppression capabilities. Discuss types and numbers of resources within office, through interagency agreements, and through resource sharing

K.4.4 Restoration

- Describe invasive species which are present in the planning area
- Describe landscape conditions which may be suitable for restoration within the planning area, and the results of recent restoration efforts in the planning area
- Describe invasive species occurrence
- Describe causal factors influencing restoration needs.

K.4.5 Methodology

- What are the analysis methods to be utilized and analysis assumptions?

K.4.6 Use of Best Available Science

- Describe data sets used, such as the FSIM layer, local data, etc. [Many data sets being used in RMPs will also be applicable to stepdown assessments].
- What are the elements of science used?

K.5 Step 4: Identification of Treatment Opportunities, Priority Areas, and Actions

The purpose of this step is to utilize the information from steps 2 and 3 in order to quantify the overall need for treatment or other actions. Specifically, this step should spatially identify and quantify priority areas, using the criteria established in Step 2. Next, this step should identify treatment opportunities which fall within priority areas. Furthermore, treatments should be prioritized and an implementation schedule developed, reflecting the reality that not every acre in need of treatment can receive action within the planning horizon.

K.5.1 Fuels Management

- Spatially delineate priority areas for fuels management, based upon criteria established in Step 2. Fuels priority areas should be delineated by type, such as:
 - Linear fuel break along roads
 - Other linear fuel breaks to create anchor points
 - Prescribed burning
 - Mechanical (e.g., conifer removal)
 - Other mechanical, biological, or chemical treatment

- Quantify the number of acres of needed fuels treatments.
- If they exist, spatially delineate areas where fuel treatments would increase the ability to use fire to improve/enhance GRSG habitat?
 - Include tables, maps or appropriate info.
- Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of fuels treatments.
- Quantify a projected level of treatment within fuels management priority areas.
- Identify treatments to be planned within fuels management priority areas.
- Include a priority or implementation schedule for proposed treatments.

K.5.2 Fire Management

- Spatially delineate priority areas for fire suppression, based upon criteria established in Step 2. Priority areas for fire management should be delineated by type, such as:
 - Initial attack priority areas;
 - Resource pre-positioning and movement priority areas;
 - Remote station staffing priority areas, if appropriate
 - Include tables, maps or other supporting information
- Quantify the number of acres of GRSG habitats for aggressive initial attack that were identified at highest risk from losing key habitat components.
- Quantify the number and type of suppression resources that will be staged or otherwise pre-positioned, as well as the associated conditions, in order to enhance initial attack capabilities.
- Spatially delineate areas where opportunities exist to enhance or improve suppression capability.
 - Include tables, maps or other supporting information.
- Spatially delineate areas where wildfire can be managed to achieve RMP objectives.
 - Include tables, maps or appropriate info.
- Quantify the number of acres within fire management priority areas
- Include a priority or implementation schedule for fire suppression proposed actions.

K.5.3 Restoration

- Spatially delineate priority areas for restoration, using criteria established in Step 2. Priority areas for restoration should be delineated by type, such as:
 - Seeding priority areas (aerial, drill, broadcast, or other);
 - Invasive species priority areas (herbicide, mechanical, biological, combination);
 - Priority areas requiring combinations of treatments (e.g., herbicide followed by seeding).
 - Include tables, maps or appropriate info.
- Identify locations where post-fire restoration treatments should be focused.
 - Include tables, maps or appropriate info.
- Spatially identify invasive species occurrence
- Identify coordination needed between renewable resource, fire management, and fuels management staff to facilitate planning and implementation of restoration treatments.
- Quantify the projected level of treatment within restoration priority areas.
- Identify treatments to be planned within restoration priority areas.
- Include a priority or implementation schedule for proposed restoration treatments.

K.5.4 Annual Treatment Needs

1. Based on the information above and within the planning area, what are the annual needs based on the key questions and summary statements?

K.5.5 Annual Treatment Abilities

1. Putting GRSG habitat protection and enhancement into perspective with other high valued resources and important land management goals, how does the annual need relate to capabilities?
2. What are the realistic annual expectations in fire management, fuels management, and restoration for the next 5 years?

Appendix B

Fuels Management Required Design Features for Sage-Grouse Conservation

1. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.
2. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.
3. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).
4. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.
5. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.
6. Where applicable, incorporate roads and natural fuel breaks into fuel break design.
7. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.
8. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression activities.
9. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by preliminary priority habitat (PPH) or that reestablish continuity between priority habitats. Annual grasslands are a second priority for restoration when the sites are not adjacent to PPH, but within two miles of PPH. The third priority for annual grassland habitat restoration projects are sites beyond two miles of PPH. The intent is to focus restoration outward from existing, intact habitat.
10. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.
11. Emphasize the use of native plant species, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.

12. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.
13. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.
14. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.
15. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near PPH or important restoration areas (such as where investments in restoration have already been made).

Appendix C Fire Operations Required Design Features for Sage-Grouse Conservation

1. Compile District/Forest level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each District/Forest, which will be aggregated into a state-wide document.
2. Provide localized maps to dispatch offices and extended attack incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics.
3. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through:
 - instructing resource advisors during preseason trainings;
 - qualification as resource advisors;
 - coordination with resource advisors during fire incidents;
 - contributing to incident planning with information such as habitat features or other key data useful in fire decision making
4. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.
5. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.
6. During periods of multiple fires, ensure line officers are involved in setting priorities.
7. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.
8. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.
9. Minimize unnecessary cross-country vehicle travel during fire operations in sage-grouse habitat.
10. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.

11. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.
12. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.
13. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.

INTRODUCTION

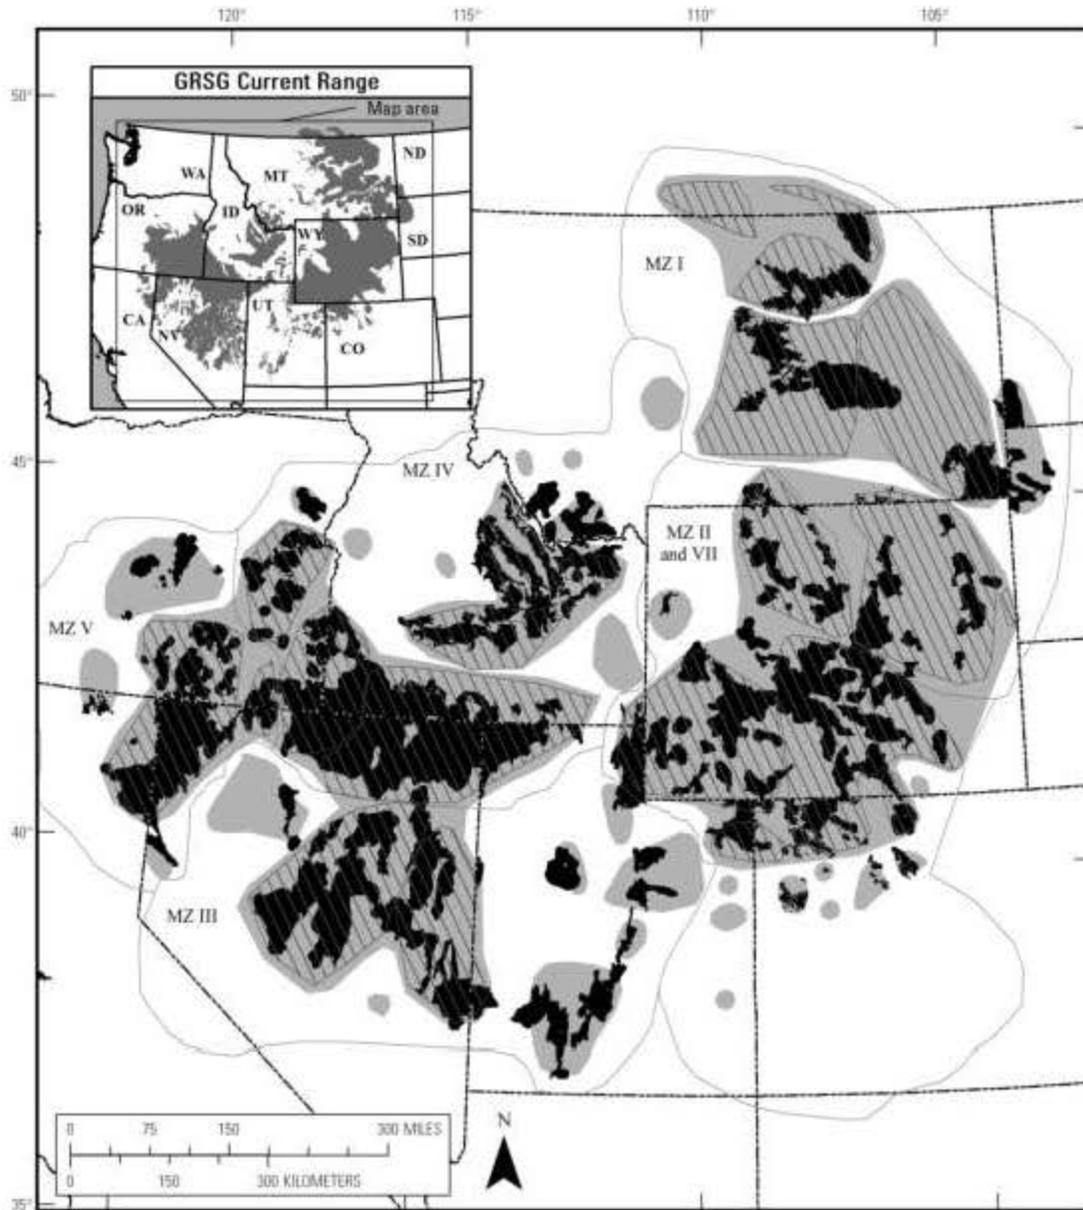

The purpose of this U.S. Bureau of Land Management (BLM) and U.S. Forest Service (USFS) Greater Sage-Grouse Monitoring Framework (hereafter, monitoring framework) is to describe the methods to monitor habitats and evaluate the implementation and effectiveness of the BLM's national planning strategy (attachment to BLM Instruction Memorandum 2012-044), the BLM resource management plans (RMPs), and the USFS's land management plans (LMPs) to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the USFS (36 CFR part 209, published July 1, 2010) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations based on the sensitivity of the resource to the decisions involved. Therefore, the BLM and the USFS will use the methods described herein to collect monitoring data and to evaluate implementation and effectiveness of the Greater Sage-Grouse (GRSG) (hereafter, sage-grouse) planning strategy and the conservation measures contained in their respective land use plans (LUPs). A monitoring plan specific to the Environmental Impact Statement, land use plan, or field office will be developed after the Record of Decision is signed. For a summary of the frequency of reporting, see Attachment A, An Overview of Monitoring Commitments. Adaptive management will be informed by data collected at any and all scales.

To ensure that the BLM and the USFS are able to make consistent assessments about sage-grouse habitats across the range of the species, this framework lays out the methodology—at multiple scales—for monitoring of implementation and disturbance and for evaluating the effectiveness of BLM and USFS actions to conserve the species and its habitat. Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. Implementation monitoring results will allow the BLM and the USFS to evaluate the extent that decisions from their LUPs to conserve sage-grouse and their habitat have been implemented. State fish and wildlife agencies will collect population monitoring information, which will be incorporated into effectiveness monitoring as it is made available.

This multiscale monitoring approach is necessary, as sage-grouse are a landscape species and conservation is scale-dependent to the extent that conservation actions are implemented within seasonal habitats to benefit populations. The four orders of habitat selection (Johnson 1980) used in this monitoring framework are described by Connelly et al. (2003) and were applied specifically to the scales of sage-grouse habitat selection by Stiver et al. (*in press*) as first order (broad scale), second order (mid scale), third order (fine scale), and fourth order (site scale). Habitat selection and habitat use by sage-grouse occur at multiple scales and are driven by multiple environmental and behavioral factors. Managing and monitoring sage-grouse habitats are complicated by the differences in habitat selection across the range and habitat use by individual birds within a given season. Therefore, the tendency to look at a single indicator of habitat suitability or only one scale limits managers' ability to identify the threats to sage-grouse

and to respond at the appropriate scale. For descriptions of these habitat suitability indicators for each scale, see “Sage-Grouse Habitat Assessment Framework: Multiscale Habitat Assessment Tool” (HAF; Stiver et al. *in press*).

Monitoring methods and indicators in this monitoring framework are derived from the current peer-reviewed science. Rangewide, best available datasets for broad- and mid-scale monitoring will be acquired. If these existing datasets are not readily available or are inadequate, but they are necessary to inform the indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions, the BLM and the USFS will strive to develop datasets or obtain information to fill these data gaps. Datasets that are not readily available to inform the fine- and site-scale indicators will be developed. These data will be used to generate monitoring reports at the appropriate and applicable geographic scales, boundaries, and analysis units: across the range of sage-grouse as defined by Schroeder et al. (2004), and clipped by Western Association of Fish and Wildlife Agencies (WAFWA) Management Zone (MZ) (Stiver et al. 2006) boundaries and other areas as appropriate for size (e.g., populations based on Connelly et al. 2004). (See Figure 1, Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.) This broad- and mid-scale monitoring data and analysis will provide context for RMP/LMP areas; states; GRSG Priority Habitat, General Habitat, and other sage-grouse designated management areas; and Priority Areas for Conservation (PACs), as defined in “Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report” (Conservation Objectives Team [COT] 2013). Hereafter, all of these areas will be referred to as “sage-grouse areas.”

 PACs: USFWS COT Report, 2013

Figure 1. Map of Greater Sage-Grouse range, populations, subpopulations, and Priority Areas for Conservation as of 2013.

This monitoring framework is divided into two sections. The broad- and mid-scale methods, described in Section I, provide a consistent approach across the range of the species to monitor implementation decisions and actions, mid-scale habitat attributes (e.g., sagebrush availability and habitat degradation), and population changes to determine the effectiveness of the planning strategy and management decisions. (See Table 1, Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.) For sage-grouse habitat at the fine and site scales, described in Section II, this monitoring framework describes a consistent approach (e.g., indicators and methods) for monitoring sage-grouse seasonal habitats. Funding, support, and dedicated personnel for broad- and mid-scale monitoring will be renewed annually through the normal budget process. For an overview of BLM and USFS multiscale monitoring commitments, see Attachment A.

Table 1. Indicators for monitoring implementation of the national planning strategy, RMP/LMP decisions, sage-grouse habitat, and sage-grouse populations at the broad and mid scales.

Implementation		Habitat		Population (State Wildlife Agencies)
<i>Geographic Scales</i>		Availability	Degradation	Demographics
Broad Scale: From the range of sage-grouse to WAFWA Management Zones	BLM/USFS National planning strategy goal and objectives	Distribution and amount of sagebrush within the range	Distribution and amount of energy, mining, and infrastructure facilities	WAFWA Management Zone population trend
Mid Scale: From WAFWA Management Zone to populations; PACs	RMP/LMP decisions	Mid-scale habitat indicators (HAF; Table 2 herein, e.g., percent of sagebrush per unit area)	Distribution and amount of energy, mining, and infrastructure facilities (Table 2 herein)	Individual population trend

I. BROAD AND MID SCALES

First-order habitat selection, the broad scale, describes the physical or geographical range of a species. The first-order habitat of the sage-grouse is defined by populations of sage-grouse associated with sagebrush landscapes, based on Schroeder et al. 2004, and Connelly et al. 2004, and on population or habitat surveys since 2004. An intermediate scale between the broad and mid scales was delineated by WAFWA from floristic provinces within which similar environmental factors influence vegetation communities. This scale is referred to as the WAFWA Sage-Grouse Management Zones (MZs). Although no indicators are specific to this scale, these MZs are biologically meaningful as reporting units.

Second-order habitat selection, the mid-scale, includes sage-grouse populations and PACs. The second order includes at least 40 discrete populations and subpopulations (Connelly et al. 2004). Populations range in area from 150 to 60,000 mi² and are nested within MZs. PACs range from 20 to 20,400 mi² and are nested within population areas.

Other mid-scale landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*) will also be assessed. The methods used to calculate these metrics will be derived from existing literature (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011).

A. Implementation (Decision) Monitoring

Implementation monitoring is the process of tracking and documenting the implementation (or the progress toward implementation) of RMP/LMP decisions. The BLM and the USFS will monitor implementation of project-level and/or site-specific actions and authorizations, with their associated conditions of approval/stipulations for sage-grouse, spatially (as appropriate) within Priority Habitat, General Habitat, and other sage-grouse designated management areas, at a minimum, for the planning area. These actions and authorizations, as well as progress toward completing and implementing activity-level plans, will be monitored consistently across all planning units and will be reported to BLM and USFS headquarters annually, with a summary report every 5 years, for the planning area. A national-level GRSG Land Use Plan Decision Monitoring and Reporting Tool is being developed to describe how the BLM and the USFS will consistently and systematically monitor and report implementation-level activity plans and implementation actions for all plans within the range of sage-grouse. A description of this tool for collection and reporting of tabular and spatially explicit data will be included in the Record of Decision or approved plan. The BLM and the USFS will provide data that can be integrated with other conservation efforts conducted by state and federal partners.

B. Habitat Monitoring

The U.S. Fish and Wildlife Service (USFWS), in its 2010 listing decision for the sage-grouse, identified 18 threats contributing to the destruction, modification, or curtailment of sage-grouse habitat or range (75 FR 13910 2010). The BLM and the USFS will, therefore, monitor the relative extent of these threats that remove sagebrush, both spatially and temporally, on all lands within an analysis area, and will report on amount, pattern, and condition at the appropriate and applicable geographic scales and boundaries. These 18 threats have been aggregated into three broad- and mid-scale measures to account for whether the threat predominantly removes sagebrush or degrades habitat. (See Table 2, Relationship between the 18 threats and the three habitat disturbance measures for monitoring.) The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Energy and Mining Density (facilities and locations per unit area)

These three habitat disturbance measures will evaluate disturbance on all lands, regardless of land ownership. The direct area of influence will be assessed with the goal of accounting for actual removal of sagebrush on which sage-grouse depend (Connelly et al. 2000) and for habitat degradation as a surrogate for human activity. Measure 1 (sagebrush availability) examines where disturbances have removed plant communities that support sagebrush (or have broadly removed sagebrush from the landscape). Measure 1, therefore, monitors the change in sagebrush availability—or, specifically, where and how much of the sagebrush community is available within the range of sage-grouse. The sagebrush community is defined as the ecological systems that have the capability of supporting sagebrush vegetation and seasonal sage-grouse habitats within the range of sage-grouse (see Section I.B.1., Sagebrush Availability). Measure 2 (see Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (see Section I.B.3., Energy and Mining Density) focus on where habitat degradation is occurring by using the footprint/area of direct disturbance and the number of facilities at the mid scale to identify the relative amount of degradation per geographic area of interest and in areas that have the capability of supporting sagebrush and seasonal sage-grouse use. Measure 2 (habitat degradation) not only quantifies footprint/area of direct disturbance but also establishes a surrogate for those threats most likely to have ongoing activity. Because energy development and mining activities are typically the most intensive activities in sagebrush habitat, Measure 3 (the density of active energy development, production, and mining sites) will help identify areas of particular concern for such factors as noise, dust, traffic, etc. that degrade sage-grouse habitat.

Table 2. Relationship between the 18 threats and the three habitat disturbance measures for monitoring.

Note: Data availability may preclude specific analysis of individual layers. See the detailed methodology for more information.

USFWS Listing Decision Threat	Sagebrush Availability	Habitat Degradation	Energy and Mining Density
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X		
Invasive Species	X		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and saleable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights-of-way		X	

The methods to monitor disturbance found herein differ slightly from methods used in Manier et al. 2013, which provided a baseline environmental report (BER) of datasets of disturbance across jurisdictions. One difference is that, for some threats, the BER data were for federal lands only. In addition, threats were assessed individually, using different assumptions from those in this monitoring framework about how to quantify the location and magnitude of threats. The methodology herein builds on the BER methodology and identifies datasets and procedures to use the best available data across the range of the sage-grouse and to formulate a consistent approach to quantify impact of the threats through time. This methodology also describes an approach to combine the threats and calculate each of the three habitat disturbance measures.

B.1. Sagebrush Availability (Measure 1)

Sage-grouse populations have been found to be more resilient where a percentage of the landscape is maintained in sagebrush (Knick and Connelly 2011), which will be determined by sagebrush availability. Measure 1 has been divided into two submeasures to describe sagebrush availability on the landscape:

Measure 1a: the current amount of sagebrush on the geographic area of interest, and

Measure 1b: the amount of sagebrush on the geographic area of interest compared with the amount of sagebrush the landscape of interest could ecologically support.

Measure 1a (the current amount of sagebrush on the landscape) will be calculated using this formula: [the existing updated sagebrush layer] divided by [the geographic area of interest]. The appropriate geographic areas of interest for sagebrush availability include the species' range, WAFWA MZs, populations, and PACs. In some cases these sage-grouse areas will need to be aggregated to provide an estimate of sagebrush availability with an acceptable level of accuracy.

Measure 1b (the amount of sagebrush for context within the geographic area of interest) will be calculated using this formula: [existing sagebrush divided by [pre-EuroAmerican settlement geographic extent of lands that could have supported sagebrush]. This measure will provide information to set the context for a given geographic area of interest during evaluations of monitoring data. The information could also be used to inform management options for restoration or mitigation and to inform effectiveness monitoring.

The sagebrush base layer for Measure 1 will be based on geospatial vegetation data adjusted for the threats listed in Table 2. The following subsections of this monitoring framework describe the methodology for determining both the current availability of sagebrush on the landscape and the context of the amount of sagebrush on the landscape at the broad and mid scales.

a. Establishing the Sagebrush Base Layer

The current geographic extent of sagebrush vegetation within the rangewide distribution of sagegrouse populations will be ascertained using the most recent version of the Existing Vegetation Type (EVT) layer in LANDFIRE (2013). LANDFIRE EVT was selected to serve as the sagebrush base layer for five reasons: 1) it is the only nationally consistent vegetation layer that has been updated multiple times since 2001; 2) the ecological systems classification within LANDFIRE EVT includes multiple sagebrush type classes that, when aggregated, provide a more accurate (compared with individual classes) and seamless sagebrush base layer across jurisdictional boundaries; 3) LANDFIRE performed a rigorous accuracy assessment from which to derive the rangewide uncertainty of the sagebrush base layer; 4) LANDFIRE is consistently used in several recent analyses of sagebrush habitats (Knick et al. 2011, Leu and Hanser 2011, Knick and Hanser 2011); and 5) LANDFIRE EVT can be compared against the geographic extent of lands that are believed to have had the capability of supporting sagebrush vegetation pre-EuroAmerican settlement [LANDFIRE Biophysical Setting (BpS)]. This fifth reason provides a reference point for understanding how much sagebrush currently remains in a defined geographic area of interest compared with how much sagebrush existed historically (Measure 1b). Therefore, the BLM and the USFS have determined that LANDFIRE provides the best available data at broad and mid scales to serve as a sagebrush base layer for monitoring changes in the geographic extent of sagebrush. The BLM and the USFS, in addition to aggregating the sagebrush types into the sagebrush base layer, will aggregate the accuracy assessment reports from LANDFIRE to document the cumulative accuracy for the sagebrush base layer. The BLM—through its Assessment, Inventory, and Monitoring (AIM) program and, specifically, the BLM’s landscape monitoring framework (Taylor et al. 2014)—will provide field data to the LANDFIRE program to support continuous quality improvements of the LANDFIRE EVT layer. The sagebrush layer based on LANDFIRE EVT will allow for the mid-scale estimation of the existing percent of sagebrush across a variety of reporting units. This sagebrush base layer will be adjusted by changes in land cover and successful restoration for future calculations of sagebrush availability (Measures 1a and 1b).

This layer will also be used to determine the trend in other landscape indicators, such as patch size and number, patch connectivity, linkage areas, and landscape matrix and edge effects (Stiver et al. *in press*). In the future, changes in sagebrush availability, generated annually, will be included in the sagebrush base layer. The landscape metrics will be recalculated to examine changes in pattern and abundance of sagebrush at the various geographic boundaries. This information will be included in effectiveness monitoring (See Section I.D., Effectiveness Monitoring).

Within the USFS and the BLM, forest-wide and field office–wide existing vegetation classification mapping and inventories are available that provide a much finer level of data than what is provided through LANDFIRE. Where available, these finer-scale products will be useful for additional and complementary mid-scale indicators and local-scale analyses (see Section II,

Fine and Site Scales). The fact that these products are not available everywhere limits their utility for monitoring at the broad and mid scale, where consistency of data products is necessary across broader geographies.

Data Sources for Establishing and Monitoring Sagebrush Availability

There were three criteria for selecting the datasets for establishing and monitoring the change in sagebrush availability (Measure 1):

- Nationally consistent dataset available across the range
- Known level of confidence or accuracy in the dataset
- Continual maintenance of dataset and known update interval

Datasets meeting these criteria are listed in Table 3, Datasets for establishing and monitoring changes in sagebrush availability.

LANDFIRE Existing Vegetation Type (EVT) Version 1.2

LANDFIRE EVT represents existing vegetation types on the landscape derived from remote sensing data. Initial mapping was conducted using imagery collected in approximately 2001. Since the initial mapping there have been two update efforts: version 1.1 represents changes before 2008, and version 1.2 reflects changes on the landscape before 2010. Version 1.2 will be used as the starting point to develop the sagebrush base layer.

Sage-grouse subject matter experts determined which of the ecological systems from the LANDFIRE EVT to use in the sagebrush base layer by identifying the ecological systems that have the capability of supporting sagebrush vegetation and that could provide suitable seasonal habitat for the sage-grouse. (See Table 4, Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.) Two additional vegetation types that are not ecological systems were added to the EVT: *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance. These alliances have species composition directly related to the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system, both of which are ecological systems in LANDFIRE BpS. In LANDFIRE EVT, however, in some map zones, the Rocky Mountain Lower Montane-Foothill Shrubland ecological system and the Rocky Mountain Gambel Oak-Mixed Montane Shrubland ecological system were named *Artemisia tridentata* ssp. *vaseyana* Shrubland Alliance and *Quercus gambelii* Shrubland Alliance, respectively.

Table 3. Datasets for establishing and monitoring changes in sagebrush availability.

Dataset	Source	Update Interval	Most Recent Version Year	Use
BioPhysical Setting v1.1	LANDFIRE	Static	2008	Denominator for sagebrush availability
Existing Vegetation Type v1.2	LANDFIRE	Static	2010	Numerator for sagebrush availability
Cropland Data Layer	National Agricultural Statistics Service	Annual	2012	Agricultural updates; removes existing sagebrush from numerator of sagebrush availability
National Land Cover Dataset Percent Imperviousness	Multi-Resolution Land Characteristics Consortium (MRLC)	5-Year	2011 (next available in 2016)	Urban area updates; removes existing sagebrush from numerator of sagebrush availability
Fire Perimeters	GeoMac	Annual	2013	< 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability
Burn Severity	Monitoring Trends in Burn Severity	Annual	2012 (2-year delay in data availability)	> 1,000-acre fire updates; removes existing sagebrush from numerator of sagebrush availability except for unburned sagebrush islands

Table 4. Ecological systems in BpS and EVT capable of supporting sagebrush vegetation and capable of providing suitable seasonal habitat for Greater Sage-Grouse.

Ecological System	Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Mixed Low Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia bigelovii</i> <i>Artemisia nova</i> <i>Artemisia frigida</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Columbia Plateau Low Sagebrush Steppe	<i>Artemisia arbuscula</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i>

Columbia Plateau Scabland Shrubland	<i>Artemisia rigida</i>
Columbia Plateau Steppe and Grassland	<i>Artemisia</i> spp.
Great Basin Xeric Mixed Sagebrush Shrubland	<i>Artemisia arbuscula</i> ssp. <i>longicaulis</i> <i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Shrubland	<i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Inter-Mountain Basins Big Sagebrush Steppe	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>xericensis</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>tripartita</i> <i>Artemisia frigida</i>
Inter-Mountain Basins Curl-Leaf Mountain Mahogany Woodland and Shrubland	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i>
Inter-Mountain Basins Mixed Salt Desert Scrub	<i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia spinescens</i>
Inter-Mountain Basins Montane Sagebrush Steppe	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia nova</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>spiciformis</i>
Inter-Mountain Basins Semi-Desert Shrub-Steppe	<i>Artemisia tridentata</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Northwestern Great Plains Mixed Grass Prairie	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia frigida</i>
Northwestern Great Plains Shrubland	<i>Artemisia cana</i> ssp. <i>cana</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i>
Rocky Mountain Gambel Oak-Mixed Montane Shrubland	<i>Artemisia tridentata</i>
Rocky Mountain Lower Montane-Foothill Shrubland	<i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia frigida</i>
Western Great Plains Floodplain Systems	<i>Artemisia cana</i> ssp. <i>cana</i>
Western Great Plains Sand Prairie	<i>Artemisia cana</i> ssp. <i>cana</i>
Wyoming Basins Dwarf Sagebrush Shrubland and Steppe	<i>Artemisia arbuscula</i> ssp. <i>longiloba</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tripartita</i> ssp. <i>rupicola</i>
<i>Artemisia tridentata</i> ssp. <i>vaseyana</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
<i>Quercus gambelii</i> Shrubland Alliance (EVT only)	<i>Artemisia tridentata</i>

Accuracy and Appropriate Use of LANDFIRE Datasets

Because of concerns over the thematic accuracy of individual classes mapped by LANDFIRE, all ecological systems listed in Table 4 will be merged into one value that represents the sagebrush base layer. With all ecological systems aggregated, the combined accuracy of the sagebrush base layer (EVT) will be much greater than if all categories were treated separately.

LANDFIRE performed the original accuracy assessment of its EVT product on a map zone basis. There are 20 LANDFIRE map zones that cover the historical range of sage-grouse as defined by Schroeder (2004). (See Attachment B, User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones.) The aggregated sagebrush base layer for monitoring had user accuracies ranging from 57.1% to 85.7% and producer accuracies ranging from 56.7% to 100%.

LANDFIRE EVT data are not designed to be used at a local level. In reports of the percent sagebrush statistic for the various reporting units (Measure 1a), the uncertainty of the percent sagebrush will increase as the size of the reporting unit gets smaller. LANDFIRE data should never be used at the 30m pixel level (900m² resolution of raster data) for any reporting. The smallest geographic extent for using the data to determine percent sagebrush is at the PAC level; for the smallest PACs, the initial percent sagebrush estimate will have greater uncertainties compared with the much larger PACs.

Agricultural Adjustments for the Sagebrush Base Layer

The dataset for the geographic extent of agricultural lands will come from the National Agricultural Statistics Service (NASS) Cropland Data Layer (CDL) (<http://www.nass.usda.gov/research/Cropland/Release/index.htm>). CDL data are generated annually, with estimated producer accuracies for “large area row crops ranging from the mid 80% to mid-90%,” depending on the state (http://www.nass.usda.gov/research/Cropland/sarsfaqs2.htm#Section3_18.0). Specific information on accuracy may be found on the NASS metadata website (<http://www.nass.usda.gov/research/Cropland/metadata/meta.htm>). CDL provided the only dataset that matches the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in this monitoring framework and represents the best available agricultural lands mapping product.

The CDL data contain both agricultural classes and nonagricultural classes. For this effort, and in the baseline environmental report (Manier et al. 2013), nonagricultural classes were removed from the original dataset. The excluded classes are:

Barren (65 & 131), Deciduous Forest (141), Developed/High Intensity (124), Developed/Low Intensity (122), Developed/Med Intensity (123), Developed/Open Space (121), Evergreen Forest (142), Grassland Herbaceous (171), Herbaceous Wetlands (195), Mixed Forest (143), Open

Water (83 & 111), Other Hay/Non Alfalfa (37), Pasture/Hay (181), Pasture/Grass (62), Perennial Ice/Snow (112), Shrubland (64 & 152), Woody Wetlands (190).

The rule set for adjusting the sagebrush base layer for agricultural lands (and for updating the base layer for agricultural lands in the future) is that once an area is classified as agriculture in any year of the CDL, those pixels will remain out of the sagebrush base layer even if a new version of the CDL classifies that pixel as one of the nonagricultural classes listed above. The assumption is that even though individual pixels may be classified as a nonagricultural class in any given year, the pixel has not necessarily been restored to a natural sagebrush community that would be included in Table 4. A further assumption is that once an area has moved into agricultural use, it is unlikely that the area would be restored to sagebrush. Should that occur, however, the method and criteria for adding pixels back into the sagebrush base layer would follow those found in the sagebrush restoration monitoring section of this monitoring framework (see Section I.B.1.b., Monitoring Sagebrush Availability).

Urban Adjustments for the Sagebrush Base Layer

The National Land Cover Database (NLCD) (Fry et al. 2011) includes a percent imperviousness dataset that was selected as the best available dataset to be used for urban adjustments and monitoring. These data are generated on a 5-year cycle and are specifically designed to support monitoring efforts. Other datasets were evaluated and lacked the spatial specificity that was captured in the NLCD product. Any new impervious pixel in NLCD will be removed from the sagebrush base layer through the monitoring process. Although the impervious surface layer includes a number of impervious pixels outside of urban areas, this is acceptable for the adjustment and monitoring for two reasons. First, an evaluation of national urban area datasets did not reveal a layer that could be confidently used in conjunction with the NLCD product to screen impervious pixels outside of urban zones. This is because unincorporated urban areas were not being included, thus leaving large chunks of urban pixels unaccounted for in this rule set. Second, experimentation with setting a threshold on the percent imperviousness layer that would isolate rural features proved to be unsuccessful. No combination of values could be identified that would result in the consistent ability to limit impervious pixels outside urban areas. Therefore, to ensure consistency in the monitoring estimates, all impervious pixels will be used.

Fire Adjustments for the Sagebrush Base Layer

Two datasets were selected for performing fire adjustments and updates: GeoMac fire perimeters and Monitoring Trends in Burn Severity (MTBS). An existing data standard in the BLM requires that all fires of more than 10 acres are to be reported to GeoMac; therefore, there will be many small fires of less than 10 acres that will not be accounted for in the adjustment and monitoring attributable to fire. Using fire perimeters from GeoMac, all sagebrush pixels falling

within the perimeter of fires less than 1,000 acres will be used to adjust and monitor the sagebrush base layer.

For fires greater than 1,000 acres, MTBS was selected as a means to account for unburned sagebrush islands during the update process of the sagebrush base layer. The MTBS program (<http://www.mtbs.gov>) is an ongoing, multiyear project to map fire severity and fire perimeters consistently across the United States. One of the burn severity classes within MTBS is an unburned to low-severity class. This burn severity class will be used to represent unburned islands of sagebrush within the fire perimeter for the sagebrush base layer. Areas within the other severity classes within the fire perimeter will be removed from the base sagebrush layer during the update process. Not all wildfires, however, have the same impacts on the recovery of sagebrush habitat, depending largely on soil moisture and temperature regimes. For example, cooler, moister sagebrush habitat has a higher potential for recovery or, if needed, restoration than does the warmer, dryer sagebrush habitat. These cooler, moister areas will likely be detected as sagebrush in future updates to LANDFIRE.

Conifer Encroachment Adjustment for the Sagebrush Base Layer

Conifer encroachment into sagebrush vegetation reduces the spatial extent of sage-grouse habitat (Davies et al. 2011, Baruch-Mordo et al. 2013). Conifer species that show propensity for encroaching into sagebrush vegetation resulting in sage-grouse habitat loss include various juniper species, such as Utah juniper (*Juniperus osteosperma*), western juniper (*Juniperus occidentalis*), Rocky Mountain juniper (*Juniperus scopulorum*), pinyon species, including singleleaf pinyon (*Pinus monophylla*) and pinyon pine (*Pinus edulis*), ponderosa pine (*Pinus ponderosa*), lodgepole pine (*Pinus contorta*), and Douglas fir (*Pseudotsuga menziesii*) (Gruell et al. 1986, Grove et al. 2005, Davies et al. 2011).

A rule set for conifer encroachment was developed to adjust the sagebrush base layer. To capture the geographic extent of sagebrush that is likely to experience conifer encroachment, ecological systems within LANDFIRE EVT version 1.2 (NatureServe 2011) were identified if they had the capability of supporting both the conifer species (listed above) and sagebrush vegetation. Those ecological systems were deemed to be the plant communities with conifers most likely to encroach into sagebrush vegetation. (See Table 5, Ecological systems with conifers most likely to encroach into sagebrush vegetation.) Sagebrush vegetation was defined as including sagebrush species or subspecies that provide habitat for the Greater Sage-Grouse and that are included in the HAF. (See Attachment C, Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers.) An adjacency analysis was conducted to identify all sagebrush pixels that were directly adjacent to these conifer ecological systems, and these pixels were removed from the sagebrush base layer.

Table 5. Ecological systems with conifers most likely to encroach into sagebrush vegetation.

EVT Ecological Systems	Coniferous Species and Sagebrush Vegetation that the Ecological System has the Capability of Producing
Colorado Plateau Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus osteosperma</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> ssp. <i>tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i> <i>Artemisia bigelovii</i> <i>Artemisia pygmaea</i>
Columbia Plateau Western Juniper Woodland and Savanna	<i>Juniperus occidentalis</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia rigida</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
East Cascades Oak-Ponderosa Pine Forest and Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i> <i>Artemisia tridentata</i> <i>Artemisia nova</i>
Great Basin Pinyon-Juniper Woodland	<i>Pinus monophylla</i> <i>Juniperus osteosperma</i> <i>Artemisia arbuscula</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Northern Rocky Mountain Ponderosa Pine Woodland and Savanna	<i>Pinus ponderosa</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Rocky Mountain Foothill Limber Pine-Juniper Woodland	<i>Juniperus osteosperma</i> <i>Juniperus scopulorum</i> <i>Artemisia nova</i> <i>Artemisia tridentata</i>
Rocky Mountain Poor-Site Lodgepole Pine Forest	<i>Pinus contorta</i> <i>Pseudotsuga menziesii</i> <i>Pinus ponderosa</i> <i>Artemisia tridentata</i>
Southern Rocky Mountain Pinyon-Juniper Woodland	<i>Pinus edulis</i> <i>Juniperus monosperma</i> <i>Artemisia bigelovii</i> <i>Artemisia tridentata</i> <i>Artemisia tridentata</i> ssp. <i>wyomingensis</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
Southern Rocky Mountain Ponderosa Pine Woodland	<i>Pinus ponderosa</i> <i>Pseudotsuga menziesii</i>

	<i>Pinus edulis</i> <i>Pinus contorta</i> <i>Juniperus</i> spp. <i>Artemisia nova</i> <i>Artemisia tridentata</i> <i>Artemisia arbuscula</i> <i>Artemisia tridentata</i> ssp. <i>vaseyana</i>
--	---

Invasive Annual Grasses Adjustments for the Sagebrush Base Layer

There are no invasive species datasets from 2010 to the present (beyond the LANDFIRE data) that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated) for use in the determination of the sagebrush base layer. For a description of how invasive species land cover will be incorporated in the sagebrush base layer in the future, see Section I.B.1.b., Monitoring Sagebrush Availability.

Sagebrush Restoration Adjustments for the Sagebrush Base Layer

There are no datasets from 2010 to the present that could provide additions to the sagebrush base layer from restoration treatments that meet the three criteria (nationally consistent, known level of accuracy, and periodically updated); therefore, no adjustments were made to the sagebrush base layer calculated from the LANDFIRE EVT (version 1.2) attributable to restoration activities since 2010. Successful restoration treatments before 2010 are assumed to have been captured in the LANDFIRE refresh.

b. Monitoring Sagebrush Availability

Monitoring Sagebrush Availability

Sagebrush availability will be updated annually by incorporating changes to the sagebrush base layer attributable to agriculture, urbanization, and wildfire. The monitoring schedule for the existing sagebrush base layer updates is as follows:

2010 Existing Sagebrush Base Layer = [Sagebrush EVT] minus [2006 Imperviousness Layer] minus [2009 and 2010 CDL] minus [2009/10 GeoMac Fires that are less than 1,000 acres] minus [2009/10 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter] minus [Conifer Encroachment Layer]

2012 Existing Sagebrush Update = [2010 Existing Sagebrush Base Layer] minus [2011 Imperviousness Layer] minus [2011 and 2012 CDL] minus [2011/12 GeoMac Fires < 1,000 acres] minus [2011/12 MTBS Fires that are greater than 1,000 acres, excluding unburned sagebrush islands within the perimeter]

Monitoring Existing Sagebrush post 2012 = [Previous Existing Sagebrush Update Layer] minus [Imperviousness Layer (if new data are available)] minus [Next 2 years of CDL] minus [Next 2 years of GeoMac Fires < 1,000 acres] minus [Next 2 years of MTBS Fires that are greater than

1,000 acres, excluding unburned sagebrush islands within the perimeter] plus
[restoration/monitoring data provided by the field]

Monitoring Sagebrush Restoration

Restoration after fire, after agricultural conversion, after seedings of introduced grasses, or after treatments of pinyon pine and/or juniper are examples of updates to the sagebrush base layer that can add sagebrush vegetation back into sagebrush availability in the landscape. When restoration has been determined to be successful through rangewide, consistent, interagency fine- and site-scale monitoring, the polygonal data will be used to add sagebrush pixels back into the broad- and mid-scale sagebrush base layer.

Measure 1b: Context for Monitoring the Amount of Sagebrush in a Geographic Area of Interest

Measure 1b describes the amount of sagebrush on the landscape of interest compared with the amount of sagebrush the landscape of interest could ecologically support. Areas with the potential to support sagebrush were derived from the BpS data layer that describes sagebrush pre-EuroAmerican settlement (v1.2 of LANDFIRE).

The identification and spatial locations of natural plant communities (vegetation) that are believed to have existed on the landscape (BpS) were constructed based on an approximation of the historical (pre-EuroAmerican settlement) disturbance regime and how the historical disturbance regime operated on the current biophysical environment. BpS is composed of map units that are based on NatureServe (2011) terrestrial ecological systems classification.

The ecological systems within BpS used for this monitoring framework are those ecological systems that are capable of supporting sagebrush vegetation and of providing seasonal habitat for sage-grouse (Table 4). Ecological systems selected included sagebrush species or subspecies that are included in the HAF and listed in Attachment C.

The BpS layer does not have an associated accuracy assessment, given the lack of any reference data. Visual inspection of the BpS data, however, reveals inconsistencies in the labeling of pixels among LANDFIRE map zones. The reason for these inconsistencies is that the rule sets used to map a given ecological system will vary among map zones based on different physical, biological, disturbance, and atmospheric regimes of the region. These variances can result in artificial edges in the map. Metrics will be calculated, however, at broad spatial scales using BpS potential vegetation type, not small groupings or individual pixels. Therefore, the magnitude of these observable errors in the BpS layer will be minor compared with the size of the reporting units. Since BpS will be used to identify broad landscape patterns of dominant vegetation, these inconsistencies will have only a minor impact on the percent sagebrush availability calculation. *As with the LANDFIRE EVT, LANDFIRE BpS data are not designed to be used at a local level. LANDFIRE data should never be used at the 30m pixel level for reporting.*

In conclusion, sagebrush availability data will be used to inform effectiveness monitoring and initiate adaptive management actions as necessary. The 2010 estimate of sagebrush availability will serve as the base year, and an updated estimate for 2012 will be reported in 2014 after all datasets become available. The 2012 estimate will capture changes attributable to wildfire, agriculture, and urban development. Subsequent updates will always include new fire and agricultural data and new urban data when available. Restoration data that meet the criteria for adding sagebrush areas back into the sagebrush base layer will be factored in as data allow. Given data availability, there will be a 2-year lag (approximately) between when the estimate is generated and when the data used for the estimate become available (e.g., the 2014 sagebrush availability will be included in the 2016 estimate).

Future Plans

Geospatial data used to generate the sagebrush base layer will be available through the BLM's EGIS web portal and geospatial gateway or through the authoritative data source. Legacy datasets will be preserved so that trends may be calculated. Additionally, accuracy assessment data for all source datasets will be provided on the portal either spatially, where applicable, or through the metadata. Accuracy assessment information was deemed vital to help users understand the limitation of the sagebrush estimates; it will be summarized spatially by map zone and will be included in the portal.

LANDFIRE plans to begin a remapping effort in 2015. This remapping has the potential to improve the overall quality of data products greatly, primarily through the use of higher-quality remote sensing datasets. Additionally, the BLM and the Multi-Resolution Land Characteristics Consortium (MRLC) are working to improve the accuracy of vegetation map products for broad- and mid-scale analyses through the Grass/Shrub mapping effort. The Grass/Shrub mapping effort applies the Wyoming multiscale sagebrush habitat methodology (Homer et al. 2009) to depict spatially the fractional percent cover estimates for five components rangewide and West-wide. These five components are percent cover of sagebrush vegetation, percent bare ground, percent herbaceous vegetation (grass and forbs combined), annual vegetation, and percent shrubs. A benefit of the design of these fractional cover maps is that they facilitate monitoring "within" class variation (e.g., examination of declining trend in sagebrush cover for individual pixels). This "within" class variation can serve as one indicator of sagebrush quality that cannot be derived from LANDFIRE's EVT information. The Grass/Shrub mapping effort is not a substitute for fine-scale monitoring but will leverage fine-scale data to support the validation of the mapping products. An evaluation will be conducted to determine if either dataset is of great enough quality to warrant replacing the existing sagebrush layers. At the earliest, this evaluation will occur in 2018 or 2019, depending on data availability.

B.2. Habitat Degradation Monitoring (Measure 2)

The measure of habitat degradation will be calculated by combining the footprints of threats identified in Table 2. The footprint is defined as the direct area of influence of “active” energy and infrastructure; it is used as a surrogate for human activity. Although these analyses will try to summarize results at the aforementioned meaningful geographic areas of interest, some may be too small to report the metrics appropriately and may be combined (smaller populations, PACs within a population, etc.). Data sources for each threat are found in Table 6, Geospatial data sources for habitat degradation. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and to calculate trends in habitat degradation to inform adaptive management. A 5-year summary report will be provided to the USFWS.

a. Habitat Degradation Datasets and Assumptions

Energy (oil and gas wells and development facilities)

This dataset will compile information from three oil and gas databases: the proprietary IHS Enerdeq database, the BLM Automated Fluid Minerals Support System (AFMSS) database, and the proprietary Platts (a McGraw-Hill Financial Company) GIS Custom Data (hereafter, Platts) database of power plants. Point data from wells active within the last 10 years from IHS and producing wells from AFMSS will be considered as a 5-acre (2.0ha) direct area of influence centered on the well point, as recommended by the BLM WO-300 (Minerals and Realty Management). Plugged and abandoned wells will be removed if the date of well abandonment was before the first day of the reporting year (i.e., for the 2015 reporting year, a well must have been plugged and abandoned by 12/31/2014 to be removed). Platts oil and gas power plants data (subset to operational power plants) will also be included as a 5-acre (2.0ha) direct area of influence.

Additional Measure: Reclaimed Energy-related Degradation. This dataset will include those wells that have been plugged and abandoned. This measure thereby attempts to measure energy-related degradation that has been reclaimed but not necessarily fully restored to sage-grouse habitat. This measure will establish a baseline by using wells that have been plugged and abandoned within the last 10 years from the IHS and AFMSS datasets. Time lags for lek attendance in response to infrastructure have been documented to be delayed 2–10 years from energy development activities (Harju et al. 2010). Reclamation actions may require 2 or more years from the Final Abandonment Notice. Sagebrush seedling establishment may take 6 or more years from the point of seeding, depending on such variables as annual precipitation, annual temperature, and soil type and depth (Pyke 2011). This 10-year period is conservative and assumes some level of habitat improvement 10 years after plugging. Research by Hemstrom et al. (2002), however,

proposes an even longer period—more than 100 years—for recovery of sagebrush habitats, even with active restoration approaches. Direct area of influence will be considered 3 acres (1.2ha) (J. Perry, personal communication, February 12, 2014). This additional layer/measure could be used at the broad and mid scale to identify areas where sagebrush habitat and/or potential sagebrush habitat is likely still degraded. This layer/measure could also be used where further investigation at the fine or site scale would be warranted to: 1) quantify the level of reclamation already conducted, and 2) evaluate the amount of restoration still required for sagebrush habitat recovery. At a particular level (e.g., population, PACs), these areas and the reclamation efforts/success could be used to inform reclamation standards associated with future developments. Once these areas have transitioned from reclamation standards to meeting *restoration* standards, they can be added back into the sagebrush availability layer using the same methodology as described for adding restoration treatment areas lost to wildfire and agriculture conversion (see Monitoring Sagebrush Restoration in Section I.B.1.b., Monitoring Sagebrush Availability). This dataset will be updated annually from the IHS dataset.

Energy (coal mines)

Currently, there is no comprehensive dataset available that identifies the footprint of active coal mining across all jurisdictions. Therefore, point and polygon datasets will be used each year to identify coal mining locations. Data sources will be identified and evaluated annually and will include at a minimum: BLM coal lease polygons, U.S. Energy Information Administration mine occurrence points, U.S. Office of Surface Mining Reclamation and Enforcement coal mining permit polygons (as available), and U.S. Geological Survey (USGS) Mineral Resources Data System mine occurrence points. These data will inform where active coal mining may be occurring. Additionally, coal power plant data from Platts power plants database (subset to operational power plants) will be included. Aerial imagery will then be used to digitize manually the active coal mining and coal power plants surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active coal mine and power plant direct area of influence. Coal mine location data source and imagery date will be documented for each digitized coal polygon at the time of creation. Subsurface facility locations (polygon or point location as available) will also be collected if available, included in density calculations, and added to the active surface activity layer as appropriate (if an actual direct area of influence can be located).

Energy (wind energy facilities)

This dataset will be a subset of the Federal Aviation Administration (FAA) Digital Obstacles point file. Points where “Type_” = “WINDMILL” will be included. Direct area of influence of these point features will be measured by converting to a polygon dataset as a direct area of

influence of 3 acres (1.2ha) centered on each tower point. See the BLM’s “Wind Energy Development Programmatic Environmental Impact Statement” (BLM 2005). Additionally, Platts power plants database will be used for transformer stations associated with wind energy sites (subset to operational power plants), also with a 3-acre (1.2ha) direct area of influence.

Energy (solar energy facilities)

This dataset will include solar plants as compiled with the Platts power plants database (subset to operational power plants). This database includes an attribute that indicates the operational capacity of each solar power plant. Total capacity at the power plant was based on ratings of the in-service unit(s), in megawatts. Direct area of influence polygons will be centered over each point feature representing 7.3ac (3.0ha) per megawatt of the stated operational capacity, per the report of the National Renewable Energy Laboratory (NREL), “Land-Use Requirements for Solar Power Plants in the United States” (Ong et al. 2013).

Energy (geothermal energy facilities)

This dataset will include geothermal wells in existence or under construction as compiled with the IHS wells database and power plants as compiled with the Platts database (subset to operational power plants). Direct area of influence of these point features will be measured by converting to a polygon dataset of 3 acres (1.2ha) centered on each well or power plant point.

Mining (active developments; locatable, leasable, saleable)

This dataset will include active locatable mining locations as compiled with the proprietary InfoMine database. Aerial imagery will then be used to digitize manually the active mining surface disturbance in or near these known occurrence areas. While the date of aerial imagery varies by scale, the most current data available from Esri and/or Google will be used to locate (generally at 1:50,000 and below) and digitize (generally at 1:10,000 and below) active mine direct area of influence. Mine location data source and imagery date will be documented for each digitized polygon at the time of creation. Currently, there are no known compressive databases available for leasable or saleable mining sites beyond coal mines. Other data sources will be evaluated and used as they are identified or as they become available. Point data may be converted to polygons to represent direct area of influence unless actual surface disturbance is available.

Infrastructure (roads)

This dataset will be compiled from the proprietary Esri StreetMap Premium for ArcGIS. Dataset features that will be used are: Interstate Highways, Major Roads, and Surface Streets to capture most paved and “crowned and ditched” roads while not including “two-track” and 4-wheel-drive routes. These minor roads, while not included in the broad- and mid-scale monitoring, may support a volume of traffic that can have deleterious effects on sage-grouse leks. It may be

appropriate to consider the frequency and type of use of roads in a NEPA analysis for a proposed project. This fine- and site-scale analysis will require more site-specific data than is identified in this monitoring framework. The direct area of influence for roads will be represented by 240.2ft, 84.0ft, and 40.7ft (73.2m, 25.6m, and 12.4m) total widths centered on the line feature for Interstate Highways, Major Roads, and Surface Streets, respectively (Knick et al. 2011). The most current dataset will be used for each monitoring update. *Note: This is a related but different dataset than what was used in BER (Manier et al. 2013). Individual BLM/USFS planning units may use different road layers for fine- and site-scale monitoring.*

Infrastructure (railroads)

This dataset will be a compilation from the Federal Railroad Administration Rail Lines of the USA dataset. Non-abandoned rail lines will be used; abandoned rail lines will not be used. The direct are of influence for railroads will be represented by a 30.8ft (9.4m) total width (Knick et al. 2011) centered on the non-abandoned railroad line feature.

Infrastructure (power lines)

This line dataset will be derived from the proprietary Platts transmission lines database. Linear features in the dataset attributed as “buried” will be removed from the disturbance calculation. Only “In Service” lines will be used; “Proposed” lines will not be used. Direct area of influence will be determined by the kV designation: 1–199 kV (100ft/30.5m), 200–399 kV (150ft/45.7m), 400–699 kV (200ft/61.0m), and 700-or greater kV (250ft/76.2m) based on average right-of-way and structure widths, according to BLM WO-300 (Minerals and Realty Management).

Infrastructure (communication towers)

This point dataset will be compiled from the Federal Communications Commission (FCC) communication towers point file; all duplicate points will be removed. It will be converted to a polygon dataset by using a direct area of influence of 2.5 acres (1.0ha) centered on each communication tower point (Knick et al. 2011).

Infrastructure (other vertical structures)

This point dataset will be compiled from the FAA’s Digital Obstacles point file. Points where “Type_” = “WINDMILL” will be removed. Duplicate points from the FCC communication towers point file will be removed. Remaining features will be converted to a polygon dataset using a direct area of influence of 2.5 acres (1.0ha) centered on each vertical structure point (Knick et al. 2011).

Other Developed Rights-of-Way

Currently, no additional data sources for other rights-of-way have been identified; roads, power lines, railroads, pipelines, and other known linear features are represented in the categories

described above. The newly purchased IHS data do contain pipeline information; however, this database does not currently distinguish between above-ground and underground pipelines. If additional features representing human activities are identified, they will be added to monitoring reports using similar assumptions to those used with the threats described above.

b. Habitat Degradation Threat Combination and Calculation

The threats targeted for measuring human activity (Table 2) will be converted to direct area of influence polygons as described for each threat above. These threat polygon layers will be combined and features dissolved to create one overall polygon layer representing footprints of active human activity in the range of sage-grouse. Individual datasets, however, will be preserved to indicate which types of threats may be contributing to overall habitat degradation.

This measure has been divided into three submeasures to describe habitat degradation on the landscape. Percentages will be calculated as follows:

Measure 2a. Footprint by geographic area of interest: Divide area of the active/direct footprint by the total area of the geographic area of interest (% disturbance in geographic area of interest).

Measure 2b. Active/direct footprint by historical sagebrush potential: Divide area of the active footprint that coincides with areas with historical sagebrush potential (BpS calculation from habitat availability) within a given geographic area of interest by the total area with sagebrush potential within the geographic area of interest (% disturbance on potential historical sagebrush in geographic area of interest).

Measure 2c. Active/direct footprint by current sagebrush: Divide area of the active footprint that coincides with areas of existing sagebrush (EVT calculation from habitat availability) within a given geographic area of interest by the total area that is current sagebrush within the geographic area of interest (% disturbance on current sagebrush in geographic area of interest).

B.3. Energy and Mining Density (Measure 3)

The measure of density of energy and mining will be calculated by combining the locations of energy and mining threats identified in Table 2. This measure will provide an estimate of the intensity of human activity or the intensity of habitat degradation. The number of energy facilities and mining locations will be summed and divided by the area of meaningful geographic areas of interest to calculate density of these activities. Data sources for each threat are found in Table 6. Specific assumptions (inclusion criteria for data, width/area assumptions for point and line features, etc.) and methodology for each threat, and the combined measure, are detailed

below. All datasets will be updated annually to monitor broad- and mid-scale year-to-year changes and 5-year (or longer) trends in habitat degradation.

Table 6. Geospatial data sources for habitat degradation (Measure 2).

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source
Energy (oil & gas)	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300
	Power Plants	Platts (power plants)	5.0ac (2.0ha)	BLM WO-300
Energy (coal)	Mines	BLM; USFS; Office of Surface Mining Reclamation and Enforcement; USGS Mineral Resources Data System	Polygon area (digitized)	Esri/Google Imagery
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Energy (wind)	Wind Turbines	Federal Aviation Administration	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	3.0ac (1.2ha)	BLM WO-300
Energy (solar)	Fields/Power Plants	Platts (power plants)	7.3ac (3.0ha)/MW	NREL
Energy (geothermal)	Wells	IHS	3.0ac (1.2ha)	BLM WO-300
	Power Plants	Platts (power plants)	Polygon area (digitized)	Esri Imagery
Mining	Locatable Developments	InfoMine	Polygon area (digitized)	Esri Imagery
Infrastructure (roads)	Surface Streets (Minor Roads)	Esri StreetMap Premium	40.7ft (12.4m)	USGS
	Major Roads	Esri StreetMap Premium	84.0ft (25.6m)	USGS
	Interstate Highways	Esri StreetMap Premium	240.2ft (73.2m)	USGS
Infrastructure (railroads)	Active Lines	Federal Railroad Administration	30.8ft (9.4m)	USGS
Infrastructure (power lines)	1-199kV Lines	Platts (transmission lines)	100ft (30.5m)	BLM WO-300
	200-399 kV Lines	Platts (transmission lines)	150ft (45.7m)	BLM WO-300
	400-699kV Lines	Platts (transmission lines)	200ft (61.0m)	BLM WO-300
	700+kV Lines	Platts (transmission lines)	250ft (76.2m)	BLM WO-300
Infrastructure (communication)	Towers	Federal Communications Commission	2.5ac (1.0ha)	BLM WO-300

a. Energy and Mining Density Datasets and Assumptions

Energy (oil and gas wells and development facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (coal mines)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (wind energy facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (solar energy facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Energy (geothermal energy facilities)

(See Section I.B.2., Habitat Degradation Monitoring.)

Mining (active developments; locatable, leasable, saleable)

(See Section I.B.2., Habitat Degradation Monitoring.)

b. Energy and Mining Density Threat Combination and Calculation

Datasets for energy and mining will be collected in two primary forms: point locations (e.g., wells) and polygon areas (e.g., surface coal mining). The following rule set will be used to calculate density for meaningful geographic areas of interest including standard grids and per polygon:

- 1) Point locations will be preserved; no additional points will be removed beyond the methodology described above. Energy facilities in close proximity (an oil well close to a wind tower) will be retained.
- 2) Polygons will not be merged, or features further dissolved. Thus, overlapping facilities will be retained, such that each individual threat will be a separate polygon data input for the density calculation.
- 3) The analysis unit (polygon or 640-acre section in a grid) will be the basis for counting the number of mining or energy facilities per unit area. Within the analysis unit, all point features will be summed, and any individual polygons will be counted as one (e.g., a coal mine will be counted as one facility within population). Where polygon features overlap multiple units (polygons or pixels), the facility will be counted as one in each unit where the polygon occurs (e.g., a polygon crossing multiple 640-acre

sections would be counted as one in each 640-acre section for a density per 640-acre-section calculation).

- 4) In methodologies with different-sized units (e.g., MZs, populations, etc.) raw facility counts will be converted to densities by dividing the raw facility counts by the total area of the unit. Typically this will be measured as facilities per 640 acres.
- 5) For uniform grids, raw facility counts will be reported. Typically this number will also be converted to facilities per 640 acres.
- 6) Reporting may include summaries beyond the simple ones above. Zonal statistics may be used to smooth smaller grids to help display and convey information about areas within meaningful geographic areas of interest that have high levels of energy and/or mining activity.
- 7) Additional statistics for each defined unit may also include adjusting the area to include only the area with the historical potential for sagebrush (BpS) or areas currently sagebrush (EVT).

Individual datasets and threat combination datasets for habitat degradation will be available through the BLM's EGIS web portal and geospatial gateway. Legacy datasets will be preserved so that trends may be calculated.

C. Population (Demographics) Monitoring

State wildlife management agencies are responsible for monitoring sage-grouse populations within their respective states. WAFWA will coordinate this collection of annual population data by state agencies. These data will be made available to the BLM according to the terms of the forthcoming Greater Sage-Grouse Population Monitoring Memorandum of Understanding (MOU) (2014) between WAFWA and the BLM. The MOU outlines a process, timeline, and responsibilities for regular data sharing of sage-grouse population and/or habitat information for the purposes of implementing sage-grouse LUPs/amendments and subsequent effectiveness monitoring. Population areas were refined from the "Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final Report" (COT 2013) by individual state wildlife agencies to create a consistent naming nomenclature for future data analyses. These population data will be used for analysis at the applicable scale to supplement habitat effectiveness monitoring of management actions and to inform the adaptive management responses.

D. Effectiveness Monitoring

Effectiveness monitoring will provide the data needed to evaluate BLM and USFS actions toward reaching the objective of the national planning strategy (BLM IM 2012-044)—to conserve sage-grouse populations and their habitat—and the objectives for the land use planning

area. Effectiveness monitoring methods described here will encompass multiple larger scales, from areas as large as the WAFWA MZ to the scale of this LUP. Effectiveness data used for these larger-scale evaluations will include all lands in the area of interest, regardless of surface ownership/management, and will help inform where finer-scale evaluations are needed, such as population areas smaller than an LUP or PACs within an LUP (described in Section II, Fine and Site Scales). Data will also include the trend of disturbance within these areas of interest to inform the need to initiate adaptive management responses as described in the land use plan.

Effectiveness monitoring reported for these larger areas provides the context to conduct effectiveness monitoring at finer scales. This approach also helps focus scarce resources to areas experiencing habitat loss, degradation, or population declines, without excluding the possibility of concurrent, finer-scale evaluations as needed where habitat or population anomalies have been identified through some other means.

To determine the effectiveness of the sage-grouse national planning strategy, the BLM and the USFS will evaluate the answers to the following questions and prepare a broad- and mid-scale effectiveness report:

- 1) Sagebrush Availability and Condition:
 - a. What is the amount of sagebrush availability and the change in the amount and condition of sagebrush?
 - b. What is the existing amount of sagebrush on the landscape and the change in the amount relative to the pre-EuroAmerican historical distribution of sagebrush (BpS)?
 - c. What is the trend and condition of the indicators describing sagebrush characteristics important to sage-grouse?
- 2) Habitat Degradation and Intensity of Activities:
 - a. What is the amount of habitat degradation and the change in that amount?
 - b. What is the intensity of activities and the change in the intensity?
 - c. What is the amount of reclaimed energy-related degradation and the change in the amount?
- 3) What is the population estimation of sage-grouse and the change in the population estimation?
- 4) How are the BLM and the USFS contributing to changes in the amount of sagebrush?
- 5) How are the BLM and the USFS contributing to disturbance?

The compilation of broad- and mid-scale data (and population trends as available) into an effectiveness monitoring report will occur on a 5-year reporting schedule (see Attachment A), which may be accelerated to respond to critical emerging issues (in consultation with the USFWS and state wildlife agencies). In addition, effectiveness monitoring results will be used to identify emerging issues and research needs and inform the BLM and the USFS adaptive

management strategy (see the adaptive management section of this Environmental Impact Statement).

To determine the effectiveness of the sage-grouse objectives of the land use plan, the BLM and the USFS will evaluate the answers to the following questions and prepare a plan effectiveness report:

- 1) Is this plan meeting the sage-grouse habitat objectives?
- 2) Are sage-grouse areas within the LUP meeting, or making progress toward meeting, land health standards, including the Special Status Species/wildlife habitat standard?
- 3) Is the plan meeting the disturbance objective(s) within sage-grouse areas?
- 4) Are the sage-grouse populations within this plan boundary and within the sage-grouse areas increasing, stable, or declining?

The effectiveness monitoring report for this LUP will occur on a 5-year reporting schedule (see Attachment A) or more often if habitat or population anomalies indicate the need for an evaluation to facilitate adaptive management or respond to critical emerging issues. Data will be made available through the BLM's EGIS web portal and the geospatial gateway.

Methods

At the broad and mid scales (PACs and above) the BLM and the USFS will summarize the vegetation, disturbance, and (when available) population data. Although the analysis will try to summarize results for PACs within each sage-grouse population, some populations may be too small to report the metrics appropriately and may need to be combined to provide an estimate with an acceptable level of accuracy. Otherwise, they will be flagged for more intensive monitoring by the appropriate landowner or agency. The BLM and the USFS will then analyze monitoring data to detect the trend in the amount of sagebrush; the condition of the vegetation in the sage-grouse areas (MacKinnon et al. 2011); the trend in the amount of disturbance; the change in disturbed areas owing to successful restoration; and the amount of new disturbance the BLM and/or the USFS has permitted. These data could be supplemented with population data (when available) to inform an understanding of the correlation between habitat and PACs within a population. This overall effectiveness evaluation must consider the lag effect response of populations to habitat changes (Garton et al. 2011).

Calculating Question 1, National Planning Strategy Effectiveness: The amount of sagebrush available in the large area of interest will use the information from Measure 1a (I.B.1., Sagebrush Availability) and calculate the change from the 2012 baseline to the end date of the reporting period. To calculate the change in the amount of sagebrush on the landscape to compare with the historical areas with potential to support sagebrush, the information from Measure 1b (I.B.1., Sagebrush Availability) will be used. To calculate the trend in the condition of sagebrush at the mid scale, three sources of data will be used: the BLM's Grass/Shrub mapping effort (Future Plans in Section I.B.1., Sagebrush Availability); the results from the calculation of the landscape

indicators, such as patch size (described below); and the BLM's Landscape Monitoring Framework (LMF) and sage-grouse intensification effort (also described below). The LMF and sage-grouse intensification effort data are collected in a statistical sampling framework that allows calculation of indicator values at multiple scales.

Beyond the importance of sagebrush availability to sage-grouse, the mix of sagebrush patches on the landscape at the broad and mid scale provides the life requisite of space for sage-grouse dispersal needs (see the HAF). The configuration of sagebrush habitat patches and the land cover or land use between the habitat patches at the broad and mid scales also defines suitability. There are three significant habitat indicators that influence habitat use, dispersal, and movement across populations: the size and number of habitat patches, the connectivity of habitat patches (linkage areas), and habitat fragmentation (scope of unsuitable and non-habitats between habitat patches). The most appropriate commercial software to measure patch dynamics, connectivity, and fragmentation at the broad and mid scales will be used, along with the same data layers derived for sagebrush availability.

The BLM initiated the LMF in 2011 in cooperation with the Natural Resources Conservation Service (NRCS). The objective of the LMF effort is to provide unbiased estimates of vegetation and soil condition and trend using a statistically balanced sample design across BLM lands. Recognizing that sage-grouse populations are more resilient where the sagebrush plant community has certain characteristics unique to a particular life stage of sage-grouse (Knick and Connelly 2011, Stiver et al. *in press*), a group of sage-grouse habitat and sagebrush plant community subject matter experts identified those vegetation indicators collected at LMF sampling points that inform sage-grouse habitat needs. The experts represented the Agricultural Research Service, BLM, NRCS, USFWS, WAFWA, state wildlife agencies, and academia. The common indicators identified include: species composition, foliar cover, height of the tallest sagebrush and herbaceous plant, intercanopy gap, percent of invasive species, sagebrush shape, and bare ground. To increase the precision of estimates of sagebrush conditions within the range of sage-grouse, additional plot locations in occupied sage-grouse habitat (Sage-Grouse Intensification) were added in 2013. The common indicators are also collected on sampling locations in the NRCS National Resources Inventory Rangeland Resource Assessment (<http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/nra/nri/?&cid=stelprdb1041620>).

The sage-grouse intensification baseline data will be collected over a 5-year period, and an annual sage-grouse intensification report will be prepared describing the status of the indicators. Beginning in year 6, the annual status report will be accompanied with a trend report, which will be available on an annual basis thereafter, contingent on continuation of the current monitoring budget. This information, in combination with the Grass/Shrub mapping information, the mid-scale habitat suitability indicator measures, and the sagebrush availability information will be used to answer Question 1 of the National Planning Strategy Effectiveness Report.

Calculating Question 2, National Planning Strategy Effectiveness: Evaluations of the amount of habitat degradation and the intensity of the activities in the area of interest will use the information from Measure 2 (Section I.B.2., Habitat Degradation Monitoring) and Measure 3 (Section I.B.3., Energy and Mining Density). The field office will collect data on the amount of reclaimed energy-related degradation on plugged and abandoned and oil/gas well sites. The data are expected to demonstrate that the reclaimed sites have yet to meet the habitat restoration objectives for sage-grouse habitat. This information, in combination with the amount of habitat degradation, will be used to answer Question 2 of the National Planning Strategy Effectiveness Report.

Calculating Question 3, National Planning Strategy Effectiveness: The change in sage-grouse estimated populations will be calculated from data provided by the state wildlife agencies, when available. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 3 of the National Planning Strategy Effectiveness Report.

Calculating Question 4, National Planning Strategy Effectiveness: The estimated contribution by the BLM or the USFS to the change in the amount of sagebrush in the area of interest will use the information from Measure 1a (Section I.B.1., Sagebrush Availability). This measure is derived from the national datasets that remove sagebrush (Table 3). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for this measure in the geographic areas of interest. This information will be used to answer Question 4 of the National Planning Strategy Effectiveness Report.

Calculating Question 5, National Planning Strategy Effectiveness: The estimated contribution by the BLM or the USFS to the change in the amount of disturbance in the area of interest will use the information from Measure 2a (Section I.B.2., Monitoring Habitat Degradation) and Measure 3 (Section I.B.3., Energy and Mining Density). These measures are all derived from the national disturbance datasets that degrade habitat (Table 6). To determine the relative contribution of BLM and USFS management, the current Surface Management Agency geospatial data layer will be used to differentiate the amount of change for each management agency for these two measures in the geographic areas of interest. This information will be used to answer Question 5 of the National Planning Strategy Effectiveness Report.

Answers to the five questions for determining the effectiveness of the national planning strategy will identify areas that appear to be meeting the objectives of the strategy and will facilitate identification of population areas for more detailed analysis. Conceptually, if the broad-scale monitoring identifies increasing sagebrush availability and improving vegetation conditions, decreasing disturbance, and a stable or increasing population for the area of interest, there is evidence that the objectives of the national planning strategy to maintain populations and their habitats have been met. Conversely, where information indicates that sagebrush is decreasing and vegetation conditions are degrading, disturbance in sage-grouse areas is increasing, and/or

populations are declining relative to the baseline, there is evidence that the objectives of the national planning strategy are not being achieved. Such a determination would likely result in a more detailed analysis and could be the basis for implementing more restrictive adaptive management measures.

With respect to the land use plan area, the BLM and the USFS will summarize the vegetation, disturbance, and population data to determine if the LUP is meeting the plan objectives. Effectiveness information used for these evaluations includes BLM/USFS surface management areas and will help inform where finer-scale evaluations are needed, such as seasonal habitats, corridors, or linkage areas. Data will also include the trend of disturbance within the sage-grouse areas, which will inform the need to initiate adaptive management responses as described in the land use plan.

Calculating Question 1, Land Use Plan Effectiveness: The condition of vegetation and the allotments meeting land health standards (as articulated in “BLM Handbook 4180-1, Rangeland Health Standards”) in sage-grouse areas will be used to determine the LUP’s effectiveness in meeting the vegetation objectives for sage-grouse habitat set forth in the plan. The field office/ranger district will be responsible for collecting this data. In order for this data to be consistent and comparable, common indicators, consistent methods, and an unbiased sampling framework will be implemented following the principles in the BLM’s AIM strategy (Taylor et al. 2014; Toevs et al. 2011; MacKinnon et al. 2011), in the BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005), and in the HAF (Stiver et al. *in press*) or other approved WAFWA MZ-consistent guidance to measure and monitor sage-grouse habitats. This information will be used to answer Question 1 of the Land Use Plan Effectiveness Report.

Calculating Question 2, Land Use Plan Effectiveness: Sage-grouse areas within the LUP that are achieving land health stands (or, if trend data are available, that are making progress toward achieving them)—particularly the Special Status Species/wildlife habitat land health standard—will be used to determine the LUP’s effectiveness in achieving the habitat objectives set forth in the plan. Field offices will follow directions in “BLM Handbook 4180-1, Rangeland Health Standards,” to ascertain if sage-grouse areas are achieving or making progress toward achieving land health standards. One of the recommended criteria for evaluating this land health standard is the HAF indicators.

Calculating Question 3, Land Use Plan Effectiveness: The amount of habitat disturbance in sage-grouse areas identified in this LUP will be used to determine the LUP’s effectiveness in meeting the plan’s disturbance objectives. National datasets can be used to calculate the amount of disturbance, but field office data will likely increase the accuracy of this estimate. This information will be used to answer Question 3 of the Land Use Plan Effectiveness Report.

Calculating Question 4, Land Use Plan Effectiveness: The change in estimated sage-grouse populations will be calculated from data provided by the state wildlife agencies, when available, and will be used to determine LUP effectiveness. This population data (Section I.C., Population [Demographics] Monitoring) will be used to answer Question 4 of the Land Use Plan Effectiveness Report.

Results of the effectiveness monitoring process for the LUP will be used to inform the need for finer-scale investigations, initiate adaptive management actions as described in the land use plan, initiate causation determination, and/or determine if changes to management decisions are warranted. The measures used at the broad and mid scales will provide a suite of characteristics for evaluating the effectiveness of the adaptive management strategy.

II. FINE AND SITE SCALES

Fine-scale (third-order) habitat selected by sage-grouse is described as the physical and geographic area within home ranges during breeding, summer, and winter periods. At this level, habitat suitability monitoring should address factors that affect sage-grouse use of, and movements between, seasonal use areas. The habitat monitoring at the fine and site scale (fourth order) should focus on indicators to describe seasonal home ranges for sage-grouse associated with a lek or lek group within a population or subpopulation area. Fine- and site-scale monitoring will inform LUP effectiveness monitoring (see Section I.D., Effectiveness Monitoring) and the hard and soft triggers identified in the LUP's adaptive management section.

Site-scale habitat selected by sage-grouse is described as the more detailed vegetation characteristics of seasonal habitats. Habitat suitability characteristics include canopy cover and height of sagebrush and the associated understory vegetation. They also include vegetation associated with riparian areas, wet meadows, and other mesic habitats adjacent to sagebrush that may support sage-grouse habitat needs during different stages in their annual cycle.

As described in the Conclusion (Section III), details and application of monitoring at the fine and site scales will be described in the implementation-level monitoring plan for the land use plan. The need for fine- and site-scale-specific habitat monitoring will vary by area, depending on proposed projects, existing conditions, habitat variability, threats, and land health. Examples of fine- and site-scale monitoring include: habitat vegetation monitoring to assess current habitat conditions; monitoring and evaluation of the success of projects targeting sage-grouse habitat enhancement and/or restoration; and habitat disturbance monitoring to provide localized disturbance measures to inform proposed project review and potential mitigation for project impacts. Monitoring plans should incorporate the principles outlined in the BLM's AIM strategy (Toevs et al. 2011) and in "AIM-Monitoring: A Component of the Assessment, Inventory, and Monitoring Strategy" (Taylor et al. 2014). Approved monitoring methods are:

- “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011);
- The BLM’s Technical Reference “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005); and,
- “Sage-Grouse Habitat Assessment Framework: Multiscale Assessment Tool” (Stiver et al. *in press*).

Other state-specific disturbance tracking models include: the BLM’s Wyoming Density and Disturbance Calculation Tool (<http://ddct.wygisc.org/>) and the BLM’s White River Data Management System in development with the USGS. Population monitoring data (in cooperation with state wildlife agencies) should be included during evaluation of the effectiveness of actions taken at the fine and site scales.

Fine- and site-scale sage-grouse habitat suitability indicators for seasonal habitats are identified in the HAF. The HAF has incorporated the Connelly et al. (2000) sage-grouse guidelines as well as many of the core indicators in the AIM strategy (Toevs et al. 2011). There may be a need to develop adjustments to height and cover or other site suitability values described in the HAF; any such adjustments should be ecologically defensible. To foster consistency, however, adjustments to site suitability values at the local scale should be avoided unless there is strong, scientific justification for making those adjustments. That justification should be provided. WAFWA MZ adjustments must be supported by regional plant productivity and habitat data for the floristic province. If adjustments are made to the site-scale indicators, they must be made using data from the appropriate seasonal habitat designation (breeding/nesting, brood-rearing, winter) collected from sage-grouse studies found in the relevant area and peer-reviewed by the appropriate wildlife management agency(ies) and researchers.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in sage-grouse designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat (see Section I.D., Effectiveness Monitoring).

III. CONCLUSION

This Greater Sage-Grouse Monitoring Framework was developed for all of the Final Environmental Impact Statements involved in the sage-grouse planning effort. As such, it describes the monitoring activities at the broad and mid scales and provides a guide for the BLM and the USFS to collaborate with partners/other agencies to develop the land use plan- specific monitoring plan.

IV. THE GREATER SAGE-GROUSE DISTURBANCE AND MONITORING SUBTEAM MEMBERSHIP

Gordon Toevs (BLM -WO)	Robin Sell (BLM-CO)
Duane Dippon (BLM-WO)	Paul Makela (BLM-ID)
Frank Quamen (BLM-NOC)	Renee Chi (BLM-UT)
David Wood (BLM-NOC)	Sandra Brewer (BLM-NV)
Vicki Herren (BLM-NOC)	Glenn Frederick (BLM-OR)
Matt Bobo (BLM-NOC)	Robert Skorkowsky (USFS)
Michael “Sherm” Karl (BLM-NOC)	Dalinda Damm (USFS)

Attachment A. An Overview of Monitoring Commitments

	Broad and Mid Scales					Fine and Site Scales
	Implementation	Sagebrush Availability	Habitat Degradation	Population	Effectiveness	
How will the data be used?	Track and document implementation of land use plan decisions and inform adaptive management	Track changes in land cover (sagebrush) and inform adaptive management	Track changes in disturbance (threats) to sage-grouse habitat and inform adaptive management	Track trends in sage-grouse populations (and/or leks; as determined by state wildlife agencies) and inform adaptive management	Characterize the relationship among disturbance, implementation actions, and sagebrush metrics and inform adaptive management	Measure seasonal habitat, connectivity at the fine scale, and habitat conditions at the site scale, calculate disturbance, and inform adaptive management
Who is collecting the data?	BLM FO and USFS Forest	NOC and NIFC	National datasets (NOC), BLM FOs, and USFS Forests as applicable	State wildlife agencies through WAFWA	Comes from other broad- and mid-scale monitoring types, analyzed by the NOC	BLM FO and SO, USFS Forests and RO (with partners)
How often are the data collected, reported, and made available to USFWS?	Collected and reported annually; summary report every 5 years	Updated and changes reported annually; summary report every 5 years	Collected and changes reported annually; summary report every 5 years	State data reported annually per WAFWA MOU; summary report every 5 years	Collected and reported every 5 years (coincident with LUP evaluations)	Collection and trend analysis ongoing, reported every 5 years or as needed to inform adaptive management
What is the spatial scale?	Summarized by LUP with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by PACs (size dependent) with flexibility for reporting by other units	Summarized by MZ and LUP with flexibility for reporting by other units (e.g., PAC)	Variable (e.g., projects and seasonal habitats)
What are the potential personnel and budget impacts?	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	At a minimum, current skills and capacity must be maintained; data management costs are TBD	At a minimum, current skills and capacity must be maintained; data layer purchase cost are TBD	No additional personnel or budget impacts for the BLM or the USFS	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment	Additional capacity or re-prioritization of ongoing monitoring work and budget realignment

Who has primary and secondary responsibilities for reporting?	1) BLM FO & SO; USFS Forest & RO 2) BLM & USFS Planning	1) NOC 2) WO	1) NOC 2) BLM SO, USFS RO, & appropriate programs	1) WAFWA & state wildlife agencies 2) BLM SO, USFS RO, NOC	1) Broad and mid scale at the NOC, LUP at BLM SO, USFS RO	1) BLM FO & USFS Forests 2) BLM SO & USFS RO
What new processes/tools are needed?	National implementation datasets and analysis tools	Updates to national land cover data	Data standards and rollup methods for these data	Standards in population monitoring (WAFWA)	Reporting methodologies	Data standards data storage; and reporting

FO (field office); NIFC (National Interagency Fire Center); NOC (National Operations Center); RO (regional office); SO (state office); TBD (to be determined); WO (Washington Office)

Attachment B. User and Producer Accuracies for Aggregated Ecological Systems within LANDFIRE Map Zones

LANDFIRE Map Zone Name	User Accuracy	Producer Accuracy	% of Map Zone within Historical Schroeder
Wyoming Basin	76.9%	90.9%	98.5%
Snake River Plain	68.8%	85.2%	98.4%
Missouri River Plateau	57.7%	100.0%	91.3%
Grand Coulee Basin of the Columbia Plateau	80.0%	80.0%	89.3%
Wyoming Highlands	75.3%	85.9%	88.1%
Western Great Basin	69.3%	75.4%	72.9%
Blue Mountain Region of the Columbia Plateau	85.7%	88.7%	72.7%
Eastern Great Basin	62.7%	80.0%	62.8%
Northwestern Great Plains	76.5%	92.9%	46.3%
Northern Rocky Mountains	72.5%	89.2%	42.5%
Utah High Plateaus	81.8%	78.3%	41.5%
Colorado Plateau	65.3%	76.2%	28.8%
Middle Rocky Mountains	78.6%	73.3%	26.4%
Cascade Mountain Range	57.1%	88.9%	17.3%
Sierra Nevada Mountain Range	0.0%	0.0%	12.3%
Northwestern Rocky Mountains	66.7%	60.0%	7.3%
Southern Rocky Mountains	58.6%	56.7%	7.0%
Northern Cascades	75.0%	75.0%	2.6%
Mogollon Rim	66.7%	100.0%	1.7%
Death Valley Basin	0.0%	0.0%	1.2%

There are two anomalous map zones with 0% user and producer accuracies, attributable to no available reference data for the ecological systems of interest.

User accuracy is a map-based accuracy that is computed by looking at the reference data for a class and determining the percentage of correct predictions for these samples. For example, if I select any sagebrush pixel on the classified map, what is the probability that I'll be standing in a sagebrush stand when I visit that pixel location in the field? *Commission Error* equates to including a pixel in a class when it should have been excluded (i.e., commission error = $1 - \text{user's accuracy}$).

Producer accuracy is a reference-based accuracy that is computed by looking at the predictions produced for a class and determining the percentage of correct predictions. In other words, if I know that a particular area is sagebrush (I've been out on the ground to check), what is the probability that the digital map will correctly identify that pixel as sagebrush? *Omission Error* equates to excluding a pixel that should have been included in the class (i.e., omission error = $1 - \text{producer's accuracy}$).

Attachment C. Sagebrush Species and Subspecies Included in the Selection Criteria for Building the EVT and BpS Layers

- *Artemisia arbuscula* subspecies *longicaulis*
- *Artemisia arbuscula* subspecies *longiloba*
- *Artemisia bigelovii*
- *Artemisia nova*

- *Artemisia pedatifida*

1 **Appendix F – Idaho Key Habitat Map Update Process**
2

3 As directed in IM ID-2013-010, Idaho BLM annually updates the Key Habitat map. The purpose
4 of this Instruction Memorandum (IM) is to request updates to the Idaho Sage-grouse Habitat
5 Planning Map. The update is needed to reflect habitat changes resulting from wildfire,
6 succession, and vegetation treatments that occurred or were observed since the last update. This
7 update is also intended to capture additional edits recommended by the field offices, sage-grouse
8 Local Working Groups (LWG), or agency partners in sage-grouse conservation.
9

10 **Factors to Consider During Edits:** The following factors are applicable to land of any
11 ownership status for which the Bureau of Land Management (BLM) data are available, or for
12 which data or other information are provided by non-BLM partners. If such new data are
13 unavailable, or not provided by partners, retain the existing spatial data in the dataset:
14

- 15 1. Wildfires that have occurred in the most recent calendar year fire season on land
16 administered by the BLM and on land not administered by the BLM.
17
- 18 2. Vegetation management projects that have been completed within key habitat or
19 potential restoration areas of sage-grouse planning areas. This includes activities
20 such as burned area rehabilitation seeding projects, sagebrush thinning/reduction,
21 conifer thinning/reduction, restoration of annual grasslands, new fuel breaks, etc.
22 However, only consider those treatment areas completed and where a change in
23 habitat classification has occurred (e.g., from annual grassland to perennial
24 grassland; perennial grassland to key habitat, etc.). Areas planned for treatment
25 or in the process of treatment (e.g., cheatgrass chemical treatment is completed,
26 but seeding is pending) should not be included until an observed change in habitat
27 category is achieved.
28
- 29 3. Changes in habitat status resulting from vegetation succession, such as perennial
30 grasslands that have transitioned to key habitat due to increased sagebrush cover.
31
- 32 4. Habitat mapping errors or omissions that have been identified in the existing
33 Idaho Sage-grouse Habitat Planning Map and other edits recommended by sage-
34 grouse conservation partners, as appropriate. For this item, it is crucial that BLM
35 field office biologists or an alternate staff specialist coordinate closely with their
36 agency partners, especially the UFSFS and the Idaho Department of Fish and
37 Game (IDFG), to actively solicit and resolve additional suggested edits that we
38 may not be aware of. Those edits must also be incorporated into the respective
39 BLM office’s update submission. This is vital to ensure that the update is
40 completed efficiently and as collaboratively as possible.
41
- 42 5. Since the Idaho Sage-grouse Habitat Planning Map is intended for use by all
43 conservation partners in Idaho, it is important that we maintain a seamless
44 coverage across land ownerships. In that regard, when editing, do not clip out
45 BLM (or non-BLM land) on the basis of land ownership. Rather, make edits
46 based on vegetation boundaries only, using the best available information and

- 47 professional judgment. If you have uncertainties about accuracies for certain
48 areas, document that in the metadata as appropriate.
49
- 50 6. Based on discussions during map updates in recent years, we will again use a 10.0
51 acre minimum polygon size for wildfires since data are readily available to that
52 scale. For vegetation treatments, we will also use a minimum area of 10 acres.
53 For sagebrush or other vegetation patches (e.g., key habitat, perennial grassland,
54 annual grassland, conifer encroachment), delineate habitat to the extent you have
55 data, recognizing that some offices may have more recent, finer resolution data
56 than others.
57
- 58 7. Areas that have recently burned, for which the field has little or no information as
59 to habitat status, should be classified as “recent burn.” Efforts to document the
60 general habitat status in these areas should be made the following field season if
61 possible, in preparation for the next map update. The field may also attribute
62 2013 fires as perennial grassland or annual grassland, as appropriate.
63
- 64 8. Sage-grouse habitat polygon descriptions relevant to this IM include key habitat,
65 perennial grassland, annual grassland, and conifer encroachment potential
66 restoration areas.
67
- 68 o Key habitat includes areas of generally intact sagebrush that provide sage-
69 grouse habitat during some portion of the year.
 - 70 o Perennial grassland can be reclassified as key habitat once average
71 sagebrush canopy cover is at least 10 percent.
 - 72 o Annual grassland areas may be reclassified as perennial grassland once a
73 restoration, fuels treatment or related project, such as an Emergency
74 Stabilization and Rehabilitation (ES&R) seeding, is considered successful
75 (i.e., seeded perennial species have successfully established).
 - 76 o Conifer encroachment areas may be reclassified as key habitat following
77 treatment of conifers if sagebrush cover is at least 10 percent and there is a
78 perennial understory. They can also be reclassified as perennial
79 grasslands if native perennial herbaceous species are dominant or if an
80 associated restoration seeding is successful.
81
- 82 9. Field offices must ensure that original project-level data utilized in this update,
83 including Global Positioning System data files, spatial, tabular and metadata
84 associated with specific vegetation treatments, restoration projects, ES&R
85 projects, etc., are archived at the field level and readily accessible in the event of
86 future data calls.
87

Appendix G

Part I – Baseline Map and Description of Development

Part II - Adaptive Management - Soft Trigger Considerations and Implementation Actions

The Sage-Grouse Implementation Task Force would utilize monitoring information to assess when triggers have been tripped. When information indicates that the soft habitat or population trigger may have been tripped, a Sage-Grouse Implementation Task Force - aided by the technical expertise of IDF&G - will assess the factor(s) leading to the decline and identify potential management actions. The Sage-Grouse Implementation Task Force may consider possible changes in management to the CMA. As to the IMA, the Sage-Grouse Implementation Team may review the causes for decline and potential management changes only to the extent those factors significantly impair the state's ability to meet the overall management objective. It is anticipated IDF&G will collect data annually and will make recommendations to the Implementation Team by August 31st for population triggers and January 15th for habitat triggers.

Only where the monitoring information indicates the cause(s) of the decline is not a primary threat will the Sage-Grouse Implementation Task Force analyze the secondary threats to the species and determine whether further management actions are needed.

Potential Implementation Level Actions to Consider in the Event Soft Trigger Criteria are Met

- ✓ Increase monitoring and evaluation of sage-grouse populations in Core Management Area (area of concern).
- ✓ Implement Core Management Area management strategy in corresponding Important Management Area of the same Conservation Area.
- ✓ Implement Core Management Area RDFs in corresponding Important Management Area of the same Conservation Area.
- ✓ Not allow any new (large) infrastructure development within the Core Management Area (no exceptions allowed).
- ✓ Reallocate resources to focus on primary threats in the Core Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Core Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Apply Core Management Area criteria for all primary threats, and/or all secondary threats to the Important Management Area.
- ✓ Reallocate resources to focus on primary threats in the Important Management Area (e.g. direct resources from other parts of the state to the area of concern).
- ✓ Reallocate resources to focus on secondary threats in the Important Management Area (e.g. direct resources from other parts of the state to the area of concern).

Part III – Livestock Grazing Management Response

If Livestock Grazing is determined to be a Causal Factor Consider the Following Measures:

- 48
- 49 1. Employ grazing management systems that ensure adequate nesting and early brood rearing
- 50 habitat within the breeding landscape.
- 51 2. When use-pattern mapping or monitoring demonstrates an opportunity to adjust livestock
- 52 distribution to benefit occupied sage-grouse breeding habitat, include as appropriate herding,
- 53 salting, and water-source management (e.g., turning troughs/pipelines on/off, extending
- 54 pipelines/moving troughs) in grazing programs.
- 55 3. If available and feasible, utilize exotic perennial grass seedings and/or annual grasslands to
- 56 avoid breeding season of use of occupied sage-grouse habitat.
- 57 4. Modify authorized seasons of use within grazing permits to provide greater flexibility in
- 58 managing livestock for the benefit of sage-grouse.
- 59 5. Where appropriate, maintain residual herbaceous vegetation at the end of the
- 60 growing/grazing season to contribute to nesting and brood-rearing habitat during the
- 61 coming nesting season. Table 5.
- 62 6. Insure that permittees are informed of management and movement requirements related to
- 63 avoidance of recent burns, rehabilitation seedings or other restoration sites.
- 64 7. Manage grazing of riparian areas, meadows, springs, and seeps in a manner that promotes
- 65 vegetative structure and composition appropriate to the site. In some cases enclosure fencing
- 66 may be a viable option. However, recognize the availability and quality of desired herbaceous
- 67 species may be improved by periodic grazing use of the enclosure.
- 68 8. Implement management actions (grazing decisions, allotment management
- 69 plan/conservation plan development, or other agreements) to modify grazing management
- 70 to meet seasonal sage-grouse habitat requirements. Employ proper grazing management by
- 71 providing flexibility in scheduling the intensity, timing, duration and frequency of grazing use
- 72 over time that best promotes management objectives. During drought periods, prioritize
- 73 evaluating effects of drought in the CMA relative to grouse needs for food and cover.
- 74 Ensure that post-drought management allows for vegetation recovery that meets sage-grouse
- 75 needs in priority sage-grouse habitat areas.
- 76 9. When using salt or mineral supplements: a) place them in existing disturbed sites, areas with
- 77 reduced sagebrush cover—e.g., seedings or cheatgrass sites—to reduce impacts to sage-
- 78 grouse breeding habitat, b) where feasible use salts or mineral supplements to improve
- 79 management of livestock for the benefit of sage-grouse habitat.
- 80 10. In general, avoid constructing new fences within 2 km of occupied leks. Where feasible,
- 81 place new, taller structures, such as corrals, loading facilities, water-storage tanks, windmills,
- 82 etc., at least 2 km from occupied leks to reduce opportunities for perching raptors. Careful
- 83 consideration, based on local conditions, should also be given to the placement of new
- 84 fences or structures near other important seasonal habitats (winter-use areas, movement
- 85 corridors etc.) to reduce potential impacts.
- 86 11. New spring developments in sage-grouse habitat should be designed to maintain or enhance
- 87 the free-flowing characteristics of springs and wet meadows. Analyze developed springs,
- 88 seeps and associated pipelines to determine if modifications are necessary to maintain the
- 89 continuity of the predevelopment riparian area within priority sage-grouse habitat. Make
- 90 modifications where necessary, considering impacts to other water users when such
- 91 considerations are neutral or beneficial to sage-grouse.
- 92 12. Ensure that new and existing livestock troughs and open water storage tanks are fitted with
- 93 ramps to facilitate the use of and escape from troughs by sage-grouse and other wildlife. Do
- 94 not use floating boards or similar objects, as these are too unstable and are ineffective. Use
- 95 BMPs to mitigate potential impacts from West Nile virus.

- 96 13. When placing new water developments in sage-grouse breeding habitat, choose sites and
97 designs that will provide the greatest enhancement for sage-grouse and sage-grouse habitat.
- 98 14. Avoid new water developments in higher quality native breeding/early brood habitats that
99 have not had significant prior grazing use except in situations in which water developments
100 may aid in better livestock distribution across the allotment and will not adversely impact the
101 species.
- 102 15. Identify and when feasible, establish strategically located forage reserves focusing on areas
103 unsuitable for sage-grouse habitat restoration or lower priority habitat restoration areas.
- 104 16. Monitor for, and treat invasive species associated with, existing range improvements.
- 105 17. Consider initiating vegetative manipulation projects where sagebrush canopy cover exceeds
106 optimal characteristics to promote grass and forb understory growth. These projects should
107 only be undertaken where it can be achieved without negatively impacting the species.

108
109 **Adaptive Grazing Management Response**

110
111 BLM will individually analyze those allotments and pastures within the relevant Conservation Area.
112 Given limited agency resources, prioritization will be given to areas that have the potential to
113 provide the greatest benefit to sage-grouse. Allocation of resources should be concentrated on
114 allotments within the CMA that have declining sage-grouse populations. Following those permits
115 within the CMA, resources will be further prioritized to allotments within the IMA with breeding
116 habitats that have decreasing lek counts. Sage-grouse populations that are stable or trending upward
117 will be a lower priority for permit renewal and the adaptive assessment process. The
118 assessment/determination process for sage-grouse pursuant to Standard 8 will consider published
119 characteristics of sage-grouse habitat and the Ecological Site Descriptions, existing vegetation,
120 habitat inventories/assessments (Stiver et al. 2010), and where available, state and transition models
121 that describe vegetation and other physical attributes for sage-grouse. The related characteristics
122 within the categories shown below will also be included. These characteristics indicate the ability of a
123 given area to provide sage-grouse habitat.

124
125 Category 1: The grazing allotment (or any pasture/significant area therein) has the existing
126 vegetation and existing ecological condition (seral state) to provide sage-grouse habitat

127
128 Category 2: The grazing allotment (or any pasture/significant area therein) has the ecological
129 potential to provide sage-grouse habitat.

130
131 Where an allotment or pasture meets one of these Categories above, the GRSG Habitat
132 Management Objectives will be incorporated into relevant resource management plans as the desired
133 conditions with the understanding that these desired conditions may not be achievable:

- 134 (a) due to the existing ecological condition, ecological potential or the existing vegetation; or
- 135 (b) due to causal events unrelated to existing livestock grazing.

136
137 Allotments will only be managed for the primary seasonal habitat that it has the potential to support.
138 Typically, summer habitats will be managed to provide the conditions described in Table 3; winter
139 Table 4; and breeding habitats in Table 5. Based on these habitat characteristics, BLM will conduct
140 fine and site scale-habitat assessments to help inform grazing management. Where necessary, a
141 determination of factors causing any failure to achieve the habitat characteristics GRSG HMOs will
142 be conducted at a resolution sufficient to document the habitat condition. This determination will
143 include consideration of local spatial and inter-annual variability. A determination of issues

144 attributable to livestock grazing management shall not result from one year of data at a specific
145 location within an allotment. If the process and conditions outlined above demonstrate that
146 livestock grazing is limiting achievement of the habitat characteristics GRSG HMOs, renewed
147 permits will include measures to achieve desired habitat conditions. These measures must be tailored
148 to address the specific management issues associated with seasonal habitat limitations identified in
149 the fine-scale assessments.

150

151

DRAFT

1 **Appendix H – Anthropogenic Disturbance**

2
3 **Disturbance Density Calculation**

4
5 **GRSG Local/Site Disturbance Calculation**

- 6
7 • **All sub-regions:** Agreed to use the same types of disturbances for fine/site scale monitoring
8 as were used for broad and mid-scale analysis. Would use local data and/or more current
9 satellite imagery if available. Recognize that site specific data, where available, provide a
10 more accurate measure of land cover, disturbance and conifer encroachment than Landfire.
11 In the long-term, ensure fine/site scale monitoring provides results that can be used across
12 the GRSG range and “rolled up” for reporting purposes. In the short term (<5 years),
13 locally derived vegetation data may not be available or easily rolled up, so use of seamless
14 land cover data such as Sagestitch is recommended.

15
16 Great Basin sub-regions agreed to use the same type of data sets as used for broad and mid-scale to
17 monitor local/site level conditions. Supplement with local data where available and/or more
18 accurate. The following data layers or local surrogate would be used.

- 19
20 1. Energy (oil and gas wells and development facilities) Based on local info, actual footprint;
21 see NOC language for certain exceptions.
22 2. Energy (coal mines) Actual footprint
23 3. Energy (wind towers) Based on local info, actual footprint
24 4. Energy (solar fields) Based on local info, actual footprint
25 5. Energy (geothermal) Based on local info, actual footprint
26 6. Mining (active developments; locatable, leasable, saleable) Based on local info, actual
27 footprint
28 7. Infrastructure (roads) actual footprint; see road attachment for specific guidance
29 8. Infrastructure (railroads) abandoned railroads are NOT a disturbance
30 9. Infrastructure (power lines) Using NOC guidance, apply these widths:
31 <100 kV: use ROW width
32 100-199kV: 100 ft
33 200-399kV:150 ft
34 400-699kV: 200 ft
35 700-799kV: 250 ft
36 10. Infrastructure (communication towers, fire lookouts, met towers) Based on local info, actual
37 footprint
38 11. Other developed rights-of-ways
39
40

41 The National Monitoring Framework lists the data sets by threat. These are:
 42

FWS Listing Decision Threat	Sagebrush Habitat Availability	Habitat Degradation (Human Activities)	Density of Energy and Mining Facilities
Agriculture	X		
Urbanization	X		
Wildfire	X		
Conifer encroachment	X		
Treatments	X*		
Invasive Species	X*		
Energy (oil and gas wells and development facilities)		X	X
Energy (coal mines)		X	X
Energy (wind towers)		X	X
Energy (solar fields)		X	X
Energy (geothermal)		X	X
Mining (active locatable, leasable, and salable developments)		X	X
Infrastructure (roads)		X	
Infrastructure (railroads)		X	
Infrastructure (power lines)		X	
Infrastructure (communication towers)		X	
Infrastructure (other vertical structures)		X	
Other developed rights of ways		X*	

43
44 The following data sets would *not* be used to calculate anthropogenic disturbance, but would be
45 used in the habitat baseline to estimate habitat availability or the amount of sagebrush on the
46 landscape within biologically significant units. Use best available data, where Landfire or Sagestitch
47 could be used for biophysical setting (bps), compared to existing vegetation type.

- 48
49 1. Habitat treatments
50 2. Wildfire
51 3. Invasive plants
52 4. Conifer encroachment
53 5. Agriculture
54 6. Urbanization, Ex-urban and rural development
55

56 **Biologically Significant Unit:**

- 57
58 - Idaho proposes use of Priority (Core) and Important management areas that generally match
59 PACs, but also anticipates assessing disturbance at other scales including nesting and winter
60 habitat, 5 km lek neighborhood, Conservation Areas and/or at the project-scale, depending on
61 need.
62
63
64 • For all subregions, data from these units would be rolled up to the PAC and WAFWA
65 Management Zone, to meet FWS needs. In addition, units must be edge matched/aligned
66 with neighboring states. All sub-regions acknowledge there may be locally important
67 biologically significant units smaller than PACs which may or may not be rolled up to PAC
68 level. The Subregions also acknowledge that assessing disturbance at larger scales such as
69 certain PACs, or via rollup of data, provides a baseline metric for future comparison, but
70 dilution may likely mask disturbance concerns occurring at more local scales.

71
72
73 ***Travel and Transportation Disturbance in Sage-Grouse Habitat***

74
75
76 The following would count as disturbance:
77 Linear transportation features identified as roads that have a maintenance intensity of 3 or 5
78 Linear transportation features identified as primitive roads, temporary routes, or
79 administrative routes that have a functional classification and a maintenance intensity of level
80 3 or 5

81
82 Non-Disturbance

83
84 The following items would not count as disturbance:
85 Linear transportation features identified as trails.
86 Linear transportation features identified as primitive roads, temporary routes, or
87 administrative routes that have a maintenance intensity of either level 0 or 1.

88 Linear transportation features identified as primitive routes.
89 Linear disturbances.
90
91

DRAFT

92 *Travel and Transportation Management Definitions*

93

94 **Roads** are linear routes managed for use by low clearance vehicles having four or more wheels, and
95 are maintained for regular and continuous use.

96

97 **Primitive Roads** are linear routes managed for use by four-wheel drive or high-clearance vehicles.
98 They do not normally meet any design standards.

99

100 **Trails** are linear routes managed for human-powered, stock, or OHV forms of transportation or for
101 historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-
102 clearance vehicles.

103

104 **Linear Disturbances** are human-made linear features that are not part of the designated
105 transportation network are identified as “Transportation Linear Disturbances.” These may include
106 engineered (planned) as well as unplanned single and two-track linear features that are not part of
107 the BLM’s transportation system.

108 **Primitive Routes** are any transportation linear feature located within a WSA or lands with
109 wilderness characteristics designated for protection by a land use plan and not meeting the
110 wilderness inventory road definition.

111

112 **Temporary routes** are short-term overland roads, primitive roads or trails which are authorized or
113 acquired for the development, construction or staging of a project or event that has a finite lifespan.
114 Temporary routes are not intended to be part of the permanent or designated transportation
115 network and must be reclaimed when their intended purpose(s) has been fulfilled. Temporary routes
116 should be constructed to minimum standards necessary to accommodate the intended use; the intent
117 is that the project proponent (or their representative) will reclaim the route once the original project
118 purpose or need has been completed. Temporary routes are considered emergency, single use or
119 permitted activity access. Unless they are specifically intended to accommodate public use, they
120 should not be made available for that use. A temporary route will be authorized or acquired for the
121 specific time period and duration specified in the written authorization (permit, ROW, lease,
122 contract etc.) and will be scheduled and budgeted for reclamation to prevent further vehicle use and
123 soil erosion from occurring by providing adequate drainage and re-vegetation.

124

125 **Administrative routes** are those that are limited to authorized users (typically motorized access).
126 These are existing routes that lead to developments that have an administrative purpose, where the
127 agency or permitted user must have access for regular maintenance or operation. These authorized
128 developments could include such items as power lines, cabins, weather stations, communication
129 sites, spring

130

131 *Maintenance Intensities*

132

133 **Level 0**

134

135 Maintenance Description:

136 Existing routes that will no longer be maintained and no longer be declared a route. Routes
137 identified as Level 0 are identified for removal from the Transportation System entirely.

138

139 Maintenance Objectives:

- 140 • No planned annual maintenance.
- 141 • Meet identified environmental needs.
- 142 • No preventative maintenance or planned annual maintenance activities.

143
144 **Level 1**

145
146 Maintenance Description:
147 Routes where minimum (low intensity) maintenance is required to protect adjacent lands and
148 resource values. These roads may be impassable for extended periods of time.

- 149
150 Maintenance Objectives:
- 151 • Low (Minimal) maintenance intensity.
 - 152 • Emphasis is given to maintaining drainage and runoff patterns as needed to protect
153 adjacent lands. Grading, brushing, or slide removal is not performed unless route bed
154 drainage is being adversely affected, causing erosion.
 - 155 • Meet identified resource management objectives.
 - 156 • Perform maintenance as necessary to protect adjacent lands and resource values.
 - 157 • No preventative maintenance.
 - 158 • Planned maintenance activities limited to environmental and resource protection.
 - 159 • Route surface and other physical features are not maintained for regular traffic.

160
161 **Level 3**

162
163 Maintenance Description:
164 Routes requiring moderate maintenance due to low volume use (for example, seasonally or
165 year-round for commercial, recreational, or administrative access). Maintenance Intensities
166 may not provide year-round access but are intended to generally provide resources
167 appropriate to keep the route in use for the majority of the year.

- 168
169 Maintenance Objectives:
- 170 • Medium (Moderate) maintenance intensity.
 - 171 • Drainage structures will be maintained as needed. Surface maintenance will be conducted
172 to provide a reasonable level of riding comfort at prudent speeds for the route conditions
173 and intended use. Brushing is conducted as needed to improve sight distance when
174 appropriate for management uses. Landslides adversely affecting drainage receive high
175 priority for removal; otherwise, they will be removed on a scheduled basis.
 - 176 • Meet identified environmental needs.
 - 177 • Generally maintained for year-round traffic.
 - 178 • Perform annual maintenance necessary to protect adjacent lands and resource values.
 - 179 • Perform preventative maintenance as required to generally keep the route in acceptable
180 condition.
 - 181 • Planned maintenance activities should include environmental and resource protection
182 efforts, annual route surface.
 - 183 • Route surface and other physical features are maintained for regular traffic.

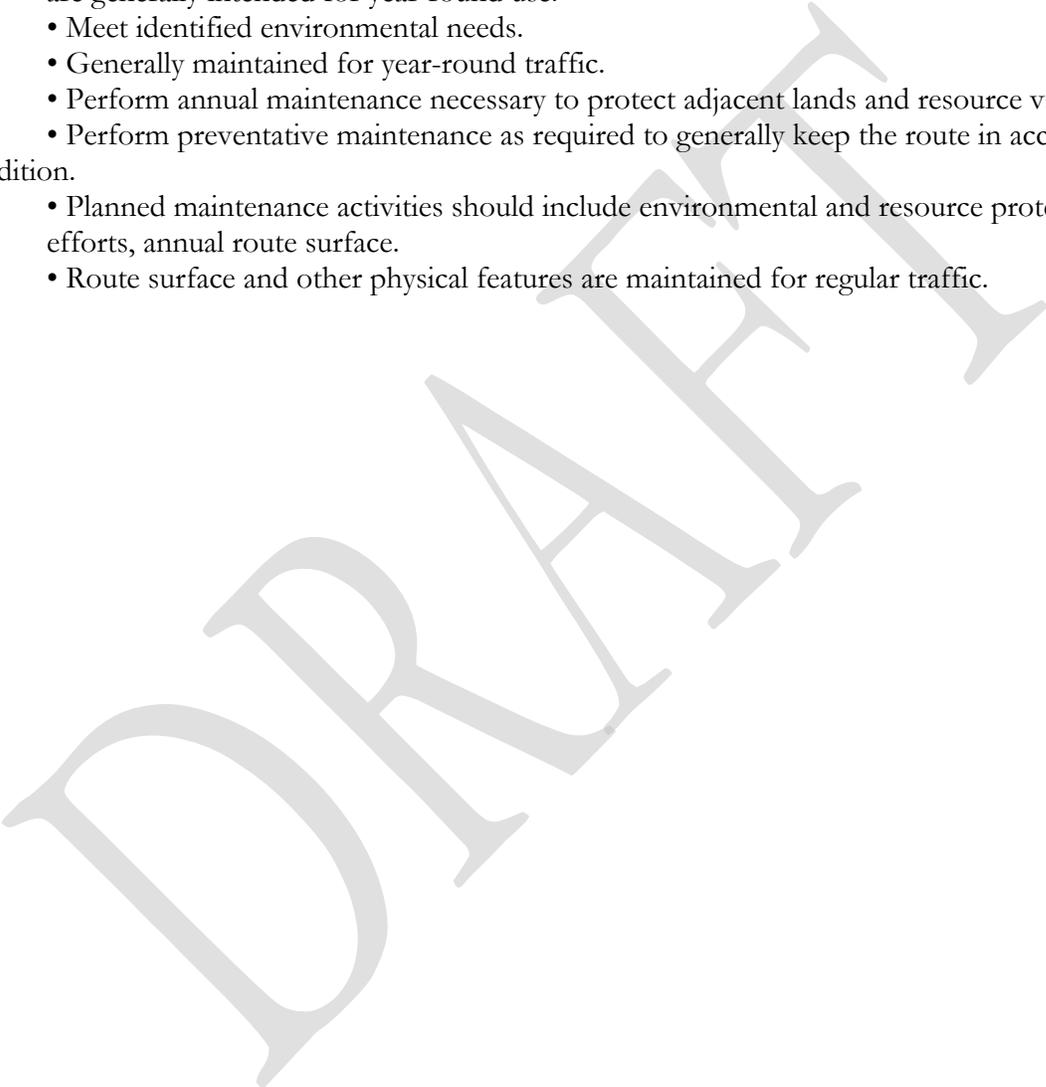

184
185 **Level 5**

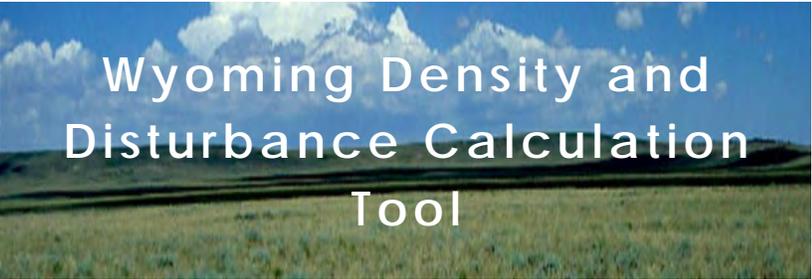

186
187 Maintenance Description:

188 Route for high (maximum) maintenance due to year-round needs, high volume of traffic, or
189 significant use. Also may include route identified through management objectives as
190 requiring high intensities of maintenance or to be maintained open on a year-round basis.
191

192 Maintenance Objectives:

- 193 • High (Maximum) maintenance intensity.
- 194 • The entire route will be maintained at least annually. Problems will be repaired as
195 discovered. These routes may be closed or have limited access due to weather conditions but
196 are generally intended for year-round use.
- 197 • Meet identified environmental needs.
- 198 • Generally maintained for year-round traffic.
- 199 • Perform annual maintenance necessary to protect adjacent lands and resource values.
- 200 • Perform preventative maintenance as required to generally keep the route in acceptable
201 condition.
- 202 • Planned maintenance activities should include environmental and resource protection
203 efforts, annual route surface.
- 204 • Route surface and other physical features are maintained for regular traffic.

● The Next Steps

- Move onto the Add/Edit/Upload Stage
 1. Select the **Add/Edit/Upload** radio button
 2. Press the **Go** button

Next Steps

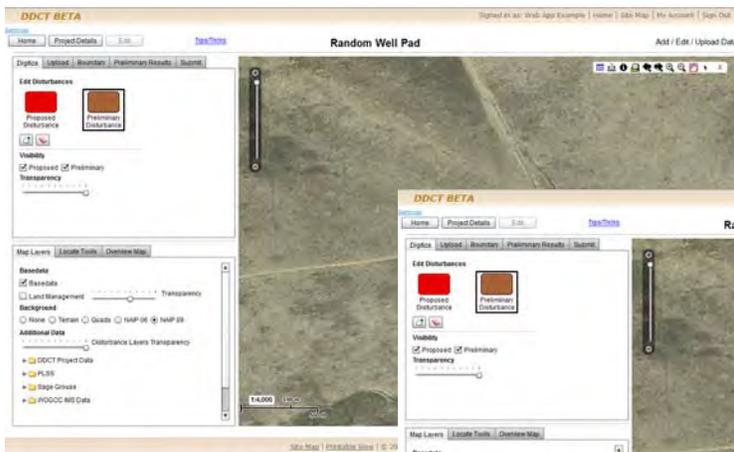

Add/Edit/Upload Data

Some Other Time

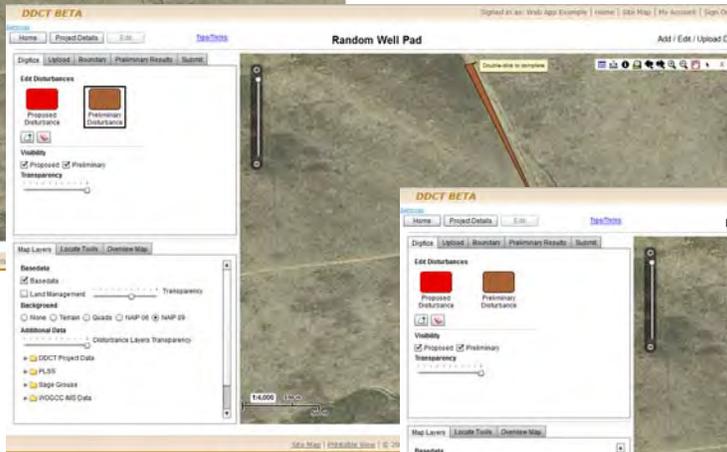

Create and Edit Features Using the Online Tool

Digitizing Features using the Online Tool

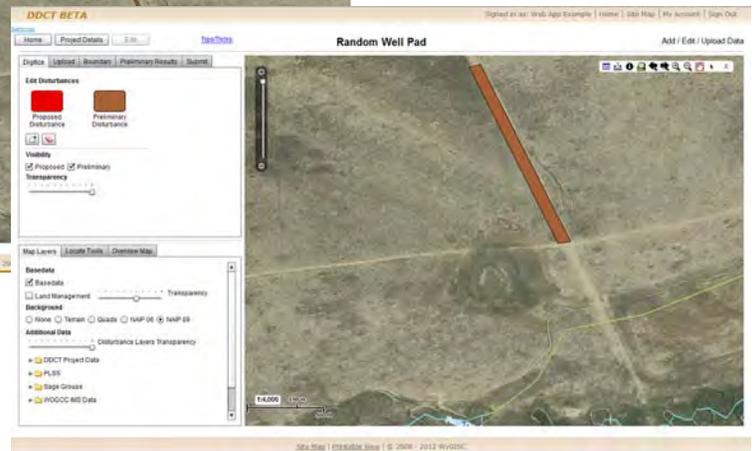

With the **Digitize** tab selected

1. Zoom into area of interest
2. Select either **Proposed Disturbance** or **Preliminary Disturbance**
3. In the map view window, click on one edge of the feature you want to digitized to start the process

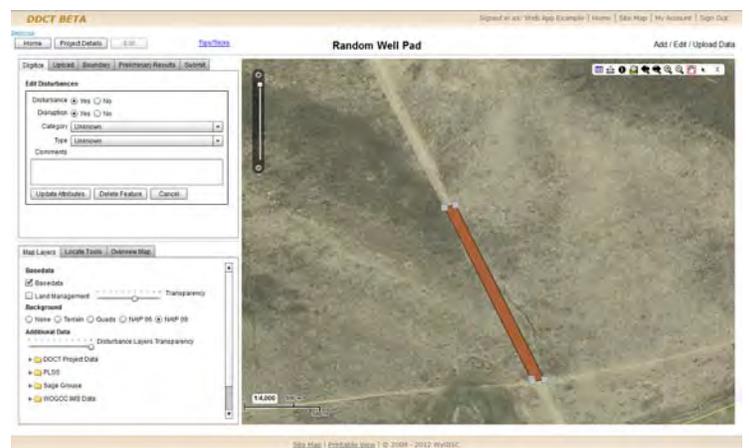

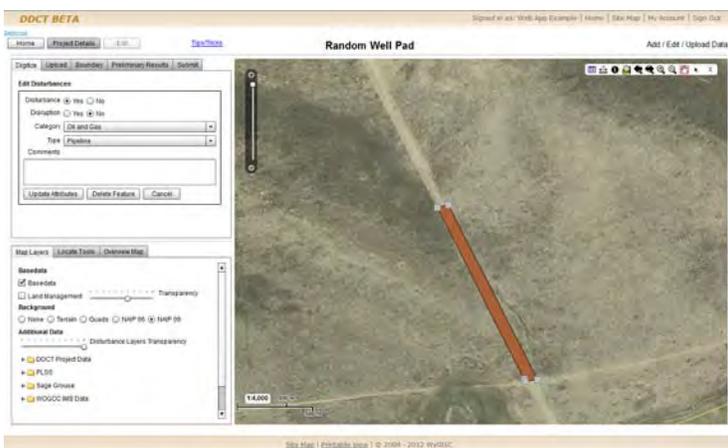

4. Keep clicking along the edge of the feature until the entire outline is created
5. Double click to finish the process

Editing Features using the Online Tool

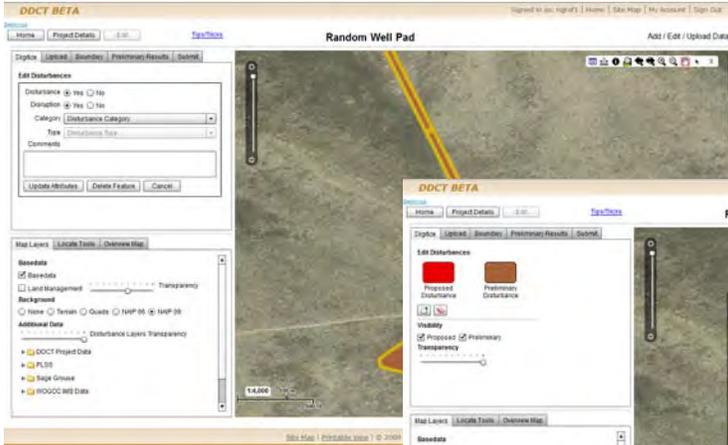

With the **Digitize** tab selected

1. Select either **Proposed Disturbance** or **Preliminary Disturbance**
2. In the map view window, click on the feature you want to edit to open the **Edit Disturbances** sub-tab
3. Select whether the feature is a Disturbance and/or Disruption
4. Select the Category and Type of disturbance
5. Enter any comments in the comments box (optional)
6. Click the **Update Feature** button to finish the process

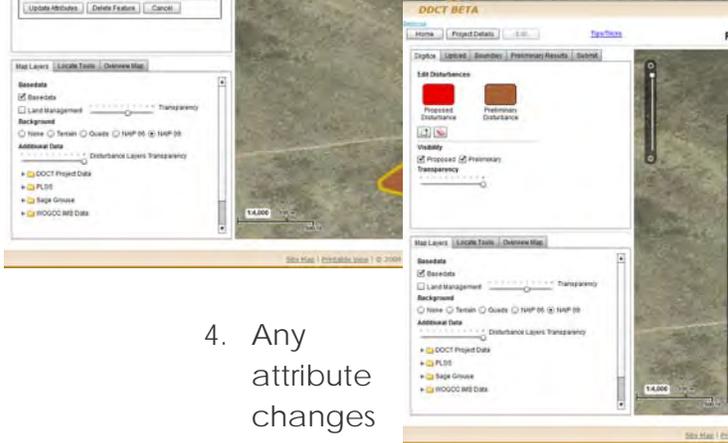

● **Selecting Multiple Features using the Online Tool**

➤ With the **Digitize** tab selected

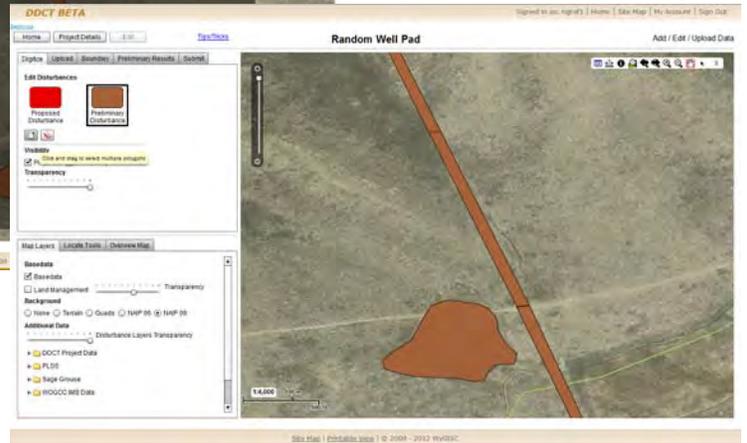

1. Click on the **Select Multiple Feature** tool
2. Use the mouse to draw a box around the features desired for selection

3. The selected features will have a yellow inner glow

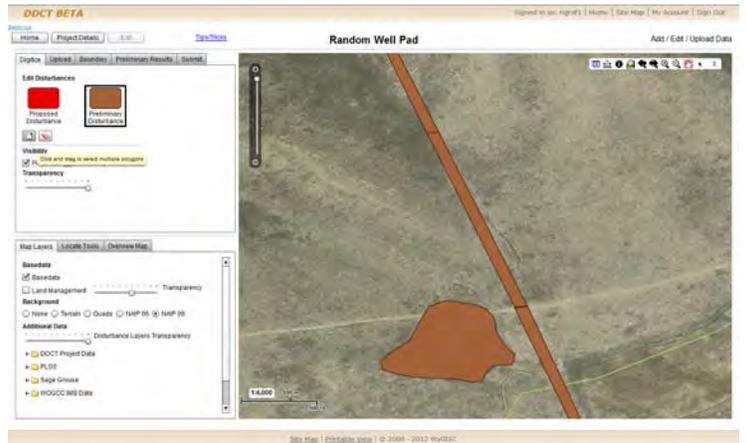

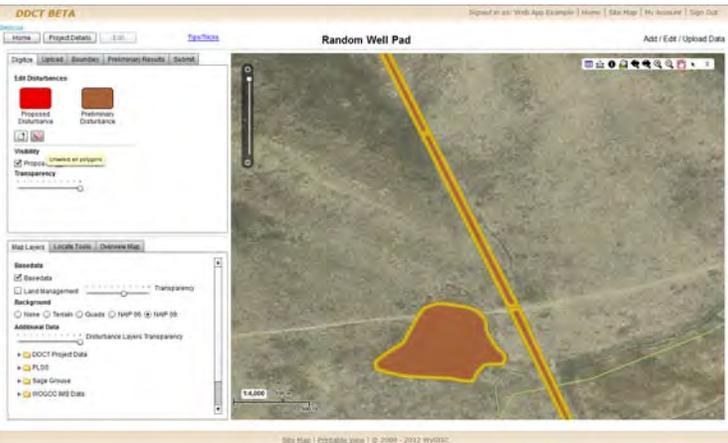

4. Any attribute changes or deleting of features will apply to all selected features

● **Clearing a Multiple Selection**

➤ With the **Digitize** tab selected

➔ Click on the **Clear Selected Features** button

Create Features Using the Upload Tool

Upload Proposed Project Area or Disturbance(s)

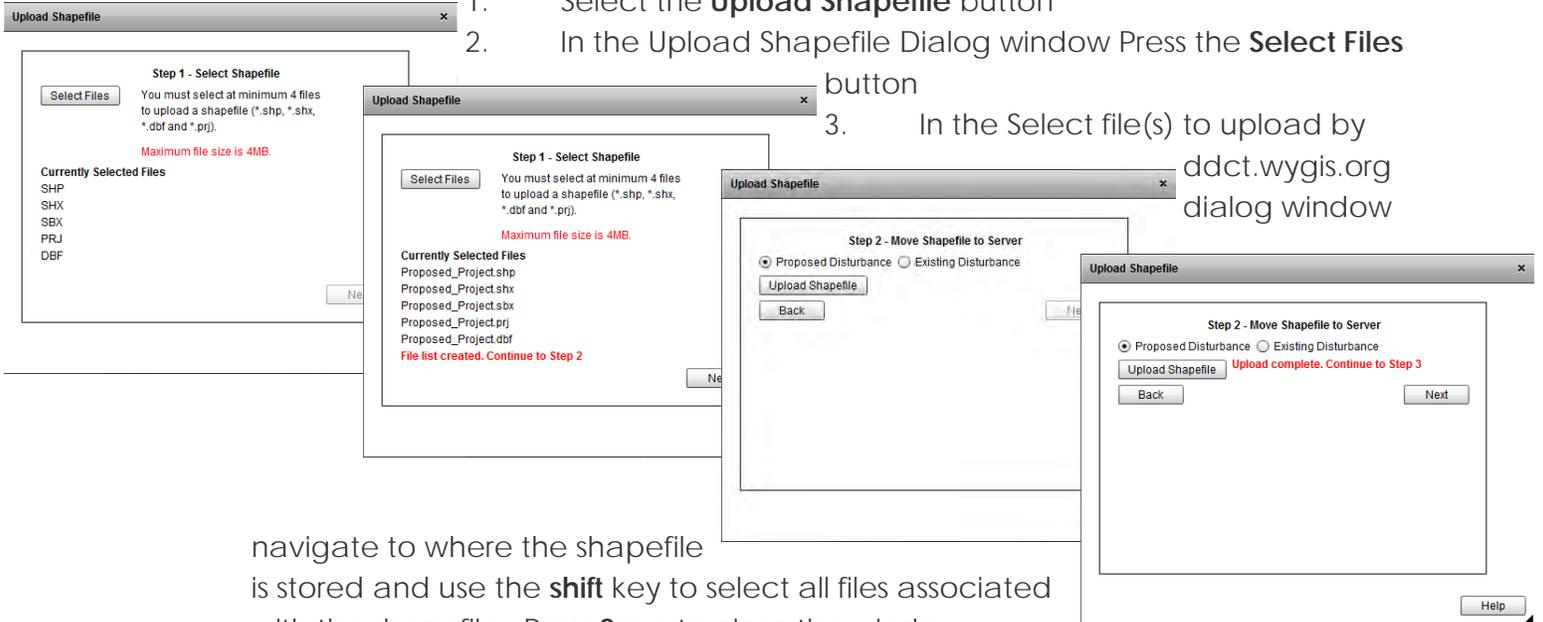

➤ With the **Upload** tab selected

1. Select the **Upload Shapefile** button

2. In the Upload Shapefile Dialog window Press the **Select Files** button

3. In the Select file(s) to upload by

ddct.wygis.org
dialog window

navigate to where the shapefile is stored and use the **shift** key to select all files associated with the shapefile. Press **Save** to close the window

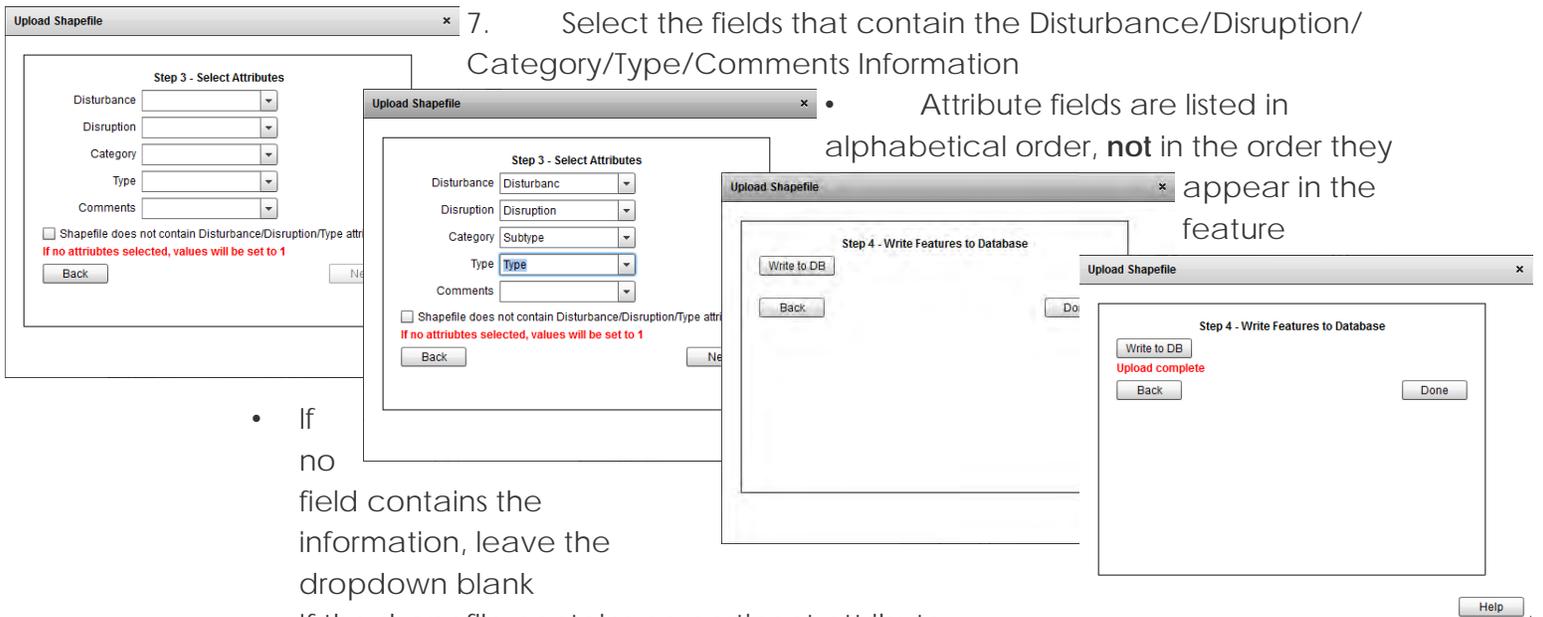

4. Press the **Next** button

5. Select whether the shapefile is a **Proposed Disturbance** or **Existing Disturbance** and click the **Upload Shapefile** button

6. When red text that says "upload complete. Continue to Step 3" appears, the upload has been successful, press the **Next** button

7. Select the fields that contain the Disturbance/Disruption/Category/Type/Comments Information

• Attribute fields are listed in alphabetical order, **not** in the order they appear in the feature

- If no field contains the information, leave the dropdown blank
- If the shapefile contains no pertinent attribute information select the check box at the bottom

8. Press the **Next** button

9. Press the **Write to DB** button to finalize the upload

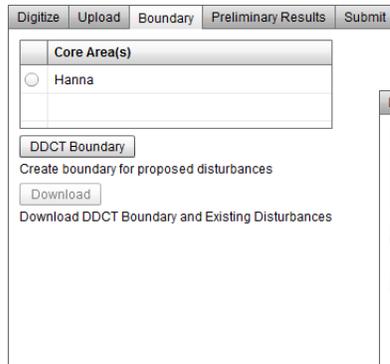

10. Press the **Done** button to finish the process

DDCT Assessment Area

Generate the boundary

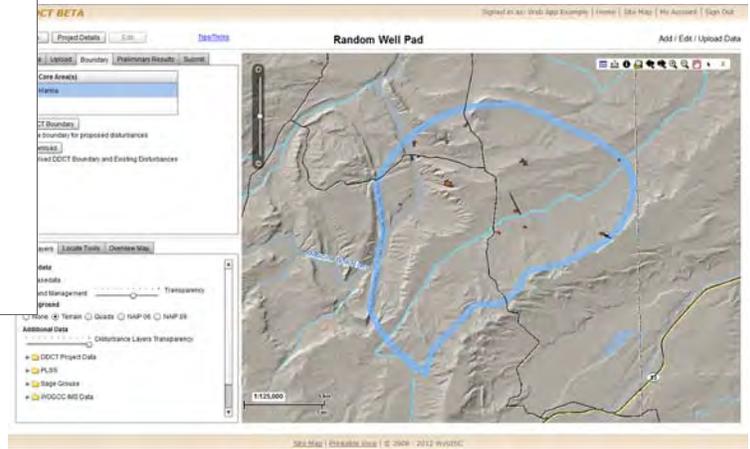

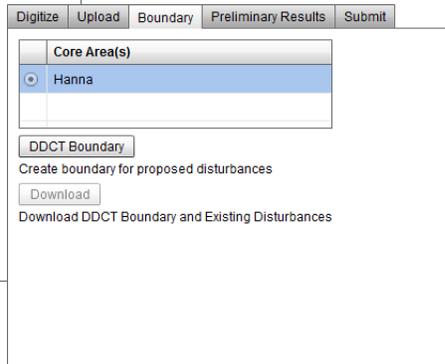

With the **Boundary** tab selected

1. Select the radio button next to the name of the **Core Area(s)** to be used in the DDCT process

2. Press the **DDCT Boundary** button

3. Wait until the boundary generation process has run, the screen will refresh when the process is complete

Download the boundary (If desired)

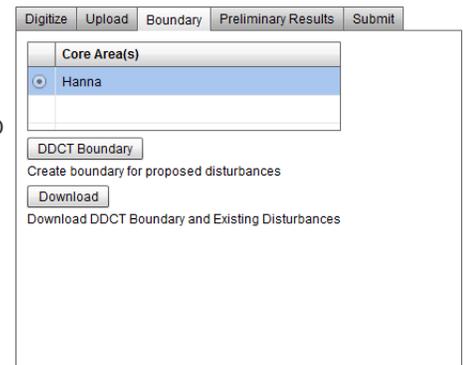

With the **Boundary** tab selected

1. Click the **Download** button

2. The download will be emailed to email address on file for the user and contain an attachment called WyGISC.zip

3. The WyGISC.zip contains an esri® File Geodatabase that contains the following features:

- ddctBoundary – The DDCT boundary
- ExistingDisturbance – Statewide Disturbance clipped to the DDCT boundary
- MapGrids – Grid covering the DDCT boundary used to create a Mapbook for the project
- PrelimDisturbance* – Preliminary Disturbance for the project area, entered by the user
- ProposedDisturbance – The proposed project boundary entered by the user

*if no Preliminary Disturbances have been created or uploaded, no PrelimDisturbance layer is included in the download

Preliminary Results

Calculate Results Using Both Preliminary and Statewide Disturbance Data

- With the **Preliminary Results** tab selected
 1. Select the Core Area for the calculation
 2. Click the **Calculate Results** button

Technical Review

● Overview of the Technical Review Process

- After the project has been submitted for Technical Review
 1. Project is reviewed by the Data and Application Steward to ensure that all disturbances have been accounted for
 2. There are two possible results of the technical review
 - Disturbances need revision
 - All disturbances are accounted for and mapped correctly

● Revision Process

- Overview of Revision Process
 - ➔ Project is moved back to the **DDCT Development** stage
 - ➔ Proponent receives a series of PDF maps highlighting the areas of concern
 - ➔ Proponent can either manually correct the problems using the online tool, or upload corrected disturbance data
 - ➔ Once the concerns have been addressed the project is then re-submitted for **Technical Review**

● All Disturbances Mapped Correctly

- Overview of the Technical to Policy Review transition
 - ➔ Role of the Data and Application Steward:
 - Take the disturbances from the Preliminary layer and incorporate them into the Statewide Disturbance Data layer
 - Change the project status to Technical Review Complete
 - Notify the proponent that the Technical Review is complete
 - ➔ Role of the Proponent

1 **Appendix J – Mitigation**

2
3 **Part I – Regional Mitigation Strategy**

4
5 The BLM/USFS will achieve no net unmitigated loss for authorized land uses within greater
6 sage-grouse priority and general habitat. No net unmitigated loss means that impacts from
7 authorized land uses will be fully offset to benefit the species. Mitigation will follow the
8 regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20;
9 e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If
10 impacts to greater sage-grouse or its habitat from authorized land uses remain after applying
11 avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation
12 projects will be used to fully offset those residual impacts in order to achieve the no net
13 unmitigated loss standard. Any compensatory mitigation will be durable, timely, and in addition
14 to that which would have resulted without the compensatory mitigation (see glossary).

15
16 The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team,
17 will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the
18 NEPA decision making process including the application of the mitigation hierarchy to address
19 impacts within that Zone. A robust and transparent Regional Mitigation Strategy will contribute
20 to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and
21 compensating for residual impacts to greater sage-grouse and its habitat.

22
23 The BLM’s Regional Mitigation Manual MS-1794 serves as a framework for developing and
24 implementing a Regional Mitigation Strategy. The following sections provide additional
25 guidance specific to the development and implementation of a WAFWA Management Zone
26 Regional Mitigation Strategy.

27
28 Developing a WAFWA Management Zone Regional Mitigation Strategy

29
30 The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team,
31 will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the
32 application of the mitigation hierarchy to address impacts within that Zone. The Strategy should
33 consider any State-level greater sage-grouse mitigation guidance that is consistent with the
34 requirements identified in this Appendix. The Regional Mitigation Strategy should be developed
35 in a transparent manner, based on the best science available and standardized metrics.

36
37 As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater
38 Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater
39 sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be
40 developed within one year of the issuance of the Record of Decision.

41
42 The Regional Mitigation Strategy should include mitigation guidance on avoidance,
43 minimization, and compensation, as follows:

- 44
45 • Avoidance

- 46 ○ Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface
47 occupancy areas) already included in laws, regulations, policies, and/or land use plans
48 (e.g. Resource Management Plans, Forest Plans, State Plans); and,
- 49 ○ Include any potential, additional avoidance actions (e.g. additional avoidance best
50 management practices) with regard to greater sage-grouse conservation.
- 51 ● Minimization
 - 52 ○ Include minimization actions (e.g. required design features, best management
53 practices) already included in laws, regulations, policies, land use plans, and/or land-
54 use authorizations; and,
 - 55 ○ Include any potential, additional minimization actions (e.g. additional minimization
56 best management practices) with regard to greater sage-grouse conservation.
- 57 ● Compensation
 - 58 ○ Include discussion of impact/project valuation, compensatory mitigation options,
59 siting, compensatory project types and costs, monitoring, reporting, and program
60 administration. Each of these topics is discussed in more detail below.
 - 61 ■ Residual Impact and Compensatory Mitigation Project Valuation Guidance
 - 62 ○ A common standardized method should be identified for estimating
63 the value of the residual impacts and value of the compensatory
64 mitigation projects.
 - 65 ○ This method should consider the quality of habitat, scarcity of the
66 habitat, and the size of the impact/project.
 - 67 ○ For compensatory mitigation projects, consideration of durability (see
68 glossary), timeliness (see glossary), and the potential for failure may
69 require an upward adjustment of the valuation.
 - 70 ○ The resultant compensatory mitigation project will, after application of the
71 above guidance, result in proactive conservation measures for Greater Sage-
72 grouse (consistent with BLM Manual 6840 – Special Status Species
73 Management, section .02).
 - 74 ■ Compensatory Mitigation Options
 - 75 ○ Options for implementing compensatory mitigation should be
76 identified, such as:
 - 77 ■ Utilizing certified mitigation/conservation bank or credit
78 exchanges.
 - 79 ■ Contributing to an existing mitigation/conservation fund.
 - 80 ■ Authorized-user conducted mitigation projects.
 - 81 ○ For any compensatory mitigation project, the investment must be
82 additional (i.e. additionality: the conservation benefits of
83 compensatory mitigation are demonstrably new and would not have
84 resulted without the compensatory mitigation project).
 - 85 ■ Compensatory Mitigation Siting
 - 86 ○ Sites should be in areas that have the potential to yield the greatest
87 conservation benefit to the greater sage-grouse, regardless of land
88 ownership.
 - 89 ○ Sites should be durable (see glossary).
 - 90 ○ Sites identified by existing plans and strategies (e.g. fire restoration
91 plans, invasive species strategies, healthy land focal areas) should be

92 considered, if those sites have the potential to yield the greatest benefit
93 to greater sage-grouse and are durable.

- 94 ■ Compensatory Mitigation Project Types and Costs
 - 95 ○ Project types should be identified that help reduce threats to greater
 - 96 sage-grouse (e.g. protection, conservation, and restoration projects).
 - 97 ○ Each project type should have a goal and measurable objectives.
 - 98 ○ Each project type should have associated monitoring and maintenance
 - 99 requirements, for the duration of the impact.
 - 100 ○ To inform contributions to a mitigation/conservation fund, expected
 - 101 costs for these project types (and their monitoring and maintenance),
 - 102 within the WAFWA Management Zone, should be identified.
- 103 ■ Compensatory Mitigation Compliance and Monitoring
 - 104 ○ Mitigation projects should be inspected to ensure they are
 - 105 implemented as designed, and if not, there should be methods to
 - 106 enforce compliance.
 - 107 ○ Mitigation projects should be monitored to ensure that the goals and
 - 108 objectives are met and that the benefits are effective for the duration of
 - 109 the impact.
- 110 ■ Compensatory Mitigation Reporting
 - 111 ○ Standardized, transparent, scalable, and scientifically-defensible
 - 112 reporting requirements should be identified for mitigation projects.
 - 113 ○ Reports should be compiled, summarized, and reviewed in the
 - 114 WAFWA Management Zone in order to determine if greater sage-
 - 115 grouse conservation has been achieved and/or to support adaptive
 - 116 management recommendations.
- 117 ■ Compensatory Mitigation Program Implementation Guidelines
 - 118 ○ Guidelines for implementing the State-level compensatory mitigation
 - 119 program should include holding and applying compensatory mitigation
 - 120 funds, operating a transparent and credible accounting system,
 - 121 certifying mitigation credits, and managing reporting requirements.
 - 122

123 Incorporating the Regional Mitigation Strategy into Land Use Authorization Analyses

124
125 The BLM/USFS will include the avoidance, minimization, and compensatory recommendations
126 from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for
127 authorized land uses that may impact greater sage-grouse or its habitat.

128 129 Implementing a Compensatory Mitigation Program

130
131 The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to
132 achieve the greatest conservation benefit, as identified in the Regional Mitigation Strategy. In
133 order to align with existing compensatory mitigation efforts, this compensatory mitigation
134 program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field
135 Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

136

137 To ensure transparent and effective management of the compensatory mitigation funds, the
138 BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-
139 level compensatory mitigation funds, within one year of the issuance of the Record of Decision.
140 The selection of the third-party compensatory mitigation administrator will conform to all
141 relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making
142 decisions that affect Federal lands.

143

144 **Glossary Terms**

145

146 **Additionality:** The conservation benefits of compensatory mitigation are demonstrably new and
147 would not have resulted without the compensatory mitigation project. (BLM Manual Section
148 1794).

149

150 **Avoidance mitigation:** Avoiding the impact altogether by not taking a certain action or parts of
151 an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the
152 proposed action to a different time or location.)

153

154 **Compensatory mitigation:** Compensating for the (residual) impact by replacing or providing
155 substitute resources or environments. (40 CFR 1508.20)

156

157 **Compensatory mitigation projects:** Specific, on-the-ground actions to improve and/or protect
158 habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements).

159

160 **Compensatory mitigation sites:** The durable areas where compensatory mitigation projects will
161 occur.

162

163 **Durability (protective and ecological):** The administrative, legal, and financial assurances that
164 secure and protect the conservation status of a compensatory mitigation site, and the ecological
165 benefits of a compensatory mitigation project, for at least as long as the associated impacts
166 persist. (BLM Manual Section 1794).

167

168 **Minimization mitigation:** Minimizing impacts by limiting the degree or magnitude of the action
169 and its implementation. (40 CFR 1508.20 (b))

170

171 **Residual impacts:** Impacts from an authorized land use that remain after applying avoidance
172 and minimization mitigation; also referred to as unavoidable impacts.

173

174 **Timeliness:** The conservation benefits from compensatory mitigation accruing as early as
175 possible or before impacts have begun. (BLM Manual Section 1794).

176

178 **Part II – Idaho Mitigation Framework**

179
180 **FRAMEWORK FOR MITIGATION OF IMPACTS FROM INFRASTRUCTURE**
181 **PROJECTS ON SAGE-GROUSE AND THEIR HABITATS**

182
183 **Sage-Grouse Mitigation Subcommittee of the Idaho Sage-Grouse State Advisory**
184 **Committee¹**
185 **December 6, 2010**

186
187 **INTRODUCTION**

188
189 The Conservation Plan for Greater Sage-grouse in Idaho (Idaho Sage-Grouse Advisory Committee
190 2006; as amended in 2009) calls for the development of a “proposal for a mitigation and crediting
191 program for sagebrush steppe habitats in Idaho and recommendations for policy consideration”
192 (Measure 6.2.4). In early 2010, the Idaho Sage-grouse Advisory Committee (SAC) established the
193 Mitigation Subcommittee to complete this task.¹ The Mitigation Subcommittee met several times
194 from the late spring, through the fall of 2010 and found broad areas of agreement among its diverse
195 participants.

196
197 This report presents the Mitigation Subcommittee’s consensus recommendations for the creation of
198 an Idaho-based program to compensate for the impacts of infrastructure projects on sagegrouse and
199 their habitats. This program – called the Mitigation Framework – would serve as a science-based
200 “mitigation module” that project developers and government regulators could use to achieve
201 compensatory mitigation objectives called for in project plans and permits. While compensatory
202 mitigation may help offset certain impacts arising from infrastructure projects, mitigation should not
203 be considered a substitute for first avoiding and then minimizing impacts.

204
205 In addition, it is important to recognize that federal and state regulatory or land-management
206 agencies, and county or local governments may also require additional stipulations, conditions of
207 approval or other requirements as well as on-site mitigation, in accordance with applicable law,
208 regulation or policy.

209
210 This document proposes a general outline or “skeleton” of policies and procedures for such a
211 program. The Mitigation Framework is designed to be transparent, inclusive, and accountable to
212 defined objectives. The Subcommittee’s purpose is to describe the program in enough detail to
213 foster a dialogue among SAC members, spot important issues and points of agreement, and assess
214 the level of support for developing a functioning mitigation program for Idaho sagegrouse and their
215 habitats.

EXECUTIVE SUMMARY

The state of Idaho is seeing an increasing number of infrastructure projects, such as transmission lines and wind energy facilities, proposed in the state’s sagebrush steppe ecosystems. Where federal permits are required, the environmental review process for these projects will analyze how these projects affect sage-grouse and will consider a range of potential mitigation measures to avoid, minimize, or offset any impacts. It is likely that the environmental review process will lead at least some developers and agencies to implement compensatory mitigation.

Compensatory mitigation consists of compensating for residual project impacts that are not avoided or minimized by providing substitute resources or habitats, often at a different location than the project area. For sage-grouse, this would include, among other things, protecting and restoring sagebrush habitats to offset habitat losses and other effects of infrastructure projects.

This framework describes the general outline for a sage-grouse compensatory mitigation program in Idaho. This program would employ an “in-lieu fee” approach to compensatory mitigation through which a project developer would pay funds into an account managed by the mitigation program for performance of mitigation actions that provide measureable benefits for sage-grouse and their habitats within Idaho.

The Mitigation Framework does not alter the legal standards or procedures for review and approval of infrastructure projects. Rather, it offers an option that project developers and/or regulators may choose for implementing mitigation plans and agency permit conditions. It should be emphasized that this program would not relieve project developers and permitting agencies of their obligation to avoid and minimize environmental impacts through appropriate project siting, design and implementation.

Although the initial focus is on sage-grouse, the Mitigation Framework can be readily adapted to provide compensatory mitigation for other sagebrush obligate and associated species. The suitability of the Framework for other species and natural features has not been evaluated.

The objectives of the Mitigation Framework include:

- Provide a credible, efficient, transparent, and flexible mechanism to implement compensatory mitigation;
- Ensure that sage-grouse impacts are offset by actions that benefit the affected species and habitats;
- Provide increased certainty for developers and agencies;
- Involve private and public partners in crafting solutions;
- Provide developers the opportunity to offset the impacts of project development and operation on sage-grouse and sage-grouse habitat, and provide a consistent mechanism to offset impacts to the species that can be evaluated in future reviews of the species’ status; and
- Evaluate issues based on best available scientific information, while acknowledging and responding to scientific uncertainty.

262 The Mitigation Framework would be established through a memorandum of agreement (MOA)
263 among entities that have the capacity and commitment to assist in its implementation. Such parties
264 may include land and wildlife management agencies, counties, tribes, participating private
265 infrastructure development companies, and non-governmental organizations. The MOA would
266 define the specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based
267 compensatory mitigation program.
268

269 The Mitigation Framework envisions a program with the following attributes: (1) a Mitigation Team
270 and program administrator to steer the mitigation program and ensure strong oversight; (2)
271 technically sound and transparent guidelines for estimating compensatory mitigation costs; (3) a
272 science-based statewide strategy to guide the selection of mitigation actions that will receive funding;
273 (4) provisions that the costs of operating the program will be borne by infrastructure developers that
274 use the Mitigation Framework to deliver compensatory mitigation; (5) monitoring the
275 implementation and effectiveness of mitigation actions funded by the Mitigation Framework
276 program; (6) a system to track benefits provided by the Mitigation Framework to sage-grouse habitat
277 in Idaho; and (7) periodic evaluation and adaptation of the Mitigation Framework program.
278

279 This framework provides only a general outline of a proposed Idaho-based compensatory mitigation
280 program. It is intended to assess the level of support for crafting the agreements and completing the
281 technical tasks needed to bring the Mitigation Framework into being.
282

283 **DISCUSSION**

284
285 I. The Role of Compensatory Mitigation in Infrastructure Development and Sage-grouse
286 Conservation

287
288 **A. Mitigation Basics**

289
290 Broadly defined, “mitigation” refers to a wide range of measures that are taken to avoid,
291 minimize, rectify, reduce, or compensate for the adverse impacts of actions affecting the
292 environment. See 40 C.F.R. § 1508.20 (definition of “mitigation” in National Environmental
293 Policy Act (NEPA) rules). In this general sense, mitigation should be an integral part of all
294 phases of project planning and implementation.
295

296 The focus of this report is on compensatory mitigation – also known as “biodiversity
297 offsets” or “offsite mitigation.” Compensatory mitigation consists of compensating for
298 residual project impacts that are not avoided or minimized by providing substitute resources
299 or habitats, often at a different location than the project area. For instance, a project
300 developer may fund the restoration of a particular type of habitat in order to replace or
301 “offset” similar habitat that is lost as a result of project construction.
302

303 This Framework adopts an “in-lieu fee” approach to compensatory mitigation. Under this
304 approach, a project developer provides funding to a compensatory mitigation program
305 administrator who then distributes the funds to the appropriate government agency,
306 foundation or other organization for performance of mitigation actions. In an in-lieu fee
307 program, the responsibility for actually delivering the compensatory mitigation is transferred
308 from the developer to the program administrator once the developer provides the necessary
309 funds to the in-lieu fee program. It is important to emphasize that compensatory mitigation

310 does not relieve project developers and permitting agencies of their obligation to avoid and
311 minimize environmental impacts. This Framework endorses the principle known as the
312 “mitigation hierarchy,” which holds that decision makers should consider the elements of
313 environmental mitigation in the following order of priority:

- 314 1. Avoid environmental impacts through project siting and design;
- 315 2. Minimize the impacts during construction, operation, maintenance, and
316 decommissioning by implementing appropriate conservation measures related to
317 timing and conduct of project activities;
- 318 3. Restore areas that have been disturbed or otherwise rectify on-site project-related
319 impacts to the greatest extent practicable; and
- 320 4. Compensate for residual impacts (direct and indirect effects that are not mitigated
321 on-site) by providing replacement habitats or other benefits.
322

323 This means that compensatory mitigation is addressed only after efforts to avoid, minimize,
324 and mitigate the impacts have been addressed. It also should be noted that significant
325 impacts to habitat areas that support special functions and values for sage-grouse may simply
326 not be replaceable through mitigation and therefore the best course may be to avoid those
327 areas altogether.
328

329 **B. Need for an Idaho Compensatory Mitigation Program**

330 In recent years, the state of Idaho has seen an increase in the number of major infrastructure
331 projects proposed in the state’s sagebrush steppe ecosystems. Several current proposals
332 involve high voltage transmission lines that would cross over hundreds of miles of sage-
333 grouse habitat. Large scale energy infrastructure projects such as wind farms may also affect
334 large areas of sagegrouse habitat. Where these projects are located at least partially on
335 federally managed public lands they will be required by federal law to go through an
336 extensive environmental review process under NEPA before relevant federal permits are
337 issued. The NEPA process requires the permitting agencies to consider the projects’
338 environmental effects (both positive and negative), alternatives, and potential mitigation
339 measures. Impacts on sage-grouse will be one of the topics analyzed in the NEPA process.
340

341 Even after efforts are taken to avoid and minimize impacts, it is possible that some of these
342 infrastructure projects will degrade some sage-grouse habitat, cause direct sage-grouse
343 mortality, or lead to indirect effects such as avoidance of previously occupied habitat. The
344 extent to which project developers and regulators adopt compensatory mitigation as a means
345 to offset these impacts is not fully known. However, it is likely that at least some developers
346 and regulators will seek to implement compensatory mitigation to benefit sage-grouse and
347 their habitats. Energy companies and other developers face daunting challenges in carrying
348 out compensatory mitigation for sage-grouse habitat. Just identifying specific mitigation
349 actions requires a major effort. Actually implementing sagebrush restoration and
350 enhancement projects is even more difficult and expensive – typically involving years of
351 effort and a significant risk of failure. Delivering this type of technically complex
352 environmental mitigation may be well outside the core business of many infrastructure
353 developers.
354

355 **C. Advantages of the Mitigation Framework**

358
359 The Mitigation Framework proposes to respond to these challenges by creating a statewide
360 program to deliver scientifically sound compensatory mitigation for multiple projects.
361 Project developers and regulators would no longer have to design, fund and implement their
362 own mitigation programs. Instead, they would have the option of contributing money to a
363 central fund overseen by agencies with expertise in habitat management and non-
364 governmental partners with similar experience. This approach to compensatory mitigation
365 offers three major advantages. The first advantage stems from the increased efficiency of an
366 Idaho-wide mitigation program compared with fragmented, project-by-project mitigation
367 programs. Mitigation efforts require a significant investment in planning, administration,
368 project oversight, and monitoring. The Mitigation Framework would consolidate these
369 functions, thus avoiding needless duplication. The second advantage is that a state mitigation
370 fund can be used for sage-grouse conservation more strategically and at a greater scale than
371 project-by-project mitigation. As described in more detail below, the Mitigation Framework
372 would fund sage-grouse habitat protection and restoration projects in accordance with a
373 statewide strategy that uses landscape-scale analyses to identify the specific measures and
374 habitats that will provide the greatest benefit for Idaho sagegrouse populations. This Idaho-
375 based mitigation strategy will be integrated with other conservation strategies throughout the
376 range of sage-grouse to ensure that actions taken in Idaho benefit the species as a whole.
377 Third, this method can engage the capacity and competence of natural resources agencies,
378 local governments, private companies, and non-governmental organizations. The Mitigation
379 Framework proposes to enlist these entities in shaping Idaho’s strategy, developing criteria
380 for use of the fund, and proposing and implementing habitat protection and restoration
381 projects. The benefits of the Mitigation Framework can be summarized as follows:

382
383 *Benefits for Project Developers:*

384
385 An efficient and reliable mechanism for meeting compensatory mitigation objectives and
386 permit conditions; and Increased certainty regarding project costs.

387
388 *Benefits for Regulatory Agencies:*

389
390 Increased certainty that in-lieu fees will result in strategic “on-the-ground” mitigation actions
391 that benefit sage-grouse.

392
393 *Benefits for Sage-Grouse:*

394
395 Increased certainty that scientifically sound mitigation actions that benefit sage-grouse and
396 offset impacts and habitat losses associated with infrastructure development will be
397 implemented.

398
399 **D. Ensuring Accountability**

400
401 In-lieu fee compensatory mitigation does pose one potentially significant drawback that must
402 be acknowledged and addressed: a poorly designed program may lack accountability for
403 delivering meaningful on-the-ground benefits for sage-grouse. Simply having a project
404 developer contribute to an in-lieu fee mitigation account does not by itself compensate for
405 the sage-grouse impacts caused by the project. Actual mitigation is possible only after well-

406 conceived habitat protection and restoration projects are planned, funded, implemented,
407 monitored, and successful in achieving stated objectives. The Mitigation Framework seeks to
408 ensure accountability by adopting a series of rigorous and transparent procedures. As
409 described below, the Framework would: (1) ensure that program administration and
410 monitoring functions are adequately funded; (2) provide technically sound guidelines for
411 estimating the costs of delivering compensatory mitigation; (3) establish a sciencebased
412 statewide strategy to guide the program; (4) develop project selection criteria and a request
413 for proposals based on the strategy; (5) require monitoring of the implementation and
414 effectiveness of mitigation actions funded by the program; (6) track benefits the Mitigation
415

416 Framework program provides to sage-grouse in Idaho; and (7) require periodic evaluation of
417 the program. Taken together, these procedures provide a high degree of certainty that the
418 Mitigation Framework will be able to turn in-lieu fee payments into tangible, lasting
419 compensatory mitigation for sage-grouse. As described in greater detail in Section E, below,
420 project developers that seek to use the Mitigation Framework will need to show two things.
421 First, they will need to show that their projects' impacts on sage-grouse and their habitats
422 have been evaluated using a scientifically sound process. Second, they will need to show that
423 their contributions to the mitigation fund reflect the Mitigation Framework's compensation
424 guidelines to ensure that funding will be adequate to offset project impacts. Having
425 demonstrated those things, the project developers should then be able to rely on their in-lieu
426 fee contribution to the mitigation account as satisfying their compensatory mitigation
427 objectives or obligations.
428

429 **II. Core Elements of Idaho Sage-Grouse Mitigation Program**

430 **A. Program Objectives**

- 431 • Provide a credible, efficient, transparent, and flexible mechanism to implement
- 432 compensatory mitigation;
- 433 • Ensure that sage-grouse impacts are offset by mitigation actions that benefit the sage-
- 434 grouse and their habitats;
- 435 • Provide increased certainty for developers and agencies;
- 436 • Involve private and public partners in crafting solutions;
- 437 • Provide developers the opportunity to offset project impacts on sage-grouse and sage-
- 438 grouse habitat, and provide a consistent mitigation mechanism that can be evaluated in
- 439 future reviews of the species' status; and
- 440 • Evaluate issues based on best available scientific information while acknowledging and
- 441 responding to scientific uncertainty.
- 442
- 443
- 444

445 **B. Scope**

446 The Mitigation Framework proposes to mitigate for impacts to Idaho sage-grouse and their
447 habitats in Idaho. The initial focus of the Mitigation Framework is on sage-grouse. However,
448 this program can be readily adapted to provide compensatory mitigation for other sagebrush
449 obligate and associate species, such as pygmy rabbits, if project developers and regulators call for
450 such mitigation.
451
452

453 Whether this Framework is suited for mitigation of impacts to a broader suite of species or
454 natural features has not been evaluated. It should be noted that some subcommittee members
455 expect to advocate in other forums that compensatory mitigation should extend beyond
456 sagegrouse. The Mitigation Framework focuses on infrastructure projects because this type of
457 development is the most likely to give rise to compensatory mitigation under existing
458 environmental policies. As used here, the term “infrastructure” refers to building structures that
459 significantly disturb sage-grouse habitat, including but not limited to projects for electricity
460 transmission, energy generation, pipeline conveyance, transportation, communications, and
461 similar purposes. The Mitigation Framework is not intended to apply to existing projects that are
462 not changing in scope or to the renewal of on-going activities, such as grazing permits. In
463 addition, the Framework is not suited to projects with minor impacts because their contributions
464 to the mitigation program would be too small to justify the effort needed to establish and
465 administer inlieu fee payments.

466
467 **C. Integration with Environmental Review Procedures**

468
469 The Mitigation Framework does not alter the legal standards or procedures for review and
470 approval of infrastructure projects. Rather, the Framework offers an option that project
471 developers and/or regulators may choose for implementing mitigation plans and agency permit
472 conditions. The Mitigation Framework is intended to complement the environmental review
473 process conducted pursuant to NEPA and other federal environmental laws as well as county
474 land use planning authorities. Many energy and other infrastructure projects undergo review and
475 approval at the county level. The issues examined and the level of environmental analysis varies
476 widely among individual counties and individual developers. If a county or developer decides to
477 address sage-grouse impacts, it will be able to use the Mitigation Framework as a mechanism for
478 meeting compensatory mitigation objectives that may arise from the county permitting process.

479
480 **D. Mitigation Strategy**

481
482 The next step focuses on the Mitigation Team’s task of developing a statewide, science-based
483 strategy that will guide the use of the mitigation fund. The mitigation program strategy would
484 establish priorities for the use of compensatory mitigation funding based on factors/risks
485 identified in the U.S. Fish and Wildlife Service’s 12-Month Findings for Petitions to List Greater
486 Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and in the
487 Conservation Plan for Greater Sage-grouse in Idaho (2006). The strategy sets mitigation
488 priorities with a landscape view of sage-grouse needs and highlights mitigation opportunities in
489 Idaho based on best available science. In setting priorities, the strategy considers species and
490 community size, landscape condition, and regional context. The strategy is responsive to the
491 threats and risks described in the sage-grouse 12- month findings. The strategy will also generally
492 describe the types of mitigation actions, project specifications, and best practices that are likely
493 to produce measureable benefits for sage-grouse habitat. Finally, the strategy addresses both
494 implementation and effectiveness monitoring requirements for mitigation actions funded
495 through the program. The Mitigation Framework’s strategy will draw heavily from the State of
496 Idaho’s sage-grouse conservation plan but has a narrower focus. It is intended to provide the
497 specific guidance on program priorities, accepted mitigation measures, and geographic areas of
498 emphasis that potential mitigation project sponsors will need to know when they apply for
499 funds. The strategy plays a crucial role in steering mitigation funding to those activities and
500 places that can provide the most effective benefits for Idaho sage-grouse populations consistent

501 with strategies to increase the viability of the species throughout its range. To this end, the
502 strategy will address one of the major policy questions that arise in the design of compensatory
503 mitigation systems: how closely should the mitigation actions be linked to the type and location
504 of the habitat that was originally affected by the infrastructure project. Stated in the alternative,
505 does removal of the mitigation action from the area of impact improve the effectiveness of or
506 benefit from the action. Some compensatory mitigation systems place a heavy emphasis on this
507 link by favoring “in-kind” and “on-site” compensatory mitigation over “out-of-kind” and “off-
508 site” compensatory mitigation. The subcommittee members generally favor an approach that
509 allows funding to flow to the projects and locations within Idaho that will provide the greatest
510 overall positive impact on sage-grouse populations. The Mitigation Framework calls for a
511 monitoring program that would assess habitat gains provided by mitigation actions and compare
512 them with the mitigation objectives of the participating infrastructure projects. The nature and
513 purpose of this monitoring is described more fully in Mitigation Program Step 4, below.

514
515 Once the strategy is complete, the Mitigation Team will develop project ranking criteria and
516 procedures that will guide the selection of the mitigation actions that will receive funding. The
517 goal is to fund projects that provide high quality, lasting benefits based on landscape scale
518 analyses that actually compensate for project impacts.

519
520 **E. Compensation Guidelines**

521
522 The Mitigation Framework Program will develop guidelines that may be used by developers
523 and/or regulators to determine the cost of meeting their compensatory mitigation objectives.
524 These compensatory mitigation objectives determine the extent of compensatory mitigation for
525 each project and are generally incorporated into project plans or permits. The compensation
526 guidelines will provide transparent, technically sound principles for determining how much it
527 costs to deliver habitat mitigation for sage-grouse. In other words, the guidelines will represent
528 best estimates of the true cost of implementing the mitigation actions needed to meet each
529 project’s compensatory mitigation objectives. The guidelines may be used by the project
530 developer and the Mitigation Framework Program Administrator to establish the in-lieu fee that
531 the developer will contribute to the mitigation fund. Specific valuation methods will be
532 developed at a later time and will likely draw from compensatory mitigation systems used
533 elsewhere in the West. Although the details have yet to be worked out, the following outline
534 illustrates the core concepts and principles (shown in bold lettering) that are likely to be
535 employed by the MOA parties in setting the Mitigation Framework’s in-lieu fee structure.

- 536 • A common unit of measurement would be established for describing and tracking both the
537 project impacts and the benefits of any compensatory mitigation actions. This unit of
538 measurement can be a physical unit such as “acres impacted” or more specifically “acres of
539 summer brood rearing habitat impacted” or “habitat units” lost.
- 540 • While the “common unit of measurement” noted above addresses the area of habitat
541 impacted and mitigated, habitat compensation ratios are used to address the quality of the
542 habitat affected by the infrastructure project. These ratios could specify the number of acres
543 of mitigation required per acre of impacted habitat based on the size, habitat
544 quality/condition and function of the impacted habitat; for more critical or important
545 habitat, more mitigation acres might be required. Thus, habitats with higher quality and
546 importance could have higher compensation ratios.

- 547 • Several factors are taken into account in calculating how much it will cost to actually
548 compensate for the acres or habitat units. The recommended approach is to evaluate on the
549 costs of implementing a conceptual portfolio of potential mitigation actions or offset
550 activities that provide benefits for sage-grouse. This portfolio of model projects would
551 include a balanced mix of accepted habitat protection and restoration measures reflecting the
552 types of projects expected to be funded by the mitigation program (in accordance with the
553 strategy discussed above). Examples of projects in this portfolio may include such actions as
554 restoring sagebrush canopy and a native understory on recently burned land, improving
555 riparian areas and wet meadows in early brood-rearing habitat, conservation easements to
556 prevent habitat loss, and land management practices that improve sage-grouse habitat.
557 Project costs include the full range of expenses needed to complete all phases of the
558 mitigation action, including administration and monitoring. The average costs of these
559 model mitigation actions per acre or habitat unit is the foundation of the in-lieu fee
560 calculation.
- 561 • In addition, the in-lieu fee should also be adjusted to take into consideration the issue of lag
562 time –the time between when habitat is lost at the impacted site relative to when habitat
563 functions are gained at the compensation site.
- 564 • The fee also needs to account for contingencies associated with delivering compensatory
565 mitigation, including an estimate of the risk of failure (i.e., the probability that offsite
566 mitigation will not result in any measureable conservation outcomes) for each mitigation site
567 or project.
- 568 • In addition to the fee calculated above, costs for establishing and operating the program,
569 including travel, technical consultation and monitoring of program effectiveness must be
570 included. This overhead fee could range from 5-15% depending on the size and complexity
571 of the proposed mitigation program.

572
573 **F. Program Structure and Oversight**

574
575 The Mitigation Framework would be established through a memorandum of agreement (MOA)
576 among the entities that would participate in its implementation. The MOA would define the
577 specific roles and responsibilities, procedures, and tasks needed to operate an Idaho-based
578 compensatory mitigation program. The MOA would serve as a joint powers agreement for state
579 and local government parties. The MOA would establish the following administrative structure
580 for the Mitigation Framework:

- 581
582 1. Core Team: A core group would oversee the Mitigation Framework program and provide
583 policy-level guidance for the Science Team and Fund Administrator, described below. The
584 Core Team would be composed of three to seven representatives of diverse perspectives
585 among the MOA signatories.
- 586
587 2. Science Team: A team of experts drawn from MOA signatories and other targeted
588 organizations will administer the science-based and technical aspects of the program. The
589 Science Team would consist of several individuals with expertise in relevant areas such as
590 habitat protection and restoration, landscape ecology/spatial analysis, wildlife biology, sage-
591 grouse ecology, project development, and mitigation policy.

593 The Team would focus on developing the policies and statewide strategy that will guide the
594 program, making requests for mitigation project proposals (RFPs), ranking mitigation
595 proposals that will receive funding, tracking monitoring reports and project benefits, and
596 evaluating program success.

597
598 3. Program Administrator: A program administrator will be responsible for fund
599 management and administrative tasks. The program administrator will provide administrative
600 support for the Mitigation Team, manage the mitigation account, and administer grants,
601 contracts, and other agreements.

602 4. Advisory Committee: A broader advisory committee consisting of agencies, companies
603 and organizations with the skills and commitment that will provide useful advice to the Core
604 Team regarding the implementation of the Mitigation Framework. The specific make up of
605 each of these groups will be determined at a later time. Potential participants in the
606 Mitigation Framework include but are not limited to representatives of:

607
608 **State of Idaho:**

United States:

609
610 Department of Fish and Game
611 Management
612 Office of Energy Resources
613 Office of Species Conservation
614 Idaho Department of Lands
615 Service

Bureau of Land
U.S. Fish and Wildlife Service
U.S. Forest Service
Natural Resources Cons.

616
617 **Energy Companies:**

Non-Governmental Organizations:

618
619 Idaho Power
620 Ridgeline Energy
621 Conservancy
622
623 Idaho Tribes
624 Idaho Sage-Grouse Advisory Committee
625 interests)
626 Sage-Grouse Local Working Groups

Idaho Conservation League
The Nature

Idaho Counties
Public Land Users (e.g., grazing

627
628 **G. Funding the Mitigation Program**

629
630 The costs of administering the program will be sustained by the project developers that seek
631 compensatory mitigation. Therefore, a portion of the in-lieu fee that project developers
632 contribute to the mitigation account will be applied for program administration. As noted
633 above, protecting and restoring sagebrush habitats are time consuming and expensive
634 undertakings. Ensuring that these activities are conducted with strong oversight should be
635 viewed as an exceptionally wise investment.

636
637 **III. Mitigation Program Steps**

638
639 The Mitigation Framework envisions a five-step process for developing, implementing, and
640 monitoring compensatory mitigation.

A. Step 1 – Assessment of Project Impacts and Development of Mitigation Objectives

Assessment of project impacts should be undertaken by the project developers proposing new infrastructure projects and the government agencies that conduct environmental reviews of those projects. Although the Mitigation Framework process is not responsible for this step, it is nevertheless crucial to the integrity of the mitigation program. Specifically, the Framework’s success in achieving its goal of offsetting major infrastructure project impacts on sage-grouse depends on an accurate accounting of those impacts. For many projects, this analysis will be done as part of the environmental review procedures required by NEPA. As noted above, NEPA requires federal agencies to address the full range of direct, indirect and cumulative impacts of the proposed project, alternatives to the proposed action, and potential mitigation before they act on permit applications. Once impacts have been assessed and compensatory mitigation objectives set, the project developer is ready to engage the Mitigation Framework, starting with determining the developer’s in-lieu fee contribution.

B. Step 2 – Determine the In-lieu Fee Contribution

The goal of Step 2 is to use valuation techniques, such as the guidelines presented above, to convert the complex range of project impacts, including direct, indirect and cumulative impacts, into monetary terms that become the basis for the in-lieu fee payment. The accepted in-lieu fee compensatory mitigation plan could be a condition of the instrument approving the project (FONSI, ROD, right-of-way grant, conditional use permit, etc.) and thus legally requires the project developer comply with the approved mitigation plan.

C. Step 3 – Commitment of Mitigation Funds by Project Developer

Infrastructure project developers can employ the Mitigation Framework by entering into an agreement with the program administrator with regard to a specific infrastructure project. This project agreement sets forth the parties’ respective responsibilities, including the project developer’s commitment to pay the in-lieu fee. Importantly, the agreement provides that the project developer’s funds can only be used for the purposes set forth in the Mitigation Framework. The agreement may also include “conditions” as requested by regulatory agencies or project developers. For instance, the agreement might provide that the in lieu fee will be used to fund mitigation actions in specific geographic areas in order to meet permit requirements. The program administrator, based on consultation with the MOA parties, may decline to enter into an agreement that is inconsistent with the Mitigation Framework principles or includes conditions that are burdensome or unworkable. Once the agreement specifying the payment structure and schedule is signed, the project developer makes the required in-lieu fee deposits to an interest bearing account managed by the program administrator. After the completion of this step, the project developer is no longer engaged in the Mitigation Framework – unless it has decided to participate as a MOA party.

D. Step 4 – Issue Request for Proposals (RFP) and Select, Implement, and Monitor Mitigation Actions

688 At least at annual intervals, the Mitigation Team will issue an RFP that invite private
689 companies, non-governmental organizations, and agencies to submit proposals for sage-
690 grouse habitat protection, restoration, and/or enhancement actions. The RFP will provide
691 guidance to mitigation project sponsors on program priorities and criteria. These priorities
692 and criteria will be drawn from the mitigation program strategy including identification of
693 geographic areas where mitigation might provide the greatest benefits as well as
694 identification of the threats that present the highest risk to the species or its core habitat.
695 The Mitigation Team should also reach out to federal, state, and local agencies, non-
696 governmental organizations and the general public in order to facilitate discussion, engage
697 stakeholders, raise awareness of the program and generate responses to the RFP. The RFP
698 will solicit project proposals that contain an operation or implementation plan and address at
699 least the following elements:

- 700
- 701 • Geographic area;
 - 702 • Threats addressed and how the mitigation action project will offset impacts resulting
703 from those threats;
 - 704 • An analysis of current sage-grouse conditions in the area;
 - 705 • Resource goals and objectives the mitigation action project will seek to provide;
 - 706 • A description of any coordination with federal, state, tribal and local resource
707 management and regulatory authorities or other stakeholder involvement required to
708 complete the mitigation action (e.g., requirement for NEPA compliance or county
709 permit);
 - 710 • A description of recent or proposed projects and events in the vicinity of the
711 proposed project, if any, such as fire rehabilitation treatments, restoration or
712 enhancement treatments or other activities that complement the effectiveness or
713 intent of the proposed, mitigation action;
 - 714 • A description of the long term protection, management, stewardship for the project
715 being implemented, and the entity responsible for these activities; and
 - 716 • A commitment to periodic evaluation and reporting on the progress of the project in
717 meeting stated goals and objectives, including a process for adaptively redirecting the
718 project if necessary.
- 719

720 When selecting projects, the Mitigation Team will estimate the biological benefits of the
721 projects activities, the likely success of those activities, the duration of benefit expected and
722 measure those benefits in relation to the strategy and RFP objectives. Mitigation Team and
723 the program administrator will work together on continuing program administration and
724 oversight including annual reporting of program activities, expenditures, and benefits. An
725 annual program report will describe program activities, budget, and assessment of whether
726 the mitigation strategy and associated projects are benefitting sage-grouse and at what level
727 or scale. The Mitigation Team and/or Program Administrator should implement a
728 monitoring program to measure and validate whether project-specific objectives have been
729 met. Monitoring is required of all compensatory mitigation actions to determine if the
730 project is meeting its performance standards and objectives. As mentioned above, at regular
731 intervals, the total habitat and/or population gains provided by the programs will be
732 compared with the habitat/population losses associated with the participating infrastructure
733 projects. The purpose of this comparison is to evaluate the mitigation program and make

734 any necessary program adjustments – particularly if the monitoring shows that the mitigation
735 benefits are not compensating for habitat losses. This comparison will not be a basis for
736 imposing new, unexpected requirements on the infrastructure project developers.
737

738 **CONCLUSION**

739
740 The framework of policies, principles and procedures outlined above are meant to start a dialogue
741 among parties engaged in sage-grouse conservation and infrastructure development. If these parties
742 agree with the Mitigation Subcommittee that there is great value in establishing an Idaho-based
743 compensatory mitigation program, then this framework will mark the beginning of an inclusive
744 effort to fill in the details and complete the tasks needed to bring such a program into being. We
745 have confidence in our collective ability to create a compensatory mitigation program that will
746 benefit infrastructure developers, agencies, conservation interests, and – not least – Idaho’s sage-
747 grouse.
748

750

DRAFT

751 **Part III –**

752

753 **IDAHO AND SOUTHWESTERN MONTANA SUBREGION-NO NET**
754 **UNMITIGATED LOSS PROCESS**

755

756 **Introduction**

757

758 The No Net Unmitigated Loss strategy is a means of assuring that proposed anthropogenic
759 activities, when approved and implemented will not result in long-term degradation of Greater
760 Sage-Grouse habitat or population and will have a net conservation benefit to the species. The
761 attached ‘flow chart’ identifies a screening process for review of proposed anthropogenic
762 activities. The goal of the process is to provide a consistent approach regardless of the
763 administrative location of the project and to ensure that authorization of these projects will not
764 contribute to the decline of the species. Though the initial Steps (1-6) are done prior to initiating
765 the NEPA process, the authorized officer must ensure that appropriate documentation regarding
766 the rationale and conclusion for each is included in the administrative record.

767

768 The flow chart provides for a sequential screening of proposals. However, Steps 2-6 can be done
769 concurrently. Steps 7-12 are related to project implementation.

770

771 **Step 1**

772

773 This screening process is initiated upon formal submittal of a proposal for authorization for use
774 of federal lands (BLM or Forest Service). The actual documentation would include, at a
775 minimum, a description of the location, scale of the project, and timing of the disturbance and
776 would be consistent with existing protocol and procedures for the specific type of use. It is
777 anticipated that the proposals would be submitted by a third party.

778

779 **Step 2**

780

781 This initial review would evaluate whether the proposal would be allowed as prescribed in the
782 Greater-Sage-Grouse Land Use Plan Amendment. For example, certain activities are prohibited
783 in suitable habitat, such as wind or solar energy development. If the proposal is an activity that is
784 specific prohibited, the submitter would be informed that the proposal is being rejected since it
785 would not be consistent with the Land Use Plan, regardless of the design of the project.

786

787 In addition to consistency with program allocations, the Land Use Plan identifies a limit on the
788 amount of disturbance that is allowed within a ‘biological significant unit’ (BSU). If current
789 disturbance within the affected unit exceeds this threshold, the project should be deferred until
790 such time as the amount of disturbance within the area has been reduced, through restoration or
791 other management actions.

792

793 **Step 3**

794

795 In reviewing a proposal, determine if the project will have a direct or indirect impact on
796 population or habitat (PPH or PGH). This can be done by:

- 797 1. Reviewing Greater Sage-Grouse Habitat maps.
798 2. Reviewing the 'Base Line Environment Report' (USGS) which identifies the area of
799 direct and indirect effects for various anthropogenic activities.
800 3. Consultation with agency, Fish and Wildlife Service, or State Agency wildlife
801 biologist.
802 4. Reviewing the standard and guidelines in the plan amendments (such as buffer
803 distances for the proposed activity).
804 5. Other methods
805

806 If the proposal will not have a direct or indirect impact on either the habitat or population,
807 proceed with the appropriate process for review, decision, and implementation of the project.
808

809 **Step 4**

810
811 If the project could have a direct or indirect impact of sage-grouse habitat or population, evaluate
812 whether the proposal can be relocated so as to not have the indirect or direct impact and still
813 achieve the intent of the proposal. This Step does not consider redesign of the project as a means
814 of not having direct or indirect impacts but rather authorization of the project in a physical
815 location that will not impact Greater Sage-grouse. If the project can be relocated so as to not
816 have an impact on sage-grouse and still achieve objectives of the proposal, inform applicant and
817 proceed with the appropriate process for review, decision, and implementation of the relocated
818 project.
819

820 **Step 5**

821
822 If the preliminary review of the proposal concludes that there may be impacts to sage-grouse
823 habitat and/or population, and the project cannot be effectively relocated to eliminate these
824 impacts; evaluate whether the agency has the authority to modified or deny the project. If the
825 agency does NOT have the discretionary authority to modify or deny the proposal, proceed with
826 the authorization process (NEPA) and include appropriate mitigation requirements that minimize
827 impacts to sage-grouse habitat and populations. Mitigations could include a combination of
828 actions such as timing of disturbance, design modifications of the proposal, site disturbance
829 restoration, and compensatory mitigation actions.
830

831 **Step 6**

832
833 If the agency has the discretionary authority to deny the project and after careful screening of the
834 proposal (Steps 1-4) has determined that direct and indirect cannot be eliminated, evaluate the
835 proposal to determine if the adverse impacts can be mitigated. If the impacts cannot be
836 effectively mitigated within the BSU, reject or defer the proposal. The criteria for determining
837 this situation would include but not limited to:

- 838 • Natural disturbance within the BSU is significant and additional activities within the area
839 would adversely impact the species.
840
841 • The current trend within the BSU is down and additional impacts, whether mitigated or
842 not, could lead to further decline of the species or habitat.

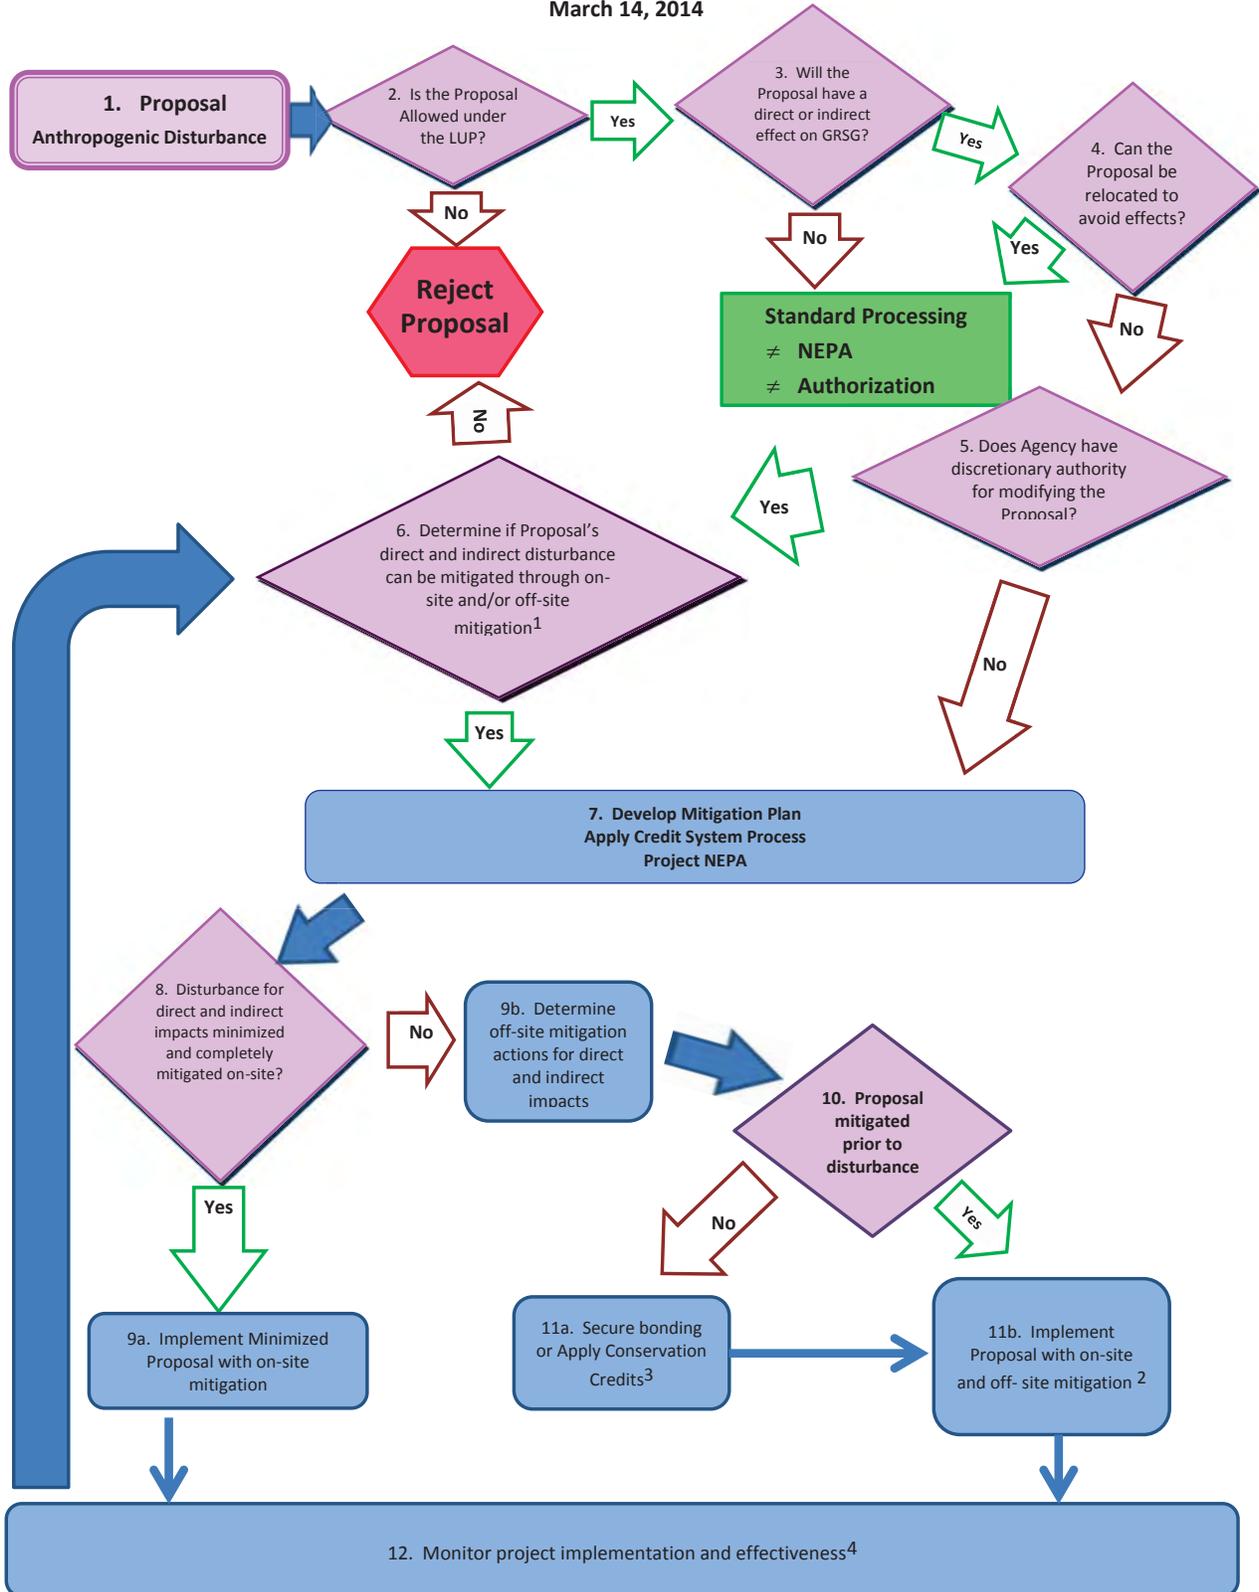

843
844
845
846
847
848
849
850
851
852
853
854
855
856
857
858
859
860
861

- The proposed mitigation has proven to be ineffective or is unproven in terms of science based approach.
- The additional impacts, after applying effective mitigation, would exceed the disturbance threshold for the BSU.
- The project would impact habitat that has been determined, through monitoring, to be a limiting factor for species sustainability within the BSU.
- Other site specific criteria that determined the project would lead to a downward trend to the current species population or habitat with the BSU.

If the project can be mitigated to provide for a net conservation benefit to the species, proceed with the design of the mitigation plan and authorization (NEPA) of the Project. The authorization process could identify issues that may require additional mitigation or denial/deferring of the project based on site specific impacts to the Greater Sage-grouse.

DRAFT

**No Net Unmitigated Loss
Draft Decision Flow Chart
March 14, 2014**

¹ In determining if the Proposal disturbance can be mitigated, the result of the mitigation action has to produce a net beneficial conservation value for sage-grouse. Additional process details are being developed for this step in coordination with the FWS and SETT in Nevada.

² Off-site mitigation projects mitigate by:
 ≠ Protective actions for future natural disturbance (i.e. fuel breaks, green strips) and/or
 ≠ restoration of legacy natural or anthropogenic disturbances

³ Process to coordinate with the State on application of Conservation Credits is in process.

⁴ All Monitor is done in accordance with established protocols and incorporated into future Mitigation Plans. Results will feedback into the determination on whether future proposals can be mitigated in Step 6.

Appendix L – Travel Management Planning Guidelines:

- Among other designation criteria from 43 CFR 8342.1(b), “areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- During subsequent travel management planning, all routes would undergo a route evaluation to determine its purpose and need and the potential resource and/or user conflicts from motorized travel. Where resource and/or user conflicts outweigh the purpose and need for the route, the route would be considered for closure or considered for relocation outside of sensitive GRSG habitat.
- During implementation-level travel planning, threats to GRSG and their habitat would be considered when evaluating route designations and/or closures.
- During subsequent travel management planning, routes that do not have a purpose or need would be considered for closure.
- During subsequent travel management planning, routes that are duplicative, parallel, or redundant would be considered for closure.
- During subsequent travel management planning, seasonal restrictions on OHV use would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, OHV timing limitations would be considered in important seasonal habitats where OHV use is a threat.
- During subsequent travel management planning, consider limiting over snow vehicle (OSV) travel to designated routes, consider seasonal closures in GRSG wintering areas from November 1 through March 31 or define Designation Criteria (i.e. minimization criteria) to regulate over snow vehicle traffic.
- During subsequent travel management planning, routes not required for public access or recreation with a current administrative/agency purpose or need would be evaluated for administrative access only.
- During subsequent travel management planning, consider prioritizing restoration of routes not designated in a Travel Management Plan.
- During subsequent travel management planning, consider using seed mixes or transplant techniques that will maintain or enhance GRSG habitat when rehabilitating linear disturbances.
- During subsequent travel management planning, consider scheduling road maintenance to avoid disturbance during sensitive periods and times to the extent practicable. Consider using time of day limits (After 10:00 AM to 7:00 PM) to reduce impacts on GRSG during breeding and nesting periods.

49
50
51
52

Over-snow vehicle – a motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

DRAFT

1 **Idaho and Southwestern Montana**
2 **Recommendation for Proposed Plan Amendment**

3
4 **1. Summary Description of Plan**

- 5 1.1. Maintain and/or increase the abundance, distribution and connectivity of GRSG by
6 conserving, enhancing and restoring GRSG habitat to maintain resilient populations
7 by reducing, eliminating or minimizing threats to GRSG habitats.
- 8 1.2. Comply with existing laws, regulations and policies.
- 9 1.3. Recognize valid existing rights.
- 10 1.4. BLM and FS would coordinate with the States of Idaho and Montana, as
11 appropriate, during implementation activities including the evaluation of
12 disturbance threshold, adaptive management triggers and mitigation.
- 13 1.5. The Idaho and Southwestern Montana Sub-Region would be divided into 5
14 Conservation Areas over which the disturbance threshold and adaptive management
15 triggers would apply. These areas are the West Owyhee, Desert, Mountain Valleys,
16 Southern and Southwestern Montana (Map 1).
- 17 1.6. The Conservation Areas would be categorized into management zones – Core,
18 Important and General, with the exception of the Southwestern Montana
19 Conservation Area which does not contain Important Management Zones (Map 2).
- 20 1.7. Adaptive Management: Idaho: actions would engage when population decline by 10
21 percent or a combined 10 percent loss nesting and/or wintering habitat within Core
22 or Important Management Zones within a Conservation Area is lost (Soft Trigger),
23 and when 20 percent of the population or nesting and wintering habitat within Core
24 or Important Management Zones within a Conservation Area is lost (Hard Trigger)
25 Montana: Adaptive management in Montana is linked with the state evaluation
26 framework.
- 27 1.8. Additional anthropogenic disturbance (AD-1) would be significantly limited in Core
28 Management Zones with specific exceptions (AD-3 & AD-4); it would be limited
29 unless consistent with specific criteria in Important Management Zones (AD-4) and
30 would be avoided in General Management Zones.
- 31 1.9. Anthropogenic disturbance (AD-1) would be contained within a 3 percent total
32 disturbance cap as applied to the biologically significant unit (the biologically
33 significant unit (BSU) is defined as the nesting and wintering habitat within Core
34 and Important Management Zones within a Conservation Area), including existing
35 anthropogenic disturbance. In Montana surface disturbance will be calculated
36 through the state surface disturbance analysis process on a project by project basis.
- 37 1.10. Mitigation would be required for all anthropogenic disturbance activities within
38 GRSG habitat. Within Core Management Zones a standard of no net unmitigated
39 loss would be required.
- 40 1.11. BLM and Forest Service would set up a Mitigation Board at the State level with state
41 involvement to develop a Mitigation Strategy and oversee the application of
42 mitigation at the site-specific level.
- 43 1.12. BLM and Forest Service would complete Wildfire and Invasive Species
44 Assessments at the local level to identify priority areas of habitat, and wildfire and
45 invasive species concern. These assessments would support and include the
46 development of fuels, restoration and rehabilitation strategies to use during
47 implementation level activities.

48 **Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary¹**

Solar/Wind/Nuclear/Hydropower		
Core	Important	General
Exclusion (LR-2)	Avoidance (LR-2)	Open (LR-2)
Commercial Service Airports		
Core	Important	General
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills		
Core	Important	General
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
Utility Corridors		
Core	Important	General
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Core (LR-7)	Same as Core (LR-7)
High-Voltage Transmission and Major Pipeline ROWs		
Core	Important	General
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
Other (Minor) Rights-of-Way and Land Use Authorizations/Permits		

¹ The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

Core	Important	General
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
Land Tenure Adjustments		
Core	Important	General
Retention with exceptions for exchange; available for exchange with no net loss of GRSG within Core and Important. Not available for disposal. (LR-13)	Same as Core (LR-13)	Available for exchange subject to existing land use plan conformance (No Action)
Fluid Mineral Resource Allocation (Includes Geothermal)		
Core	Important	General
Idaho: Low or no potential areas Closed Moderate to High potential areas Open subject to No Surface Occupancy Montana: Open subject to NSO. (FLM-1)	Idaho: Open subject to No Surface Occupancy Montana: Not Applicable (FLM-1)	Idaho and Montana: Open subject to CSU (FLM-1)
Non-Energy Leasables		
Core	Important	General
Known Phosphate Leasing Areas (KPLAs) are Open – Not Applicable, No KPLAs in Core Closed to leasing outside KPLAs (NEL-1)	KPLAs are Open Open with standard and additional stipulations for leasing outside KPLAs. (NEL-1)	KPLAs are Open to leasing with standard stipulations (NEL-1)
Mineral Materials (Salable Minerals)		
Core	Important	General
Closed to new site authorizations. Existing sites Open to new sales subject to RDFs, buffers and seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to criteria. Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)

2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance in to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management zones and associated management to maintain a resilient population and to designate strategically located adjacent zones to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
 - a. Increasing canopy cover and average patch size of sagebrush in perennial grasslands.
 - b. Increasing the amount, condition and connectivity of seasonal habitats.
 - c. Protecting or improving GRSG migration/movement corridors.
 - d. Reducing conifer encroachment within GRSG seasonal habitats.
 - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
 - f. Reducing the extent of annual grasslands adjacent to Core and Important Management Zones.
- Decadal treatment objectives by population area are identified in Table 1.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward 70% of lands within CMZs and IMZs capable of producing sagebrush at 10-30% canopy cover and less than 10% conifer canopy cover.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species.

93 Table 1. Acres of Treatment within a 10-Year Period to Achieve Vegetation Objectives²

Population Area	Mechanical Conifer Treatment	Prescribed Fire	Annual Grass Treatment

Table 2. Seasonal Habitat Desired Conditions for Greater Sage-Grouse

ATTRIBUTE	INDICATOR	DESIRED CONDITION
Lek Habitat	Proximity of trees ^{9,16}	<Trees (e.g. juniper) none to uncommon within 3 km of occupied leks
	Proximity of sagebrush to leks ¹⁶	Adjacent protective sagebrush cover within 100 m of an occupied lek ¹⁶
Nesting Habitat	Apply indicators to areas within 10 km of occupied leks, that have the ecological capability to provide sagebrush cover.	
	Seasonal habitat needed ¹⁰	>80% of the landscape in sagebrush cover
	Sagebrush canopy cover ^{2,10,11,13}	15-25%
	Sagebrush height ¹⁰	
	Arid sites ³	12-31 inches (30-80cm)
	Mesic sites ⁴	16-31 inches (40-80cm)
	Predominant sagebrush shape ¹⁶	>50% in spreading shape ⁵
	Perennial grass cover ^{2,10}	
Arid sites ³	≥10%	
Mesic sites ⁴	≥15%	
Perennial grass height ^{10,11,13,16}	≥7 inches ¹⁰	
Perennial forb canopy cover ^{2,10}		
Arid sites ³	≥5%	
Mesic sites ⁴	≥10%	
BROOD-REARING/SUMMER¹ (July-October)¹ (Apply to all habitat outside of nesting/breeding and winter)		
Cover	Seasonal habitat needed ¹⁰	>40% of the landscape in sagebrush cover
	Sagebrush canopy cover ^{2,10}	10-25%
	Sagebrush height ¹⁰	40-80cm
	Perennial grass canopy cover ^{2,10}	>15%
	Upland and riparian perennial forb availability ^{2,16}	Preferred forbs are common with several preferred species present ^{7,8}

² These acreage figures represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

	Riparian meadow habitat function	>80% relative composition ^a of riparian herbaceous species ⁹
WINTER¹ November-March¹ (Apply to areas of low snow accumulation)		
Cover and Food	Seasonal habitat needed ¹⁰	>80%
	Sagebrush canopy cover above snow ^{2, 10}	>10%
	Sagebrush height above snow ¹⁰	>25cm

¹ Seasonal dates can be adjusted by local unit according to geographic region.
² Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to other species present.
³ 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (HAF 2014).
⁴ ≥12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (HAF 2014).
⁵ Sagebrush plants that are more tree or columnar-shaped do not provide the protective cover of sagebrush with a spreading shape (HAF 2014).
⁷ Preferred forbs are listed in HAF Table III-2 (HAF 2014). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2.
⁸ Cover may be higher according to local riparian classifications.

Forest Service Maximum Allowable Use Levels for GRSG Habitat

Seasonal Habitat	Allowable Use of Key Species
Nesting/Breeding ¹	Residual perennial grass height: Grazing post nesting/breeding season: 4 in. ^{15,16} Grazing during nesting/breeding season ^a : 7 in. ^{10,15,16}
	^a Average, assuming current vegetation composition has the capability. ≤35% shrub species
Brood-Rearing /Summer	≤40% herbaceous species ¹⁷
	≤35% woody species
	Average stubble height 4 inches (depending on site capability and potential) for herbaceous riparian vegetation ¹⁷
Winter	≤35% shrub species

102 1-Grass heights only apply in nesting habitats with sufficient sagebrush cover (15-25%) to support
103 nesting.

- 104 **3. General Direction (GD)**
- 105 **3.1.** GD-1: Comply with state and federal laws, regulations, policies, and standards, including
- 106 FLPMA multiple use mandates and NFMA regulations.
- 107 **3.2.** GD-2: Implement actions (day-to-day management, monitoring, and administrative
- 108 functions) that stem directly from regulations, policy, and law, which are considered in
- 109 conformance with the LUPA that are not specifically addressed in the plan amendment.
- 110 **3.3.** GD-3: Preserve and recognize valid existing rights, which include any leases, claims, or
- 111 other use authorizations established before a new or modified authorization, change in land
- 112 designation, or new or modified regulation is approved. Activities on existing mineral leases
- 113 are managed through terms, conditions and stipulations on the leases, and through specific
- 114 operating conditions included in operating plan approvals for the duration of the lease.
- 115 **3.4.** GD-4: Allowable uses and management actions from the existing LUPs that remain valid
- 116 and do not require amending are carried forward.
- 117 **3.5.** GD-5: Sustain habitat in sufficient quantities and quality for resilient plant and wildlife
- 118 populations.
- 119 **3.6.** GD-6: Provide for human safety and property protection from wildfire.
- 120 **3.7.** GD-7: Ensure that existing utility corridors would remain unchanged.
- 121 **3.8.** GD-8: Limit all Forest Service-administered lands to designated routes.
- 122 **3.9.** GD-9: Existing requirements regarding site-specific environmental analysis, public
- 123 involvement, consultation with tribes and other agencies, or compliance with applicable
- 124 laws without waiver are maintained.
- 125 **3.10.** GD-10: Appropriate, site-specific analysis as described in NEPA and any requisite
- 126 site specific decision making (i.e., 43 CFR Subpart 4160, or 36 CFR Part 251) would be
- 127 conducted prior to approving proposed management actions.
- 128 **3.11.** GD-11: Impacts analysis on other sagebrush steppe species and impacts on state
- 129 endowment trust lands managed by the Idaho Department of Lands would be analyzed
- 130 during site-specific project NEPA review.
- 131 **3.12.** GD-12: Activities not specifically addressed by the plan amendment would still be
- 132 subject to the allowances and restrictions of the applicable land use plans.
- 133 **3.13.** GD-13: Information in the Management Plan and Conservation Strategies for Sage-
- 134 Grouse in Montana would be considered when designing projects that may affect sensitive
- 135 species or federally listed species in Montana.
- 136 **3.14.** GD-14: Any oil and gas leasing decisions would be consistent with the BLM and
- 137 Forest Service requirements for leasing decisions as found in 43 CFR Part 3101 and 36 CFR
- 138 228.102, respectively.
- 139 **3.15.** GD-15: In conjunction with plan evaluation, re-evaluate management zones,
- 140 required design features and other protective stipulations as new science, information and
- 141 data regarding the habitats and behavior of the species is obtained. Incorporate these
- 142 findings as part of plan maintenance.
- 143 **3.16.** GD-16: Incorporate required design features (RDFs) as described in Appendix A in
- 144 the development of project or proposal implementation, reauthorizations or new
- 145 authorizations and suppression activities.
- 146 **3.17.** GD-17: Incorporate best management practices as described in Appendix A, as
- 147 applicable and appropriate in the design and development of implementation activities and
- 148 projects.
- 149 **3.18.** GD-18: Conduct implementation and project activities consistent with seasonal
- 150 habitat restrictions described in Appendix B.

151
152
153
154
155
156
157
158

- 3.19. GD-19: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.
- 3.20. GD-20: Consistent with regulations, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs that would result in full rehabilitation to restore lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work.

REVIEW

159 **4. Coordination**

- 160 4.1. CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and
161 monitor activities to achieve desired conditions and to maximize the utilization of available
162 funding opportunities. Coordination efforts could include: adjacent landowners, federal
163 and state agencies, local governments, tribes, communities, other agencies, resource
164 advisory groups and non-governmental organizations.
- 165 4.2. CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to
166 establish the State of Idaho as a cooperating agency during implementation of the final
167 decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and
168 Task Team. Montana BLM will participate as appropriate on Montana’s Sage-grouse
169 Oversight Team to facilitate coordinated and implementation of BLM’s final decision and
170 Montana’s forthcoming sage-grouse conservation strategy.
- 171 4.3. CC-3: The BLM and Forest Service would consider any recommendations from the
172 Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation
173 Task Force.
- 174 4.4. CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana
175 and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse
176 Oversight Team regarding proposed management changes, the implementation of
177 conservation measures, mitigation, and site-specific monitoring, related to adaptive
178 management and livestock grazing (Appendix O).
- 179 4.5. CC-5: At the state level, BLM and Forest Service would consider recommendations from
180 the Governor in the decision process recognizing that the BLM and Forest Service have the
181 final decision making authority and responsibility on federal lands under their appropriate
182 jurisdiction.
- 183 4.6. CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP,
184 USFWS, and other conservation partners in collaborative efforts with adjacent states
185 (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG
186 habitat and population status and trends within the broader USFWS PACs and make
187 appropriate recommendations for GRSG conservation at broader scales.
- 188 4.7. CC-7: At the state level, BLM and Forest Service would coordinate with appropriate
189 WAFWA Sage-grouse Technical Committee to develop consistent population and habitat
190 monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 191 4.8. CC-8: All prescribed burning would be coordinated with state and local air quality agencies
192 to ensure that local air quality is not significantly impacted by BLM and Forest Service
193 activities.

194
195

196 **5. Greater Sage-Grouse Management Areas**

197 **5.1.** Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region
 198 to form the geographic basis for achieving population objectives; evaluating the disturbance
 199 density and adaptive regulatory triggers; and tailor adaptive management responses. These
 200 conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys,
 201 Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

202 Conservation Area Description:

203
 204
 205 Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and
 206 includes habitat in west-central population area. It extends west from Rexburg, north and
 207 west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of
 208 Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and
 209 west of Highway 20 to the Dylan Karaus Road, west to Canyon Creek. Canyon Creek to the
 210 confluence with the Snake River form the western boundary.

211
 212 Desert Conservation Area – located north of the Snake River and south of the Mountain
 213 Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake
 214 River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern
 215 boundary.

216
 217 West Owyhee Conservation Area – located south of the Snake River and west of the
 218 Bruneau River.

219
 220 Southern Conservation Area – located south of the Snake River and east of the Bruneau
 221 River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the
 222 Sawtooth National Forest in Box Elder County.

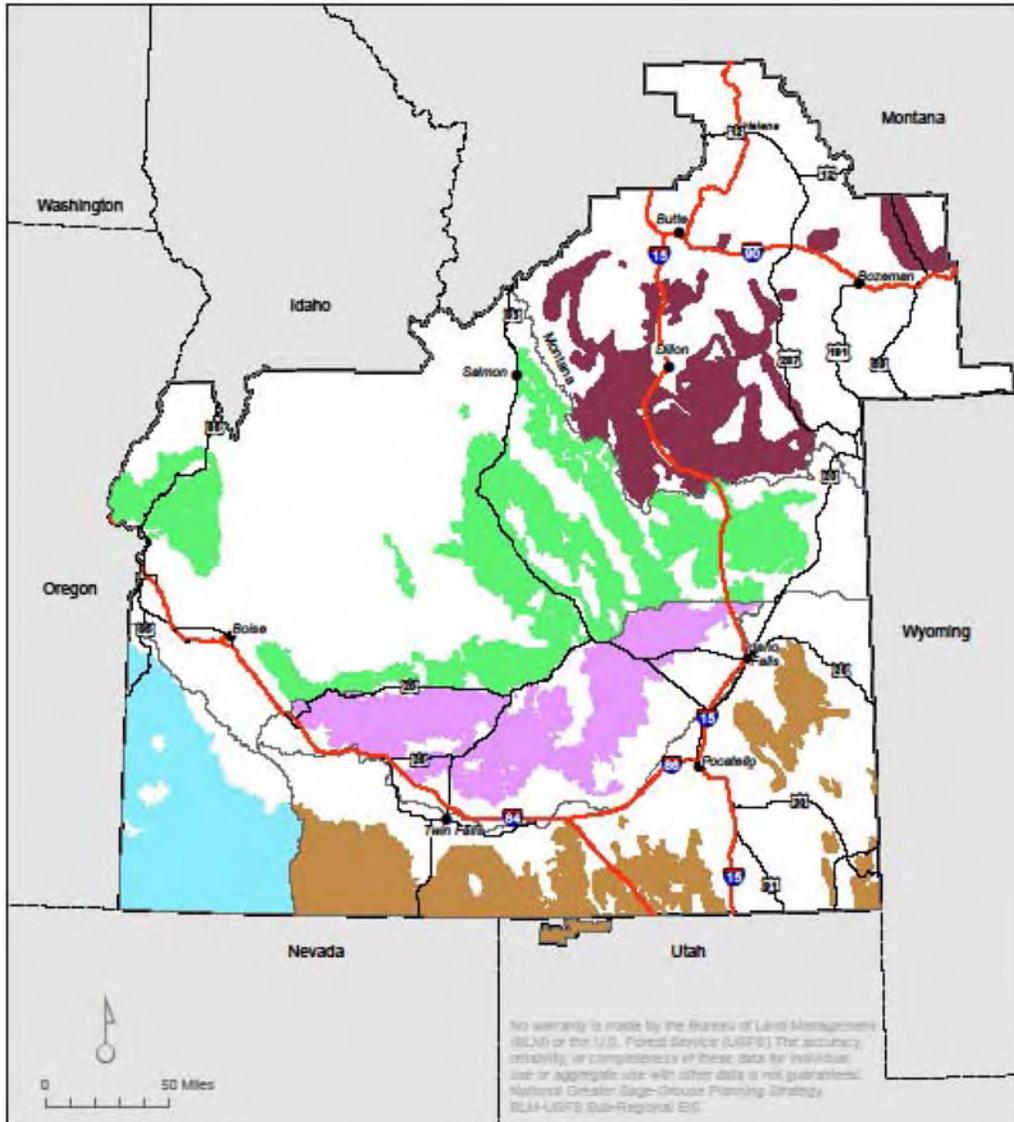

223
 224 Southwestern Montana – located in southwestern Montana - encompassing the Dillon and
 225 Butte BLM Field Office boundaries.

226
 227 Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively
 228 contiguous, while those in the Mountain Valleys and Southern CAs tend to be more
 229 fragmented due to topography, elevational and land use differences.

230 **5.2.** MA-2: Within each Conservation Area (CA) designate GRSG Management Zones: Core,
 231 Important and General Management Zones (Map 2). **Core Management Zones (CMZs)**
 232 focus on conserving the two key meta-populations in the sub-region. These meta-
 233 populations consist of a large aggregation of interconnected breeding subpopulations of
 234 GRSG that have the highest likelihood of long-term persistence. The CMZ encompasses
 235 areas with the highest conservation value to GRSG, based on the presence of larger leks,
 236 habitat extent, important movement and connectivity corridors and winter habitat. Core
 237 Management Zones include adequate area to accommodate continuation of existing land
 238 uses and landowner activities. **Important Management Zones (IMZs)** contain additional
 239 high value habitat and populations that provide a management buffer for the CMZ, connect
 240 patches of CMZ. The IMZ encompasses areas of generally moderate to high conservation
 241 value habitat and/or populations and in some CAs includes areas beyond those identified
 242 by USFWS as necessary to maintain redundant, representative and resilient populations

- 243 (Priority Areas for Conservation (PACs)). The IMZs are typically adjacent to CMZs but
244 generally reflect somewhat lower GRSG population status and/or reduced habitat value due
245 to disturbance, habitat fragmentation or other factors. There are no IMZs designated within
246 the Southwestern Montana CA. **General Management Zones (GMZs)** encompass habitat
247 that is outside of CMZs or IMZs. It is generally characterized by more marginal habitat and
248 few, if any, occupied leks or other important seasonal use areas.
- 249 **5.3.** MA-3: Annually prioritize Conservation Areas at the state scale considering results of the
250 annual adaptive regulatory trigger evaluations relative to implementation of restoration and
251 mitigation activities.
- 252 **5.4.** MA-4: Prioritize activities to protect, enhance and restore GRSG habitats (i.e. suppression
253 activities, fuels management activities, vegetation treatments, invasive species treatments,
254 etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of
255 engaging adaptive management), followed by Core Management Zones, then Important
256 Management Zones then General Management Zones within the Conservation Areas. Local
257 priority areas within these zones will be further refined as a result of completing the GRSG
258 Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could
259 include projects outside GRSG habitat when those projects would provide a benefit to
260 GRSG habitat.
- 261 **5.5.** MA-5: The management zone map and biologically significant unit baseline map would be
262 re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years).
263 This re-evaluation could indicate the need to adjust Core, Important or General
264 Management Zones or the habitat baseline. These adjustments could occur upon
265 completion of the appropriate analysis (plan amendment) to review the allocation decisions
266 based on the map.
- 267 **5.6.** MA-6: The appropriateness of specific project proposals or management activities within
268 the management zone designations (Core, Important, General) would be assessed
269 individually during project-level NEPA analysis. This evaluation is necessary since
270 designations of Core, Important and General Management Zones were derived at a broad
271 scale with additional refinements relative to boundaries and management consideration;
272 locally GRSG habitat suitability and vegetation characteristics vary.
- 273

Map 1. Conservation Areas within Idaho and Southwestern Montana Subregion

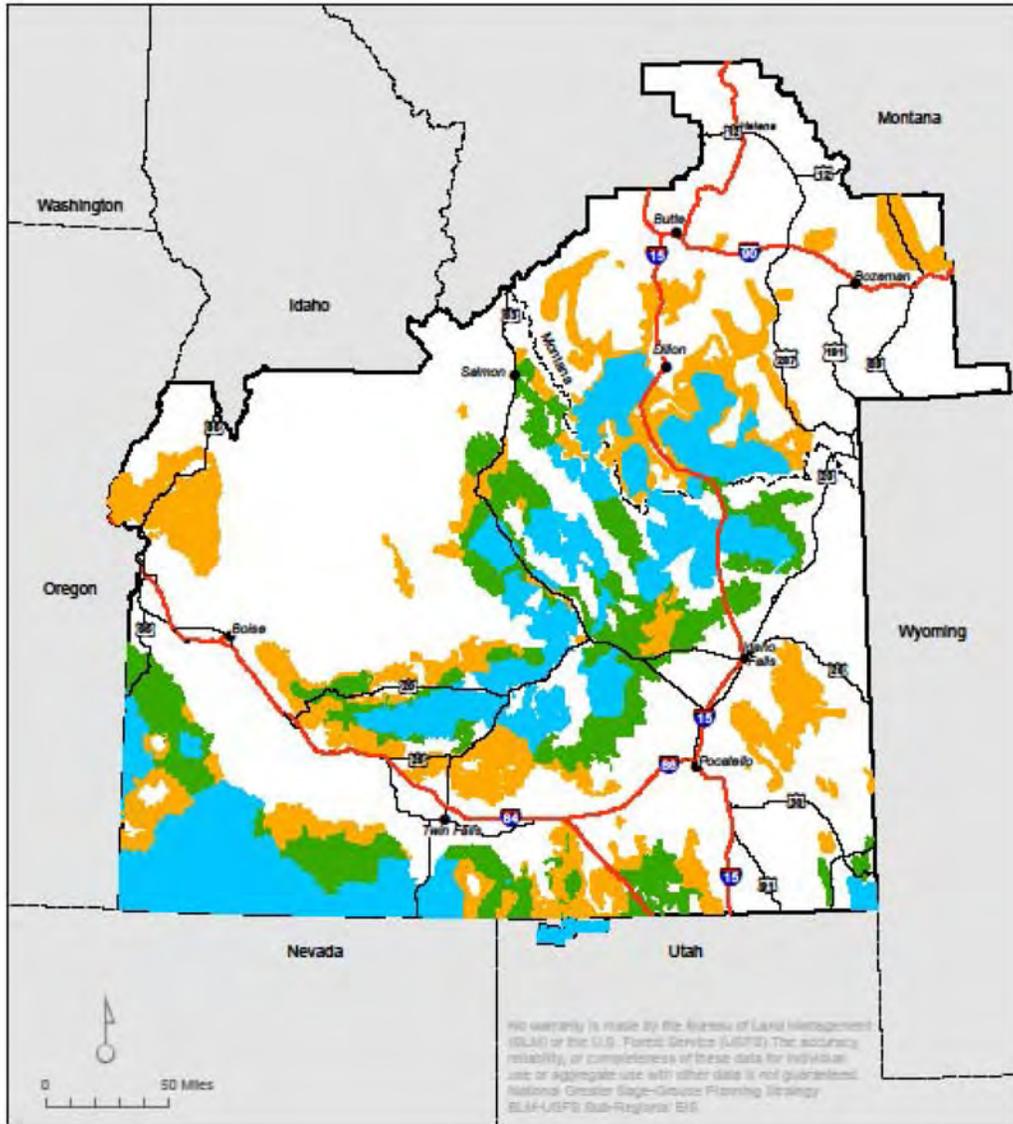

Conservation Area with Management Zone

 - General
 - Analysis Boundary

274 **6. Adaptive Management**

- 275 **6.1.** Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers,
276 evaluated within a Conservation Area, to determine an appropriate management response.
- 277 **6.2.** AM-2: Utilize monitoring information collected through the Monitoring Framework Plan
278 (Appendix E) to determine when adaptive regulatory triggers have been met.
- 279 **6.3.** AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through
280 use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to
281 track and identify habitat changes to assess the habitat trigger in the adaptive management
282 approach. Key habitat map updates are made each winter by BLM in coordination with the
283 FS and Idaho Department of Fish and Game (IDFG), using the process described in
284 Appendix F.
- 285 **6.4.** AM-4: BLM and Forest Service would utilize population information collected and
286 maintained by the Idaho Department of Fish and Game to track and identify population
287 changes to assess the population trigger in the adaptive management approach...
- 288 **6.5.** AM-5: Twice each year the applicable monitoring information would be reviewed to
289 determine if any adaptive management criteria have been met.
- 290 **6.6.** AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships
291 within the biologically significant units (BSU). The BSU is defined as the nesting and
292 wintering habitat within Core and Important Management Zones within a Conservation
293 Area.
- 294 **6.7.** AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
295 A 20 percent combined loss of nesting and/or wintering habitat within CMZ within
296 a CA compared to the 2011 biologically significant unit (BSU) baseline (Map 3) (The
297 BSU is defined as the nesting and wintering habitat within Core and Important
298 Management Zones within a Conservation Area, inclusive of all ownerships and is
299 used in the evaluation of the adaptive regulatory triggers and the anthropogenic
300 disturbance threshold); or
301 A 20 percent combined loss of nesting and/or wintering habitat within IMZ within a
302 CA compared to the 2011 BSU baseline.
- 303 **6.8.** AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
304 A 10 percent combined loss of nesting and/or wintering habitat within CMZ within
305 a CA compared to the 2011 BSU baseline; or
306 A 10 percent combined loss of nesting and/or wintering habitat within IMZ within a
307 CA compared to the 2011 BSU baseline.
- 308 **6.9.** AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
309 A 20 percent decline in maximum number of males counted and a finite rate of change
310 significantly below 1.0 within CMZ within a CA over a period of 3 consecutive years
311 compared to the 2009-2011 baseline; or
312 A 20 percent decline in maximum number of males counted and a finite rate of change
313 significantly below 1.0 within IMZ within a CA over a period of 3 consecutive years
314 compared to the 2009-2011 baseline.
- 315 **6.10.** AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
316 A 10 percent decline in maximum number of males counted and a finite rate of
317 change below 1.0 within CMZ within a CA over a period of 3 years when compared
318 to the average finite rate of change from 2009-2011; or

- 319 A 10 percent decline in maximum number of males counted and a finite rate of
320 change below 1.0 within IMZ within a CA over a period of 3 years when compared
321 to the average finite rate of change from 2009-2011.
- 322 **6.11.** AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been
323 met then the Implementation Team would engage to identify implementation level
324 actions that may be appropriate to consider.
- 325 **6.12.** AM-12: When any of the Adaptive Regulatory Criteria for Soft Triggers have been
326 met the Implementation Team would evaluate causal factors and recommend
327 additional potential implementation level activities Appendix G.
- 328 **6.13.** AM-13: When any of the Adaptive Regulatory Criteria for Hard Triggers have been
329 met due to loss of habitat then CMZ management actions would be applied to the
330 IMZ within that CA.
- 331 **6.14.** AM-14: If an adaptive regulatory trigger is tripped and livestock grazing is identified
332 as a probable limiting factor then adjustments would follow the Adaptive Grazing
333 Management Response described in Appendix G.
- 334 **6.15.** AM-15: Remove any adaptive management response when the habitat or population
335 information shows a return to or an exceedance of baseline values within the
336 associated CA.
- 337 **6.16.** Montana Adaptive Management:
338

339 **7. Anthropogenic Disturbance**

340 **7.1.** Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as
341 calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the
342 nesting and wintering habitat within Core and Important Management Zones within a
343 Conservation Area, inclusive of all ownerships. Anthropogenic disturbance excludes habitat
344 disturbance from wildfire and includes activities described in Appendix H. For Idaho this
345 disturbance is measured by direct footprint or by ROW width for linear features. For
346 Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool
347 process described in Appendix I.

348 **7.2.** AD-2: New anthropogenic disturbances within winter and nesting habitat within Core or
349 Important management zones within a CA where the disturbance threshold is already
350 exceeded from any source or where the proposed development would result in the
351 threshold being exceeded would not be allowed until enough habitat has been restored to
352 maintain the area under this threshold (subject to valid existing rights).

353 **7.3.** AD-3: Core Management Zone: Anthropogenic Disturbance Exception Criteria – in
354 addition to the Core and Important Management Zone Anthropogenic Disturbance
355 Development Criteria (AD-4), the following criteria must all be met in the screening and
356 assessment process:

- 357 a. The population trend for the GRSG within the associated Conservation Area is
358 stable or increasing over a three-year period and the population levels are not
359 currently engaging the adaptive management triggers (this applies strictly to new
360 authorizations; renewals and amendments of existing authorizations would not be
361 subject to this criteria when it can be shown that long-term impacts from those
362 renewals or amendments would be substantially the same as the existing
363 development);
- 364 b. The development with associated mitigation would not result in a net loss of GRSG
365 habitat and would provide a net conservation benefit of the respective Core
366 Management Zone;
- 367 c. The project would not likely result in a net loss of GRSG habitat or habitat
368 fragmentation or other impacts causing a decline in the population of the species
369 within the relevant CA;
- 370 d. The project is developed pursuant to a valid existing authorization;
- 371 e. The project is an incremental upgrade/capacity increase of existing development;
- 372 f. Cannot be reasonably accomplished outside of the Core Management Zone;
- 373 g. Can be co-located within the footprint of existing infrastructure (proposed actions
374 would not increase the 2011 authorized footprint and associated impacts more than
375 fifty percent (50%), depending on industry practice.
- 376 h. Development would follow the required design features (RDF) and best
377 management practices (BMPs) as described in Appendix A;
- 378 i. The project would not exceed the disturbance threshold (AD-1).
- 379 j. The project has been reviewed by the State Implementation Team and
380 recommended for consideration by the Idaho Governor.

381 **7.4.** AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development
382 Criteria – the following criteria must be met in the screening and assessment process:

- 383 a. The project cannot reasonably be achieved, technically or economically, outside of
384 this management zone; and

- 385 b. The project is co-located within the footprint for existing infrastructure, to the
- 386 extent practicable. In the event co-location is not practicable, the siting should best
- 387 reduce cumulative impacts and/or impacts on other high value natural, cultural, or
- 388 societal resources; and
- 389 c. The project does not result in a net loss of GRSG habitat or habitat fragmentation
- 390 or other impacts causing a decline in the population of the species within the
- 391 relevant CA; and
- 392 d. The project design mitigates unavoidable impacts through appropriate
- 393 compensatory mitigation; and
- 394 e. The project complies with the applicable RDFs and BMPs as described in
- 395 Appendix A.
- 396 f. The project would not exceed the disturbance threshold (AD-1).
- 397 **7.5. AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading**
- 398 **ROWs is preferred over the creation of new ROWs or the construction of new facilities in**
- 399 **all management zones.**
- 400 **7.6. AD-6: Construction activities and other short-term anthropogenic disturbances would be**
- 401 **carried out subject to seasonal and timing restrictions Appendix B.**
- 402

REVIEW

403 **8. Mitigation**

- 404 **8.1.** Mitigation (MIT)-1: BLM and USFS would establish an inter-agency GRSG Conservation
405 Board at the state level (both Idaho and Montana) to oversee GRSG Conservation.
- 406 **8.2.** MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Board would
407 develop a State Mitigation Strategy. In Idaho this strategy would be consistent with the
408 Idaho Mitigation Framework (Appendix J).
- 409 **8.3.** MIT-3: Mitigate impacts from anthropogenic developments (Appendix H) to GRSG
410 habitats by first avoidance of impacts, minimizing impacts and then compensating for
411 impacts.
- 412 **8.4.** MIT-4: Mitigate anthropogenic development (Appendix H) impacts to CMZs to a no net
413 loss standard (Appendix K) through application of appropriate mitigation in accordance
414 with the Mitigation Framework (Appendix L), referred to as no unmitigated loss.
- 415 **8.5.** MIT-5: Mitigate anthropogenic development (Appendix H) impacts to GRSG habitat
416 through application of appropriate mitigation in accordance with the Mitigation Framework
417 (Appendix L).
- 418

REVIEW

419 **9. Wildfire Preparedness/Prevention**

- 420 **9.1.** Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland
421 Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 422 **9.2.** WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the
423 existing coordinated inter-agency approach to fire restrictions based upon National Fire
424 Danger Rating System thresholds (fuel conditions, drought conditions, and predicted
425 weather patterns).
- 426 **9.3.** WFP-3: Annually incorporate into existing fire management plans results and updates from
427 the Wildfire and Invasive Species Habitat Assessments described in Appendix D, to
428 communicate/explain the resource value of GRSG habitat, including fire prevention
429 messages and actions to reduce human-caused ignitions.
- 430 **9.4.** WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative,
431 interagency organization dedicated to achieving consistent implementation of the goals,
432 actions, and policies in the National Fire Plan and the Federal Wildland Fire Management
433 Policy.
- 434 **9.5.** WFP-5: Continue annual coordination meetings held between cooperating agencies that
435 have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations
436 and other stakeholders into this coordination. Discuss priority suppression areas and
437 distribute maps showing priority suppression areas at both the Conservation Area and the
438 local office levels as based on the adaptive management strategy and Wildfire and Invasive
439 Species Assessments.
- 440 **9.6.** WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat
441 and sagebrush management issues as related to wildfire suppression.
- 442 **9.7.** WFP-7: As part of the Wildfire and Invasive Species Assessments, identify roads, trails, and
443 recreational use areas with high frequency of human caused fires within or adjacent to the
444 Core or Important Management Zones. Consider these areas during annual fire restriction
445 evaluations, and as appropriate, through site specific management.
- 446 **9.8.** WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention
447 programs to reduce human caused ignitions.
- 448 **9.9.** WFP-9: Implement activities identified within the Wildfire and Invasive Species
449 Assessments.
- 450

451 **10. Wildfire Suppression**

452 **10.1.**WFS-1: Complete Wildland Fire and Invasive Species Assessments as described within
453 Appendix D within 1 year of the Record of Decision and incorporate results into
454 appropriate Fire Management Plans as they are completed. Wildfire and Invasive Species
455 Habitat Assessments are interdisciplinary evaluations of the threats posed by wildfire and
456 invasive species, as well as identification of priority areas/treatment opportunities for fuels
457 management, fire management, and restoration. These assessments identify priority areas
458 and describe strategies for fuels management, suppression and restoration activities.

459 **10.2.** WFS-2: As part of the Wildfire and Invasive Species Assessments incorporate a
460 wildfire response time analysis focusing on response time to identified priority areas within
461 Core and Important Management Zones or on those fires that have the potential to impact
462 Core and Important Management Zones. Incorporate findings into Unit Initial Attack
463 program

464 **10.3.** WFS-3: As part of the Wildfire and Invasive Species Assessment incorporate a water
465 capacity analysis for suppression purposes, including potential private water sources.
466 Provide water availability to respond to fire in or threatening CMZ and IMZ during initial
467 attack.

468 **10.4.** WFS-4: During high fire danger conditions, stage initial attack and secure additional
469 resources closer to priority areas identified in the Wildfire and Invasive Species
470 Assessments, based on anticipated fires and weather conditions, with particular
471 consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure
472 quicker response times in or near GRSG habitat.

473 **10.5.** WFS-5: Utilize a full range of fire management strategies and tactics through
474 strategic wildfire suppression planning consistent with appropriate management response
475 and within acceptable risk levels, to achieve resource objectives for GRSG habitat
476 consistent with land use plan direction. Utilizing both direct and indirect attack as
477 appropriate to limit the overall amount of GRSG habitat burned. This could include
478 suppressing fires in intact sagebrush habitats; limiting fire growth in General Management
479 Zones when suppression resources are available or managing wildfire for resource benefit in
480 areas of conifer (juniper) encroachment.

481 **10.6.** WFS-6: Suppression priorities: Firefighter and public safety followed by property are
482 the highest priority for protection during suppression activities. Maintaining GRSG habitat
483 will be prioritized immediately after human life and property, commensurate with
484 threatened and endangered species habitat or other critical habitats to be protected.

485 **10.7.** WFS-7: Ensure close coordination with federal and state firefighters including the
486 Rangeland Fire Protection Associations during suppression activities.

487

488 **11. Fuels Management**

- 489 **11.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and
490 spread of unwanted wildfires and provide anchor points or control lines for the
491 containment of wildfires during suppression activities with an emphasis on maintaining,
492 protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and
493 strategically and effectively reduce wildfire threats in the greatest area.
- 494 **11.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to
495 match expected potential for the ecological site and consistent with GRSG habitat
496 objectives unless fuels management objectives requires additional reduction in sagebrush
497 cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel
498 management treatments against the additional loss of sagebrush cover on the local
499 landscape in the NEPA process.
- 500 **11.3.** FM-3: Apply appropriate seasonal restrictions for implementing fuels management
501 treatments according to the type of seasonal habitats present. Allow no treatments in
502 known winter range unless the treatments are designed to strategically reduce wildfire risk
503 around and/or in the winter range and would protect, maintain, increase, or enhance winter
504 range habitat quality. Ensure chemical applications are utilized where they would assist in
505 success of fuels treatments. Strategically place treatments on a landscape scale to prevent
506 fire from spreading into Core Management Zones or WUI.
- 507 **11.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain
508 and protect GRSG habitat informed by the Wildfire and Invasive Species Assessments
509 completed as described in Appendix D.
- 510 **11.5.** FM-5: When developing the fuels management strategy as part of the Wildfire and Invasive
511 Species Assessment described in Appendix D consider up-to-date fuels profiles; land use
512 plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological
513 factors; active vegetation management steps to provide critical breaks in fuel continuity
514 where appropriate; incorporate a comparative risk analysis with regard to the risk of
515 increased habitat fragmentation from a proposed action versus the risk of large scale
516 fragmentation posed by wildfires if the action is not taken.
- 517 **11.6.** FM-6: Fuel treatments will be designed though an interdisciplinary process to expand,
518 enhance, maintain, and protect GRSG habitat which considers a full range of fuel reduction
519 techniques, including: grazing, targeted grazing, prescribed fire, chemical, biological and
520 mechanical treatments.
- 521 **11.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as
522 vegetated fuel breaks in appropriate areas.
- 523 **11.8.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings) or be located
524 adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be
525 placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster
526 suppression options to protect existing intact habitat.
- 527 **11.9.** FM-9: Strategically pre-treat areas to reduce fine fuels.
- 528 **11.10.** FM-10: Protect seeding efforts from subsequent fire events.
- 529 **11.11.** FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to
530 reduce the potential start and spread of unwanted wildfires may be implemented
531 within existing grazing authorizations if feasible such as through temporary non-
532 renewable authorizations, or through contracts, agreements or other appropriate
533 means separate from existing grazing authorizations and permits.

- 534 **11.12.** FM-12: Targeted grazing to achieve fuels management objectives should conform to
535 the following criteria:
- 536 • Targeted grazing should be implemented strategically on the landscape, and
537 directly involve the minimum footprint and grazing intensity required to meet fuels
538 management objectives.
 - 539 • Allow conformance to the applicable Standards for Rangeland Health and
540 Guidelines for Livestock Grazing Management (Idaho or Montana) at the
541 assessment scale.
 - 542 • Where feasible and applicable coordinate with the grazing permittee to
543 strategically reduce fuels through livestock management within the Mandatory Terms
544 and Conditions of the applicable grazing authorizations
- 545 **11.13.** FM-13: Prioritize the use of native seeds for fuels management treatment based on
546 availability, adaptation (site potential), and probability of success. Where probability
547 of success or native seed availability is low or non-economical, nonnative seeds may
548 be used to meet GRSG habitat objectives to trend toward restoring the fire regime.
549 When reseeding, use fire resistant native and nonnative species, as appropriate, to
550 provide for fuel breaks.
- 551 **11.14.** FM-14: Maintain effectiveness of fuels projects to ensure long-term success,
552 including persistence of seeded species and/or other treatment components while
553 maintaining the integrity of adjacent vegetation.
554

- 555 **12. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation**
556 **12.1.** ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of
557 the Wildfire and Invasive Species Assessment process described in Appendix D to
558 determine if rehabilitation actions are needed, based on ecological potential, and direct
559 emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency
560 Restoration (BAER) (FS) actions after fire.
- 561 **12.2.** ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans
562 based on site potential and in accordance with the Restoration/Rehabilitation
563 Strategy developed as a result of the Wildfire and Invasive Species Assessments.
- 564 **12.3.** ESR-3: Adjust management activities, as appropriate to ensure successful
565 establishment of vegetation from ESR and rehabilitation informed through the
566 evaluation of measurable groundcover and vegetation objectives such as plant vigor,
567 seed production and growing season conditions.
- 568 **12.4.** ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas
569 to mitigate the effect of the burn on local GRSG populations.
570

REVIEW

571 **13. Habitat Restoration and Vegetation Management**

572 **13.1.** VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential
573 to improve GRSG habitat using a full array of treatment activities as appropriate, including
574 chemical, mechanical and seeding treatments.

575 **13.2.** VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance
576 sagebrush cover or to promote diverse and healthy grass and forb understory to
577 achieve the greatest improvement in GRSG habitat based on Wildfire and Invasive
578 Species Assessments, HAF assessments, other vegetative assessment data and local,
579 site specific factors that indicate sagebrush canopy cover or herbaceous conditions
580 do not meet habitat management objectives (i.e. is minimal or exceeds optimal
581 characteristics). This may necessitate the use of prescribed fire as a site preparation
582 technique to remove annual grass residual growth prior to the use of herbicides in
583 the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but
584 such efforts will be carefully planned and coordinated to minimize impacts to sage-
585 grouse seasonal habitats.

586 **13.3.** VEG-3: Require use of native seeds for restoration based on availability, adaptation
587 (ecological site potential), and probability of success (Richards et al. 1998). Non-
588 native seeds may be used as long as they support GRSG habitat objectives (Pyke
589 2011) to increase probability of success, when adapted seed availability is low or to
590 compete with invasive species especially on harsher sites.

591 **13.4.** VEG-4: Implement management changes in restoration and rehabilitation areas, as
592 necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and
593 to ensure long-term persistence of improved GRSG habitat (Eiswerth and
594 Shonkwiler 2006). Management changes could be considered during livestock
595 grazing permit renewals, travel management planning, and renewal or reauthorization
596 of rights-of-way.

597 **13.5.** VEG-5: Consider establishing seed harvest areas that are managed for seed
598 production (Armstrong 2007) to provide a reliable source of locally adapted seed to
599 use during rehabilitation and restoration activities.

600 **13.6.** VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years
601 when preferred native seed is in short supply. This may require reallocation of native
602 seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Core or
603 Important Management Zones to those inside it. Where probability of success or
604 native seed availability is low, nonnative seeds may be used as long as they meet
605 GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate
606 sagebrush species/subspecies and important understory plants, relative to site
607 potential, shall be the highest priority for rehabilitation efforts.

608 **13.7.** VEG-7: During land health assessments evaluate the compatibility of existing
609 nonnative seedings for GRSG habitat to keep as a component of a grazing system,
610 development of a forage reserve, or to be used as a fuelbreak (Davies et al. 2011) or
611 during restoration development. If nonnative seedings do not contribute to a
612 grazing system, are not suitable for a forage reserve, and are not suitable fuelbreaks,
613 evaluate the nonnative seedings in and adjacent to CMZ to determine if they should
614 be diversified with or converted to native grasses, forbs, and shrubs, including
615 sagebrush.

616 **13.8.** VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer
617 encroachment areas. Refrain from using prescribed fire and conducting removal

618 projects in old-growth juniper stands. Old-growth juniper trees are characterized by
619 rounded tops and spreading canopies, often containing dead limbs and/or spike
620 tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and
621 are typically host to arboreal lichens. Leader growth in the upper quarter of the tree
622 is usually less than one inch. These trees are generally distributed on rock outcrop or
623 rubble land soils, or other soils with coarse fragments in the soil-surface and/or
624 slopes over 12-25%, where juniper vegetation type is the climax plant community
625 (IDFG 2000; Miller et al 2005; USDI and USGS 2007).
626

REVIEW

627 **14. Invasive Species**

628 **14.1.** Invasive Species (INV)-1: Incorporate results of the Wildfire and Invasive Species
629 Assessments into projects and activities addressing invasive species.

630 **14.2.** INV-2: Implement noxious weed and invasive species control using integrated weed
631 management actions per national guidance and local weed management plans for
632 Cooperative Weed Management Areas in cooperation with State and Federal
633 agencies, affected counties, and adjoining private lands owners.

634 **14.3.** INV-3: Conduct integrated weed management actions for noxious and invasive weed
635 populations that are impacting or threatening GRSG habitat quality using a variety of
636 eradication and control techniques including chemical, mechanical and other
637 appropriate means.

638 **14.4.** INV-4: Require project proponent to ensure that treatments of noxious weeds and
639 invasive species on disturbed project construction areas are completed for at least 3
640 years.

641

REVIEW

642 **15. Lands and Realty / Infrastructure**

643 **15.1.** Lands and Realty (LR)-1: Core: Designate and manage Core Management Zones as ROW
644 avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions (Appendix
645 A, B & C). Important: Designate and manage Important Management Zones as ROW
646 avoidance areas subject to RDFs, BMPs, buffers and seasonal timing restrictions. General:
647 Designate and manage General Management Zones as open with proposals subject to
648 RDFs, BMPs, buffers and seasonal timing restrictions.

649 **15.2.** LR-2: Core: Designate and manage Core Management Zones as exclusion areas for
650 utility scale (20 MW) Wind and Solar testing and development, nuclear and
651 hydropower energy development. Important: Designate and manage Important
652 Management Zones as avoidance areas for Wind and Solar testing and development,
653 nuclear and hydropower development. General: Designate and manage General
654 Management Zones as open for Wind and Solar testing and development and
655 nuclear and hydropower development subject to RDFs, BMPs, buffers and seasonal
656 timing restrictions.

657 **15.3.** LR-3: Core: Development of commercial service airports and facilities (as defined by
658 FAA 2014 – publically owned airports that have at least 2,500 passenger boardings
659 each calendar year and receive scheduled passenger service) would not be allowed
660 within Core Management Zones. Important and General Management Zones are
661 Avoidance and Open respectively for these types of ROW applications as described
662 in LR-1.

663 **15.4.** LR-4: Core: Development of new landfills would not be allowed within Core
664 Management Zones. Important and General Management Zones are Avoidance and
665 Open respectively for these types of ROW applications as described in LR-1.

666 **15.5.** LR-5: Core Management Zones: Rights-of-way for development of new or amended
667 ROWs and land use authorizations, not excluded, would only be considered when
668 consistent with the Anthropogenic Disturbance Exception Criteria (AD-3).
669 Important: Rights-of-way for development of new or amended ROWs and land use
670 authorizations, not excluded, could be considered consistent with the Important
671 Management Zones Anthropogenic Disturbance Development Criteria. (AD-4).
672 General: New ROW and land use authorizations could be considered.

673 **15.6.** LR-6: If the project is an incremental upgrade/capacity increase of existing
674 development - the existing transmission line must be removed within a specified
675 amount of time after the new line is installed and energized.

676 **15.7.** LR-7: Existing designated corridors, including Section 368 Corridors, will remain
677 Open (subject to the ongoing settlement agreement).

678 **15.8.** LR-8: Process unauthorized use. If the use is subsequently authorized, it would be
679 authorized consistent with direction for the Management Zones within which it is
680 located and the RDFs, BMPs, buffers and seasonal timing restrictions. If the use is
681 not subsequently authorized the site would be reclaimed by removing these features
682 and restoring the habitat.

683 **15.9.** LR-9: Land use authorizations that are temporary in nature would be subject to
684 seasonal or timing restrictions and mitigation requirements regarding habitat loss as
685 needed.

686 **15.10.** LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or
687 amendments to existing water facilities which include additional structures to
688 improve fish passage or benefits to fisheries (new diversions, fish screens) would be

- 689 allowed on a case-by-case bases subject to RDFs and BMPs to reduce impacts to
690 GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 691 **15.11.** LR-11: When a ROW grant expires, is relinquished, or terminated, the lease holder
692 would be required to reclaim the site by removing overhead lines and other
693 infrastructure and to eliminate avian predator nesting opportunities provided by
694 anthropogenic development on public lands associated with the now void ROW
695 grant (e.g., remove powerline and communication facilities no longer in service).
- 696 **15.12.** LR-12: Work with ROW holders to retrofit existing towers with perch deterrents or
697 other anti-perching devices, where appropriate, to limit GRSG predation.
- 698 **15.13.** LR-13: Land tenure adjustments would be subject to the following disposal,
699 exchange, and acquisition criteria, which include retaining lands with GRSG habitat.
700 Retention of areas with GRSG would reduce the likelihood of habitat conversion to
701 agriculture, urbanization, or other uses that would remove sagebrush habitat and
702 potentially impact sensitive plants. Criteria:
- 703 a. Lands within Core and Important Management Zones would not be available
704 for disposal (Appendix M).
 - 705 b. Acquire habitat within Core and Important Management Zones, when
706 possible (i.e. willing landowner), and retain ownership of habitat within all Zones,
707 except if a land exchange would allow for additional or more contiguous federal
708 ownership patterns.
 - 709 c. Lands within Core and Important Management Zones would be retained
710 unless exchange of those lands would increase the extent or provide for connectivity
711 of Core or Important Management Zones.
 - 712 d. Evaluate potential land exchanges containing historically low-quality GRSG
713 habitat that may be too costly to restore in exchange for lands of higher quality
714 habitat, lands that connect seasonal GRSG habitats or lands providing for threatened
715 and endangered species. These potential exchanges should lead to an increase in the
716 extent or continuity of or provide for improved connectivity of Core Management
717 Zones. Higher priority will be given to exchanges for those in-tact areas of
718 sagebrush that will contribute to the expansion of sagebrush areas within Core
719 Management Zones currently in public ownership. Lower priority would be given to
720 other lands that would promote enhancement in the Core and Important
721 Management Zones.
 - 722 e. Identify lands for acquisition that increase the extent of or provide for
723 connectivity of Core Management Zones.
- 724

725 16. Minerals

726 16.1. Fluid Minerals

727 **16.1.1.** Fluid Minerals (FLM)-1: Idaho: Areas within Core Management Zones with no or
728 low potential for fluid mineral development (oil and gas or geothermal) would be
729 closed. Areas within Core Management Zones with moderate to high potential for
730 development and Important Management Zones would be open to mineral leasing and
731 development subject to no surface occupancy, in accordance with the Anthropogenic
732 Disturbance Exceptions (Core – AD-3) and the Anthropogenic Disturbance
733 Development Criteria (Important – AD-4) subject to RDFs, BMPs, buffers, timing
734 restrictions and standard stipulations. General Management Zones would be open to
735 mineral leasing and development subject to CSU which includes RDFs, BMPs, buffers,
736 seasonal timing restrictions and standard stipulations. Montana: Areas within Core
737 Management Zones would be open to leasing subject to no surface occupancy. No
738 waivers, exceptions or modifications would be allowed unless approved by the State
739 Director. General Management Zones would be open to leasing subject to CSU which
740 includes RDFs, BMPs, buffers, seasonal timing restrictions and standard stipulations.

741 **16.1.2.** FLM-2: Core Management Zones: Waivers, exemptions or modifications to the
742 NSO stipulation could be considered upon recommendation from the Governor
743 through the Implementation Task Force during the federal site-specific NEPA analysis
744 based on Core Management Zone Anthropogenic Disturbance Exception Criteria
745 (AD-3). Important Management Zones: Waivers, exceptions or modifications to the
746 NSO stipulation could be considered upon recommendation from the Governor
747 through the Implementation Task Force during the federal site-specific NEPA analysis
748 based on the Important Management Zone Anthropogenic Disturbance Development
749 Criteria (AD-4). In the event a waiver, exception or modification were allowed
750 development would still be subject to CSU which includes RDFs, BMPs, buffers,
751 seasonal timing restrictions and standard stipulations.

752 **Waivers, Exceptions and Modifications (WEMs)** (Source IM-2008-032)

753
754 A waiver is a permanent exemption from a lease stipulation, the stipulation would no
755 longer apply anywhere within the lease. Waivers require a 30-day public review and are
756 approved and signed by the State Director.

757
758 An exception is a one-time exemption for a particular site within the lease; exceptions
759 are determined on a case-by-case basis; the stipulation continues to apply to all other
760 sites within the lease. An exception is a limited type of waiver.

761
762 A modification is a change to the provisions of a lease stipulation, either temporarily or
763 for the term of the lease. Depending on the specific modification, the stipulation may
764 or may not apply to all sites within the lease to which the restrictive criteria are applied.

765 **16.1.3.** FLM-3: Incorporate required design features, best management practices appropriate
766 to the management area, buffers and seasonal timing restrictions as conditions of
767 approval into any post-lease activities.

768 **16.1.4.** FLM-4: Complete a Master Development Plan on leases where a producing field is
769 proposed to be developed.

770 **16.1.5.** FLM-5: Encourage unitization when deemed necessary for proper development and
771 operation of an area (with strong oversight and monitoring). The unitization must be

772 designed in a manner to minimize adverse impacts on GRSG according to the Federal
773 Lease Form, 3100-11, Sections 4 and 6.

774 **16.2. Unleased Fluid Minerals**

775 **16.2.1.** FLM-6: Allow temporary geophysical exploration, subject to site-specific RDFs,
776 BMPs, buffers, seasonal restrictions, and daily timing restrictions.

777 **16.2.2.** FLM-7: Parcels nominated for lease in Core or Important Management Zones would
778 be evaluated to determine whether they meet the Anthropogenic Disturbance
779 Exception (AD-3 for CMZ) or Anthropogenic Disturbance Development Criteria
780 (AD-4) for IMZ), prior to lease offering. Parcels which do not meet the criteria would
781 not be offered for lease.

782 **16.3. Locatable Minerals**

783 **16.3.1.** Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in
784 all management zones.

785 **16.3.2.** LOC-2: Apply reasonable and appropriate Conditions of Approval to prevent
786 unnecessary or undue degradation of GRSG habitat when a Plan of Operations is
787 submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36
788 CFR 228.5(a)(3) on National Forest System lands).

789 **16.4. Salable Minerals**

790 **16.4.1.** Salable Minerals (SAL)-1: Core: No new site authorizations would be approved.
791 Important: New site authorizations could be considered consistent with the
792 Anthropogenic Disturbance Development Criteria (AD-4) subject to RDFs, BMPs,
793 buffers and seasonal timing restrictions. Sales from existing community pits within
794 CMZ and IMZ would be subject to seasonal timing restrictions. General: Open to new
795 site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing
796 sites Open to new sales subject to seasonal timing restrictions.

797 **16.4.2.** SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat
798 management objectives.

799 **16.4.3.** SAL-3: Require reclamation bonding that would require restoration of GRSG habitat
800 on new site authorizations for mineral material pits in IMZ (this would not apply to
801 free use permits issued to a government entity such as a county road district, but would
802 apply to non-profit entities).

803 **16.5. Non-Energy Solid Mineral Leasable Minerals**

804 **16.5.1.** Non Energy Leasables (NEL)-1: Core and Important Management Zones: Areas
805 within Know Phosphate Leasing Areas (KPLAs) will remain open to leasing. CMZ
806 areas outside KPLAs are closed to leasing and prospecting. IMZ areas outside of
807 KPLAs are open to leasing in accordance to the Anthropogenic Disturbance
808 Development Criteria (AD-4) subject to the anthropogenic disturbance cap (AD-1),
809 RDFs, BMPs, buffers and seasonal timing restrictions. Exceptions may be made for
810 lease modifications and fringe leases where valid existing rights may be affected.
811 General Management Zones: Lands are available for leasing, exploration activities and
812 initial mine development subject to RDFs, BMPs, buffers, timing restrictions (seasonal
813 and daily) and standard stipulations.

814 **16.5.2.** NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy
815 mineral leases when exploration activities or initial mine development is proposed, as
816 appropriate.

817 **16.5.3.** NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-
818 energy mineral leases.

16.6. Mineral Split Estate

16.6.1. Mineral Split Estate (MSE)-1: In coordination with surface land owner, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in the management zone where the federal government owns the mineral estate and the surface is non-federal ownership.

16.6.2. MSE-2: Recommend to the state regulatory entity to apply a timing restriction stipulation, COAs, and buffer restricts around occupied leks, when concurring to the approval of authorizations for mineral-related surface disturbance on lands in GRSG habitat where the federal government owns the surface and the mineral estate is in non-federal ownership.

REVIEW

830 **17. Range Management/Livestock Grazing**

831 17.1. Range Management (RM)-1: Continue to make GRSG habitat available for livestock
832 grazing. Active AUMs for livestock grazing would remain the same, though the number of
833 AUMs available on an allotment may be adjusted based on site-specific conditions to meet
834 management objectives during term permit renewals, AMP development, or other
835 appropriate implementation planning. Additionally, temporary adjustments can be made
836 annually to livestock numbers, the number of AUMs, season of use in accordance with
837 applicable regulations.

838 17.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing
839 permits consistent with management zone prioritization (MA-4), unless other higher
840 priority considerations exist such as threatened, endangered and proposed species
841 habitat that livestock grazing could affect. Where possible, conduct land health
842 assessments at the watershed, or other meaningful landscape-scale.

843 17.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage
844 livestock operations that utilize mixed federal, private and/or state land to be
845 managed at the landscape scale to benefit GRSG and their habitat across land
846 ownerships.

847 17.4. RM-4: CMZ & IMZ: During the land health assessment process, identify the type(s)
848 of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat
849 assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or
850 Forest Service approved methodology, in accordance with current policy and
851 guidance to determine whether vegetation structure, condition and composition are
852 meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2;
853 Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state
854 and transition models to inform desired habitat conditions and expected responses
855 to management changes for the land unit being assessed.

856 17.5. RM-5: When modifying grazing management, analyze indirect effects to habitat,
857 including changes in fuel loading and wildfire behavior.

858 17.6. RM-6: When livestock management practices are determined to not be compatible
859 with meeting or making progress towards achievable habitat objectives following
860 consultation, cooperating and coordination with permittees and interested publics,
861 implement changes in grazing management through grazing authorization
862 modifications, or allotment management plan implementation. Potential
863 modifications include, but are not limited to, changes in:

- 864 1) Season or timing of use;
- 865 2) Numbers of livestock;
- 866 3) Distribution of livestock use;
- 867 4) Duration and/or level of use;
- 868 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
- 869 6) Voluntary measures such as temporary non-use; and
- 870 7) Grazing schedules (including rest or deferment).

871 17.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration
872 and rehabilitation efforts in sage-grouse habitat areas.

873 17.8. RM-8: CMZ & IMZ - When an allotment becomes vacant or grazing preference is
874 relinquished, consider voluntary retirement of the allotment or grazing preference in
875 whole or in part, or converting the area to a forage reserve/buffer when doing so
876 would maintain or enhance sage-grouse habitat. GMZ - When an allotment

- 877 becomes vacant or grazing preference is relinquished, consider converting it to a
878 forage reserve/buffer to use during fire rehabilitation or restoration efforts
879 elsewhere, when such actions would result in a net benefit to GRSG habitat and
880 other priority resources.
- 881 **17.9.** RM-9: CMZ & IMZ - Where practical, design pasture rotations to utilize exotic
882 perennial grass seedings and/or annual grasslands, during GRSG nesting season
883 annually or periodically.
- 884 **17.10.** RM-10: Evaluate the locations where salt/supplements are placed. In coordination
885 with the permittee, have salt/supplements placed in areas which would reduce
886 impacts to GRSG habitat (e.g., existing disturbed areas).
- 887 **17.11.** RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit
888 disturbance of occupied leks when trailing livestock across BLM- and Forest Service
889 -administered lands in the spring. Work with permittees in locating over-nighting,
890 watering and bedding locations to minimize impacts to seasonal habitats.
- 891 **17.12.** RM-12: Design any new structural range improvements, following cooperation,
892 consultation and coordination with permittees, to minimize and/or mitigate effects
893 to GRSG habitat. Any new structural range improvements are subject to RDFs
894 (Appendix A). Structural range improvement in this context, include, but are not
895 limited to: fences, exclosures, corrals or other livestock handling structures;
896 pipelines, troughs, storage tanks (including moveable tanks used in livestock water
897 hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 898 **17.13.** RM-13: During the land health assessment and grazing permit renewal process,
899 evaluate existing livestock management range improvements with respect to their
900 effect on GRSG habitat. Consider removal of projects that are not needed for
901 effective livestock management, are no longer in working condition, and/or
902 negatively affect GRSG habitat, with the exception of functional projects needed for
903 management of habitat for other threatened, endangered or proposed species or
904 other sensitive resources.
- 905 **17.14.** RM-14: Prioritize removal, modification or marking of fences or other structures in
906 areas of high collision risk following cooperation, consultation and coordination with
907 permittees to reduce the incidence of GRSG mortality due to fence strikes (Stevens
908 et al. 2012).
909

910 **18. Wild Horses and Burros**

- 911 **18.1.** Wild Horse and Burro (WHB)-1: Develop or amend BLM Herd Management Area Plans
912 and Forest Service Wild Horse Territory Plans to incorporate GRSG habitat objectives and
913 management considerations for all BLM HMAs) and Forest Service Wild Horse Territories.
- 914 **18.2.** WHB-2: When evaluating AML on HMAs within CMZ, evaluate indicators that
915 address structure/condition/composition of vegetation and measurements specific
916 to achieving GRSG habitat objectives.
- 917 **18.3.** WHB-3: Utilize interdisciplinary land health assessments in HMAs containing GRSG
918 habitat to determine whether vegetation characteristics are meeting appropriate
919 seasonal habitat objectives.
- 920 **18.4.** WHB-4: CMZ: Do not expand HMAs. IMZ: Analysis of proposed additions to
921 existing HMA boundaries should consider the direct, indirect and cumulative
922 impacts on GRSG habitat, including the need for additional infrastructure such as
923 boundary fencing, and consider alternative areas outside of CMZ and IMZ.
924

REVIEW

925 **19. Travel Management**

- 926 **19.1.** Travel Management (TM) -1: Limit motorized travel within Idaho BLM Field
927 Offices to existing roads, primitive roads, and trails. This excludes areas previously
928 designated as open through an affirmative land use plan decision or currently under
929 review for designation as open, currently being analyzed in ongoing RMP revision
930 efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. The initial
931 designation would be “limited to existing roads, primitive roads and trails”; this
932 designation would change to “limited to designated roads, primitive roads and trails”,
933 in areas where travel management plans are completed.
- 934 **19.2.** TM-2: Close areas adversely affected by off-highway vehicles immediately to the
935 type(s) of vehicle causing the adverse effect until the adverse effects are eliminated
936 and measures implemented to prevent recurrence when the authorized officer
937 determines that off-road vehicles are causing or will cause considerable adverse
938 effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical
939 resources, threatened or endangered species, wilderness suitability, other authorized
940 uses, or other resources. This may include closure or specific routes or areas. (43
941 CFR 8341.2)
- 942 **19.3.** TM-3: Develop Travel Management Plans for each Field Office as described in the
943 BLM Travel Management Handbook 8342.1 and according to the travel
944 management planning guidelines (Appendix N).
- 945 **19.4.** TM-4: During subsequent travel management planning design and designate a travel
946 system to minimize adverse effects on GRSG. Locate areas and trails to minimize
947 harassment of wildlife or significant disruption of wildlife habitats. Give special
948 attention to protect endangered or threatened species and their habitats. Allow for
949 route upgrade, closure of existing routes, and creation of new routes to help protect
950 habitat and meet user group needs, thereby reducing the potential for pioneering
951 unauthorized routes. The emphasis of the comprehensive travel and transportation
952 planning within Core Management Zones would be placed on having a neutral or
953 positive effect on GRSG habitat.
- 954 **19.5.** TM-5: Conduct road maintenance activities to avoid disturbance during specific
955 times at different seasons – see seasonal and timing restrictions section.
956

957 **20. Recreation**

958 **20.1.** REC-1: Manage existing recreation uses and sites to minimize adverse effects on
959 GRSG or their habitat through incorporation of RDFs, BMPs, buffers and seasonal
960 restrictions.

961 **20.2.** REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails,
962 trailheads, staging areas) within CMZs and IMZs unless the development would have
963 a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation,
964 diverting use away from critical areas, etc.); or the new construction replaces existing
965 facilities and reduces impacts from the existing facilities as in TM-4, or unless the
966 development is required for visitor safety or resource protection.

967

REVIEW

968 **21. Monitoring**

- 969 **21.1.** Monitoring (MON)-1: Annually complete a review of Wildfire and Invasive Species
970 assessment implementation efforts within GRSG habitat with appropriate USFWS
971 and state agency personnel.
- 972 **21.2.** MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 973 **21.3.** MON-3: Monitor invasive vegetation post vegetation management treatment
- 974 **21.4.** MON-4: Monitor project construction areas for noxious weed and invasive species
975 for at least 3 years, unless control is achieved earlier.
- 976 **21.5.** MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to
977 annually assess GRSG population and habitat status in the context of the adaptive
978 management triggers.
- 979 **21.6.** MON-6: Continue to support updates to the Key Habitat map to track vegetation
980 changes in relation to GRSG habitat on a yearly basis, until such a time this process
981 is replaced. The process used to update the Key Habitat Map is described in
982 Appendix F.
- 983 **21.7.** MON-7: Monitor GRSG habitat as described in the monitoring framework plan
984 (Appendix E) in coordination with IDFG and MT FWP.

EMS TRANSMISSION Memorandum

To: Edwin L. Roberson
Assistant Director, Resources and Planning (AD-200)

From: Timothy M. Murphy 
Acting State Director, BLM Idaho

Jamie E. Connell
State Director, BLM Montana¹

Subject: Idaho and Southwestern Montana Subregional Administrative Draft Proposed Plan Update

I. INTRODUCTION

This memo documents the key elements, allocations, and disturbance considerations in the Idaho and Southwestern Montana (IDswMT) Subregional Greater Sage-grouse (GRSG) Land Use Plan Amendment and Final Environmental Impact Statement (FEIS) Administrative Draft Proposed Plan (ADPP) in response to WO Memo from Ed Roberson (1610 (210) of May 12, 2014). It has been reviewed and concurred with by the State Director in Montana/Dakotas.

The IDswMT effort includes portions of three states (Idaho, Montana, and Utah) and would amend 29 BLM and US Forest Service (USFS) land use plans. The planning area encompasses slightly more than 49 million acres of which 18.1 million acres are identified as GRSG habitat across all ownerships. BLM administered public lands comprise 9.3 million acres (roughly 50%) and USFS lands comprise 1.9 million areas (roughly 10%) of the total GRSG habitat within the subregion. Most of the subregion is located within WAFWA MZ IV with a small portion of southeast Idaho contained within WAFWA MZ II. The primary ongoing threats to GRSG are loss of habitat resulting from wildfire and spread of cheatgrass; of substantially less concern is loss of habitat due to infrastructure and oil and gas development. The ADPP addresses all of the applicable threats identified by population in the Fish and Wildlife Service (FWS) Conservation Objectives Team (COT) report (Table 1).

¹ This memorandum is a coordinated response from both Idaho and Montana BLM. It has been developed in coordination with the Montana BLM and has been concurred with by the Montana State Director.

II. COORDINATION

The ADPP has been developed in close coordination with BLM, USFS, FWS, the State of Idaho through the Governor's Office of Species Conservation and GRSG Task Force and the Idaho Department of Fish and Game and the State of Montana through Montana Fish Wildlife and Parks. The ADPP addresses the objectives described in the COT report and required policies and directives. The FWS provided the final COT threat assessment table as part of their public comments and the BLM held subsequent cooperating agency meetings with FWS, USFS and the State of Idaho to discuss, clarify and resolve the concerns identified in their letter and COT threat assessment table. The BLM has addressed all the concerns identified by FWS and have provided additional conservation measures or additional clarity to existing conservation measures in the ADPP (Table 2).

The State of Montana has prepared a draft strategy that has been reviewed. The Governor of Montana has yet to issue an expected Sage-Grouse Conservation Executive Order that would outline how the State of Montana would address GRSG conservation; therefore, it is not possible at this time to fully determine how the ADPP would compare with the potential State regulatory mechanisms or management actions to protect and conserve GRSG and their habitat. The Montana portion of the planning effort has also been coordinated with the other BLM plans in Montana to ensure some level of consistency within Montana. The ADPP (which applies to federal lands) remains flexible to provide cooperative landscape-level management for the conservation of GRSG which transcends ownership boundaries when coupled with the pending Executive Order from the Governor of Montana (which is anticipated to apply to all land ownerships whenever a state authorization is required).

III. KEY ELEMENTS

The primary threat to GRSG that the IDswMT effort responds to is wildfire. In coordination with the State of Idaho and FWS, the IDswMT ADPP identifies and maps three management zones (Core (ID & MT), Important (ID only) and General (ID & MT))² within five conservation areas (Map 1) which are responsive to the stochastic nature of wildfire and provide protections for GRSG and their habitat. Management actions for fuels and suppression management, in addition to those identified for inclusion from the Fire and Invasives Analysis Team have been included to further respond to the threat of wildfire. The ADPP also includes an adaptive management strategy and a mitigation strategy which utilizes the State of Idaho Mitigation Framework. For the SW Montana portion of the plan these components would be consistent with the Montana strategy.

The ADPP includes allocation decisions (Table 1) and program conservation measures to respond to GRSG threats, including required design features, best management practices, activity, and development buffers for GRSG leks and seasonal or timing restrictions.

The focus of the ADPP, including the delineation of three management zones, is to retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats and across broader habitat areas. Core Management Zones (CMZ) are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key metapopulations

² Within the subregion management areas have been delineated into three zones – Core, Important and General, only two of which occur in Montana – Core and General.

within the subregion (Garton et al. 2011). These areas encompass all the seasonal habitats necessary to support approximately 73% of the breeding males (and by association the entire population) in Idaho. The Important Management Zones (IMZ) are delineated to provide protection to seasonal habitats adjacent to the CMZs and support approximately 22% of the breeding males (and by association the entire population) in Idaho. The two management zones encompass the FWS identified priority areas for conservation (PAC) and include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas.

The areas identified in the IDswMT subregion include the seasonal habitats relied upon by roughly 95% of the entire GRSG population in the subregion as contrasted with adjacent states where roughly 70-80% of the entire GRSG populations are included within areas identified for primary focus on threat amelioration. The IDswMT ADPP provides threat amelioration management on an additional 1 million acres (243k of Core and 795k of Important) and 3.8% of the breeding males (and population – 687 males and 39 leks) than just those areas identified by USFWS as the most important areas needed for maintaining GRSG representation, redundancy, and resilience across the landscape (USFWS 2013) (Map 2).

While CMZ is equivalent in concept and direction as Priority in the National Policy Team guidance (NPT) (May 1, 2014) and General Management Zones are the equivalent to General areas, the NPT does not have a similar designation as IMZ included within the IDswMT ADPP. This zone is a foundational component of the IDswMT ADPP and directly supports to adaptive management approach which is to adjust threat amelioration management into additional areas if further declines in populations or habitat occur. In coordination efforts with the State of Idaho, this three-tiered management approach was initially developed through the Governor's GRSG Task Force and is supported by State and County representatives on that Task Force. This acceptance in those arenas is helping to support development of the State's management approach for State and private lands within Idaho, consistent with the federal lands.

This three-tiered approach is not consistent with the NPT guidance. With several deviations CMZ allocation management in the IDswMT is consistent with the NPT guidance, in the event that adaptive management triggers are engaged then management in IMZs would then become reflective of Priority management, until that occurrence, IMZs are managed in a more protective approach than typically described for General.

IV. RESPONSE TO FWS COMMENTS ON DRAFT EIS

In the Service's comment letter on the Draft EIS (January 31, 2014) an evaluation of the co-preferred alternatives and their consistency with the COT report was described. The BLM, USFS, FWS and the State of Idaho have worked together over the last several months to reconcile the two co-preferred alternatives into on cohesive approach that responds to the concerns raised by FWS and further refines the approaches previously described in the Draft EIS.

V. CROSS JURISDICTIONAL ISSUES

Management direction within the subregion for Idaho and Montana has been coordinated across state boundaries with Wyoming, Utah, Nevada and Oregon. Allocation level decisions are mostly consistent across those boundaries with some discrepancy adjacent to Wyoming where there are some areas of

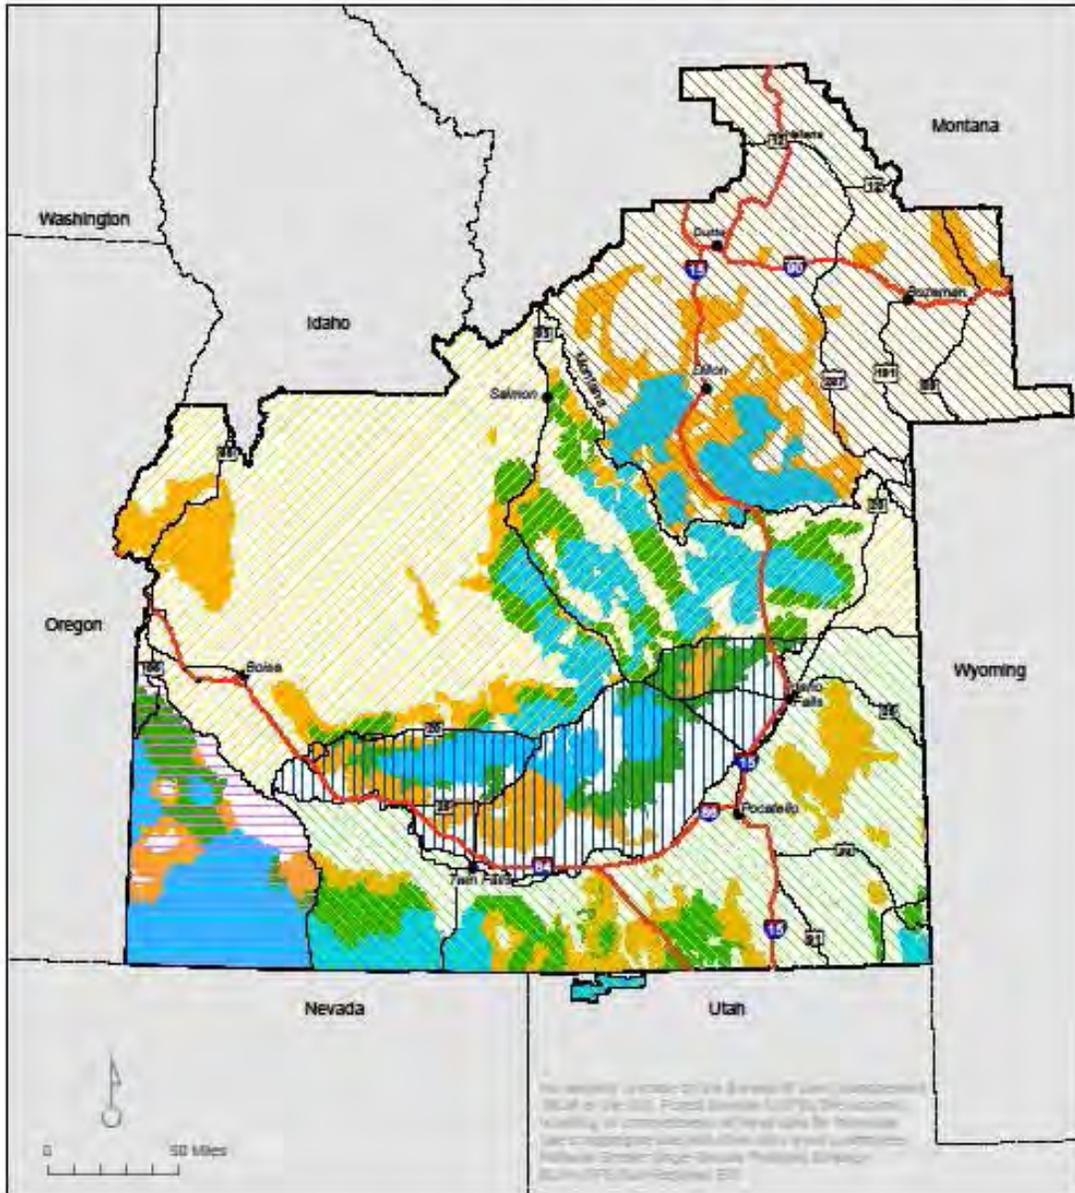

Core Management Zones in Idaho where across the border Wyoming identifies General management areas. There are some similar minor concerns with Utah. Core zones in Idaho and Priority areas in Nevada and Oregon largely match across the boundary and address the same allocation management in those areas.

Other Montana BLM planning efforts have incorporated mitigation and adaptive management approaches. The direction in the Southwestern Montana portion of the Final EIS for these components will differ from Idaho in order to maintain consistency with other Montana BLM plans.

VI. AREAS OF DISAGREEMENT

None.

Map 1: Conservation Areas and Management Zones

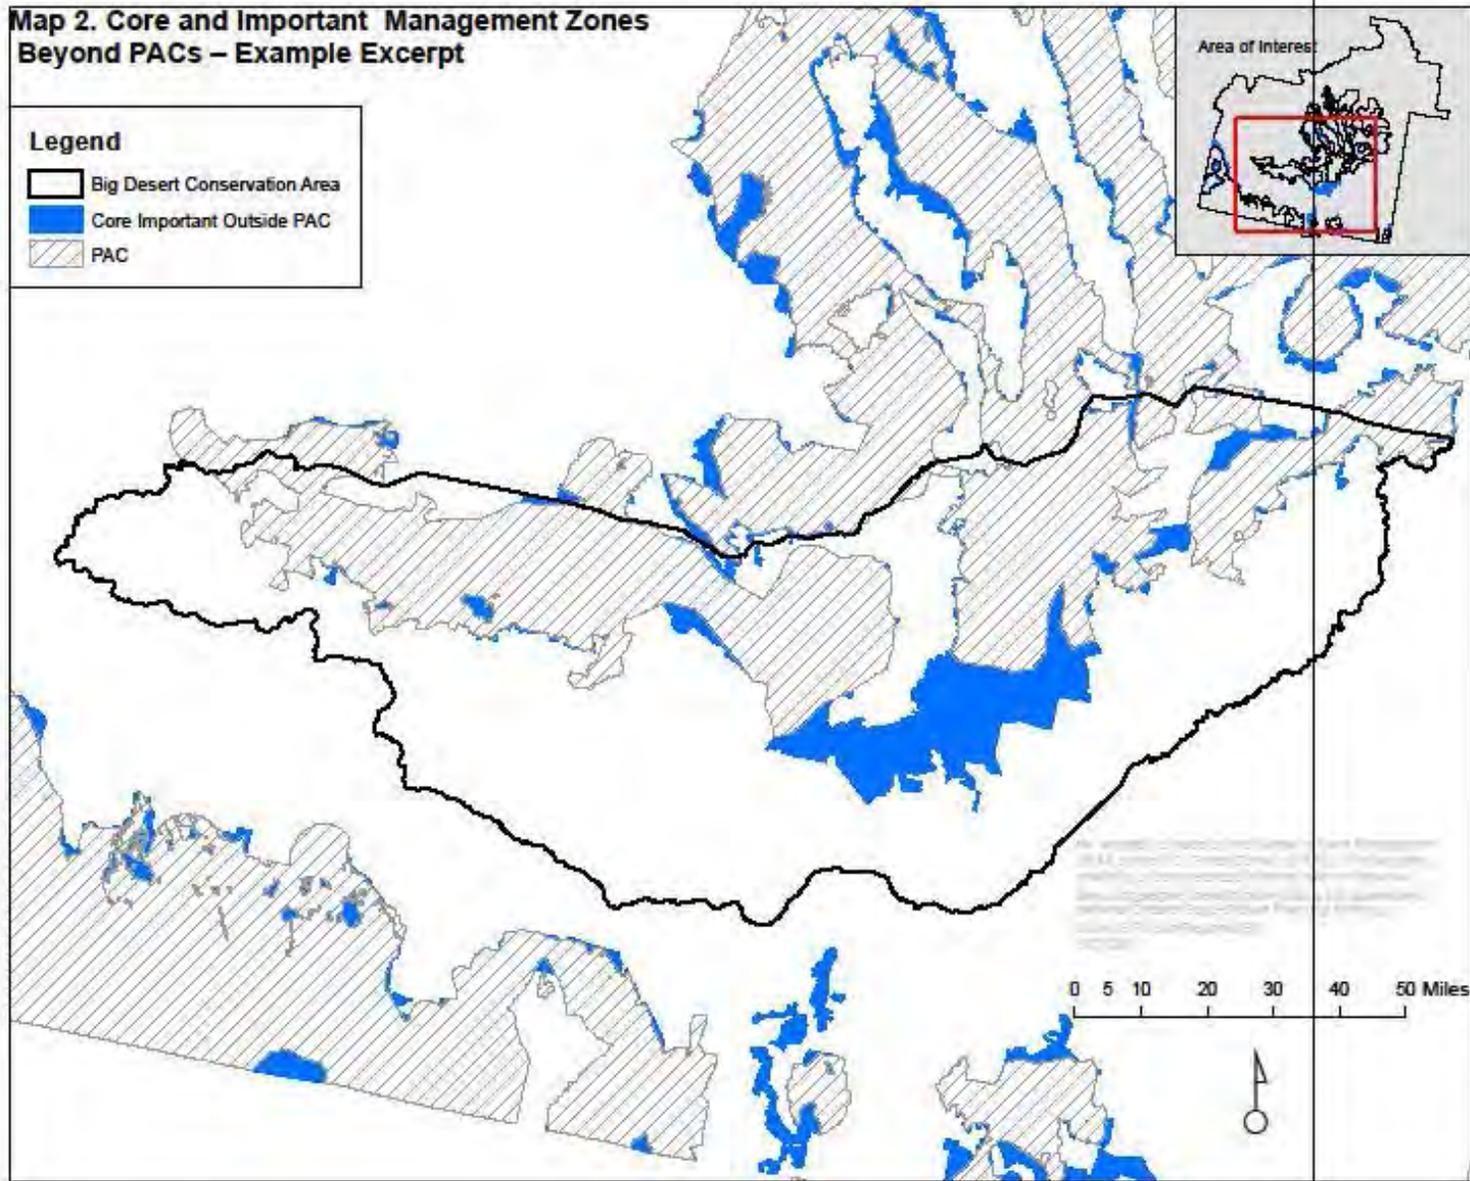

Conservation Area

-  Idaho Desert Conservation Area
-  Idaho Mountain Valleys Conservation Area
-  Idaho Southern Conservation Area
-  Idaho West Owyhee Conservation Area
-  SW Montana Conservation Area

Management Zone

-  Important
-  General
-  Analysis Boundary

**Table 1. Allocation/Disturbance Checklist
Idaho and SW Montana EIS - Administrative Draft Proposed Plan**

Allocations/ Disturbance	Consistent with NPT Table	Rationale for Change
Solar/Wind Energy Development ROW	All Core ³ : (Core is analogous to Priority) Consistent with Priority guidance.	General areas are not identified as avoidance; however, required design features, lek buffers and timing restrictions would be required and would limit and eliminate impacts to the limited GRSG habitat contained in this zone (<5% of leks and males).
	All Important: Consistent with General guidance as long as population numbers and habitat availability do not engage an adaptive management trigger. If an adaptive trigger is engaged consistent with Priority.	
	All General: Inconsistent	
High-Voltage Transmission and Major Pipeline ROW ⁴	All Core: Consistent with Priority guidance with very limited exception opportunity.	General areas are not identified as avoidance; however, required design features, lek buffers and timing restrictions would be required and would limit and eliminate impacts to the limited GRSG habitat contained in this zone (<5% of leks and males).
	All Important: Consistent with Priority guidance with limited exception opportunity as long as population numbers and habitat availability do not engage an adaptive management trigger. If an adaptive trigger is engaged even more limitation to the exceptions would apply the same as Core.	
	All General: Inconsistent with guidance, Consistent with COT reduction of threats.	
Other (Minor) ROWs and Land Use Authorizations/Permits	All Core: Consistent with Priority guidance.	
	All Important: Consistent with Priority guidance.	
	All General: Consistent with General guidance.	
Fluid Mineral Resource Allocation (Including Geothermal)	Idaho Core: Inconsistent with guidance. Montana Core: Consistent with Rocky Mountain guidance.	Idaho: Oil and Gas: Core areas with low to no potential, which is most of the subregion, are closed. Core areas with moderate to high potential, which are

³ Idaho portion of the plan identifies three (3) management delineations – Core, Important and General. Core areas are contained within the boundaries of the USFWS Priority Areas for Conservation (PAC) and make up roughly 66% of those areas. The remaining 33% of the PACs and other areas beyond the PACs are identified as Important Management Areas. This further refinement of management areas is **NOT** consistent with the NPT guidance. The Montana portion of the plan identifies two (2) management delineations – Core and General. Important direction does not apply to any areas in SW Montana. Direction for SW Montana in Core and General management areas as the same as for Idaho unless noted separately in the table.

⁴ Coordination across state boundaries for utility corridors is yet to be completed.

Allocations/ Disturbance	Consistent with NPT Table	Rationale for Change
	All Important: Consistent with General guidance, includes additional restrictions to development.	within WAFWA MZ II and adjacent to Wyoming General areas are open, consistent with Wyoming General management (160k acres). Geothermal: Core areas with low or no potential are closed. Core areas with moderate to high potential are open. All Core, Important and General areas would implement required design features, lek buffers and timing restrictions to reduce and eliminate impacts to GRSG. Reasonably foreseeable development scenarios show limited, if any, development likely in the next 10-15 years. This direction is consistent with the COT in reducing the minimal threat that is present.
	All General: Consistent	
Non-Energy Leasable Materials	All Core: Consistent All Important: Consistent All General: Consistent	All Known Phosphate Leasing Areas are outside of GRSG identified Core and Important management zones.
Mineral Materials (Salable Minerals)	All Core: Consistent with Priority guidance. All Important: Consistent with General guidance with stringent limitation criteria. All General: Consistent	Core areas are closed to new mineral material site authorizations and open for sales from within existing sites subject to required design features and seasonal timing restrictions. Important and General areas are open to new mineral material site authorizations subject to required design features, lek buffers and timing restrictions to reduce impacts to GRSG. No differentiation was made between free use and commercial use permits with regard to use of existing sites.
Disturbance (3 %) WY only (5%)	Idaho Core: Consistent with scale of application, Inconsistent with specific biologically significant unit identified. Montana Core: Consistent with other Montana plans. All Important: Consistent with scale of application, Inconsistent with specific biologically significant unit identified. All General: N/A	A 3% disturbance cap is applied to seasonal habitats of highest concern - nesting and wintering habitat - within Core and Important Management Areas.

Table 2. ADPP Response to FWS Comments

USFWS Concern	Resolution
Consistency across subregional boundaries	The BLM and FS have coordinated across subregional boundaries to further develop consistent approaches, or to clearly describe the rationale for the threat response where inconsistencies exist. Allocation level decisions are consistent across subregional boundaries; some conservation measures vary based on relative threats and habitat conditions/usage.
Disturbance Caps and no unmitigated loss	Disturbance caps have been included and further description of no net unmitigated loss has been included as part of the ADPP. A consistent approach and scale to measuring disturbance has been included with emphasis on seasonal habitats of concern in the Idaho and southwestern Montana subregion.
Adaptive Management Hard and Soft Triggers and an Implementation Team	Adaptive management hard and soft triggers as well as an Implementation Team to help assess these triggers in coordination with the State of Idaho has been included in the ADPP.
Lek buffers and noise protective measures	Buffers and their applicability have been further refined and defined in conjunction with FWS as have appropriate noise protective measures which are now included as required design features.
Implementation and Effectiveness Monitoring	These monitoring components have been further described at the broad, mid and fine scales and are included in the ADPP.
Mitigation	Additional description of how mitigation is included as components of project proposals and stepped forward through use of the state mitigation strategies is included in the ADPP. Decision to develop a mitigation board and develop a state specific mitigation strategy consistent with and in conjunction with WAFWA MZ strategies is also included in the ADPP.
Certainty of Effective Implementation (specificity)	Management actions and conservation measures have been refined to more clearly articulate the intent and direction to support the specificity needed by the Service to ensure certainty of implementation.
Impacts Analysis	Work is ongoing to augment the initial impacts analysis described in the Draft EIS. Additional work is being completed to delineate effects with specific regard to priority areas for conservation and the identified threats. This work will be complete in the Final EIS.
Priority Areas for Conservation and Mapping	Further refinement of the GRSG management areas, consistent with the COT and biologically meaningful units has occurred in coordination with the State of Idaho, FWS, BLM and FS. This management area delineation is a foundational component of the Idaho and southwestern Montana ADPP.
Infrastructure	Further refinement and definition of infrastructure criteria with respect to effects on GRSG habitat has been included and describes the application of these criteria in relation to COT objectives in the ADPP.
Wildfire/Invasives	The ADPP includes application of the Wildfire and Invasives Assessment process and other work developed by the Fire and Invasives Assessment Team to address fire concerns. In addition several components of the Idaho State Plan have been incorporated into the ADPP which further prioritize and address wildfire concerns.

Brent Ralston

From: Lauren Mermejo
Sent: Tuesday, July 29, 2014 4:57 PM
To: Brent Ralston
Subject: Inconsistent with NPT Guidance

Here are the red highlighted areas that did not comport to the NPT Guidance:

1. Solar and Wind in Important and General Habitat
2. Non-energy Leasables in Important Habitat
3. Mineral Materials in Important Habitat
4. High Voltage Transmission and Major Pipeline ROWs in General Habitat
5. No Net Unmitigated Loss not applied to General Habitat

Also, don't forget that Idaho is different in its application of avoidance criteria (whereas all of the other sub-regions adopted only ROW avoidance criteria)

Hope this helps you get prepared.....

Lauren

Good Morning,

We wanted to provide you some materials prior to our State Director call this afternoon. Below you will find the agenda for our upcoming Great Basin Federal Family meeting (Aug 19-21), a brief description below of the population summary tables and examples of those tables. For the Rocky Mountain Federal Family meeting we are expecting the agenda to look very similar.

The population summaries are based on the information found in our Draft Preferred Alternatives as it relates to the threats identified in the COT Report. We will be providing this information (hard copy via mail) prior to the meeting along with

the maps to all participants attending the Federal Family meeting. This will give you all an opportunity to review the materials and come prepared for the meeting discussions.

Talk to you later today but if you have any questions, please do not hesitate to call me. Thanks!

Kathy

Population Summary Tables

- ✓ There are a total of seven population summary tables that are part of this informational packet. The tables are organized in two different ways: 1) by populations fully within a sub-region (a total of five tables), and 2) by populations that span across more than one sub-region (such as the Western Great Basin and Northern Great Basin Populations).
- ✓ Population Statistics: At the top of each table, there is a list of statistics relative to the population (or multiple populations that are solely within a sub-region). In order to provide context as to how the PACs correlate with the populations, this table provides the land status acre figures split by PPMA, PGMA, and Non-habitat for lands within the PACs and lands not within the PAC.
- ✓ Threats: The threats posed to each population are presented in the left-hand column of each table. The threats identified in this column are those threats cited as “present and widespread” in Table 2 of the USFWS’s 2013 Conservation Objectives Team (COT) Report. Although not identified as “present and widespread”, additional threats were addressed as they relate to the National Policy Team (NPT) allocation guidance.
- ✓ Red text: The red text indicates areas where the sub-regional ADPP allocation deviates from the NPT guidance provided to the sub-regional teams in April 2014. Rational as to why there is a deviation from the NPT guidance is also provided in red text in the right hand column of the table.
- ✓ Green text: The green text indicates areas where the Forest Service is deviating from the BLM’s allocation or management direction to address that threat.
- ✓ Purple text: The purple text is only displayed in the Montana population for the Idaho/SW Montana ADDP and depicts where the BLM has different management decisions in Idaho and Montana.

Draft Internal Deliberative Document – Not for Distribution

Great Basin Region Federal Family Meeting Agenda

August 19-21, 2014 – BLM Oregon State Office, Portland, OR

Objectives of this Meeting

- Identify threats to Greater Sage-grouse (GRSG) for each PAC/population within the BLM/FS planning area as identified in the COT Report
- Determine how each BLM and FS plan addresses these threats through land use allocations and other conservation actions
- Discuss the adequacy of the land use allocation decisions and other conservation measures to address these threats and any changes in plans required to address inadequacies and/or inconsistencies in response
- Provide clear and specific guidance to develop draft final administrative plans that are adequate to address the threats to each GRSG population identified in the COT Report

DAY ONE – TUESDAY AUGUST 19, 2014

- 8:00 am **Welcome**
Jerry Perez, OR State Director
- 8:05 am **Introductions**
Penny Mabie, Meeting Facilitator
- 8:10 am **Opening Remarks**
Neil Kornze, BLM Director
Noreen Walsh, USFWS Regional Director, Mountain-Prairie Region
Chris Iverson, USFS Deputy Regional Forester
Amy Lueders, BLM Nevada State Director
- 8:30 am **Process, Expectations, and Outcomes**
Jim Lyons, Deputy Assistant Secretary for Land and Minerals Management, DOI
Michael Bean, Counselor for Fish, Wildlife, and Parks, DOI
- 9:00 am **Agenda Review (Logistics)**
Penny Mabie, Meeting Facilitator
- 9:15 am **BLM Approach to Developing ADPP's**
Ed Roberson, BLM Assistant Director for Resources and Planning
- 9:25 am **Forest Service Approach to Developing their DPPA's**
Chris Iverson, USFS
- 9:40 am **Major Changes between BLM/FS DEIS' and ADPPs in Great Basin**
Lauren Mermejo, Great Basin Regional Project Manager
- 10:00 am 15 Minute Break**

Draft Internal Deliberative Document – Not for Distribution

10:15 am **5-Minute Plan Overview by BLM State Directors**

NV - Amy Lueders, BLM NV State Director

CA - Jim Kenna, BLM CA State Director

OR - Jerry Perez, BLM OR State Director

UT - Juan Palma, BLM UT State Director

ID - Tim Murphy, BLM Acting ID State Director

MT - Jamie Connell, BLM MT State Director

11:00 am **Information Packet Orientation**

Frank Quamen, BLM-NOC Wildlife Biologist

Matt Magaletti, BLM- WO Planning

WAFWA Management Zone V

Review of Conservation Strategies for Populations Solely within OR

11:15 am

- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**

Jim Lyons - ASLM

- ✓ **Review of present threats to this population**

Frank Quamen/Matt Magaletti

- ✓ **Discuss proposed responses to each threat and rationale**

Matt Magaletti, State Directors, and Project Leads

- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**

Meeting Principals (Facilitated by Penny Mabie)

- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**

- ✓ **Identify and record specific change to relevant plans**

Meeting Principals (Facilitated by Penny Mabie)

12:00 pm

1 Hour Lunch

Review of Conservation Strategies for the Western Great Basin Population (NV/NE CA and OR)

1: 00 pm

- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**

Jim Lyons - ASLM

- ✓ **Review of present threats to this population**

Frank Quamen/Matt Magaletti

- ✓ **Discuss proposed responses to each threat and rationale**

Matt Magaletti, State Directors, and Project Leads

- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**

Meeting Principals (Facilitated by Penny Mabie)

- ✓ **Finalize changes (if any) in plans to address identified threats to each**

Draft Internal Deliberative Document – Not for Distribution

PAC/population and remaining issues in question

- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

3:00 pm **Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie

3:30 pm 15 Minute Break

WAFWA Management Zone III

Review of Conservation Strategies for Populations solely within Utah

- 3:45 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**
Jim Lyons - ASLM
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

5:45 pm **Close-out**
Penny Mabie, Meeting Facilitator

DAY TWO – WEDNESDAY AUGUST 20, 2014

8:00 am **Recap from day 1**
Penny Mabie, Meeting Facilitator

Continuation of WAFWA Management Zone III

Review of Conservation Strategies for Populations solely within Nevada

- 8:15 am ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
- ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
- ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

9:15 **Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie

9:45 am 15 Minute Break

WAFWA Management Zone IV

Review of Conservation Strategies for Populations solely within Idaho

- 10:00 am ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
- ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
- ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

12:00pm 1 Hour Lunch

Draft Internal Deliberative Document – Not for Distribution

Review of Conservation Strategies for Northern Great Basin Population (ID, NV/CA, and OR)

- 1:00 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- 2:30 pm** **15 Minute Break**
- 2:45 pm
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)
- 4:00 pm
- Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie
- 5:00 pm
- Close-out**
Penny Mabie, Meeting Facilitator

DAY THREE – THURSDAY AUGUST 21, 2014

8:00 am **Recap from day 2**
Penny Mabie, Meeting Facilitator

Continuation of WAFWA Management Zone IV

Review of Conservation Strategies for Populations solely within Southwest Montana

8:15 am ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 ✓ **Review of present threats to this population**
 Frank Quamen/Matt Magaletti
 ✓ **Discuss proposed responses to each threat and rationale**
 Matt Magaletti, State Directors, and Project Leads
 ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
 Meeting Principals (Facilitated by Penny Mabie)
 ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 ✓ **Identify and record specific change to relevant plans**
 Meeting Principals (Facilitated by Penny Mabie)

9:15 am **Validate outcomes for the entire WAFWA Management Zone IV**
Penny Mabie, Meeting Facilitator

9:45 am 15 Minute Break

10:00 am **Adaptive Management, Mitigation and Monitoring**
Status by BLM State Directors Facilitated by Penny Mabie

11:00 am **Update on Coordination with States**
Status by BLM State Directors Facilitated by Penny Mabie

12:00 pm 1 Hour Lunch

1:00 pm **Next Steps with the States**
Jim Lyons, ASLM

1:45 pm **NRCS Sage Grouse Initiative Update with the States/Private Landowners**
Tim Griffiths, NRCS Sage Grouse Initiative Coordinator

2:15 pm **Schedule Discussion**
Ed Roberson, BLM
Noreen Walsh, USFWS

2:45 pm 15 Minute Break

Draft Internal Deliberative Document – Not for Distribution

3:00 pm **Outcome Summary and Follow-up Actions**
Penny Mabie, Meeting Facilitator

4:00 pm **Closing Remarks**
Jim Lyons, DOI
Ed Roberson, BLM
Noreen Walsh, USFWS
Chris Iverson, USFS

Great Basin Region Roll-Up Attendees:

- BLM States (12): State Directors: **Amy Lueders, Jerry Perez, Juan Palma, Jim Kenna, Tim Murphy and Jamie Connell**
Project Managers: Joe Tague, Joan Suther, Mike Haske, Quincy Bahr, Brent Ralston, John Carlson
 - BLM Regional (2): Lauren Mermejo and Johanna Munson
 - BLM WO/NOC (8): **Neil Kornze, Steve Ellis, Ed Roberson,** Kathy Stangl,
Frank Quamen, Joe Stout, Steve Small, and Matt Magaletti
 - DOI (3) **Jim Lyons, Michael Bean, and Sarah Greenberger**
 - SOL (3): **Bret Birdsong, Ted Boling,** and Sarah Shattuck
 - USFS National (5): **Chris Iverson,** Glen Stein and Madelyn Dillon
Project Managers: Ron Rodriguez, Rob Mickelson
 - OGC (1): Kathryn Guillou Bergenholtz
 - FWS (11): **Noreen Walsh,** Pat Deibert, Nicole Alt, Paul Henson
Dennis Mackey, Ted Koch, Mary Grim, Michael Fris,
Terry Rabot, Larry Crist and Jesse Delia
 - NRCS National (1): Tim Griffiths
 - Facilitator (1): Penny Mabie
 - EMPSI Rep (1): David Batts
- TOTAL: 48 (16 Principals at the table)**

In 4 hours we will be having a call to help us all prepare for the two Federal Family meetings that we will have in near future. We will quickly run through the draft agenda for the Great Basin meeting (the Rocky Mountain agenda will be framed the same way). We did a trial run of the meeting with USFS, FWS, SOL and DOI: and I want to some issues. Also, there are several topics I believe you need to be prepared to discuss:

- *Buffers – What are the lek buffers in your plan.
- *Disturbance Threshold - What you plan will say.
- *Adaptive Management – What your soft/hard triggers are, your current response strategy, and scales.
- *Have an idea of what the resource potential is relative to the major allocations considered in your plan.
- *How your plan protect PACs – closed vs open; exclude vs avoid
- *Where you are with the State(s) in developing a monitoring strategy (fine and site scale)

I would like to update you on the ROD concept we discussed at the ELT.

Finally, we had a team review Chapter 2 for all 14 documents and have decided we need to create an outline or template Chapter 2 for consistency. This is more about formatting for a common look and feel. We will work with your planning project managers.

I look forward to our call. Thank you all. ed

Federal Family Meeting - Conference Call - (866) 506-1142 – P/C 444397#

When Fri Aug 8, 2014 4:30pm – 5:15pm Eastern Time

- Who
- Noreen Battle - organizer
 - Donald Simpson
 - Erin Jones
 - Bridget Clayton
 - Jeffery Foss
 - Ruth Welch
 - Steven Ellis
 - John Carlson
 - Nancy Haug
 - Matthew Magaletti
 - Thomas Pogacnik
 - Katherine Kitchell
 - Stephen Small
 - Juan Palma
 - Kathryn Stangl
 - Edwin Roberson

Subject: Re: Prep for Pre-Roll Up Meeting Call on Wednesday

Hello Jeff - The intent of this call is to prepare Tim for the questions that he will need to address at the upcoming Federal Family meeting. As discussed on our SD call last Friday, the SDs will need to discuss the following elements of their plans:

- Buffers – Know what your buffers are.
- Disturbance
- Adaptive Management – Know what your soft/hard triggers are, your current response strategy, and scales
- Have an idea of resource potential
- How you plan on protecting the PACs – closed vs. open
- Where are you with the States in developing a monitoring strategy (fine and site scale)

During our "Mock Roll-up" meeting last week, the following questions specific to ID came up which Tim will also need to be prepared to explain to the group on how and why ID decided to move in this direction...

- 3 percent disturbance in biologically significant unit for nesting and winter habitat only?
- Core/important/general habitat categories - how were these developed?
- Issues with MT/ID as there are great differences?
- Designated corridors in SE Idaho?

Hope this helps - thanks!

Kathy

Brent

Please prepare a succinct script for Tim (NTE 5 minutes) for him to address the 6 points in Ed's message. Please complete this by Friday and provide a copy to Tim so he can customize it in prep for the Portland meeting.

Thanks
Jeff

Hello all,

I wanted to follow-up with you all as I know many of you were not able to participate on our call last Friday. The point of that call was to share the outcomes of the "Mock Roll-up" meeting that occurred on the 8/5 and 8/6. We had good participation from all agencies partners so felt that the meeting was successful but there still are some unanswered questions that only you and your project leads can answer. So, I think it is very important for you all to know what we expect at the Portland and Denver meetings. Here is a quick review of what we discussed on the Friday call:

1-On the Federal Family meeting agenda (Tuesday) all State Director's will be asked to give a 5-minute overview of where you all are with your plans. The bullets below should be covered and we are asking that you please do not do a PowerPoint but speak directly to these points.

- Buffers – Know what your buffers are.
- Disturbance
- Adaptive Management – Know what your soft/hard triggers are, your current response strategy, and scales
- Have an idea of resource potential

- How you plan on protecting the PACs – closed vs. open
- Where are you with the States in developing a monitoring strategy (fine and site scale)

2-As identified on the agenda, these meetings will focus on the threats and allocations related to the specific populations. We know you will be looking to your project leads for the specifics but we are looking for you to provide answers to questions that may come up as to why certain decisions were carried forward in your plans.

3-Also on agenda for Thursday there are two topics that you all will be asked to lead the discussions on. The first topic includes Adaptive Management, Mitigation and Monitoring, and the second is an update on your coordination with your state partners. On the first item, we are asking for a status update of where you are with adaptive management, mitigation and monitoring. Regarding the coordination with the state partners piece, it would be very helpful if you provide your insights on how you think the upcoming meeting with states should move forward.

I know this is a lot to think about with your busy schedules but want you know in advance what the meeting expectations are. Please let me know if you have any questions. Thanks, ed

Tim,

Here are the background materials for next week.

GB FFM packet & GRSG Atlas – this is an electronic version of the hardcopy materials we received.
SD Introduction – this is the highlight points for the introductory discussion.
Fed Fam TPs – these are talking points with more detail organized by topic for easy reference.
FFM Talking Points – this is the more detailed and exhaustive list of topics and rationale that has come to us as potential topics for next week.

Federal Family Meeting
August 2014

1. Why does Idaho need to have three GRSG management zones?

The Idaho delineates three GRSG management zones – Core, Important and General, to retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats and across broader habitat areas. Each of these management zones has associated management restrictions and protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy.

Core Management Zones (CMZ) are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key metapopulations within the subregion (Garton et al. 2011). These areas encompass 65% of the occupied leks and associated seasonal habitats necessary to support 73% of the breeding males (and by association the entire population) in Idaho. CMZ compose 66% of the USFWS priority areas for conservation (PACs). They have the highest priority for wildfire suppression and minimization activities (fuel breaks and reduction treatments) and have the most restrictive management direction for anthropogenic development which is consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

Important Management Zones (IMZ) are delineated to provide protection to habitats adjacent to the CMZs and encompass 30% of the occupied leks and support approximately 22% of the breeding males (and by association the entire population) in Idaho. IMZ compose the remaining areas of PACs (33%) and in addition include over 750K additional acres supporting 4% of the breeding males outside of PAC areas. The two management zones encompass the FWS identified priority areas for conservation (PAC) and include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas. The IMZ areas provide a management buffer between more intact CMZ areas and General Management Zones with a higher likelihood of wildfire occurrence. The IMZ also has protective and restrictive management supporting the retention and recovery of GRSG habitats in IMZ and CMZ with management direction for anthropogenic development disturbance that is largely consistent with the national policy team direction with several exceptions – solar, wind, non-energy leasable (phosphate) and mineral material developments.

General Management Zones (GMZ) contain less than 5% of the occupied leks and population and represent the least intact and least productive habitats for GRSG.

The three-tiered management zone approach, unique to Idaho's Plan, was specifically designed in coordination with the State of Idaho to support an adaptive management strategy that substantively addresses the primary threat to the species in Idaho and which could be supported and applicable to non-federal lands within the management zone in coordination with Rural Fire Protection Associations, the development and support of which has garnered Gubernatorial and Congressional support in the State of Idaho.

2. *Why is Solar development not excluded in Important and General Management Zones?*
3. *Why is Wind development not excluded in Important and General Management Zones?*
4. *Why is non-energy leasable development not excluded in Important Management Zones?*
5. *Why is mineral materials development not excluded in Important Management Zones?*

- a. See - *Why does Idaho need to have three GRSG management zones?*
- b. The management zone development restrictions serve to discourage further development in GRSG habitat. The management for the identified uses is consistent with the objectives described in the USFWS COT Report and consistent with the identified PAC areas. The CMZ areas are extremely limited to further anthropogenic disturbance and go beyond the direction provided by the National Policy Team (e.g. closures to fluid mineral leasing and a cessation of further development in the event an adaptive regulatory hard trigger is engaged).
- c. Any proposed development in Important Zones must comply with the Anthropogenic Disturbance Development Criteria (avoidance criteria); if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and
- b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. The project complies with the applicable RDFs and BMPs as described in Appendix A.
- f. The project would not exceed the disturbance threshold (AD-1).

6. *Why are high voltage transmission and major pipeline ROW developments not avoided in General Management Zones?*

The GMZ is not identified as an avoidance area for ROW developments; however, proposals within this zone would still need to conform to the required design features, lek buffers and seasonal restrictions which would serve to direct actions away from GRSG habitat (leks specifically) and times that could impact bird behavior. This maintains a high standard of limiting effects to GRSG even within GMZ. This serves to direct potential use away from CMZ and IMZ areas while still minimizing and eliminating impacts to GRSG.

7. *Why is no net unmitigated loss not applied to General Management Zones?*

This has been further refined during the development of the Proposed Plan to include no net unmitigated loss within GMZs as well.

8. *Why does avoidance criteria apply to more than ROWs?*

While many activities or proposals for development are carried out within the purview of ROW permits, others are not, and in some cases proposals involve both actions permitted under a ROW and those permitted under other authorities. In Idaho the ROW avoidance criteria has been expanded to include all large scale anthropogenic disturbance proposals. This effectively accomplishes several objectives:

1. All disturbance and associated effects is evaluated with regard to GRSG impacts with the same rule set (individual proposals may have very different potential impacts – a transmission line versus and oil and gas well – which would be considered in the evaluation of the projects conformance to the criteria.
2. This eliminates the potential occurrence where an activity may be approved/not approved while the ROW associated with or supporting that activity would be conversely not approves/approved, leading to inconsistencies in application.

9. *Lek Buffers*

10. *Disturbance Threshold*

Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a Conservation Area, inclusive of all ownerships for evaluation.

Anthropogenic disturbance excludes habitat disturbance from wildfire and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix I.

New anthropogenic disturbances within winter and nesting habitat within Core or Important management zones within a CA where the disturbance threshold is already exceeded from any source or where the proposed development would result in the threshold being exceeded would not be allowed until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights).

Core Management Zone: Anthropogenic Disturbance Exception Criteria – in addition to the Core and Important Management Zone Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the screening and assessment process:

- f. The project would not exceed the disturbance threshold (AD-1).

Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- f. The project would not exceed the disturbance threshold (AD-1).

11. *Adaptive Management*

Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:

A 20 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2012 biologically significant unit (BSU) baseline (Map 3) (The BSU is defined as the nesting and wintering habitat within Core and Important Management Zones within a

Conservation Area, inclusive of all ownerships and is used in the evaluation of the adaptive regulatory triggers and the anthropogenic disturbance threshold).; or
A 20 percent combined loss of nesting and/or wintering habitat within IMZ within a CA compared to the 2012 BSU baseline.

Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:

A 10 percent combined loss of nesting and/or wintering habitat within CMZ within a CA compared to the 2012 BSU baseline; or
A 10 percent combined loss of nesting and/or wintering habitat within IMZ within a CA compared to the 2012 BSU baseline.

Adaptive Regulatory Criteria for Hard Population Triggers are defined as:

A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within CMZ within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or
A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IMZ within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline.

Adaptive Regulatory Criteria for Soft Population Triggers are defined as:

A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within CMZ within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or
A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IMZ within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.

When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.

When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then CMZ management actions would be applied to the IMZ within that CA.

If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.

5.14. AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.

12. Resource Potentials

Solar: Extremely low to the point of not addressed in Solar PEIS

Wind: Low with a few areas with higher potential/interest – Cotterell, China Mountain

Oil and Gas: Low in most of Idaho; moderate to high in Bear Lake (se Idaho) and sw Montana

Geothermal: Low in western, northern and eastern part of Idaho and sw Montana; moderate to high in central part of Idaho

Phosphate: high in Known Phosphate Leasing Areas in eastern part of Idaho

13. Protection of PACs

14. State Monitoring Strategy

Spending some focused time on prep for the Fed FAM Meeting. I sure appreciate the effort to develop material for me, not to mention the coordination you did with EA, NOC, and others. The link below has some points where I have brief Qs or need clarification

To view Timothy Murphy's file, click this link:
[Qs for Brent.docx](#)

Sent from my iPhone

Anthropogenic disturbance is well below 3%: Do we have a SWAG on that ? If indeed small I'd like to give an approx. number as it can really shore-up our contentions on everything from 3 zones to protective measures.

USFWS put some information together regarding PACs based on Don Major's work:

- **Infrastructure development has been limited in Idaho's sage-grouse habitats. Since European settlement, approximately 0.5% disturbance has occurred from large-scale anthropogenic infrastructure within Idaho's Priority Areas for Conservation (PACs) as shown for each Conservation Area.**
 - o **Desert: 0.45%**
 - o **Mountain Valleys: 0.53%**
 - o **Southern: 0.48%**
 - o **West Owyhee: 0.12%**

We are still working to map the BSUs and calculate these numbers according to that stratification but the numbers should be similar.

Names of 2 meta pops in ID and SW MT subregion ?

**Salmon/Snake/Beaverhead north of the Snake River
Northern Great Basin south of the Snake River**

Idaho Maps:

Wind & Solar - Why Exclusion areas in the General MgmtZone, e.g. red within the Weiser area (farthest NW population in Idaho)?

Those ROW exclusions are pre-existing designations and are not the result of decisions in this LUP.

Fluid Mineral Leasing (O&G) – Why Open Major Stips (NSO) in Core Mgmt Zone (NE Idaho)?

Not exactly sure which area, the Core I see in NE Idaho is all closed (red), in SW Montana Core areas are open with major stipulations, which is still consistent with the NPT guidance and the direction Montana wanted to go for leasables. In SE Idaho, small portion of Bear Lake plateau is open with major stips. For fluid minerals in Idaho the direction in Core is Closed in areas of no or low potential; Open with No Surface Occupancy (Major Stips) in moderate to high potential areas.

Geothermal – Why Open Major Stips (NSO) in Core areas throughout the state?

For fluid minerals in Idaho the direction in Core is Closed in areas of no or low potential; Open with No Surface Occupancy (Major Stips) in moderate to high potential areas. The difference between oil and gas and geothermal is in the difference in potential areas – there are more moderate to high potential geothermal areas in Core than for oil and gas.

Locatable Minerals - Brief TP for Locatable Open in Core & Important Mgmt Zones

This GRSG planning effort does not recommend any areas for withdrawal from locatable mineral entry. The withdrawals shown on the map are existing. BLM's only discretionary decision is to recommend for withdrawal which would be taken up by Congress for final decision.

Salable Mineral Material Disposals – Brief TP for Open in Core & Important Mgmt Zones

In Core Zones, new pit developments are closed, in Important new

pits could be considered based on the anthropogenic disturbance criteria.

ROW Constraints – applied to all levels of E transmission i.e. small distribution through major power lines?

Yes, understanding that part of the anthropogenic disturbance criteria relates to limiting effects to GRSG, smaller distribution type lines would have a smaller footprint and fewer impacts to GRSG and could potentially occur whereas high voltage transmission could not under the same criteria.

Resource Potential:

Are Cotterell and China Mtn within PAC, within Core, Important?

They are both with PACs – China Mtn is within Core south of Twin Falls and Cotterell is within Important se of Burley.

Monitoring Strategy:

Fed Family Meeting paper, page 5, 15. State Monitoring Strategy says... State of ID monitors & tracks pop indices and BLM and FS monitor and track habitat indices. SDIntroduction paper says... In Idaho the population component of the Adaptive Management Strategy is monitored and tracked by the State F&G agency, BLM and FS in coordination with the F&G and Local Sage-Grouse Working Groups who track the habitat component. Clarification?

These are both trying to say the same thing and it looks like my grammar confused the issue:

There are two components/indices involved with the adaptive management strategy – population and habitat.

Population metrics (leks, # males) are counted each year by the State Fish and Game agencies (sometimes BLM and Forest Service

participate with these counts but the data is the State's and managed by them.

Habitat metrics (acres key habitat or restoration habitats) are tracked by BLM in coordination with IDFG, Forest Service and Local Working Groups. BLM maintains and manages this data while the partner agencies are involved in annual updates based on fire maps, restoration activities and updated local data.

Packets (various TPs and answers to Qs) from Friday: We say Core + Important cover all of the PAC areas, yet the numbers in the packets say Core 66% of PAC + Important 33% of PACs =99%?

This should probably be stated in the other direction – approximately 66% of the PACs are in Core and approximately 33% are in Important, so that 100% of PACs are in Core and Important with approximately 750K additional acres beyond PACs in Important Zones.

Gonna need to chat more on Buffers. Address Plan's concept of protected space around leks (NSO, no leasing, exclusion, CSU, timing stip, etc. Our key is protection of Core and Important and basis in science.

Paul is back Monday and we might want to pull him into this conversation – especially for buffers.

Let's plan on 1000 - 1200 Monday to cover the following stuff.

Names of 2 meta pops in ID and SW MT subregion ?

Idaho Maps (what Brent coordinated with NOC showing just Idaho plan):

- Wind & Solar - Why Exclusion areas in the General MgmtZone, e.g. red within the Weiser area (farthest NW population in Idaho) ?
- Fluid Mineral Leasing (O&G) – Why Open Major Stips (NSO) in Core Mgmt Zone (NE Idaho) ?
- Geothermal – Why Open Major Stips (NSO) in Corevareas throughout the state ?
- Locatable Minerals - Brief TP for Locatable Open in Core & Important Mgmt Zones
- Salaboe Mineral Material Disposals – Brief TP for Open in Core & Important Mgmt Zones
- ROW Constraints – applied to all levels of E transmission i.e. small distribution through major pwr lines ?

Resource Potential:

Don't know my geography as good I should. Are Cotterell and China Mtn within PAC, within Core, Important ?

Monitoring Strategy:

Fed Family Meeting paper, page 5, 15. State Monitoring Strategy says... State of ID monitors & tracks pop indices and BLM and FS monitor and track habitat indices. SDIntroduction paper says... In Idaho the population component of the Adaptive Management Strategy is monitored and tracked by the State F&G agency, BLM and FS in coordination with the F&G and Local Sage-Grouse Working Groups who track the habitat component. Clarification?

Names of the 2 meta-pops

Packets (various TPs and answers to Qs) from Friday: We say Core + Important cover all of the PAC areas, yet the numbers in the packets say Core 66% of PAC + Important 33% of PACs =99% ??

Gonna need to chat more on Buffers. Address Plan's concept of protected space around leks (NSO, no leasing, exclusion, CSU, timing stips, etc... Our key is protection of Core and Important and basis in science.

Anything I have not addressed, need for clarity, emphasis, or something missing ? Attached and pasted below

The Idaho and SW Montana Subregional Plan covers 18.5 M BLM & FS acres, in which there are 11 M acres of habitat for Greater Sage-Grouse.

The 11 million acres represent 12 % of the habitat range-wide & provides habitat for 15 % of Sage-Grouse range-wide.

The greatest threat to Sage-Grouse in the subregion by far is wildfire and invasive species (ann brome). Other threats are minor or very site specific in extent.

Anthropogenic disturbance is well below 3% in all S-G areas and potential for solar, wind, and O&G development is low in most or all of the subregion. SE ID has a high potential phosphate resource w/designated PO4 leasing areas.

The Plan designates 5 Conservation Areas based on relative threats, S-G populations, and similar habitat conditions.

There are 3 Mgmt Zones in ID and 2 in SW MT. They're based on S-G pops & habitat conditions to protect the 2 key meta-populations in the subregion.

The zones are Core, Important & General in ID, and Core & General in SW MT. Designated to protect S-G habitat through habitat prioritization and protective measures within the most critical habitat.

There is a 3% disturb. threshold across all Conservation Areas and all Mgmt Zones.

The Mgmt Zones, Adaptive Mgmt strategy, Disturbance Threshold and all other significant components of the plan have been developed in full coop & coordination w/the State of ID, USFWS & FS.

Core Management Zones cover 5.2 M acres of BLM & FS S-G habitat, 66% of the priority areas for conservation, protect 68% of leks and 77% of the pop.

Important Management Zones provide protection to an additional 3.1 million acres of BLM & FS S-G habitat, protect the remaining areas within PACs & add an additional 750 thousand acres outside of PACs. The Important Zone protects 26% of leks and 20% of the population.

Combined Core & Important Management Zones encompass over 64% of the sage-grouse habitat in the sub-region, contain all of the priority areas for conservation plus an additional 750 k acres, include over 94% of the leks and 97% of the pop in ID.

The Adaptive Mgmt Strategy is designed to specifically address the threat of wildfire. Core Mgmt Zones are the highest priority for allocating suppression resources during times of multiple starts, & for fuel breaks & other fuels mgmt activities.

The Important Management Zone is the next highest priority for suppression & fuels mgmt activities. In the event significant portions of pops or habitat are lost (primarily due to fire although other factors could play a role) the Important Mgmt Zone then receives the same high priority & restrictive measures as Core.

The Adaptive Mgmt Strategy uses soft & hard triggers to determine mgmt changes, based on a 10% (soft trigger) or 20% (hard trigger) change in either pop or habitat.

A soft trigger results in an analysis of cause and evaluation of implementation level activities with potential adjustments to reduce or eliminate impacts to S-G.

A hard trigger results in a planning scale change in mgmt direction. When any Adaptive Regulatory Criteria for a Hard Trigger is met, then CMZ mgmt. actions are applied to the IMZ w/in a Conservation Area. Such as Additional priority for wildfire suppression, fuels treatments and limitations on anthropogenic disturbance activities.

The Adaptive Management Strategy is a coordinated effort among BLM, FS, USFWS and the States of ID and MT for their respective states.

An institutionalized Monitoring Process in ID since 2001, the pop component of the Adaptive Mgmt Strategy is monitored & tracked by State F&G, BLM and FS in coordination with the F&G and Local Sage-Grouse Working Groups who track the habitat component. (The State of ID Office of Species Conservation also supports this effort with oversight to be provided to the ID Implementation TF when it is convened.) Key habitat maps are updated yearly in coord among State, BLM, FWS, FS, & Local Working Groups.

Implementation of the Habitat Assessment Framework & the broad scale Monitoring Framework are included in the monitoring strategy.

The Adaptive Mgmt Strategy is designed to address the largest threat to S-G in the subregion, ...fire and to sustain viable populations of S-G.

The 3% disturbance threshold is designed to limit development w/in critical habitats (nesting & wintering) w/in Core & Important Mgmt. Zones, by Conservation Area;... and is inclusive of all

land ownerships for evaluation. Current disturbance is significantly below 3% and future development is not expected to ever hit this threshold.

The plan identifies the need to mitigate all impacts across all management zones. A no net unmitigated loss requirement applies w/in all Mgmt Zones.

Resource Potentials: **Solar** – Extremely Low.

Wind: Low w/few areas with higher potential (Cotterell, China Mtn)

O&G: Low in most of ID; mod to high in far SE ID (Bear Lake) and SW MT

Geothermal: Low in W, N, & E ID & SW MT; Mod to High in Central Idaho

Phosphate: High in Known Phosphate Leasing Areas in E ID

The ID portion of the plan has been closely coordinated & developed with the State, USFWS, and the FS.

Impact Minimization Measures like Buffers & Timing Restrictions were collaboratively developed among biologists from BLM, FS, FWS, & the State.

Implementation and effective management direction is reliant on a continued strong partnership and involvement of all partners.

There is a very strong foundation for inclusion of State and potentially private lands.

This coalition of support, and mgmt addressing primary threats, protection to over 95% of the S-G pop in ID and consistency with the Service's Conservation Objective, and the protection of all of the PAC, provides a strong footing to maintain resilient populations in the subregion.

Subject: Re: Buffers

Tim,
Some states/subregions used a more generic buffer (e.g., 4 miles or such, for everything) but we do not believe the science justifies that universal approach. Where we found more specific "science" we used that. For example, our 600 m buffer for transmission was based on a recent graduate study (Gillan et al. 2013) in western Idaho, that detected GRSG avoided transmission lines by 600 m. The 3 mile Comm tower buffer is based on the Johnson et al. (2011) paper from the Studies in Avian Biology GRSG book, that found "a steady downward pattern of trends in lek counts as the number of towers increased either within 5 km (3 miles) or 18km." We felt the 3 mile buffer would be sufficient, as an 18 km (11 mile) buffer would not be realistic, as it would preclude towers pretty much across all habitat. For our references to 2 mile buffers, (solar, misc. anthropogenic structures, recreational events), we fell back to the Connelly et al. 2000 guidelines relative to tall structures, as there was little else to go on- for example, there is no research on effects of solar or recreational activities on GRSG.

An important thing to bear in mind is that for the IDswMT plan, new proposals for anthropogenic disturbance will need go through the state implementation team screen "Exception Criteria" first, so protections to the GRSG are not based solely on the buffer size. Also Solar and Wind development are excluded in Core outright. I copy/pasted the exception criteria below for reference. See below. Note, especially, items 6.1 a, c. and i.

Let me know if you need anything else.

Paul

Exection Criteria from Proposed Plan:

6.1. AD-3: Core Management Zone: Anthropogenic Disturbance Exception Criteria – in addition to the Core and Important Management Zone Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the screening and assessment process:

- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers;
- b. The development with associated mitigation would not result in a net loss of GRSG habitat and would provide a net conservation benefit of the respective Core Management Zone;
- c. The project would not likely result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA;

- d. The project is developed pursuant to a valid existing authorization;
- e. The project is an incremental upgrade/capacity increase of existing development;
- f. Cannot be reasonably accomplished outside of the Core Management Zone;
- g. Can be co-located within the footprint of existing infrastructure (proposed actions would not increase the existing authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
- h. Development would follow the required design features (RDF) and best management practices (BMPs) as described in Appendix A;
- i. The project would not exceed the disturbance threshold (AD-1).
- j. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.

- 1.
- 2.
- 3.
- 4.
- 5.
- 6.
- 7.

7.1.

7.2.

7.3.

7.4. AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and
- b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- c. The project does not result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and

- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. The project complies with the applicable RDFs as described in Appendix A.
- f. The project would not exceed the disturbance threshold (AD-1).

Subject: Buffers

Most states have standard buffer size. I may be asked what drives our numbers. Brent says ID buffers devised by our biologists. A good one to run to ground is Comm Towers 3 miles contracting Transmission Lines at 600 meters.

Program/Use	Buffer
Fluid Minerals Development	2 miles
Solar Development	2 miles
Misc. Anthropogenic Structures	2 miles
Roads	0.8 miles
Industrial Pipelines	0.6 miles
Salable Minerals Developments	0.8 miles
Communication Towers	3 miles
Transmission Lines	600 meters
Organized Recreational Events	2 miles

Waivers, Exemptions and Modifications

Waivers, Exceptions and Modifications (WEMs) (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers require a 30-day public review and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

Utah	Idaho	Nevada	Oregon	Montana
Exceptions to the NSO stipulation could be granted if the following conditions are met:	FLM-3: Core Management Zones: Waivers, exemptions or modifications to the NSO stipulation could be considered in accordance with the Anthropogenic Disturbance Exceptions (Core – AD-3) and the Anthropogenic Disturbance Development Criteria (Important – AD-4)	Action G-UFM 1: In unleased federal fluid mineral estate in PPMA, apply a no surface occupancy (NSO) stipulation. A lease exception may be considered Action G-UFM 2: In unleased federal fluid mineral estate in PGMA, apply a NSO stipulation, but allow for waivers, exception, or modifications consistent with the objective.	Action MLS – x: Stipulate all leases within PPMA as NSO, with no waivers or modifications. A single exception will be allowed:	Areas within Core Management Zones would be open to leasing subject to no surface occupancy. No waivers, exceptions or modifications would be allowed unless
The development (e.g., well pad, road, etc.) is on a portion of the lease is determined to be in non-habitat, the area is not used by GRSG, nor would it have direct, indirect or cumulative effects to sage grouse or its habitat (see conditions outlined in MA-GRSG-2). The determination would be made by a team of agency GRSG biologists, including experts from the state wildlife agency, USFWS, and BLM/FS.	The project would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);	where a portion of the proposed lease is determined to be in nonhabitat, the area is not used by GRSG, and the lease would not have direct, indirect, or cumulative effects on GRSG or its habitat. A team of agency GRSG experts, including experts from the state wildlife agency, USFWS, SEIT, the BLM and the Forest Service, would make this determination.	Exception: a lease exception may be considered where a portion of the proposed lease is determined to be in non-habitat, the area is not used by Greater Sage-grouse, or it would not have direct, indirect, or cumulative effects to Greater Sage-grouse or its habitat. The determination would be made by a team of interagency Greater Sage-grouse experts, including an expert from the state wildlife agency, USFWS, and the BLM.	

Utah	Idaho	Nevada	Oregon	Montana
Prior to granting an exception to this NSO stipulation a 30-day public review period will be provided (43 CFR 3101.1-4).	Waivers require a 30-day public review	Waivers require a 30-day public review	Waivers require a 30-day public review	Waivers require a 30-day public review
In addition, exceptions to this NSO stipulation may only be granted by the BLM Utah State Director.	are approved and signed by the State Director.	All exceptions must be approved by the State Director.	All exceptions must be approved by the State Director.	approved by the State Director.
<p>If an exception is granted to this NSO stipulation, the following restrictions would be placed on the proposed development as COAs.</p> <p>disturbance is limited to an average of one minerals disturbance per 640 acres, regardless of type of mineral disturbance (i.e., non-energy, coal, locatable, mineral material, or fluid) (MA-MIN-2);</p> <p>construction, drilling, and completion, and scheduled maintenance activities would not occur during sensitive seasonal periods (i.e., breeding and nesting, brood rearing, winter) (MA-GRSG-3); and</p> <p>disturbance would be consistent with the 3 percent disturbance objective (Objective-GRSG-3).</p> <p>In addition, the RDFs identified in Appendix J, Required Design Features for Fluid Minerals, would be attached as lease notices to all new leases in PPMA and would be applied during the permitting process as COAs, unless at least one of the following can be demonstrated in the NEPA analyses associated with the specific project:</p> <p>A specific design feature is documented to not be applicable to the site-specific conditions of the project/activity;</p> <p>A proposed design feature or BMP is</p>	<p>In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.</p> <p>subject to RDFs, BMPs, buffers, timing restrictions and standard stipulations</p> <p>Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:</p> <p>A specific RDF is not applicable to the site-specific conditions of the project or activity;</p> <p>A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or</p> <p>Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.</p>	<p>Objective G-Lease-FM 2: Conserve and maintain the quality and distribution of PPMA and PGMA through application of lease stipulations, Conditions of Approval (COAs), and RDFs on existing and future leases.</p>

the extent allowable by law,					<p>appropriate standard no higher than necessary to accommodate their intended purpose.</p> <ul style="list-style-type: none"> • Place infrastructure in already disturbed locations where the habitat has not been fully restored. • Cluster disturbances, operations, and facilities. • Micro-site linear facilities to reduce impacts to sage-grouse habitats. • Locate staging areas outside GRSG habitat to the extent possible. • Coordinate road construction and use among ROW holders. • Construct road crossings at right angles to ephemeral drainages and stream crossings. • Consider placing pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering co-locating with other ROW. • Control the spread and effects of non-native plant species. • Eliminate or minimize external food sources for corvids. <p>New ROW structures will be constructed with perch deterrents or other anti-perching devices, where needed.</p>
Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix B.			Provide seasonal restrictions so that development does not occur during sensitive seasonal periods (see Action G-SSS-3) in GRSG habitat.	Provide seasonal protection so that development does not occur during sensitive seasonal periods in PPMA and PGMA habitat. During any sensitive seasonal period, manage discretionary surface disturbing activities and uses within 1 mile of PPMA and 0.6 mile for PGMA of occupied or pending leks to prevent surface disturbance within Greater Sage-grouse habitat and disruption of its activities. Seasonal protection periods are from March 1 through June 30 for breeding and early	Development does not occur during sensitive seasonal periods (i.e., breeding and nesting, brood rearing, winter) (MA-GRSG-5);

Idaho – Mitigation/RDFs	Idaho – Core	Idaho – Core & Important	Nevada	Oregon	Utah
				brood-rearing, late brood-rearing from July 1 to September 30, and November 1 through February 28 for wintering.	
Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C. (0.6-2.0 miles)			New anthropogenic disturbance does not occur within 4 miles of an active lek in PPMA and PGMA, except within existing designated corridors.	New anthropogenic disturbance does not occur within 1 mile of an occupied or pending lek in PPMA habitat, and 0.6 mile of an occupied or pending lek in PGMA habitat except designated corridors are open	Development does not occur within 1-mile of an occupied lek in PPMA, except in designated corridors.
Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law 10 dB increase during breeding			Development must meet noise restrictions (see Action G-SSS-4 and Appendix B) in GRSG habitat.	Development meets noise restrictions (see X) in PPMA and PGMA	Development meets noise restrictions (MA-GRSG-3);
			New road ROWs would be considered if a county or state is pursuing a Title V FLPMA ROW grant on an RS 2477 road and the new ROW grant would create no new surface disturbance.		
	The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.				Development meets tall structure restrictions (MA-GRSG-3);

BLM, FS and FWS leadership met in Portland this week to discuss our progress to date and the work that remains to develop a comprehensive, rangewide strategy for GRSG conservation in the context of our multiple-use sustained yield missions.

Key Messages -

Jim Lyons: It doesn't matter how painful we need to finish as a team with a landscape level approach that results in the conservation of sage-grouse.

Neil Kornze: This is the 11th hour, we need to resolve concerns and make decisions that move us forward.

Noreen Walsh: The COT is the lens by which we need to evaluate the actions to minimize threats. Differences between subregions must be simply explainable.

Approach -

BLM and Forest service will retain all priority (Core and Important) and general habitat lands currently under federal management and manage these for the benefit of the GRSG.

BLM and Forest Service will avoid and/or minimize further surface disturbance of priority areas for conservation (PACs) through closures or no surface occupancy restrictions applied to any further leasing and development of resources.

BLM and FS will eliminate or limit further development of rights of way (transmission lines and pipelines) in PACs in order to minimize impacts. Efforts will be made to route transmission lines outside of PACs or, where this is not technically feasible will use the least impactful route possible and mitigate for the full effect of the development.

All development on priority and general habitat will be mitigated to ensure no net unmitigated loss of habitat for GRSG.

BLM and FS will set specific, quantifiable objectives and timeframes for rangeland improvement and vegetative management to address the negative impacts of improper livestock grazing on GRSG habitat.

Items of Concern for Idaho/SW Montana

Avoidance of Wind Development in Important – Exclusion Optimal

Avoidance of Solar Development in Important – Exclusion Optimal

Closure of Fluid Minerals in Core/Low Potential – No Surface Occupancy Optimal

Application of FIAT Approach in Montana

NSO Waivers tied to Avoidance Criteria – Waiver only for non-habitat - **** DECISION**

Items of National Concern

Disturbance Threshold – Measurement, Application & Scale

Solicitor's to Follow-Up on Buffers

Brent is planning on meeting with the State of Idaho (Dustin and Cally) to discuss allocation decisions and potential flexibility in Important with Wind and Solar, and Fluid Mineral NSO in Core.

National Greater Sage-Grouse
Idaho & Southwestern Montana Sub Region
Federal Family Meeting
August 2014

1. Why does Idaho need to have three GRSG management zones?

The Idaho delineates three GRSG management zones – Core, Important and General, to retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats and across broader habitat areas. Each of these management zones has associated management restrictions and protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy.

Core Management Zones (CMZ) are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key metapopulations within the subregion (Garton et al. 2011). These areas encompass 65% of the occupied leks and associated seasonal habitats necessary to support 73% of the breeding males (and by association the entire population) in Idaho. CMZ compose 66% of the USFWS priority areas for conservation (PACs). They have the highest priority for wildfire suppression and minimization activities (fuel breaks and reduction treatments) and have the most restrictive management direction for anthropogenic development which is consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

Important Management Zones (IMZ) are delineated to provide protection to habitats adjacent to the CMZs and encompass 30% of the occupied leks and support approximately 22% of the breeding males (and by association the entire population) in Idaho. IMZ compose the remaining areas of PACs (33%) and in addition include over 750K additional acres supporting 4% of the breeding males outside of PAC areas. The two management zones encompass the FWS identified priority areas for conservation (PAC) and include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas. The IMZ areas provide a management buffer between more intact CMZ areas and General Management Zones with a higher likelihood of wildfire occurrence. The IMZ also has protective and restrictive management supporting the retention and recovery of GRSG habitats in IMZ and CMZ with management direction for anthropogenic development disturbance that is largely consistent with the national policy team direction with several exceptions – solar, wind, non-energy leasable (phosphate) and mineral material developments.

General Management Zones (GMZ) contain less than 5% of the occupied leks and population and represent the least intact and least productive habitats for GRSG.

The three management zone approach, unique to Idaho's Plan, was specifically designed in coordination with the State of Idaho to support an adaptive management strategy that substantively addresses the primary threat to the species in Idaho and which could be supported and applicable to non-federal lands within the management zone in coordination with Rural Fire Protection Associations, the development and support of which has garnered Gubernatorial and Congressional support in the State of Idaho.

2. Why is Solar development not excluded in Important and General Management Zones?

3. *Why is Wind development not excluded in Important and General Management Zones?*
4. *Why is non-energy leasable development not excluded in Important Management Zones?*
5. *Why is mineral materials development not excluded in Important Management Zones?*

- a. See - *Why does Idaho need to have three GRSG management zones?*
- b. The management zone development restrictions serve to discourage further development in GRSG habitat. The management for the identified uses is consistent with the objectives described in the USFWS COT Report and consistent with the identified PAC areas. The CMZ areas are extremely limited to further anthropogenic disturbance and go beyond the direction provided by the National Policy Team (e.g. closures to fluid mineral leasing and a cessation of further development in the event an adaptive regulatory hard trigger is engaged).
- c. Any proposed development in Important Zones must comply with the Anthropogenic Disturbance Development Criteria (avoidance criteria); if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and
- b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. The project complies with the applicable RDFs and BMPs as described in Appendix A.
- f. The project would not exceed the disturbance threshold (AD-1).

6. *Why are high voltage transmission and major pipeline ROW developments not avoided in General Management Zones?*

The GMZ is not identified as an avoidance area for ROW developments; however, proposals within this zone would still need to conform to the required design features, lek buffers and seasonal restrictions which would serve to direct actions away from GRSG habitat (leks specifically) and times that could impact bird behavior. This maintains a high standard of limiting effects to GRSG even within GMZ. This serves to direct potential use away from CMZ and IMZ areas while still minimizing and eliminating impacts to GRSG.

7. *Why is no net unmitigated loss not applied to General Management Zones?*

This has been further refined during the development of the Proposed Plan to include no net unmitigated loss within GMZs as well.

8. *Why does avoidance criteria apply to more than ROWs?*

While many activities or proposals for development are carried out within the purview of ROW permits, others are not, and in some cases proposals involve both actions permitted under a ROW and those permitted under other authorities. In Idaho the ROW avoidance criteria has been expanded to include all large scale anthropogenic disturbance proposals. This effectively accomplishes several objectives:

1. All disturbance and associated effects is evaluated with regard to GRSG impacts with the same rule set (individual proposals may have very different potential impacts – a transmission line versus oil and gas well – which would be considered in the evaluation of the projects conformance to the criteria.
2. This eliminates the potential occurrence where an activity may be approved/not approved while the ROW associated with or supporting that activity would be conversely not approves/approved, leading to inconsistencies in application.

9. Lek Buffers

The plan contains direction to minimize impacts from various impacts and causes. These include minimization measures, buffers around leks and seasonal timing restrictions. The following table delineates specific uses and associated lek buffers.

Program/Use	Buffer
Fluid Minerals Development	2 miles
Solar Development	2 miles
Misc. Anthropogenic Structures	2 miles
Roads	0.8 miles
Industrial Pipelines	0.6 miles
Salable Minerals Developments	0.8 miles
Communication Towers	3 miles
Transmission Lines	600 meters
Organized Recreational Events	2 miles

10. Disturbance Threshold

Limit anthropogenic disturbance to 3 percent. This is measured within the nesting and wintering habitat within Core and Important management zones, separately, by Conservation Area. This area is inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and includes specific activities defined in the Monitoring Strategy. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads).

If or when the 3% threshold were hit within the nesting and wintering areas of either Core or Important management zones then new anthropogenic disturbances within that Core or Important management zone would not be not be allowed (subject to valid existing rights).

Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

f. The project would not exceed the disturbance threshold (AD-1).

11. 3 percent disturbance in biologically significant unit for nesting and winter habitat only?

Nesting and wintering habitats were delineated in Idaho within each of the Conservation Areas to monitor and adaptively manage threats at a biologically meaningful scale. Measuring habitat loss and disturbance within nesting and wintering habitats, as opposed to across the entire Conservation Area or PAC, has several advantages:

- It more accurately reflects methodologies applied in relevant scientific literature (e.g. Knick et al. 2013, Wisdom et al. 2011, Aldridge et al. 2008);
- Provides greater sensitivity for threat response within the large meta-populations;
- Provides a disincentive for development in more critical habitats, while at the same time providing an incentive for proactive maintenance and restoration of those same habitats.

12. Adaptive Management

The Idaho portion of the plan contains both soft and hard triggers for adaptive management. The triggers are a loss of 10% (soft) or 20% (hard) of either population of habitat when compared to 2001 baseline values.

When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities.

When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then CMZ management actions would be applied to the IMZ within that CA.

If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response.

Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.

13. Resource Potentials

Solar: Extremely low to the point of not addressed in Solar PEIS

Wind: Low with a few areas with higher potential/interest – Cotterell, China Mountain

Oil and Gas: Low in most of Idaho; moderate to high in Bear Lake (se Idaho) and sw Montana

Geothermal: Low in western, northern and eastern part of Idaho and sw Montana; moderate to high in central part of Idaho

Phosphate: high in Known Phosphate Leasing Areas in eastern part of Idaho

14. Protection of PACs

Core and Important Management Zones encompass all of the PAC areas. Protective management is included for both management zones which meets the COT objectives and affects over 95% of the population in Idaho.

15. State Monitoring Strategy

The subregional monitoring strategy includes measures and processes to support the evaluation of the adaptive regulatory triggers and anthropogenic disturbance cap. The State of Idaho monitors and tracks population indices and the BLM and Forest Service monitor and track habitat indices.

Implementation of the Habitat Assessment Framework and the broad scale Monitoring Framework are also included as part of the local monitoring strategy.

16. Issues with MT/ID as there are great differences?

Montana BLM continues to work forward in the development of adaptive management and anthropogenic disturbance approaches applicable to Montana that are also consistent with the yet to be final State of Montana Plan. These will be incorporated into the proposed plan when final.

17. Designated corridors in SE Idaho?

No final answer on these corridors, their validity and designation is being investigated.

18. Mitigation

The plan calls for mitigation for any impacts to GRSG and their habitat to a net conservation benefit standard and in addition any key habitat impacted through discretionary actions would be mitigated to a no net loss standard.

National Greater Sage-Grouse
Idaho & Southwestern Montana Sub Region
Federal Family Meeting
August 2014

1. *Why is Solar development not excluded in Important and General Management Zones?*
2. *Why is Wind development not excluded in Important and General Management Zones?*
3. *Why is non-energy leasable development not excluded in Important Management Zones?*
4. *Why is mineral materials development not excluded in Important Management Zones?*

- a. See Management Zones delineation.
- b. Any proposed development in Important Zones must comply with the Anthropogenic Disturbance Development Criteria (avoidance criteria); if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

AD-4: Core and Important Management Zone: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- a. The project cannot reasonably be achieved, technically or economically, outside of this management zone; and
 - b. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
 - c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
 - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
 - e. The project complies with the applicable RDFs and BMPs as described in Appendix A.
 - f. The project would not exceed the disturbance threshold (AD-1).
5. *Why are high voltage transmission and major pipeline ROW developments not avoided in General Management Zones?*
 6. *Why is no net unmitigated loss not applied to General Management Zones?*
 7. *Why does avoidance criteria apply to more than ROWs?*
 8. *Why does Idaho have three GRSG management zones?*

The Idaho delineates three GRSG management zones – Core, Important and General. Each of these management zones has associated management restrictions and protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy.

Core Management Zones contain 65% of the occupied leks and associated seasonal habitats; 73% of the breeding males; and compose 66% of the USFWS priority areas for conservation (PACs). They are the most restrictive and management direction for anthropogenic development within these areas consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

Important Management Zones contain 30% of the occupied leks; 22% of the breeding males; and compose 33% of the PAC areas plus over 1 million additional acres supporting 4% of the breeding males outside of PAC areas. Core and Important Management Zones support approximately 95% of the population in Idaho. They contain restrictive management direction for anthropogenic development disturbance that is largely consistent with the national policy team direction with several exceptions – solar, wind, non-energy leasable (phosphate) and mineral materials developments.

General Management Zones contain less than 5% of the occupied leks and population and represent the least intact and least productive habitats for GRSG.

9. qssq

1. The BLM and FS have reviewed all threats to GRSG....
2. BLM and Forest service will retain all priority and general habitat lands currently under federal management and manage these for the benefit of the GRSG.
3. BLM and Forest Service will avoid and/or minimize further surface disturbance of priority areas for conservation (PACs) through closures or no surface occupancy restrictions applied to any further leasing and development of resources. Where valid existing rights could lead to surface disturbance, BLM and FS will work with lease holders to consolidate and limit further infrastructure in PACs in order to reduce the impacts of development where they may occur.
4. BLM and FS will eliminate or limit further development of rights of way (transmission lines and pipelines) in PACs in order to minimize impacts. Efforts will be made to route transmission lines outside of PACs or, where this is not technically feasible will use the least impactful route possible and mitigate for the full effect of the development.
5. All development on priority and general habitat will be mitigated to ensure no net unmitigated loss of habitat for GRSG.
6. BLM and FS will set specific, quantifiable objectives and timeframes for rangeland improvement and vegetative management to address the negative impacts of improper livestock grazing on GRSG habitat.

BLM, FS and FWS leadership met in Portland this week to discuss our progress to date and the work that remains to develop a comprehensive, rangewide strategy for GRSG conservation in the context of our multiple-use sustained yield missions.

We had an intense, focused, and very productive meeting.

We have one more meeting of the federal family to review the rocky mtn plans

Then we look forward to meeting with the states to compare notes, to share our draft plans, to review the state plans for state and private lands, and to see how we can work together to strengthen our plans and our cumulative GRSG conservation efforts, where needed.

We're optimistic that we can meet our goal of.....

Brent Ralston

From: Lauren Mermejo

To: Brent Ralston
Subject: Inconsistent with NPT Guidance

Here are the red highlighted areas that did not comport to the NPT Guidance:

1. Solar and Wind in Important and General Habitat
2. Non-energy Leasables in Important Habitat
3. Mineral Materials in Important Habitat
4. High Voltage Transmission and Major Pipeline ROWs in General Habitat
5. No Net Unmitigated Loss not applied to General Habitat

Also, don't forget that Idaho is different in its application of avoidance criteria (whereas all of the other sub-regions adopted only ROW avoidance criteria)

Hope this helps you get prepared.....

Lauren

Ed's questions regarding ID-BLM Response to NPT 6/4/14

In preparation for our discussion later today, I wanted to provide you with some of the concerns we would like to go over with you and your team regarding the info memo you sent us on 5/29/14. Hopefully you can provide us with some clarification/rationale on a few inconsistencies with the NPT allocation recommendations.

For Priority Habitat (Core/Important):

What is your rationale for managing medial (important) habitat as a ROW avoidance area, instead of managing it as a ROW exclusion area for wind/solar?

Idaho is only closing areas to fluid mineral development that are low potential. What is the biological rationale for opening moderate and high potential areas for development? Are you applying NSO to any core (priority) areas?

Are core and important areas closed to non-energy leasables?

For mineral materials, what is the rationale for leaving medial (important) areas open? For existing sites, are they subject to the 3% disturbance cap and no net unmitigated loss?

For General Habitat

What is your rationale for not managing general habitat as a ROW avoidance area for solar/wind?

What is your rationale for not managing general habitat as a ROW avoidance area for high-voltage transmission ROWs?

Adaptive Management

Is BLM Idaho's adaptive management strategy consistent with the AM sideboards? How does the AM strategy apply to other allocation categories other than ROWs?

Disturbance

What do you mean when you say that BLM Idaho is “inconsistent with specific biological units.” The NPT guidance allowed the sub-regions to provide for their own unit, as long as information could be aggregated up to the PAC level. Also – you state that the cap is only subject to “seasonal habitats of highest concern” – does this mean that you are not applying the cap to all general and priority (core, important, and general)? Who makes the determination of what is of a “highest concern?”

Will the no net unmitigated loss be applied to core, important, and general habitat?

How much medial (important) habitat lies within the PAC boundaries?

Cross-Jurisdictional Coordination

Are there any inconsistencies with how the Forest Service plans to manage their priority and general habitat areas?

Have you resolved all of the FWS stop-light matrix concerns (shifting reds to yellows or greens)?

I look forward to our discussion. After we discuss these questions and reconcile these issues, we can confirm that the data you sent to the NOC is ready for the roll-up or you can send any changes in data on to the NOC.

Memorandum

To: Ed Roberson, Assistant Director, Resources and Planning (AD-200)

From: Tim Murphy, Acting State Director, BLM Idaho

Subject: Supplemental Update for Idaho and Southwestern Montana Subregional Administrative Draft Proposed Plan

Date: June 4, 2014

I. INTRODUCTION

This memorandum documents additional descriptions and rationale in support of the May 28, 2014, update memorandum for the Idaho and Southwestern Montana (IDswMT) Administrative Draft Proposed Plan (ADPP). This document is organized by the questions and concerns that have been identified and further descriptions are included to responding to those concerns.

II. THREE MANAGEMENT ZONES

The Idaho portion of the ADPP delineates three management zones – Core, Important and General. These management zones represent a continuum of management restrictions/protections for greater sage-grouse (GRSG) and are foundational to the adaptive management strategy contained within the ADPP.

Core Management Zones contain 65% of the occupied leks; 73% of the breeding males; and compose 66% of the USFWS priority areas for conservation (PACs). They are the most restrictive and management direction within these areas consistent with the national policy team direction or goes beyond that direction in its protection of GRSG.

Important Management Zones contain 22% of the breeding males. They compose 33% of the PAC areas plus over 1 million additional acres supporting 4% of the breeding males outside of PAC areas. Core and Important Management Zones support approximately 95% of the population in Idaho.

General Management Zones contain less than 5% of the population and represent the least intact and least productive habitats for GRSG.

Any proposed development within Important Management Zones would be required to meet the following Anthropogenic Disturbance Development Criteria:

- a. The project does not result in a net loss of GRSG habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and
- b. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
- c. The project is co-located within the footprint for existing infrastructure, to the extent practicable. In the event co-location is not practicable, the siting should best reduce cumulative impacts and/or impacts on other high value natural, cultural, or societal resources; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation;

JUNE 4, 2014

- e. The project complies with the applicable RDFs as described; and
- f. The project would not exceed the disturbance threshold

The restrictions/protections from development in Core Zones, coupled with the stringent development criteria associated with proposals in Important Zones effectively pushes development to areas outside Core and Important Zones (i.e. the PAC areas); or maintains the standard that any development within Important Zones would not impact the GRSG population and any impacts to habitat would be mitigated.

III. CORE and IMPORTANT ZONES

Rationale for managing Important Zones as ROW avoidance areas for Wind and Solar development.

Core Zones exclude the highest potential areas for these types of developments within GRSG habitat. Any proposed development in Important Zones must comply with the Development Criteria (previous); if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

Biological rationale for opening moderate and high potential areas for fluid mineral development development.

Areas of moderate to high fluid mineral potential would be open in Core and Important Zones, subject to a no surface occupancy restriction which is consistent with the NPT guidance. Areas of low or no potential within Core Zones would be closed – this is more restrictive/protective of GRSG habitat than the NPT guidance.

Core and Important Zones closed to non-energy leasables

Non-energy leasable areas in Idaho are associated with phosphate mining. Areas with this potential have been inventoried and identified as Known Phosphate Leasing Areas (KPLAs) which are the only areas currently open for phosphate leasing. There are no KPLAs within Core or Important Zones, so Core and Important Zones are closed to non-energy leasables.

Rationale for leaving Important Zones open for mineral materials

Core Zones are closed to new site authorizations. Any new site development in Important Zones must comply with the Development Criteria (previous) including the disturbance cap; if development were to proceed then lek buffers, required design features and appropriate seasonal or timing restrictions would also be applied to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required. Sales from existing pits would be subject to seasonal timing restrictions and required design features.

IV. GENERAL ZONES

Rationale for not managing as a ROW avoidance area for solar/wind

General Management Zones contain less than 5% of the population and represent the least intact and productive habitats for GRSG. Presence of a developable resource within General Zones is sparse to non-existent. Any proposed development in General Zones is guided by application of lek buffers, required design features and appropriate seasonal or timing restrictions to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

Rationale for not managing as a ROW avoidance area for high-voltage transmission ROWs

General Management Zones contain less than 5% of the population and represent the least intact and least productive habitats for GRSG. Any proposed development in General Zones is guided by application of lek

JUNE 4, 2014

buffers, required design features and appropriate seasonal or timing restrictions to limit impacts to GRSG or habitat. In addition mitigation of residual impacts would be required.

V. ADAPTIVE MANAGEMENT

BLM Idaho's adaptive management strategy consistency with the AM sideboards

The adaptive management strategy included with the ADPP includes adaptive changes that adjustment management of Important Zones. It provides for more restrictive management when a trigger is engaged and it also provides for removing this restrictive management when habitat and populations recover to pre-trigger levels. The concept that an adaptive trigger can only be used to adjust management in a more restrictive direction even if habitat and populations have recovered and would no longer meet the trigger criteria is not consistent with Idaho's incentive-based strategy.

The additional component presented in the National Policy Team guidance of adjusting management to a more restrictive alternative if necessary requires additional discussion with FS, FWS, and our State partners.

VI. DISTURBANCE

Biological significant units that could be aggregated up to the PAC level

Idaho BLM has worked with our partners (FS, FWS and State of Idaho) to define the biologically significant unit for analysis of the disturbance cap/threshold as the nesting and wintering habitat within Core or Important Zones by Conservation Area. This delineation recognizes the strategic importance and value of biologically limiting seasonal habitats and the desire to push development away from and limit additional development within those areas.

This calculation can be aggregated to the PAC level consistent with the National Policy Team guidance.

VII. CROSS-JURISDICTIONAL COORDINATION

Inconsistencies with Forest Service plans

BLM and FS have been coordinating closely through the development of the ADPP. The FS is currently finalizing the FS ADPP and while initial indications are toward consistency there may be several areas requiring further discussion. These discussions are pending until the FS has completed their initial ADPP development.

Resolution of FWS COT consistency

In the Service's comment letter on the Draft EIS (January 31, 2014) an evaluation of the co-preferred alternatives and their consistency with the COT report was described. The BLM, FS, FWS and the State of Idaho have worked together over the last several months to reconcile the two co-preferred alternatives into one cohesive approach that responds to the concerns raised by FWS and further refines the approaches previously described in the Draft EIS. All of the concerns identified by FWS as documented on the COT evaluation table (i.e. stop-light matrix) have been resolved. As a point of clarification this table did not identify any significant areas of concern of inconsistency (red) based on evaluation of the co-preferred alternatives described in the Draft EIS. Several areas of concern were identified (yellow) and these have been resolved by further augmenting of direction in the ADPP.

EMS TRANSMISSION Memorandum

To: Edwin L. Roberson
Assistant Director, Resources and Planning (AD-200)

From: Timothy M. Murphy 
Acting State Director, BLM Idaho

Jamie E. Connell
State Director, BLM Montana¹

Subject: Idaho and Southwestern Montana Subregional Administrative Draft Proposed Plan Update

I. INTRODUCTION

This memo documents the key elements, allocations, and disturbance considerations in the Idaho and Southwestern Montana (IDswMT) Subregional Greater Sage-grouse (GRSG) Land Use Plan Amendment and Final Environmental Impact Statement (FEIS) Administrative Draft Proposed Plan (ADPP) in response to WO Memo from Ed Roberson (1610 (210) of May 12, 2014). It has been reviewed and concurred with by the State Director in Montana/Dakotas.

The IDswMT effort includes portions of three states (Idaho, Montana, and Utah) and would amend 29 BLM and US Forest Service (USFS) land use plans. The planning area encompasses slightly more than 49 million acres of which 18.1 million acres are identified as GRSG habitat across all ownerships. BLM administered public lands comprise 9.3 million acres (roughly 50%) and USFS lands comprise 1.9 million areas (roughly 10%) of the total GRSG habitat within the subregion. Most of the subregion is located within WAFWA MZ IV with a small portion of southeast Idaho contained within WAFWA MZ II. The primary ongoing threats to GRSG are loss of habitat resulting from wildfire and spread of cheatgrass; of substantially less concern is loss of habitat due to infrastructure and oil and gas development. The ADPP addresses all of the applicable threats identified by population in the Fish and Wildlife Service (FWS) Conservation Objectives Team (COT) report (Table 1).

¹ This memorandum is a coordinated response from both Idaho and Montana BLM. It has been developed in coordination with the Montana BLM and has been concurred with by the Montana State Director.

II. COORDINATION

The ADPP has been developed in close coordination with BLM, USFS, FWS, the State of Idaho through the Governor's Office of Species Conservation and GRSG Task Force and the Idaho Department of Fish and Game and the State of Montana through Montana Fish Wildlife and Parks. The ADPP addresses the objectives described in the COT report and required policies and directives. The FWS provided the final COT threat assessment table as part of their public comments and the BLM held subsequent cooperating agency meetings with FWS, USFS and the State of Idaho to discuss, clarify and resolve the concerns identified in their letter and COT threat assessment table. The BLM has addressed all the concerns identified by FWS and have provided additional conservation measures or additional clarity to existing conservation measures in the ADPP (Table 2).

The State of Montana has prepared a draft strategy that has been reviewed. The Governor of Montana has yet to issue an expected Sage-Grouse Conservation Executive Order that would outline how the State of Montana would address GRSG conservation; therefore, it is not possible at this time to fully determine how the ADPP would compare with the potential State regulatory mechanisms or management actions to protect and conserve GRSG and their habitat. The Montana portion of the planning effort has also been coordinated with the other BLM plans in Montana to ensure some level of consistency within Montana. The ADPP (which applies to federal lands) remains flexible to provide cooperative landscape-level management for the conservation of GRSG which transcends ownership boundaries when coupled with the pending Executive Order from the Governor of Montana (which is anticipated to apply to all land ownerships whenever a state authorization is required).

III. KEY ELEMENTS

The primary threat to GRSG that the IDswMT effort responds to is wildfire. In coordination with the State of Idaho and FWS, the IDswMT ADPP identifies and maps three management zones (Core (ID & MT), Important (ID only) and General (ID & MT))² within five conservation areas (Map 1) which are responsive to the stochastic nature of wildfire and provide protections for GRSG and their habitat. Management actions for fuels and suppression management, in addition to those identified for inclusion from the Fire and Invasives Analysis Team have been included to further respond to the threat of wildfire. The ADPP also includes an adaptive management strategy and a mitigation strategy which utilizes the State of Idaho Mitigation Framework. For the SW Montana portion of the plan these components would be consistent with the Montana strategy.

The ADPP includes allocation decisions (Table 1) and program conservation measures to respond to GRSG threats, including required design features, best management practices, activity, and development buffers for GRSG leks and seasonal or timing restrictions.

The focus of the ADPP, including the delineation of three management zones, is to retain and protect sagebrush cover and GRSG habitat (consistent with Wisdom et al. 2011, Aldridge et al. 2008, and Knick et al. 2000) through appropriate prioritization and protective measures within the most critical habitats and across broader habitat areas. Core Management Zones (CMZ) are delineated to protect large unfragmented, contiguous landscapes from anthropogenic disturbance and to focus wildfire reduction (suppression activities and fuels treatments) associated with the two key metapopulations

² Within the subregion management areas have been delineated into three zones – Core, Important and General, only two of which occur in Montana – Core and General.

within the subregion (Garton et al. 2011). These areas encompass all the seasonal habitats necessary to support approximately 73% of the breeding males (and by association the entire population) in Idaho. The Important Management Zones (IMZ) are delineated to provide protection to seasonal habitats adjacent to the CMZs and support approximately 22% of the breeding males (and by association the entire population) in Idaho. The two management zones encompass the FWS identified priority areas for conservation (PAC) and include areas beyond those PAC boundaries that would receive threat amelioration management to help foster connectivity and retention of habitat within CMZ and PAC areas.

The areas identified in the IDswMT subregion include the seasonal habitats relied upon by roughly 95% of the entire GRSG population in the subregion as contrasted with adjacent states where roughly 70-80% of the entire GRSG populations are included within areas identified for primary focus on threat amelioration. The IDswMT ADPP provides threat amelioration management on an additional 1 million acres (243k of Core and 795k of Important) and 3.8% of the breeding males (and population – 687 males and 39 leks) than just those areas identified by USFWS as the most important areas needed for maintaining GRSG representation, redundancy, and resilience across the landscape (USFWS 2013) (Map 2).

While CMZ is equivalent in concept and direction as Priority in the National Policy Team guidance (NPT) (May 1, 2014) and General Management Zones are the equivalent to General areas, the NPT does not have a similar designation as IMZ included within the IDswMT ADPP. This zone is a foundational component of the IDswMT ADPP and directly supports to adaptive management approach which is to adjust threat amelioration management into additional areas if further declines in populations or habitat occur. In coordination efforts with the State of Idaho, this three-tiered management approach was initially developed through the Governor's GRSG Task Force and is supported by State and County representatives on that Task Force. This acceptance in those arenas is helping to support development of the State's management approach for State and private lands within Idaho, consistent with the federal lands.

This three-tiered approach is not consistent with the NPT guidance. With several deviations CMZ allocation management in the IDswMT is consistent with the NPT guidance, in the event that adaptive management triggers are engaged then management in IMZs would then become reflective of Priority management, until that occurrence, IMZs are managed in a more protective approach than typically described for General.

IV. RESPONSE TO FWS COMMENTS ON DRAFT EIS

In the Service's comment letter on the Draft EIS (January 31, 2014) an evaluation of the co-preferred alternatives and their consistency with the COT report was described. The BLM, USFS, FWS and the State of Idaho have worked together over the last several months to reconcile the two co-preferred alternatives into on cohesive approach that responds to the concerns raised by FWS and further refines the approaches previously described in the Draft EIS.

V. CROSS JURISDICTIONAL ISSUES

Management direction within the subregion for Idaho and Montana has been coordinated across state boundaries with Wyoming, Utah, Nevada and Oregon. Allocation level decisions are mostly consistent across those boundaries with some discrepancy adjacent to Wyoming where there are some areas of

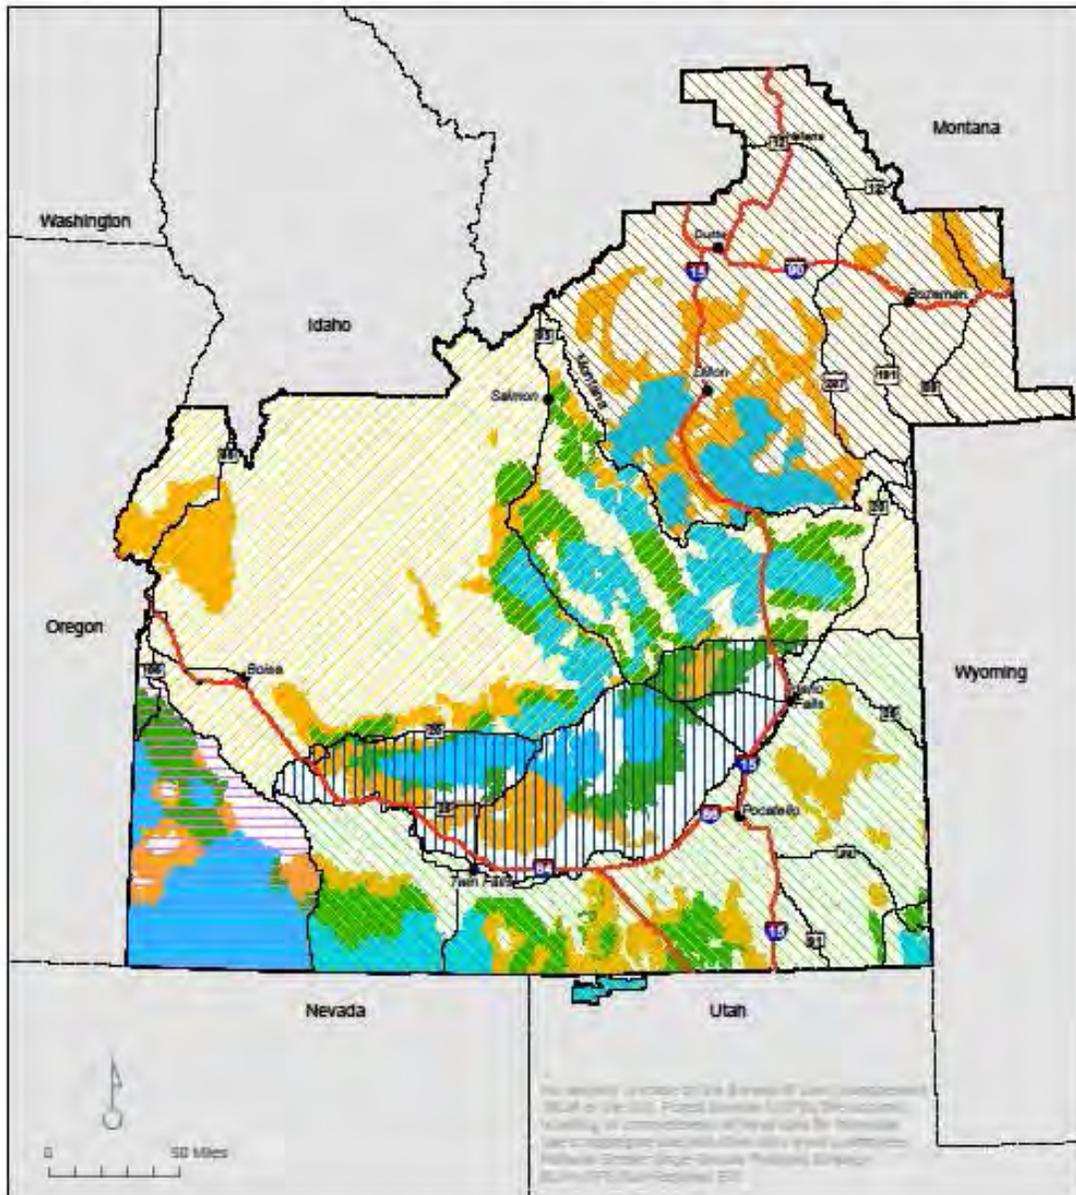

Core Management Zones in Idaho where across the border Wyoming identifies General management areas. There are some similar minor concerns with Utah. Core zones in Idaho and Priority areas in Nevada and Oregon largely match across the boundary and address the same allocation management in those areas.

Other Montana BLM planning efforts have incorporated mitigation and adaptive management approaches. The direction in the Southwestern Montana portion of the Final EIS for these components will differ from Idaho in order to maintain consistency with other Montana BLM plans.

VI. AREAS OF DISAGREEMENT

None.

**Table 1. Allocation/Disturbance Checklist
Idaho and SW Montana EIS - Administrative Draft Proposed Plan**

Allocations/ Disturbance	Consistent with NPT Table	Rationale for Change
Solar/Wind Energy Development ROW	All Core ³ : (Core is analogous to Priority) Consistent with Priority guidance.	General areas are not identified as avoidance; however, required design features, lek buffers and timing restrictions would be required and would limit and eliminate impacts to the limited GRSG habitat contained in this zone (<5% of leks and males).
	All Important: Consistent with General guidance as long as population numbers and habitat availability do not engage an adaptive management trigger. If an adaptive trigger is engaged consistent with Priority.	
	All General: Inconsistent	
High-Voltage Transmission and Major Pipeline ROW ⁴	All Core: Consistent with Priority guidance with very limited exception opportunity.	General areas are not identified as avoidance; however, required design features, lek buffers and timing restrictions would be required and would limit and eliminate impacts to the limited GRSG habitat contained in this zone (<5% of leks and males).
	All Important: Consistent with Priority guidance with limited exception opportunity as long as population numbers and habitat availability do not engage an adaptive management trigger. If an adaptive trigger is engaged even more limitation to the exceptions would apply the same as Core.	
	All General: Inconsistent with guidance, Consistent with COT reduction of threats.	
Other (Minor) ROWs and Land Use Authorizations/Permits	All Core: Consistent with Priority guidance.	
	All Important: Consistent with Priority guidance.	
	All General: Consistent with General guidance.	
Fluid Mineral Resource Allocation (Including Geothermal)	Idaho Core: Inconsistent with guidance. Montana Core: Consistent with Rocky Mountain guidance.	Idaho: Oil and Gas: Core areas with low to no potential, which is most of the subregion, are closed. Core areas with moderate to high potential, which are

³ Idaho portion of the plan identifies three (3) management delineations – Core, Important and General. Core areas are contained within the boundaries of the USFWS Priority Areas for Conservation (PAC) and make up roughly 66% of those areas. The remaining 33% of the PACs and other areas beyond the PACs are identified as Important Management Areas. This further refinement of management areas is **NOT** consistent with the NPT guidance. The Montana portion of the plan identifies two (2) management delineations – Core and General. Important direction does not apply to any areas in SW Montana. Direction for SW Montana in Core and General management areas as the same as for Idaho unless noted separately in the table.

⁴ Coordination across state boundaries for utility corridors is yet to be completed.

Allocations/ Disturbance	Consistent with NPT Table	Rationale for Change
	All Important: Consistent with General guidance, includes additional restrictions to development.	within WAFWA MZ II and adjacent to Wyoming General areas are open, consistent with Wyoming General management (160k acres). Geothermal: Core areas with low or no potential are closed. Core areas with moderate to high potential are open. All Core, Important and General areas would implement required design features, lek buffers and timing restrictions to reduce and eliminate impacts to GRSG. Reasonably foreseeable development scenarios show limited, if any, development likely in the next 10-15 years. This direction is consistent with the COT in reducing the minimal threat that is present.
	All General: Consistent	
Non-Energy Leasable Materials	All Core: Consistent All Important: Consistent All General: Consistent	All Known Phosphate Leasing Areas are outside of GRSG identified Core and Important management zones.
Mineral Materials (Salable Minerals)	All Core: Consistent with Priority guidance. All Important: Consistent with General guidance with stringent limitation criteria. All General: Consistent	Core areas are closed to new mineral material site authorizations and open for sales from within existing sites subject to required design features and seasonal timing restrictions. Important and General areas are open to new mineral material site authorizations subject to required design features, lek buffers and timing restrictions to reduce impacts to GRSG. No differentiation was made between free use and commercial use permits with regard to use of existing sites.
Disturbance (3 %) WY only (5%)	Idaho Core: Consistent with scale of application, Inconsistent with specific biologically significant unit identified. Montana Core: Consistent with other Montana plans. All Important: Consistent with scale of application, Inconsistent with specific biologically significant unit identified. All General: N/A	A 3% disturbance cap is applied to seasonal habitats of highest concern - nesting and wintering habitat - within Core and Important Management Areas.

Table 2. ADPP Response to FWS Comments

USFWS Concern	Resolution
Consistency across subregional boundaries	The BLM and FS have coordinated across subregional boundaries to further develop consistent approaches, or to clearly describe the rationale for the threat response where inconsistencies exist. Allocation level decisions are consistent across subregional boundaries; some conservation measures vary based on relative threats and habitat conditions/usage.
Disturbance Caps and no unmitigated loss	Disturbance caps have been included and further description of no net unmitigated loss has been included as part of the ADPP. A consistent approach and scale to measuring disturbance has been included with emphasis on seasonal habitats of concern in the Idaho and southwestern Montana subregion.
Adaptive Management Hard and Soft Triggers and an Implementation Team	Adaptive management hard and soft triggers as well as an Implementation Team to help assess these triggers in coordination with the State of Idaho has been included in the ADPP.
Lek buffers and noise protective measures	Buffers and their applicability have been further refined and defined in conjunction with FWS as have appropriate noise protective measures which are now included as required design features.
Implementation and Effectiveness Monitoring	These monitoring components have been further described at the broad, mid and fine scales and are included in the ADPP.
Mitigation	Additional description of how mitigation is included as components of project proposals and stepped forward through use of the state mitigation strategies is included in the ADPP. Decision to develop a mitigation board and develop a state specific mitigation strategy consistent with and in conjunction with WAFWA MZ strategies is also included in the ADPP.
Certainty of Effective Implementation (specificity)	Management actions and conservation measures have been refined to more clearly articulate the intent and direction to support the specificity needed by the Service to ensure certainty of implementation.
Impacts Analysis	Work is ongoing to augment the initial impacts analysis described in the Draft EIS. Additional work is being completed to delineate effects with specific regard to priority areas for conservation and the identified threats. This work will be complete in the Final EIS.
Priority Areas for Conservation and Mapping	Further refinement of the GRSG management areas, consistent with the COT and biologically meaningful units has occurred in coordination with the State of Idaho, FWS, BLM and FS. This management area delineation is a foundational component of the Idaho and southwestern Montana ADPP.
Infrastructure	Further refinement and definition of infrastructure criteria with respect to effects on GRSG habitat has been included and describes the application of these criteria in relation to COT objectives in the ADPP.
Wildfire/Invasives	The ADPP includes application of the Wildfire and Invasives Assessment process and other work developed by the Fire and Invasives Assessment Team to address fire concerns. In addition several components of the Idaho State Plan have been incorporated into the ADPP which further prioritize and address wildfire concerns.

ID/swMT GRSG EIS
Section 7 Consultation Coordination
Meeting Minutes
20 August 2014

1. Attending: Scott Hoefler (BLM), Mark Robertson, Barb Schmidt (FWS), Chris Colt, Doug Middlebrook, Katherine Malengo (FS); Absent: Bruce Davidson (FS), Anna Halford (BLM)
2. Discussion of Slickspot Peppergrass (LEPA): The final Conservation Agreement has been approved and is expected to be signed by early next week.
3. Discussion of Grizzly: we are lacking spatial data on current distribution of grizzly; would like this information to overlay with sage-grouse habitat. Discussed the initial determination, need to review overlap of distribution and sage-grouse habitat; may affect, not likely to adversely affect call may be most appropriate. Doug has started looking into this species, Katherine will take over and finish the analysis. Chris will talk to FS Biologist who is on the Grizzly Recovery Team to get best contact person for distribution mapping. Mark/Barb will talk to East Idaho Field Office FWS to give them a heads up on the project and this species and get some initial feedback.
4. Discussion of yellow-billed cuckoo: Riparian gallery forest species – some overlap with sage-grouse habitat. Discussion about potential effects; based on no specific management actions in riparian gallery forest habitat and existing protection measures for riparian areas the initial view was no adverse impacts. Chris and Scott will research existing LUP BAs and other for language describing protections and how management actions will not impact YBCU. Mark/Barb will talk to East Idaho Field Office FWS to give them a heads up on the project and this species and get some initial feedback.
5. NOAA/NMFS: An initial letter was sent to NMFS and a response was received. Information from this letter was incorporated into the analysis. There is some overlap of GRSG habitat and designated critical habitat based on the 8th huc mapping Doug is working on, however, based on the scope of the management actions, we do not anticipate any adverse impacts to anadromous fish. Scott has been in contact with Bill Lind (NMFS) and will continue to communicate. Specifically, he will contact Bill and discuss the current “no effect” determination direction with the project. Chris will provide Scott an example notification letter from the Oregon project.
6. Timeline: Expect to have draft Biological Assessment completed by 17 September, 2014. Will provide to FWS for informal review. They will then have ~2-3 weeks to review and let BLM/FS know of any concerns with determinations and analysis methodology. We will discuss and decide on FWS informal review dates as we get closer based on project timeline and other FWS logistical considerations. Then we will finalize the BA and provide to FWS.
7. Next meeting: Wednesday 8/27/14 @ 10:00 MDT

Subject: GRSG GBR FedFam Mtg - Attachment A
Attachments: Attachment A-GRSG GBR Fed Family Mtg PDX_2014_08_19-21_Reviewed_Distribute.docx

Importance: High

Good Friday Afternoon to Joan, Joe, Quincy and Brent!!

I wanted to share with you our Attachment A from the Federal Family Meeting notes. This Attachment summarizes the action items that we need to follow up on from our meeting. The notes, themselves, are not ready to be distributed as Sarah is still reviewing and commenting on the 29 pages of them....they should be ready in a week or two.

Please do not distribute Attachment A any further than your desks at this point. They may change or be modified as a result of the Rocky Mountain Meeting next week....but I wanted you all to think about what we have left to do on this list. The Solicitors and the WO have many of the tasks to follow up on.

Quincy.....your name comes up a lot as well!!

I am not sure if we are going to distribute this list at the Rocky Mtn. FFM, or just use it as points of discussion....haven't heard yet.

I won't be on the PL Tuesday call for the next two weeks – and neither will David. I am sure he will have someone else from EMPSi open up the meetings and take notes – so plan on having the calls. Next week we will be in Denver at the Rocky Mtn. FFM, and the next week in Washington to do a roll-up of the roll-up meetings. I think that is where the rubber is going to meet the road.

If anything REALLY interesting comes up.....I will send you all out an e-mail and let you know.

Carry on with all the great things you are accomplishing. Have a great week-end!

Lauren

**ATTACHMENT A:
GREATER SAGE-GROUSE GREAT BASIN FEDERAL FAMILY MEETING - SUMMARY OF OUTCOMES AND ACTION ITEMS**

Applicable Sub-regions?	Topic or Resource Program	Outcome and Action	Who?	When?
All	Land Tenure / Retention	<p>The following land retention policy text should be included into the ADPP for land retention and related management actions should be adjusted as appropriate:</p> <p>"Lands classified as priority habitat and general habitat (or habitat classification appropriate for the sub-region) for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse."</p>	PMs to incorporate as written into ADPP	ADPP
All	Vegetation Management/ Prescribed Fire	<p>Incorporate the following language regarding when fire would be used as a vegetation treatment tool for areas with <12" precip.</p> <ul style="list-style-type: none"> • Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. • If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how Conservation Objective Team/land use plan objectives would be addressed and met and why alternative techniques were not selected. • Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat in 	<p>Lauren to consolidate language</p> <p>PMs to incorporate into ADPP</p>	ADPP

Subject: *The Next Steppe: Sage-grouse and Rangeland Wildfire in the Great Basin* 2014
Conference. November 5-7, 2014, at the Boise Centre, Boise, Idaho

We are facing a critical juncture for public land management in the Great Basin as the U.S. Fish and Wildlife Service decides whether to list the Greater Sage-grouse. The 2014 conference, *The Next Steppe: Sage-grouse and Rangeland Wildfire in the Great Basin*, brings together scientists, agency leaders, rangeland and fire managers and partners directly engaged in the management of sage-grouse habitat in light of rangeland wildfires.

The conference focuses on practical components for dealing with rangeland wildfires in the Great Basin. Speakers, panelists and moderators are individuals engaged in on-the-ground work in sagebrush habitat and/or fire operations. It is our intention to facilitate the diverse dialogue and honest communication necessary to develop innovative solutions to combat this escalating challenge.

We are already seeing policy shift as we allocate more resources to fires threatening sage-grouse habitat. As resource and fire management plans are updated to reflect this natural resource priority, we must develop policies and practices that eliminate some of the threats fire has on sage-steppe habitat. The conference provides a unique forum where we can look at the larger picture and learn from one another about what works and what doesn't.

Staff engaged in the direct management of sage-grouse habitat located in the priority Fire and Invasives Action Team (FIAT) states are strongly encouraged to attend. The conference is a major priority for the Department of the Interior as it shows our commitment to enhancing healthy habitat for sage-grouse.

Who Should Attend from BLM FIAT States:
State Directors
State and District Fire Management Officers

District Managers
Field Managers
Fire and Fuels Specialists
Appropriate Biologists

While we encourage all active partners to attend, space is limited so we are asking you limit your personal invitation to only 20 non BLM partners, federal, state or nonprofit, who you feel would best benefit from this conference. These could include: scientists or staff engaged in sagebrush-steppe management or research responsibilities within the Great Basin, conservation groups engaged in protecting sagebrush-steppe within the Great Basin, Rural Fire Departments, Rural Fire Protection Associations, ranchers and/or elected officials, from local county commissioners to statewide and national office-holders.

Registration, agenda and lodging information is available online at <http://fireandsagegrouse.nifc.gov/>. Questions or comments may be directed to 208-387-5457 or via email to sagegrouseandfire@blm.gov.

Subject: Webinar with the States - Please Populate the following slides

Hello Great Basin Project Leads,

I apologize for the delay in getting these slides to you, but leadership finally gave us the "ok" to work with this version. As you are aware, the Great Basin Webinar is set for **Tuesday, September 30, 2014 from 12pm to 5pm EST** - Ed should be sending out an email invite with the webinar instructions shortly to your SDs and state Task Force representatives. Each BLM SD will have 30 minutes to discuss their ADPP's 5 slides. The first 3 slides will be populated by the NOC for you. As you will see in the PP presentation attached, Utah's first three slides have already been populated to give you a sense of the type of information that will be in those slides. By Friday, those slides for ID, OR, and NV will be populated. The states were given a list of questions to address (which you will see in the PP) and they also have 30 minutes. They were given the option to either populate their own slides or to verbally present their strategies.

What I need from all of you is to populate the two slides that list the program areas that address the COT Report Threats. In many cases, that threat may not exist in your planning area. If that the case, simply say "not a present and widespread threat." For those program areas that do pertain to the threats in your sub-region, simply state what allocation you are applying to both priority habitat management areas and general habitat management areas and any other information you feel is relevant to the audience. As you will see, the tables do not provide you with much space, so brevity is the key. So here is what I need:

Quincy: Populate tables on slides 13 and 14.

Brent: Populate tables on slides 21 and 22.

Joan: Populate tables on slides 29 and 30.

Joe: Populate tables on slides 37 and 38.

If you can send me back your slides by **COB Friday**, that would be excellent. If you need more time, just give me a call.

I really appreciate all your help in such as short time period.

Thanks,

DRAFT POWERPOINT
FOR REVIEW

National Greater Sage-grouse Conservation Plan Great Basin Region Federal and State Coordination Webinar

September 30, 2014

BLM - USFS
Sage-Grouse Conservation Plan

Meeting Objectives

- **Information Sharing:** Review and discuss the BLM sub-Regional (state level) plans and individual State plans for Greater Sage-Grouse conservation to understand the approaches and strategies employed in each state.
- **Clarification:** Identify key questions and information needed for the follow-up face-to-face meetings with the Task Force representatives.
- **Preparation:** Federal and State Coordination Meeting

Meeting Agenda

Welcome (5 minutes)

- *Neil Kornze, BLM Director;*
- *Noreen Walsh, USFWS*
- *Chris Iverson, Deputy Regional Forester;*
- *Virgil Moore, Idaho Department of Fish and Game Director;*
- *Jeremiah Reiman, Wyoming Natural Resource Policy Director*

Strategies common to all BLM/FS sub-regional Proposed Plans/FEISs (10 minutes)

- *Ed Roberson, BLM Assistant Director for Resources and Planning*

Similar proposed management direction found in each of the sub-regional Proposed Plans/FEISs (10 minutes)

- *Ed Roberson, BLM Assistant Director for Resources and Planning;*
- *Amy Lueders, BLM Nevada State Director*

Meeting Agenda (Continued)

Individual Review of State & BLM/FS Administrative Conservation Strategies

(1 hour per state/sub-region, 4 hours max)

Nevada/California

- Amy Lueders, BLM Nevada State Director;
- Chris Iverson, Deputy Regional Forester;
- _____, State of Nevada Rep.
- _____, State of California Rep.

Utah

- Juan Palma, BLM Utah State Director;
- Chris Iverson, Deputy Regional Forester;
- _____, State of Utah Rep.

Oregon

- Jerry Perez, BLM State Director
- _____, State of Oregon Rep.

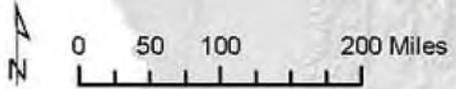

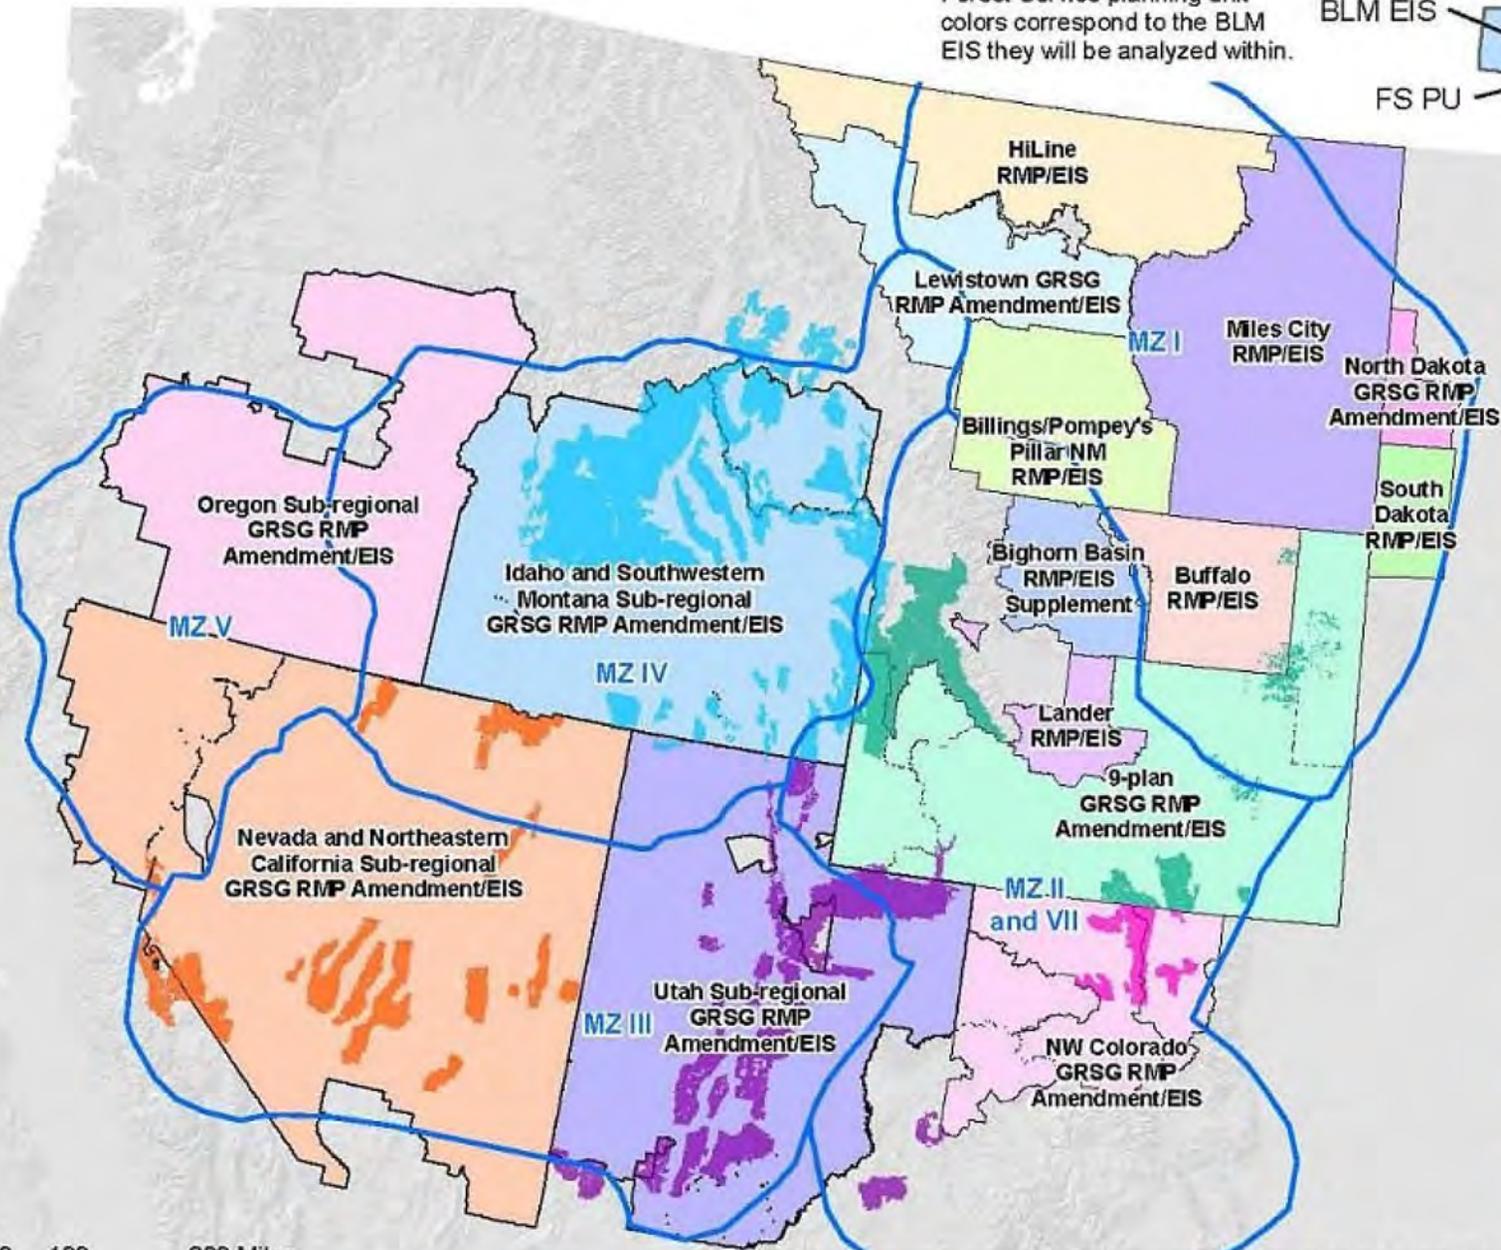

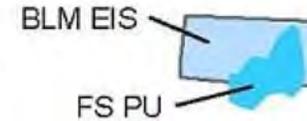

Idaho/Montana

- Tim Murphy, BLM State Director;
- Chris Iverson, Deputy Regional Forester;
- _____, State of Idaho Rep.
- _____, State of Montana Rep.

BLM USFS GRSG Planning Strategy Sub-region/EIS Boundaries

Forest Service planning unit colors correspond to the BLM EIS they will be analyzed within.

Overview of Draft Proposed Plan Amendment

Program	BLM & FS Draft Proposed Plan
Land Tenure <i>Address COT Threats: Agriculture conversion, urbanization, and small size.</i>	Priority, Important and General Habitat Management Areas will be retained in Federal ownership.
Wildland Fire Management <i>Address COT Threats: Fire</i>	Priority Habitat Management Areas are the highest priority for suppression and rehabilitation activities. BLM and FS will support development of Rural Fire Protection Associations and include in suppression activities. BLM & Forest Service will complete Wildland Fire and Invasive Assessments with partners.
Vegetation Management <i>Address COT Threats: conifer removal and weeds.</i>	Habitat Management Objectives are identified for GRSG habitat which include decadal treatment objectives for conifer (juniper) removal and annual grass treatments. BLM & Forest Service will complete Wildland Fire and Invasive Assessments with partners to identify areas of concern for weeds and invasive species and develop management strategies to address.
Fluid Minerals <i>Address COT Threats: Energy</i>	Priority and Important Habitat Management Areas are subject to No Surface Occupancy, General Habitat Management Areas are Open with GRSG constraints.
Solar/Wind ROWs <i>Address COT Threats: Energy</i>	Solar and Wind Development are Excluded in Priority Habitat Management Areas, Avoided in Important Habitat Management Areas and Open in General Habitat Management Areas.
Wild Horses and Burros <i>Address COT Threats: Free Roaming Equids</i>	No expansion of herd management areas would be allowed in Priority Habitat Management Areas. Manage Herd Management Areas to Appropriate Management Levels (AML). Incorporate habitat management objectives into herd management plans.

Overview of Draft Proposed Plan Amendment

Program	BLM & FS Draft Proposed Plan

Earlier this AM I asked a similar question of Ed as to what is planned for upcoming sage grouse meetings for State Directors.

Brent and I are doing our best to track what is being scheduled but the communication has been limited and lots of moving parts.

If you want, I can attend the October 8th meeting but I do need to be back in Boise by the morning of October 9th as Carol and I have a long scheduled trip to Jackson Hole we are taking from afternoon of October 9 and will be back in the office after the Columbus Day holiday, Oct 14.

Hope your time away has been restful.

Jeff

On Thu, Sep 25, 2014 at 9:20 AM, Timothy Murphy <tmurphy@blm.gov> wrote:
GB related calls and meetings are a bit of a challenge to track so please take a close look. If Ed responds to Juan that should help with current scheduling. From Ed's note the Sept 30 Great Basin webinar will dominate the day 10-3 MT. Kathy, please ask IT to have our large monitor connected to a PC and speaker (mic or phone too if that is needed). Please inquire with Cally, Virgil, Dustin about joining us. I gave a heads-up to Cally.

Oct 8 is the face to face with states. GB meeting is morning. Location Tba.
Jeff, I plan to stay with my plan to travel to CDA (too many prior cancellations).

Ed,

I know you have a 100 things going on all at once, but I want to make sure I do not disappoint you by spacing out an important meeting that either I need to prepare for or need to attend.

I'm hearing (can you or your staff help me confirm) of a few meetings upcoming for sage-grouse:

- 1:00 MDT Friday (9/26) meeting for State Directors with WO/DOI discussing policies to apply for the GRSG sub-regions - Do you want me at this meeting? Are there materials or an invite that have been sent out?
- Webinars for State Directors to brief the States on the ADPPs (September 30) - about 25 minutes for SDs to present the BLM and FS ADPPs from a 4-5 slide PowerPoint, followed by 30 minutes from the States to present the state's conservation efforts.
- Webinar for the Great Basin on September 30th
- Webinar for the Rocky Mountain on October 3rd.
- I'm hearing that the Governor's Task Force meeting on October 8-9 would not include the State Directors, but just the WO and Departmental staff.

I may have not captured all the various meeting dates and times and the expectation for me at these meetings, and so forth. Will there be a conference call to let me know what is expected of me at these various meetings.

Also, how and from whom will I hear that the Utah issues have been either resolved or not. Is the expectation that I resolve the Utah issues here in Utah or is someone working at some orbiting sphere above me solving some of these issues?

Thanks.

-Juan

On Fri, Sep 19, 2014 at 3:29 PM, Roberson, Edwin <eroberso@blm.gov> wrote:
Dear Sage-Grouse State Directors,

I wanted to catch you all up on some activities that have occurred since our two federal family roll-up meetings and evolving plans for our meetings with the states to discuss our plans. I have put a hold notice on all of your calendars for a proposed conference call next Friday and 3 pm Eastern Daylight Time. I will provide additional information next week about the call but wanted to set a placeholder now. I also wanted to provide you some information before the call.

First, I want to let you know that our national sage-grouse team spent 2.5 days here in DC working through the action items and decisions from the roll-up meetings. In this regard, we are making progress on some of the key consistency areas--adaptive management, disturbance, buffers, livestock grazing, no net

unmitigated loss, transmission corridors, ACECs, conservation summaries, cumulative effects analysis, etc. I will be meeting with Noreen Walsh, Chris Iverson and Jim Lyons next Tuesday afternoon to get their feedback on the issues and approaches. Then we will brief Neil, Steve and you all on where we are before we meet with the states.

Regarding the proposed meetings with the states, there has been a refinement of the plans since we met in Portland and Denver. Jim has worked with Virgil Moore on a proposal to have two webinars instead of two face to face meetings that you all would need to attend. One webinar would cover the Great Basin plans and one for the Rocky Mountains. The Great Basin webinar would be held on Tuesday, September 30th 12-5 PM EST and the Rocky Mountain webinar Friday, October 3rd from 12-5PM EST. The Sage Grouse Team is working on the webinar information and will provide that to you next week. We are hoping for (and counting on) you all to participate as you have been the primary spokesperson for your plans with the Governor's office and it only makes sense that you provide the overview of your plans.

The face-to-face meeting with the States are proposed to follow the Governors' Sage-Grouse Task Force meeting October 7th and 8th. With your busy schedules we will not be requesting that you attend these face to face meetings but if you would like to you are more than welcome. We are working with the same hotel where the Task Force meeting is being held to secure the same meeting room the WGA has secured as well as a block of rooms. The Great Basin meeting would be on the afternoon of the 8th from 1:30 - 5:30 pm and the Rocky Mountain meeting 9-1PM. The location of these meetings is TBD.

As you will see below from Noreen's email, FWS is having an ESA webinar on October 2nd, which will affect our dates. We are working on firming up the dates, agenda, attendees and other logistics, but hope this helps you with logistics and the next steps ahead. I will keep you posted as we move forward. Thanks, Ed

Dear Sage-grouse Task Force Members,

As you know, the U.S. Fish and Wildlife Service (Service) is currently working on a status review for the greater sage-grouse leading to our 2015 decision. The status review follows the process outlined in Section 4 of the Endangered Species Act (ESA) and must address a

number of scientific and related policy issues. We would like to take this opportunity to provide to our state and federal partners an overview of the ESA status review process and related policy issues. We will cover these policy issues as background, so the content of the policy presentations will not be specific to the greater sage-grouse.

We will be hosting this meeting in the Mountain-Prairie Regional Office in Lakewood, Colorado and online through a webinar. You and your staff are welcome to join either in person or via webinar.

During the course of this one day meeting, we will address:

- The Endangered Species Act (ESA) Status Review Process

- Potentially Relevant ESA Policies (the basics of the policies, how they are applied under the ESA, frequently asked questions about the policy)
 - Listable Entity and Distinct Population Segment (DPS)
 - Significant Portion of the Range (SPR)
 - Foreseeable Future
 - Policy for Evaluation of Conservation Efforts (PECE) when Making Listing Decisions

- Overview of the Service's approach to the greater sage-grouse status review

DATE: **October 2, 2014**

TIME: 9:00 am MT – 4:00 pm MT

LOCATION: Mountain Prairie Regional Office (1st Floor, Eagle Room B),

134 Union Blvd

Lakewood CO 80228

WEBINAR:[1] <http://www.mymeetings.com/nc/join.php?sigKey=mymeetings&i=443154588&p=LEADER&t=c>

PHONE: 877-357-9157 (code: 996-0360)

We greatly appreciate your commitment to greater sage-grouse conservation and your interest in the 2015 status review. Please feel free to circulate the invitation to your interested staff, and encourage people to join the webinar in common locations so we don't run out of connection capability.

An identical invitation has been sent to sage-grouse state wildlife agency directors.

Please contact Nicole Alt (303-236-4213) with any questions.

Best regards,

Noreen

Call #3

9/23/2014

Folks Calling In: Mike Pellant, Karen Prentice, Tom Rinkes, Glen Burkhardt, John Wilson, Shawn Servoss, Verlin Smith, Wayne Wetzel, Louis Brueggeman, Mace Crane, Theresa Burcsu, Krista Gollnick-Waid, Dave Mueller, Andrew Johnson, Don Major, Paul Makela, Ethan ?, Joe Tague, Sandy Gregory, Craig Goodell, Joe Tague, Sandy Gregory, Laurie Kurth, Tim Metzger, Doug Havlina

Key Messages from FIAT call 3:

FIAT Team Updates:

- Central Oregon FIAT (Craig Goodell) – Craig is planning first meeting for next week in Prineville, and doing some GIS prep.
- Northern GB and Snake/Salmon/Beaverhead (Joe Adamski) – Getting data prepped and polling team members for meeting dates
- Southern Great Basin (Sandy Gregory) - Team is meeting Thursday. Exploring a template to document meetings and progress.
- Western Great Basin (Ken Collum) – Working with partners on Step 2

Program Lead Updates:

- Fuels Mgmt (Krista Gollnick-Waid) – Working to line up a geodatabase which would be complimentary to NFPORS to track the spatial data and feature classes of FIAT projects
- Fire Operations (Rex McKnight) – no report
- Habitat Restoration and Recovery – Vicki Herren is working with Gina Ramos to identify a vegetation representative from WO220
- ESR (Jeremy Kruger) – no report

BIN Topics:

- Table 4 of the R/R GTR will be buffed out by a small team led by Mike Pellant. He'll select the group which will include folks with field exposure.
- ATTENTION TEAM LEADS: The EMPSi contact for meeting documentation assistance is Peter Gower (peter.gower@empai.com, phone = 775-323-1433). Call him directly.
- WebEx for FIAT teams will be Friday, October 3, 0900 mountain.

Action Item	Responsible	Due Date
Compare the two sagebrush cover layers (FIAT Step 1 and BLM Disturbance and Monitoring)	Matt Bobo	9/25
Complete a call to discuss the NFPORS/FACTS/geodatabase topic involving BLM and USFS	Karen, Krista, Doug, Laurie	Schedule by 9/25
Get vegetation rep from WO 220	Vicki and Gina	9/26
Post Reno powerpoints to sharepoint site	Doug	9/24
Assemble short team to revise Table 4 in the Chambers GTR	Mike	10/2
Reach out to adjoining States and Districts to get those folks committed to the Northern Great Basin FIAT	Joe Adamski	10/1
Schedule FIAT overview WebEx for FIAT teams	Doug	9/23

Sage-Grouse Great Basin Region Project Management Team Weekly Call

September 2, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Joe Tague, NV; Quincy Bahr, UT; Seth Flanigan, UT; Brent Ralston, ID; Joan Suther, OR; Vicki Herren, WO/NOC; Doug Havlina, NIFC; Frank Quamen, NOC; Johanna Munson, WY; Matt Magaletti, WO

USFS: Randy Sharp; Madelyn Dillon

EMPSi: David Batts; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- Matt: Follow up with Sarah Shattuck regarding WHB gather management actions.
- Project Leads: Review Wild Horse and Burro goals, objectives, and actions from NV/CA to see what can be incorporated into each subregional plan.
- Lauren: Follow up with Lee Corum and Frank regarding best available science for buffers.
- Doug: Send FIAT information sharing call information with Lauren.

Meeting Minutes

WO Updates

- Continuing work on the buffers table. USFWS webinar tomorrow prior to Rocky Mountain Region federal family meeting. Discussions related to disturbance white paper; team has agreed upon 4 disturbance measures. Forest Service staff are in Washington to talk about WO review and protest schedule and process.
- Lauren reviewed federal family notes which include all the follow up tasks. Waiting for WO and SOL review. Hope to distribute them by Wednesday.
- Lauren will send the complete Wild Horse and Burro goals, objectives, and actions from NV/CA plan. Project leads should review these and see what you can incorporate.
- Oregon received advice from their regional SOL to not put in the action on gathers. Matt will follow up with Sarah.

NOC updates

- Have been working on assignments from Great Basin federal family meeting, such as the buffer assignment. Asked for USGS input– they will look at buffers and make recommendations on what is the best available science.

- USFWS also looking at science behind buffers, highlighting concerns about duplicating efforts. Lauren will follow up with Lee Corum (USFWS) and discuss with Frank.
- Challenging meetings regarding disturbance cap and where it's applied (e.g., the Biologically Significant Unit). USFWS is still concerned about disturbance around leks.
- Preparing for Rocky Mountain Region federal family meeting next week.

Subregional Updates

- In general, all subregions are awaiting further guidance that is anticipated to result from the Rocky Mountain Region federal family meeting.
- Oregon sent disturbance and mitigation appendices out to cooperators and internal team to review.
- ID/MT trying to finalize proposed plan, following up on certain items after federal family meeting.
- UT is working on disturbance monitoring plan, disturbance inventory, and inventory of existing rights table.
- Inventory of existing rights is intended to help inform the USFWS of the magnitude of existing rights, give a reference point. May need to caveat that data may change as more information becomes available.
- NV/CA – preparing numbers for existing authorizations.
- USFWS data request regarding conservation efforts – Vicki has been working on this to get a strategy in place. Existing authorizations may help to address their request regarding threats. Robin Sell will be on a 4 month detail at NOC to help coordinate the data call.

Forest Service Update

- Glen and Chris in DC to meet with Forest Service leadership and provide a briefing. Generally finished with the Great Basin draft planning language, though waiting on additional information from NV/CA.
- Reviewing the response to comment reports, and waiting for the latest UT report.
- Lauren has an updated Great Basin Region summary of allocations table. Madelyn will compare this table with the Forest Service plans. Some NV/CA details may be unknown.

Other

- Fire and Invasives IM signed by Ed last week. Training session is scheduled for 9/16-18 in Reno.
- FIAT– will have the first information sharing call today. Doug will send the information to Lauren. It is scheduled for every Tues from 1-3 pm Mountain.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

September 9, 2014 10:00 a.m. PST

Attendance

BLM: Joe Tague, NV; Brent Ralston, ID; Joan Suther, OR; Jessica Rubado, OR

USFS: Rob Mickelsen

EMPSi: Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower

Handouts

- None.

Action Items

EMPSi

- EMPSi will check CommentWorks to determine which subregions received comments about soil crusts and will develop a response.

Meeting Minutes

Review of Consistency with Other Plans

- How are all subregions reviewing for consistency with other plans?
 - ID/MT will look at county sage-grouse plans and will flag inconsistencies. Will not go through all county land use plans, though Brent has reviewed these in a cursory manner. Intends to put a brief statement in Chapter 2 (referencing an appendix) to discuss where the county sage-grouse plans are incorporated or inconsistent. Intend to meet with counties individually after plans are final and in the review process.
 - OR asked Cooperating Agencies for inconsistencies with their land use plans and did not receive anything specific.
 - NV/CA had a similar experience as Oregon. They do not intend to go through the county land use plans.
 - Until we have a ROD with a decision, we are not inconsistent with any plan. At what point do we need to do this review?

Soil Crust Analysis

- Public comments received on the DEIS asked for additional analysis of effects to soil crust from livestock grazing. Are all subregions including additional analysis?
 - Subregions decided that additional, in-depth analysis is not needed, though all should acknowledge that there could be effects to soil crust.
 - EMPSi will check in CommentWorks to determine which subregions received this comment and will develop a response indicating that a detailed impact analysis is not

appropriate at the planning scale given the lack of data across the subregions. A more detailed impact analysis would occur at the implementation or site-specific scale.

Wild Horse and Burros

- In Oregon, had a discussion about limiting grazing in circumstances where wild horse and burros were unmanageable. Including as an adaptive management provision. Other subregions are not including this. NV/CA includes a request for emergency gather funds if not at AML.

VDDT Modeling Update

- Vegetation modeling reports are done. Rob will be meeting with Craig this week and creating a spreadsheet with outputs that will be shared. Will show the COT population area for each subregion, initial habitat conditions relative to desired conditions, and required treatment needed to get to desired conditions.
- Compared to the first run 1) LANDFIRE data shows more GRS habitat in better condition than the first vegetation map. First – 60% meeting; now – 79% meeting; 2) changes in vegetation types: more WY sagebrush and low sagebrush. Less treatment required because habitat conditions start out better.
- Acres imply precision that is not there. Rob suggested showing a percentage of sagebrush that needs to be treated, but participants felt that the USFWS probably will want to see numbers. Consider rounding to nearest thousand.

Attachments: GBR PM Meeting Notes 2014-09-23.docx

Hi all,

Attached are notes from this morning's call. Also, below is the guidance Carol-Anne provided regarding inclusion of commenter names in the comment report. We can discuss more on the next Great Basin call if needed:

1. Without a doubt, include everyone that submitted a unique letter or meeting comment card (these are the 300-ish letters that were not submitted via a form letter site). This would include a reference to a group's master form letter (e.g., "Sierra Club – Campaign Letter")
 - a. List these names in triple column after the report. E.g.,

Adams, Angie	Garrison, Carol-Anne	Prohaska, Holly
Batts, David	Holmgren, Derek	Ricklefs, Chad
	Zaccherio, Meredith	
 - b. Do the cooperating agency, organizations, user groups, etc. listing as the first table; individual names as the second table.
2. Do not include the form letters. Why? Because, they're all the same and we cover them in the "Sierra Club – Campaign Letter" reference. We do still track the names of the form letter submitters (unique or not) as part of the decision file records, and we can make a reference to "names being available upon request" or something similar in the front matter text of the report/appendix.
3. Easiest way to get the names for listing, run a comment works report – this way we're assured of including all the names that appear in the report. This will also catch anyone that include unique, substantive comments in a form letter.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

September 23, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Joe Tague, NV; Quincy Bahr, UT; Brent Ralston, ID; Joan Suther, OR; Jessica Rubado, OR; Matt Magaletti, WO; Vicki Herren, WO

USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Derek Holmgren; Peter Gower; Drew Vankat

Handouts

- Oregon RDF NTT comparison table

Action Items

Sub regional PMs and Forest Service

- PMs: Coordinate with your State Directors to get invites for the Friday call and webinar next week.
- PMs: Respond to Matts request for additional information on adaptive management.

EMPSi

- Send information regarding commenter names for the comment response report.

Meeting Minutes

Policy Recommendations from Off-Site Meeting

- Vicki Herren is now in the WO.
- Off-site meeting last week to follow up after the two federal family meetings. Created a set of additional action items and policy recommendations for NPT.
- Policy recommendations are being sent to Ed this afternoon. Meeting on Friday (3-4 pm EST) with State Directors to review recommendations and schedule. PMs should contact their State Directors for the invite. Schedule is pending approval in the Department office so Matt can't share yet, but PMs will not need to have WO review documents ready until after holidays.
- The following are the policy recommendations:
 - No net unmitigated loss – recommend that everyone will utilize this concept. Does not impact GBR, but the RMR states will include (except WY).
 - Lek buffer – USGS will have their recommendations to BLM by October 6. Provided list of scientific review panelists included academics, state representatives, federal agencies. SOL is reviewing this list.
 - CEA # 1 - Important Management Zones in ID will be grouped with General Management Zone for calculations. In the narrative, state that they do have more restrictive management. Brent does not feel like this makes sense because they could be managed as Core in the future. SOL opinion would rather group with the less

restrictive allocation to be on the safe side. If a concern, Brent should discuss with Tim, who could voice concerns during the Friday meeting.

- CEA #2 – Originally the CEA was going to be run utilizing the preferred alternative data. Will now use the ADPP data since it is available for all plans. Expect subregions will submit ADPP data to NOC by October 22.
- Changing nomenclature – PPMA, PGMA becomes Priority Habitat Management Areas (PHMA), General Habitat Management Areas (GHMA), and Important Habitat Management Areas (IHMA). UT concerned because a lot of areas aren't habitat but may someday become habitat. RMR (including WY) agreed to use the terminology.
- Working with states – First will have two separate webinars: GBR webinar on Tuesday, Sept 30 12-5 pm eastern; RMR on Friday, Oct 3, 12-5 pm EST. This will be a state director responsibility, but PMs will attend and their input will be needed. Working on what is required, but likely will need 4 slides (map with acres/percentages; relationship of the subregion to the rangewide conditions; then discuss the ADPP). Very high level summary, 1 hour per state. BLM will include FS in their discussion.
- Matt may ask PMs for input on slides later this week with a very quick turn-around.
- Three objectives for these webinars:
 - Information sharing: reviewing and discussing BLM/FS ADPPs and state plans
 - Clarification: key questions for a follow-up face-to-face meeting
 - Preparation for task for meeting
- Then, task force meetings October 8th and 9th which will require Department-level involvement. State Directs will not be there. States will also share what they are doing.
- Process for publishing proposed plans – eliminate Regional Management Team and NPT briefings in place of one interagency + director briefing combined.
- Due to the webinars, there will be no call next week.

Adaptive Management and RDFs

- Adaptive management- big discussion last week and reviewed the sideboard tables as a group. Will need a hard wired response to triggers – more of an issue in RMR, but also applies to OR. Matt will email everyone additional questions.
- Matt emailed the RDF table from OR – how RDFs from NTT were addressed in the proposed plan. Instead of utilizing word docs, PMs should use that excel spreadsheet.
- There are three exceptions that describe when we don't have to use an RDF. Group agreed to include this text in their documents.

Updates from the NOC

- Disturbance: Made progress 2 weeks ago. Settled on scales and where the disturbance cap and fire apply. USFWS said that it should be applied to sagebrush availability (except for WY). Wanted to have a follow up call to determine how disturbance will be calculated. However, attendees have limited time, so may have to wait until later in October. In the meantime, Vicki, Gordon, Frank will try to finalize white paper.

- Brent and Joe should discuss the reservation lands (shown differently in NV and ID). ID does not have management on these lands, but they are included in disturbance calculation. ID met with tribes last week who approved and supported their plan.

Subregional Updates

- Oregon working on things that they can; coordinating with other subregions.
- IDMT – no updates.
- UT – working with SOL on some items. Waiting from direction regarding some other items.
- NVCA – FIAT meetings – think that the project leads understand the FIAT, but some misunderstandings within teams. Need to keep teams focused and on task. Hope to make a lot of headway over the next month. Done with first part of assessments early in November.
- Table 2 – call on Friday to discuss methodologies to make sure that all subregions are consistent. The goal of the table is to put the threat from various disturbances in perspective. Joe will send meeting invite to David and Glen.

Forest Service Updates

- None. All plans in for review.

Other

- CEA webinar in about 3 weeks to review Buffalo sample CEA.
- Comment reports – David will send a recommendation for how to publish names. Will discuss further at the next call.

Jason,

Most of the management actions described in the ADPP (administrative draft proposed plan) apply to both Idaho and Montana equally. There are a few sections where we know difference do exist and they have been identified as separate in the ADPP. These include fluid mineral direction in action FLM-1; coordination with State Agencies in actions CC-2 and CC-4; adaptive management direction in the adaptive management section (5) and disturbance cap description and measurement in section (6).

The differences have already been described in FLM-1 and CC-2 & CC-4 for those decisions. The adaptive management and disturbance cap decisions still need developed for the sw Montana portion of the sub region, which I understand John Carlson is working on.

In addition Kelly Bockting is reviewing all the sections of the ADPP to ensure that proposed decisions for sw Montana are reflected in the existing management actions and if not to identify specific areas of the ADPP where additional sw Montana direction is needed.

At the meeting we will specifically discuss the know incompletes (adaptive management and disturbance) as well as additional identified areas needing clarification (those areas Kelly or John identify), plus we will step through the EIS to identify any additional areas of needed information to adequately reflect and display sw Montana (i.e. Chapters 3 & 4).

Brent et al,

I've passed this along to Jeff Berglund (my counterpart in MT) who will also be attending the meeting. To ensure that this meeting is efficient and productive, it would be great to have the MT specific proposed direction (BLM & FS) a week or two in advance. I recognize that there may still be some issues that are not completely resolved (e.g. adaptive management), but hopefully by this time these are pretty limited.

Thanks,

Jason

In the trailing messages it looks like there was a question regarding the FS Proposed Plan as well. With regard to the FS Proposed Plan, all the Desired Conditions, Objectives, Stds. And Guides will apply to the B-D NF similar to the Idaho Forests. Any differences would be related to differences in how habitat is mapped in each of the states. We are waiting to see what the decision will be for disturbance and AMS.

Rob,

I think that would be great, because I think those are really the two pieces that need the attention. I'm not sure there are really any other concerns coming out of Montana or management actions that Montana needs to do differently than disturbance and adaptive management.

Hey Brent,

Just wondering, if it would be advantageous to have a discussion about Adaptive Management and Disturbance Calculation with both B-D staff and BLM staff after the BLM Proposed Plan discussion? If the NPT gets us the decisions on these topics in the next 2 weeks we might be ready to have the discussion with regard to Montana.

Subject: Biological soil crust follow up

I looked further into the biological soil crust discussion we had on Tuesday. Utah did not receive any comments on biological soil crusts, but NV/CA, ID/MT, and OR did. Here is what I suggest:

- 1) Review your DEIS for discussion of biological soil crust. Consider adding a statement to Chapter 3 (vegetation or soils section) to the effect that biological soil crusts have numerous ecological functions, including resistance to invasive annuals. Be sure to review and cite appropriate literature such as Ponzetti et al. 2007, Deines et al. 2007, and Serpe et al. 2006. These three papers were specifically cited by environmental groups to defend their comments.
- 2) Add statement to Chapter 4 GRSG in the nature and type of effects that livestock grazing could impact (trample, break up, degrade, etc) biological soil crust.

Regarding comment response, Oregon currently has a succinct and I think appropriate response: "Biological soil crust information has been added to Section 3.xx. Impacts on soil resources from livestock have been clarified in Section 4.xx." Per our discussion, I will add a sentence: "A detailed analysis of impacts to biological soil crusts is not appropriate at the land use plan scale and further impacts will be analyzed on a site-specific basis during project implementation." I will put this response for all three subregions.

Any thoughts or revisions, please send them to me for consideration!

Thanks,

Meredith

Biological Soil Crusts - Chapter 3 DEIS – suggested text

Biological soil crusts are an important component of a broad range of ecological sites in the Intermountain West. They function as a living mulch by retaining soil moisture, increasing organic matter and discouraging annual weed growth (Eldridge and Greene 1994, Belnap and Gillette 1997, 1998, Belnap 2001, McKenna-Neumann *et al.* 1996, Rosentreter *et al.* 2007). Biological soil crust communities are more prevalent at lower elevations compared to higher elevations with greater precipitation where vascular plant growth precludes biological crust development (Belnap 2001). Specific to soil erosion, biological soil crusts protect interspatial surface areas by occupying open areas between larger plants (Belnap *et al.* 1997). Biological crust condition and cover is also a direct function of the ecological health of the plant community and the NRCS “National Range and Pasture Book” identifies biological soil crusts as a critical ecological attribute to be used as an indicator of rangeland health (USDA 2003). Anthropogenic disturbances have been documented to impact the diversity and function of these communities (Robinson, Ponzetti *et al.* 2013, Peterson 2013).

Kathy

Greater Sage-Grouse Federal Family Meeting

August 19-21, 2013

BLM Oregon State Office, Portland

Summary Meeting Notes

Outcomes and Action Items: See Attachment A: Greater Sage-Grouse Great Basin Federal Family Meeting - Summary of Outcomes and Action Items

Attendance: See Attachment B, Sign-In Sheet

Handouts: Information Packet (Agenda and Population Summary Tables) and Map Packet

PowerPoint Presentations: See Attachment C

These notes represent a summary of the discussion and decisions made during the meeting. They are not intended to be a transcript or verbatim record. All outcomes are noted; any outcomes requiring additional action are summarized in Attachment A.

Notes submitted by: David Batts, EMPSi

Introductions and Opening Remarks

- Neil Kornze, BLM Director. This is a very important meeting to assess all the hard work over the last few years. This effort is unique, and this meeting is an important opportunity to share BLM and Forest Service efforts and to get input on USFWS expectations.
- Noreen Walsh, USFWS Regional Director, Mountain-Prairie Region. There is no single action that will have a greater impact on the sagebrush ecosystem than these amendments, given that federal lands cover 64 percent of the sage-grouse range. Three key things to consider moving forward:
 - (1) COT Report sets the baseline of the objectives USFWS wants to achieve for the Greater Sage-Grouse by Priority Areas for Conservation (PACs).
 - (2) Do not focus on the “minimum” to address the threat, especially in Great Basin where fire is such a large threat.
 - (3) This meeting is not about the listing, but will help inform the listing process. USFWS wants the BLM and Forest Service to tell the story of how the actions in the plans equate to conservation of the Greater Sage-Grouse.
- Chris Iverson, Forest Service Deputy Regional Forester. This planning effort is complex and second to none. There has been a lot of coordination, and we are looking forward to outcomes. Recognizing that Forest Service regulations and guidance have some different requirements, the Forest Service is working closely with the BLM for consistent management.
- Amy Lueders, BLM Nevada State Director. Solutions for the Great Basin are very different from the Rocky Mountain Region due to fire. We need to focus on the solutions in the Great Basin. A lot of smart people have coordinated to arrive at workable solutions. We need to continue to trust each other for a common goal of conserving the Greater Sage-Grouse.

Process, Expectations, and Outcomes

Jim Lyons, Deputy Assistant Secretary for Lands and Minerals Management, DOI

- This process has been a marathon. We need to work hard as a team to get across the finish line together. NRCS is also a critical partner with the BLM, Forest Service, and USFWS. The Secretary of Interior's expectation is that we will work together and across departmental boundaries to avoid a listing.
- Key discussion points from PowerPoint Presentation (see Attachment C)
 - A key finding of COT Report was to “stop the bleeding.” Maintain the integrity of PACs is the critical foundation for sage-grouse conservation.
 - The finish line is a healthy viable population that survives over a long period of time and avoids the need for a listing.
 - Objectives for this meeting are to:
 - Identify threats for each population/PAC within a planning area.
 - Determine how each Administrative Draft Proposed Plan (ADPP) addresses each threat.
 - Discuss the adequacy of land use allocation decisions; focus on inadequacies and and/or inconsistencies.
 - The challenge is to figure out creative ways to focus development outside of PACs.
 - The BLM will issue two RODs, one for Great Basin and one for Rocky Mountain, that tell the story for conservation.
- Key questions moving to the finish line:
 - Do the ADPPs adequately address conservation threats in the COT report?
 - Are conservation strategies consistent (outcomes) and rational?
 - How do the state Greater Sage-Grouse plans align with federal ADPPs?
 - Are cumulative effects adequate to conserve the Greater Sage-Grouse?
- This is more than protecting a species; it is conserving an important ecosystem that supports many species.

Michael Bean, Counselor for Fish, Wildlife, and Parks, DOI.

- A determination of “warranted for listing” does not mean that Greater Sage-Grouse will be listed if the factors used for the warrant determination are addressed.
- Federal land is a critical part of Greater Sage-Grouse conservation because of the large amount of habitat on BLM-administered and National Forest System lands. State plans are also important. The BLM and Forest Service ADPPs can provide guidance for the states.

Agenda Review and Logistics

- Ground Rules: Be frank, honest, and open; Be respectful; Be decision-oriented; Be succinct; Be clear.
- This is an outcome-based meeting:
 - If there is agreement in this room, the agreement needs to hold outside of this room.
 - If there is lack of agreement, identify what the issue is and what needs to happen to get the issue resolved at this meeting.
 - If there is a lack of information, we need to have a plan to get that information for this meeting.
- Roundtable brainstorming of concerns about the meeting:
 - We will not arrive at consistency across ADPPs.
 - There is a lack of clarity, and we will leave not knowing what the ADPPs would achieve.
 - The ADPPs will not having a common narrative.
 - Different agencies will not be willing to step out of our traditional roles.
 - There will be an expectation that big decisions will be left to the local level.
 - We will not devise the strongest conversation strategy.
 - We will leave thinking we have a shared understanding when there is not.
 - We will not able to patch the holes in the ADPPs.
 - Subject matter experts are not engaged.
 - We will not be able to meet the schedule and deadlines.

BLM Approach to Developing Administrative Draft Proposed Plans (ADPPs)

Ed Roberson, Assistant Director for Resources and Planning, BLM

- See PowerPoint presentation (Attachment C)
- The ADPPs contain different ways of defining habitat that align with state definitions.
- For this roll-up meeting, we pulled up the threats and applied the allocations to the populations.

Forest Service Approach to Developing their DPPAs

Chris Iverson, Forest Service Deputy Regional Forester

- The Forest Service planning team reviewed the 5 draft EISs that involved the 19 National Forest Service units for inconsistencies and are striving to achieve consistency among them. We are developing a Forest Service proposed plan.
- Forest Service is working under some other laws and regulations that that have different requirements than the BLM, including viability analysis and preparation of biological evaluations. In general, this has resulted in more conservative allocations and actions.
- The Forest Service proposed plan is written in the Forest Service planning language (e.g., desired future conditions, standards, and guidelines), which is similar to, but different from the BLM language.
- The Forest Service planning team is striving for consistency with BLM and state plans.
- RODs will likely be at the regional forester level. The number of RODs is still being discussed in terms of how best to tell the Forest Service story.

Major Changes between BLM/Forest Service DEIS' and ADPPs in Great Basin

Lauren Mermejo, Great Basin Regional Project Manager

- See PowerPoint presentation (Attachment C).
- We are addressing public comments and incorporating substantive comments into the ADPPs.
- We are updating ADPPs based on public input, new information, and coordination with cooperating agencies and state/federal partners.
- There will be many changes in the ADPPs, resulting in more consistency.

5-Minute Overview by BLM State Directors

- **Amy Lueders, BLM Nevada State Director.** There has been a lot of coordination between BLM, Forest Service, and USFWS. About 16 percent of the population and habitat is in Nevada. Issues to be resolved through the ADPP process include: (1) not including the 3 percent disturbance cap. (2) More protection for preliminary general habitat due to the proximity of the preliminary general habitat to priority habitat. In Nevada, the habitat and PACs do not align very well as the PACs cannot be replicated. The state has moved away from the using the current PAC boundaries. The Nevada/California ADPP includes hard and soft triggers for adaptive management, and buffers for seasonal restrictions and springs and seeps. State is developing a habitat credit system; the BLM will likely adopt this credit system.
- **Nancy Haug, BLM California State Director.** The State of California is looking at the habitat credit system being developed in Nevada. California management is well integrated with the Nevada approach.
- **Jerry Perez, BLM Oregon State Director.** Oregon has about 14.8 million acres of habitat, of which about 10.2 million are on BLM-administered lands. Oregon has about 10 percent of habitat range wide. Wildfire has consumed about 1.8 million acres (not all sagebrush) and represents a major threat. Predation was brought up a lot in public comments. Buffers range from 1 to 4 miles depending upon habitat type. Oregon's ADPP is using the decadal 3 percent disturbance threshold, with no more than 1 percent in 10 years. Preliminary priority management area (PPMA) covers the PACs and lines up well. Preliminary general habitat is outside PACs. There is a lot of consistency with the state efforts; except on renewables where the BLM's ADPP is more restrictive.
- **Juan Palma, BLM Utah State Director.** Utah has a lot of local Greater Sage-Grouse conservation groups, and the BLM maintains a strong relationship with them. The state is complex in management needs, as shown by the fact that it is in two Greater Sage-Grouse planning regions (Great Basin and Rocky Mountain), three WAFWA zones, and 11 PACs. The PACs match with preliminary priority areas and the state Greater Sage-Grouse areas. There are some acres of preliminary general habitat in PACs, but it is limited. There are two populations in Utah that are not identified in the COT report as PACs. In total, 99.2 percent of breeding birds are covered by the preliminary priority habitat. Utah can apply no net unmitigated loss to preliminary priority habitat, but it will be very difficult to apply no net unmitigated loss to preliminary general habitat.
- **Tim Murphy, BLM Idaho State Director.** The subregion has 12 percent of the habitat range wide and 15 percent of the population. Idaho has three management zones: core, important, and general. The no net unmitigated loss requirement is included in the ADPP. Combined, core and important management zones cover all of the PACs. There is ongoing monitoring in Idaho and maps are updated. Idaho is planning to use the 3 percent disturbance cap across Core and Important habitat in the ADPP.

- **Jamie Connell, BLM Montana State Director.** Over half of BLM-administered lands in the Montana part of the Idaho/Montana subregion are in priority habitat. The existing 2006 Dillon RMP has a lot of strong protections for Greater Sage-Grouse but will be amended for new science and guidance. Core areas match the state priority areas. Montana is striving to be consistent with the Montana state plan that is still under development.

Global Discussions for all Sub-regions and Outcomes

- Defining scale for management and analysis: Priority/General Habitat and PACs
 - There are different scales of defining habitat: priority/general habitat is being used for planning purposes. The COT report identified PACs as important areas, and USFWS is generally using PACs for evaluation.
 - National Policy Team decided that priority and general habitat within the PACs is the focus of the ADPPs.
 - In Nevada, there is not a good overlap between preliminary priority habitat and PACs for reasons noted above. The final EIS will include analysis of the new Coates map, which will better represent the PACs in Nevada.
 - How do we handle preliminary general habitat within PACs? USFWS is okay with lesser protection on preliminary general habitat but if the preliminary general habitat is in a PAC, it could mean that the management would not be meeting the intent of the PACs. Idaho, Utah, and Nevada have this situation. USFWS has anticipated that new science (e.g., Coates map) may change the 2013 PACs. (see additional discussion on PACs in Utah below in section *Populations fully within Utah Sub-region [9b, 9c, 10a, 10b, 11, 12, 13a, 13b, 13c, 15a, 15b, and 26b]*)
 - USFWS noted that it will be easier for the listing analysis if the plans contain a crosswalk between management of priority and general habitat and PACs.
 - **OUTCOME:** It is agreed that sub-regions will continue to use priority and general habitat (core and important for Idaho) as the geographical delineator for management measures and analysis, but that all plans will include a crosswalk that overlays priority and general habitat with PACs.
- We do not need to have consistency in preliminary general habitat between ADPPs, but we do need to make sure there is logic between the political boundaries.
- Inconsistency issue: USFWS emphasized that differences in direction across jurisdictional boundaries without biological rationale are an issue that needs to be addressed.
- We discussed the approach of closing low potential areas to development and leasing. Closing low potential areas may provide certainty.
- Disturbance: Discussion of difference between use of terms “threshold” and “cap”. There is not supposed to be a difference, but the two terms imply a difference. The disturbance framework will define specifics of the cap/threshold.
 - **OUTCOME:** Agreed that all plans use the term “disturbance cap”.
- USFWS has concern about management direction for grazing not being quantifiable and detailed enough to understand how habitat will be protected or enhanced.
 - **OUTCOMES:** (1) SOL and a grazing group will review actions and provide guidance.

WAFWA Management Zone V

Populations Solely within Oregon (17 and 24)

- Small isolated parcels: BLM and Forest Service have limited authority to address this threat, with the primary tool being land retention. All ADPPs retain preliminary priority habitat. Discussed that not all ADPPs explicitly state that preliminary general habitat will be retained. Retaining preliminary general habitat is not part of National Technical Team (NTT) Report, and may not be analyzed in the range of alternatives.
 - OUTCOME: We developed common language for land retention to be incorporated into the ADPPs; see Attachment A.
- Fire and fuel treatments: USFWS is concerned about the use of fire as a treatment in a less than 12 inch precipitation zone. Fire is an important tool to treat some invasive species; the ADPPs provide a process to evaluate the risk. The ADPPs need a clear criteria outlining when fire will be used.
 - OUTCOME: We developed common language to be incorporated into all ADPPs; see Attachment A.
- Conifer removal: The Oregon ADPP has a buffer for conifer removal to 0 percent cover within 1 mile around leks, and less than 5 percent in 20 years. ADPPs vary in how they address conifer removal; some use buffers and some use a criteria-based process. The challenge with a standard buffer (e.g., 4-mile) is that conditions vary by state; for example, some areas in Idaho and Oregon likely have Douglas-fir within 4 miles.
 - OUTCOME: We developed a common goal to be incorporated into all ADPPs; see Attachment A.
- Weeds and annual grasses: ADPPs rely on the FIAT report to guide BLM/Forest Service management; how accurate is the FIAT report? There is concern about the regulatory certainty. The timeline for the FIAT assessment of the first set of priority areas is January 2015, so there will be results prior to the RODs.
 - OUTCOME: We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Energy: Energy development is not a widespread threat for these populations. We discussed whether low potential areas should be closed. There were concerns that changes in technology could change potential. A plan that closes areas makes a stronger statement for regulatory certainty, so closing low potential does not “cost” much. Applying NSO stipulations offers a high degree of protection but waivers, exemptions, and modifications increase uncertainty. For Oregon, there is a process that involves USFWS in any waivers, exemptions, and modifications to reduce uncertainty. There is not consistency in the use of waivers, exemptions, and modifications between sub-regions. If more certainty is needed in Oregon, they could close areas with low potential.
- OUTCOME: We agreed that the ADPPs will include language that is consistent with National Policy Team (NPT) guidance (only the one exception would be allowed but waivers or modifications would not.)
- Mining: OUTCOME: We agreed that the current draft of the Oregon sub-region’s ADPP meets NPT guidance.

- Infrastructure: All Great Basin ADPPs have avoidance criteria for ROWs (Utah, Oregon, Nevada/California are the same; Idaho has different criteria that applies to all anthropogenic disturbances). Avoid, minimize, and mitigate is the process for all sub-regions.
 - OUTCOME: We agreed that the Oregon sub-region's ADPP meets NPT guidance.
- Grazing: Oregon's ADPP considers closing some RNAs to grazing based on certain plant types that are important to Greater Sage-Grouse. There is concern about the certainty of the management actions.
 - OUTCOME: We will form a team to evaluate grazing actions.

Western Great Basin Population (#31)

- Fire: Same as discussed for *Populations Solely within Oregon*.
- Conifers: In Nevada, ADPP provides that the FIAT Report will prioritize conifers with input from the VDDT objectives, which provide the measureable objectives. Future habitat conditions were projected and amount of acres for treatment to meet sagebrush objectives were estimated. There is inconsistency between the Nevada and Oregon approaches (Oregon has buffers defined by distance).
 - OUTCOME: We developed common language to be incorporated into all ADPPs; see Attachment A.
- Weeds: OUTCOME: We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Mineral Materials: There is inconsistency between Oregon and Nevada for preliminary general habitat. Nevada provides more protection than NPT Guidance because preliminary general habitat in Nevada is adjacent to preliminary priority habitat and within PACs, while preliminary general habitat in Oregon is outside PACs and more scattered.
 - OUTCOME: Oregon will review decision to determine if the ADPPs should consider closing preliminary general habitat to mineral materials
- Infrastructure: There is inconsistency in direction for preliminary general habitat for minor ROWs.
 - OUTCOME: Oregon will review the decision to determine if the ADPP should analyze closing preliminary general habitat (exclusion areas) for ROWs
- Grazing: Nevada and Oregon are consistent with the exception of Oregon RNAs. Coates is the best science for Nevada. Connelly is best science for Oregon. If new science comes out, management would be adjusted to it. Improper grazing is the threat, not grazing. Forest Service is defining the structure that is desirable and managing for it. USFWS will be most comfortable with any action that incorporates and manages for future science on Greater Sage-Grouse.
 - OUTCOME: (1) The BLM will review rangeland health and need to tie to Connelly, Coates, and future science. (2) Oregon and Nevada (and any other subregions that want it) will send grazing management sections of their current ADPPs to SOL for review.
- Free Roaming Equids: Modifying AML could mean lowering them to meet Greater Sage-Grouse objectives.
 - OUTCOME: We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Energy: The waivers, exceptions, and modifications are limited in priority and less restrictive in preliminary general habitat. Management direction in the current draft of the ADPPs for this population only uses the one exception from the NPT in priority habitat.

- OUTCOME: We reached agreement that the current draft of the ADPP for this population in the current draft of the ADPP can move forward.

WAFWA Management Zone III

Populations Solely within Nevada/NE California Subregion (14, 15c, and 30)

- Isolated/Small Size and Agricultural Conversion: OUTCOME: We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Fire: Same as discussed for *Populations Solely within Oregon*
- Conifers: Same as discussed for *Western Great Basin Population (#31)*
- Weeds and Annual Grasses: OUTCOME: We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Energy: OUTCOME: We reached agreement that the management direction meets NPT Guidance for priority habitat and exceeds guidance for general habitat.
- Mining (Locatables): All areas are open to locatables and the BLM ADPP is not recommending any withdrawals. Nevada has about 37,000 acres in Greater Sage-Grouse habitat under mining plans of operation, which is about 1 percent of habitat. The disturbance cap is not applicable to mining. USFWS would like to see recommendations for withdrawal of all habitats that do not have mining claims.
 - OUTCOME: We reached agreement that the management direction meets for preliminary priority habitat and for preliminary general habitat in the current draft of the ADPP can move forward.
- Infrastructure: OUTCOME: We reached agreement that the management direction meets NPT Guidance for priority habitat and exceed guidance for preliminary general habitat.
- Grazing: OUTCOME: Same as discussed for *Western Great Basin Population (#31)*
- Free Roaming Equids: OUTCOME: We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Recreation (travel and transportation): Forest Service has designated routes. The BLM is working with a mix of existing and designated routes. USFWS is also concerned about the fire ignition risk from travel, along with impacts from travel (e.g., fragmentation).
 - OUTCOME: We reached agreement that each ADPP should clearly describe the current authority for temporary closures as a travel management tool to reduce fire ignition risk.

Populations fully within Utah Sub-region (9b, 9c, 10a, 10b, 11, 12, 13a, 13b, 13c, 15a, 15b, and 26b)

- Non-habitat in Utah PACs:
 - PAC polygons were drafted to be slightly larger where there was preliminary priority habitat that might provide for “opportunity” areas. That is why there is non-habitat in the PACs. The state incorporated these areas and views them as possible mitigation sites.
 - 99.2 percent of breeding males are within PACs (only 30 males are in preliminary general habitat). About 33 percent of the birds are in the NE PAC (adjacent to Wyoming).
 - The State of Utah refers to PACs as Greater Sage-Grouse Management Areas.
 - Non-habitat areas in PACs are not classified as general or priority management areas, so there are no direct management allocations/actions for them in the preferred alternative that was analyzed in

the Draft EIS. Some are important for connectivity, some could be treated as opportunity areas, and some are truly non-habitat (e.g., four-wing saltbrush communities).

- Discussed possibility of reclassifying these non-habitat areas within PACs.
 - Red areas could be included as some type of management areas, recognizing that some of these areas are not habitat (e.g., cliffs and saltbrush). This would help manage these areas for connectivity.
 - Commit to assessing these areas and, if they are being restored, look into making management changes (through the appropriate FLPMA/NEPA process).
 - If the intent is to make these areas priority habitat, it should be classified as such.
 - **OUTCOME:** SOL will work with Quincy to conduct a legal review to determine room for incorporating non-habitat into priority management.
- Isolated/Small Size and Agricultural Conversion: Preliminary general management area varies because it is No Action plus no net unmitigated loss and the No Action is different between plans.
 - **OUTCOME:** Same as discussed for *Populations solely within Oregon* (#17 and 24)
- Fire: **OUTCOME:** Same as discussed for *Populations solely within Oregon* (#17 and 24)
- Conifers: **OUTCOME:** Same as discussed for *Western Great Basin Population* (#31)
- Weeds and Annual Grasses: Invasive species should be noted as a threat in population II, even though it was not recognized in the COT Report.
 - **OUTCOME:** We reached agreement that the management direction in the current draft of the ADPP can move forward.
- Energy - Solar and Wind: Utah is different than NPT Guidance on wind in PGMA. NPT Guidance is avoidance for PGMA; ADPP is proposing open. We discussed if PGMA within PAC should be exclusion and outside PAC open. Noted that the PGMA within the PACs have disturbance and few birds.
 - **OUTCOME:** We reached agreement that the allocation direction in the ADPP in the current draft of the ADPP can move forward recognizing the explanation in the Population Summary table as to why the PGMA is open to wind.
 - **OUTCOME:** Utah will add a paragraph in the plan stating that the 23,000 acres of PGMA were not PPMA because of the following reasons: there is a xxx kV transmission line covering xx acres, etc.
- Energy – Fluid Minerals: current draft of ADPP for this population (Utah subregion) is different from the NPT Guidance on PGMA in that it defers to No Action direction with no net unmitigated loss. Added 1/640 criteria.
 - This approach does not try to redirect development. We discussed if ADPPs should give priority to leasing on lands outside priority management areas subject to valid existing rights. In Utah there are three priority areas that have high oil and gas potential. This information should go in the conservation summary and in Chapter 2.
 - There is inconsistency with buffers between all the ADPPs. This variation is due to regional and local science and conditions.
 - USFWS feels that some of the language in the energy section (and the ADPP in general) has some undefined language that should be defined and tightened up (e.g., “if technically feasible...” what is technical feasibility?)
 - **OUTCOMES:**

- We reached agreement that the allocation direction in the ADPP is adequate, recognizing the explanation in the Population Summary table as to why the PGMA is open to fluid minerals.
 - Create summary table of buffer sizes between ADPPs for different programs. BLM science team lead at the NOC will review and try to come up with more consistency in the buffer applications through science.
 - Define loose language (e.g., “if technically feasible...” what is technical feasibility?)
- Mining (Mineral Materials): PPMA is closed to new development but allows for existing development, unless it is occurring within 1 mile of a lek. USFWS recommended a 4-mile lek buffer to protect nesting and lek habitat for leasable and salable mining. The ADPP is meeting NPT Guidance, plus a 1-mile buffer, but the greater 4-mile buffer is being requested per USFWS due to the fragmented populations. A more fragmented population is more vulnerable. In Montana, the analysis showed that removing the smaller gravel pits resulted in more truck traffic and air impacts.
 - OUTCOME: We reached agreement that the allocation direction is acceptable with the addition of not allowing expansion of existing mines within a 4-mile buffer of a lek.
 - ACTION: In Utah, the BLM will apply the NPT Guidance in Utah for mineral materials, leasable minerals, and non-energy minerals in PPMA and will not allow the expansion of existing mines within 4-miles of leks due to the isolation and fragmented populations in Utah.
- Energy – Coal: The current drafts of all ADPPs in the Great Basin did not do new suitability analyses. SOL has provided guidance that the BLM has the discretion to limit coal development. Utah will consider going with a 4-mile NSO buffer upon further coordination with SOL.
 - OUTCOME: We reached agreement that the allocation direction is acceptable with the consideration of a 4-mile NSO buffer due to the isolation and fragmented populations in Utah.
 - ACTION: SOL to consult with the BLM on applying a 4-mile NSO buffer for coal mining.
- Infrastructure – Transmission and ROWs:
 - We discussed whether differences in ADPP from NPT guidance for PGMA that are identified as being open for a major transmission line is appropriate. Similar issue as discussed for Energy-Wind (see above).
 - The rationale is reasonable. For minor ROWs, the avoidance criteria are being revised to address access to private property.
 - OUTCOME: We reached agreement that the allocation direction in the ADPP is adequate recognizing the explanation in the Population Summary table as to why the PGMA is open to major transmission lines.
- Infrastructure – Corridors: Current draft of Utah sub-region’s ADPP would undesignate some corridors and would propose some new corridors, some of which are in PPMA. There was no way to route the corridors to completely avoid PPMAs. The reason for one of the new corridors is to steer future development and concentrate development in order to protect habitat from future transmission lines in PPMA. Graphically, it is hard to explain why the BLM is proposing new corridors in PPMA. NPT Guidance is that no new corridors will be designated and NTT says to co-locate lines.
 - OUTCOME: USFWS, SOL, and BLM Utah will review and determine if designating new corridors is appropriate for this effort.
- Recreation: USFWS has requested a 4-mile buffer (1) seasonally for dispersed recreation (e.g., camping, and motorized travel), and (2) no new campgrounds. Dispersed recreation and camping would be very difficult to effectively enforce.

- **OUTCOME:** We reached agreement that the travel management allocation direction in the ADPP is adequate. We will tighten up language on new development. No need for the 4-mile buffer for dispersed recreation.

Populations fully within Idaho portion of Idaho/SW Montana sub-region (18, 23, 25, and 27)

- Isolated/Small Size: Idaho has the same issues as other sub-regions.
- Fire: Prescribed fire is a sparsely-used tool.
 - **OUTCOME:** Same as discussed for *Populations solely within Oregon* (#17 and 24)
- Conifers: Idaho is using the same actions as other sub-regions and has the same consistency questions as other sub-regions.
- Weeds/Annual Grasses: Idaho's concerns regarding weeds and annual grasses are the same as other sub-regions.
- Energy – Solar and Wind: Idaho's ADPP does not follow the NPT Guidance. Solar and wind have minimal potential in Idaho, however.
 - Solar would need to meet development criteria. Monitoring and adaptive management are also being used at 10 percent and 20 percent triggers. The “important area anthropogenic disturbance criteria” are “and’s” not “or’s”. Once the 20 percent threshold is met, Important becomes Core. The cause of impacts is determined at 10 percent.
 - The same “technical feasibility” refinement is needed as in other sub-regions.
 - Idaho is still working out details of triggers with Governor's board. FEIS needs to be clear that the BLM decision is not going through Governor's board.
 - Forest Service is consistent with NPT guidance.
 - We need to be able to dovetail management actions into state plan direction in order to facilitate implementation.
 - USFWS would like a clear explanation of why Idaho is using the three-tier process and how it complies with NPT Guidance, or why any differences would benefit Greater Sage-Grouse.
 - **OUTCOME:** Although management for solar energy development is still inconsistent with NPT Guidance, we reached agreement that the allocation direction in the current draft of the ADPP can move forward.
 - **OUTCOME:** The BLM will prepare a written explanation on the three-tiers of habitats and how they apply to all resource uses (not just fire) and how the three tiers benefit Greater Sage-Grouse.
 - **OUTCOME:** Idaho will examine using 1 percent disturbance per 10 years (which is similar to Oregon).
- Energy – Fluid
 - Forest Service and the BLM have different management strategies. This is a USFWS consistency concern whenever BLM and Forest Service differ.
 - Land is closed to fluid minerals development or such development is subject to NSO stipulations in the ADPP. Anthropogenic disturbance criteria will be applied to waivers, exceptions, and modifications.
 - Closure is mostly in low and no potential fluid areas, because we do not want to shift development to non-BLM-administered lands with important habitat.

- The ADPP is consistent with NPT, with the exception of “exception criteria”. Exception criteria is replaced by anthropogenic disturbance development criteria. One area with high potential is closed.
- Anthropogenic disturbance development criteria are used as a screen. This is not a rationale for its use, but rather a different management alternative.
- Core and Important habitat are split out in order to manage for fire and invasive species.
- OUTCOME: Management for fluid minerals is still inconsistent.
- OUTCOME: “Minimum impact” should be explained in anthropogenic disturbance development criteria.
- OUTCOME: Idaho will reexamine consistency with adjacent state(s) regarding small area(s) of management.
- OUTCOME: Idaho broke geothermal out from other fluid minerals in ADPP due to differences in potential. So land can be open to geothermal and closed to oil/gas. SOL will coordinate with BLM on this issue.
- OUTCOME: Idaho agreed to use the one exception from the NPT for fluid minerals in Core and Important habitat in addition to its avoidance criteria.
- High Voltage Transmission and Minor ROWs. OUTCOME: We reached agreement that the allocation direction in the ADPP is adequate.
- Livestock Grazing: OUTCOME: Same as Population #31
- Free-roaming Equids: OUTCOME: We reached agreement that the allocation direction in the ADPP is adequate.

SW Montana Portion of Idaho and SW Montana Sub-region (19-22)

- Weeds and Annual Grasses: The BLM will incorporate the FIAT as an appendix.
 - OUTCOME: We reached agreement that the allocation direction in the ADPP is adequate.
- Grazing: Discussion on grazing Standards and Guides and whether they provide regulatory certainty. The Habitat Assessment Framework (HAF) will be incorporated to assess whether grazing is affecting Greater Sage-Grouse habitat. USFWS noted that if the regulatory language is the same as in 2010, it will be difficult to say there is more regulatory certainty. It would be best for ADPPs to have stronger direction. The monitoring plan will be part of all the ADPPs.
 - OUTCOME: We reached agreement that the direction in the ADPP is adequate.

Population 26a – Northern Great Basin, Sub-regions: Nevada, Idaho, and Oregon

There are differences in management strategies between jurisdictional boundaries (e.g., wind and mineral materials). A good example is the difference between fluid minerals management in northern Nevada, where ADPP applies NSO stipulations, and Idaho, where ADPP closes areas to fluid minerals development. We discussed that the conservation benefit would be the same on the landscape since there will not be any ground disturbance.

Resource Specific Direction for ADPPs

Land Retention in General Habitat

Proposed policy statement: "Lands classified as PAC, priority habitat, and general habitat for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the lands have no habitat value and that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse."

Discussion: We will remove PAC because plans are focused on priority and general habitat; analysis has not been done by PAC. USFWS noted that not including PAC could result some "important" lands being disposed. The BLM and Forest Service need to include Idaho Important habitat. Language is meant to address disposal; it is not intended to set priorities for land acquisition. It was proposed that the following be removed "...lands have no habitat value..." and replaced with "...lands have no direct or indirect adverse impact on the conservation of the Greater Sage-Grouse within the population."

OUTCOME: We agreed to adopt the revised Land Retention Policy, which must be reflected in the ADPPs.

"Federal lands identified as PAC, priority habitat, important habitat (Idaho only), and general habitat for Greater Sage-Grouse¹ will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the lands have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse."

¹ Each sub-regional EIS may contain different classifications for these habitat types.

Language for <12" Precipitation Zone

Use of prescribed fires to manage sagebrush habitat in low (less than 12 inch) precipitation zones is not supported in the scientific literature for two primary reasons: habitat restoration is extremely difficult, particularly in low moisture scenarios, and purposefully introducing the primary threat to the sagebrush ecosystem within the Great Basin presents a risk of unintentional fire escape with resulting negative impacts. Pat pulled existing language from the four ADPPs and combined them into a statement that is proposed to go in all ADPPs for consistency.

- Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.
- If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how Conservation Objective Team/land use plan objectives would be addressed and met and why alternative techniques were not selected.
- Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site specific variables allow, prescribed fire

could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat in PPMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities).

- Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality.

Discussion: This approach keeps the tool but provides the sideboards for use. The language could be condensed, but the concept is good.

OUTCOME: We agreed to add the language into all ADPPs.

What is Successful Restoration? A Utah Issue

The BLM commits to restoration of the habitat. The measure of success is restoration of the habitat (using existing tools like the HAF). USFWS would like to see measure of success be restoration of habitat and use by the Greater Sage-Grouse. This higher standard is needed due to the fragmented and small populations. There might be a hybrid approach based on adjacency. This is a range-wide issue on mitigation and what is meant by no net loss; this ties into the mitigation strategy.

Proposed approach: Restoration needs to occur in areas where birds are able and likely to re-settle or the ratio of restoration must necessarily increase. One option could be for restoration of habitat adjacent to existing populations.

OUTCOME: We agreed on the intent of the proposed approach.

Oregon General Habitat Island within Priority Habitat – Should management be the same?

This applies to infrastructure and mining development on roughly 100 acres of preliminary general habitat. Oregon is following the NPT Guidance for General Habitat in these islands, and is not proposing to manage them as Priority habitat.

Discussion: The ADPP will need to make sure to include justification for why the islands are treated differently. Every little difference included in the plans makes it more difficult to tell the story and does not send a strong conservation message.

OUTCOME: No change.

Conifers

There was inconsistency between Oregon and Nevada approaches: Nevada is based on Coates, and Oregon is based on Baruch-Mordo; both are using local science.

Distance of 1-mile buffer vs. 4-mile: Oregon's ADPP will use the 1 mile buffer based on science and added a citation to the revised text.

Proposed revised text for Oregon's ADPP: Remove encroaching juniper within 1.0 mile (Baruch-Mordo) of occupied or pending leks. Prioritize treatment leks based on lek count data, lek complexes and distribution of juniper. Treat phase 1 and early phase 2 juniper areas and other areas to benefit breeding and nesting sage-grouse, create movement corridors, and improve late brood-rearing habitat.

Discussion: The science can support different buffers. There will not be consistency locally due to science. All ADPPs have committed to best available science, VDDT, and FIAT so they are incorporated by reference in this topic.

Common Goal: Remove conifers encroaching into sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDDT and the FIAT report will help refine the location for specific priority areas to be treated.

OUTCOME: All plans to incorporate the intent of the common goal into their ADPPs. Actions to achieve objective should be based on best available science.

Waivers, Exceptions, and Modifications

The BLM has stringent CFRs for oil and gas leasing and development, which serve as sideboards. The NPT Guidance for priority areas is either closed or open subject to NSO with specific exemptions including review by an interagency team (no waivers or modifications). The NSO is applied to the lease and the exemption for the APD subject to NEPA. We discussed that NSO with exemptions seems to deviate the intent for protecting the surface. No exemption is a clear message; if exemption is needed, it should be short and simple for clarity. For communication, we should work the language into something like NSO with exemptions following this process 1, 2, 3.... (vs. open with major stipulations).

See handout of comparison of language in the plans. All are consistent with NPT Guidance and relatively consistent across the states within preliminary priority habitat except for Idaho, which allows for exceptions with mitigation. Idaho does not have an interagency team review of exemptions.

OUTCOME: We need consistency in NSO and exemptions. All ADPPs agree to adopt NPT Guidance. (Montana is verifying).

Buffers

USFWS provided a quick overview of the science of buffers. Disturbance within 1-mile of lek can impact breeding. Most literature is focused on 4-mile around lek for disturbance. The Wyoming 0.6-mile buffer is not a standalone buffer; it includes density and mitigation requirements along with impact analysis to demonstrate no impact. Environmental factors (e.g., topography) influences the buffer the birds actually need.

See handout Comparison of Lek Buffers Presented in Great Basin ADPPs. There are different buffers between sub-regions and between the BLM and Forest Service; some have references to science for the buffers. All sub-regions need to reference science. The national monitoring group could review this.

OUTCOME: The monitoring team will review buffers to validate the science and look for if and where there is a need for consistency.

ACTION: Frank will coordinate with the monitoring team and have results by the Rocky Mountain Region Federal Family meeting.

Disturbance

Frank provided an overview of the disturbance process that would be used to measure the 3 percent disturbance cap. Disturbance is the relationship between the amount of sagebrush on the landscape and anthropogenic disturbance. Habitat degradation is measured over sagebrush potential (not where sagebrush exists).

Disturbance by potential = Habitat Degradation / Areas of biotic potential (contains sagebrush or could in the future).

Disturbance by PAC= Habitat Degradation / PAC (or can be for any unit)

Sagebrush availability = Existing vegetation type / Areas of biotic potential

We need a common scale and a common method that the public can understand.

We are working on establishing the meaningful scale (unit for measurement against the cap). For broad and mid-scale, there are the range, management zones, and populations. Biological significant units are an intermediate scale. Fine and site scale includes PAC, leks, winter range, and project level.

The NTT referenced a surveyed section as the scale.

The finer scale better represents the impact on/benefit to Greater Sage-Grouse.

The simplest approach is a consistent scale and one formula:

- Disturbance by unit = Habitat Degradation / PAC (or can be for any unit)

OUTCOME: Disturbance and Monitoring Subteam to define a common scale based on this input.

Overview of Plans – Jim and Sarah

Summary of major outcomes common to all ADPPs:

1. The BLM and Forest Service have reviewed all threats to the Greater Sage-Grouse as identified by the COT report and will develop and implement measures to eliminate or mitigate those threats on a landscape-level, in a coordinated manner, across the remaining range of the species based upon the findings and recommendations of the COT report, the NTT report, and best available science.
2. The BLM and Forest Service will retain all priority and preliminary general habitat lands currently under federal management and manage these for the benefit of the Greater Sage-Grouse.
3. The BLM and Forest Service will avoid and/or minimize further surface disturbance of PACs through closures or NSO stipulations applied to any further leasing and development of resources. Where valid existing rights could lead to surface disturbance, the BLM and Forest Service will work with lease holders to consolidate and limit further infrastructure in PACs in order to reduce the impacts of development where they may occur.

4. The BLM and Forest Service will eliminate or limit further development of rights of ways (e.g., transmission lines and pipelines) in PACs in order to minimize impacts. Efforts will be made to route transmission lines outside of PACs or, where this is not technically feasible, will use the least impactful route possible and mitigate for the full effect of the development.
5. All development on preliminary priority and general habitat will be mitigated to ensure no net unmitigated loss of habitat for the Greater Sage-Grouse.
6. The BLM and Forest Service will set specific, quantifiable objectives and timeframes for rangeland improvement and vegetative management to address the negative effects of improper grazing on Greater Sage-Grouse habitat.
7. The BLM and Forest Service will place a priority on the prevention and suppression of rangeland fires and the restoration of rangelands impacted by fire using the FIAT report to guide the development of priorities. Prescribed fire will not be used as a fire prevention tool in regions of less than 12 inches of precipitation unless certain defined exceptions are met. The agencies will use motorized travel restrictions, when appropriate, to aid in fire prevention.

Schedule

- Rocky Mountain Region Federal Family meeting will be in Denver (NOC) September 9th-11th.
- Engaging states in late September. The idea is to have a 2-day meeting with the Great Basin states and a 2-day meeting with the Rocky Mountain Region. The goal is to identify inconsistencies between federal and state plans, and identify remedies.
- Governor's Task Force will meet in early October.
- The BLM and Forest Service will resolve differences between plans as appropriate, after state meetings.
- Finalize ADPP and data.
- Data roll-up and conduct the cumulative effects analysis for each plan.
- Proposed Plans/Final EISs will be released winter 2014.
- Protest and Governor's Consistency Review.
- Idaho and Utah may have Section 7 consultation.
- RODs will be issued winter 2014/early spring 2015. One ROD for Great Basin and one for Rocky Mountain.
- Discussion: Need to talk to NOC about printer timelines.

Adaptive Management, Mitigation, and Monitoring via State Directors

NPT Guidance provides direction and has had legal review.

Oregon – Oregon's proposed adaptive management plan is based on habitat and population with hard and soft triggers. The hard trigger for population is 5-year moving average, 20 percent. Habitat is based on habitat loss; below 60 percent is the soft trigger, and below 30 percent is the hard trigger. When the hard trigger is reached, no more permitting will be allowed.

Idaho – Idaho worked closely with the State and USFWS. The adaptive management plan addresses the greatest threats. The soft trigger is a 10 percent decrease in population in any conservation area; identify cause and remedy. The hard trigger is 20 percent and would move Important habitat to Core habitat management.

Utah – Utah is working closely with State and on same page. The adaptive management plan is in compliance with NPT Guidance. Utah has a 7-year rolling average. Utah would likely follow the Nevada process.

Nevada/California – Nevada/California is working with the State. The plan includes hard and soft triggers for population at three different scales (lek, lek cluster, and biologically significant unit). Nevada/California is working with partners on population triggers. For habitat, the trigger is at two scales, lek and lek cluster. Nevada State is developing a mitigation credit system; California is looking to adopt this system.

Montana – Montana's adaptive management plan is still under development; Montana is committed to working within NPT Guidance. The state is not helping to develop triggers since they do not yet have a State Plan.

Closing Remarks

Noreen Walsh

1. COT sets the framework of reference for listing; therefore, PACs are a key geographic unit.
 - Need to address non-habitat in PACs.
 - Crosswalk of management to PACs is important.
 - PAC needs to be part of the analysis and part of the story.
2. Livestock Grazing and Rangeland Health is a concern and will be scrutinized. The BLM and Forest Service need to be clear on standards and timeline. Overall, the ADPPs need to be different from what the USFWS saw in their 2010 plan reviews.
3. Clarity is needed to demonstrate to others that these ADPPs provide conservation certainty.
 - Changes in boundaries across stateliness will make telling the story difficult. While there might be a reason, we need to assess if it is worth doing it that way.
 - Use only two terms: preliminary priority habitat and preliminary general habitat.

Jim Lyons

This meeting has had beneficial outcomes and will help inform the Rocky Mountain Region. If we can demonstrate that we can work across jurisdictions, it will be a milestone. Talking points from the meeting:

The BLM, Forest Service, and USFWS leadership met in Portland this week to discuss our progress to date and the work that remains to develop a comprehensive, range-wide strategy for Greater Sage-Grouse conservation in the context of our multiple-use and sustained yield mission.

We had an intense and focused meeting. We made good progress in reviewing the BLM and Forest Service ADPPs and in determining what we need to do to address any remaining gaps and inconsistencies in the plans

We have one more meeting of the Federal Family to review the Rocky Mountains ADPPs in 2 weeks.

We look forward to meeting with the states to compare notes, to share our ADPPs, to review the state plans for state and private lands, and to see how we can work together to strengthen our ADPPs and our cumulative Greater Sage-Grouse conservation efforts, where needed.

We're optimistic that we can meet our goal of a landscape-level conservation strategy to conserve the Greater Sage-Grouse and avoid the need to list the species as threatened or endangered.

Much done and much work yet to do.

But working together with the states, we believe we can get there.

Neil Kornze

We appreciate all the hard work. We appreciate the State Director's creativity. Ed will lead consistency and edge mapping. Thanks to Noreen's and USFWS's input; continue to state your needs. We appreciate the DOI perspectives.

1. By end of the process, it will not be business as usual.
2. This is a great opportunity to implement the future of landscape planning.
3. The BLM is guided by the principle of multiple use and sustained yield; the agency has focused on the multiple use but needs to revisit sustain yield.

GREATER SAGE-GROUSE GREAT BASIN FEDERAL FAMILY MEETING - SUMMARY OF OUTCOMES AND ACTION ITEMS**

Applicable Sub-regions?	Topic or Resource Program	Outcome and Action	Who?	When?
All	Land Tenure / Retention	<p>The following land retention policy text should be included into the ADPP for land retention and related management actions should be adjusted as appropriate:</p> <p>"Lands classified as priority habitat and general habitat (or habitat classification appropriate for the sub-region) for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse."</p>	PMs to incorporate as written into ADPP	ADPP
All	Vegetation Management/ Prescribed Fire	<p>Incorporate the following language regarding when fire would be used as a vegetation treatment tool for areas with <12" precipitation:</p> <ul style="list-style-type: none"> • Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized. • If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how Conservation Objective Team/land use plan objectives would be addressed and met and why alternative techniques were not selected. • Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat in PPMAs (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods to combat annual grasses and restore native plant communities). 	<p>Lauren to consolidate language</p> <p>PMs to incorporate into ADPP</p>	ADPP

**ATTACHMENT A:
GREATER SAGE-GROUSE GREAT BASIN FEDERAL FAMILY MEETING - SUMMARY OF OUTCOMES AND ACTION ITEMS**

Applicable Sub-regions?	Topic or Resource Program	Outcome and Action	Who?	When?
		<ul style="list-style-type: none"> Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. 		
All	Disturbance	All ADPPs should refer to the “disturbance cap” instead of disturbance threshold.	PMs incorporate into ADPPs	ADPP
All	Conifers/Veg Management	Incorporate the following common goal for conifer removal: “Remove conifers encroaching into sagebrush habitats. Prioritize treatments closest to occupied sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and tools like VDDT and the FIAT report will help refine the location for specific priority areas to be treated.”	PMs to incorporate as written into ADPPs	ADPP
All	Fire	<p>Ensure ADPPs discuss the current authority for temporary closures as a travel management tool to reduce fire ignition risk.</p> <p>“In PPMA and PGMA, temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).</p> <p>Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.”</p>	PMs to verify this is discussed in Chapter 2.	ADPP
All	Fluid Minerals	Exceptions related to fluid minerals - All ADPPs will consider NPT Guidance	PMS	ADPP

BLM
Sage Grouse Conservation Plan

NATIONAL SYSTEM OF PUBLIC LANDS
U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT

2

Background

- **March, 2010** : FWS “warranted but precluded” determination – requires “regulatory certainty”
- **December, 2011**:
 - Federal/state partnership meeting convened by Sec. Salazar/governors
 - December 2011, BLM releases NTT report
- **February, 2013**: USGS issues baseline report “Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-Grouse”
- **March, 2013**: FWS issues Conservation Objectives Team (COT) report under direction of SGTF

GRSG Conservation Plan Objective

“... to develop recommendations on how to best *advance a coordinated, multi-state, range-wide effort to conserve the sage-grouse, including the identification of conservation measures to ensure the long-term viability of the species.*”

From: Greater Sage-grouse Conservation Objectives: Final Report. February 2013.

Key Findings in the COT report

“Stop the bleeding” –

1. “Maintenance of the integrity of PACs is the essential foundation for sage-grouse conservation”
2. “Important habitats outside of PACs be conserved to the extent possible”
3. “Requires eliminating activities known to negatively impact sage-grouse and their habitats or re-designing these activities to achieve the same goal”

Reinforcing Findings in the NTT report

“New Paradigm”

... Management priorities will need to be shifted and balanced to maximize benefits to sage-grouse habitats and populations in priority habitats.

Adequacy of management adjustments will be measured by science-based effectiveness monitoring of the biological response of sage-brush landscapes and sage-grouse populations. Ultimately, success will be measured by the maintenance and enhancement of sage-grouse populations well into the future.”

Reinforcing Findings in the NTT report

Key Milestones

Milestone	Date
✓ All draft EISs published/ public comment periods closed	Spring 2014
✓ Administrative draft proposed plans (ADDPs) produced	June/July 2014
✓ Draft plan data converted to geospatial displays in order to permit review of conservation strategies in response to identified threats for each PAC/population	July/August 2014
BLM/FWS planning teams meet to review plans for consistency, adequacy, and cumulative conservation response to threats in each PAC	Aug 2014
States join conversation to review plans and evaluate combined conservation effort in response to PAC threats	Aug/Sept 2014
Land use plans revised in response to joint plan review	Fall 2014
Proposed land use plan revisions / final EIS protest periods and governor consistency reviews	Fall 2014
Land use plan records of decision are signed	Late Fall 2014/ early 2015

Objectives of this Meeting

- 1. Identify threats to Greater Sage-grouse (GRSG) for each PAC/population within the BLM/FS planning area as identified in the COT Report**
- 2. Determine how each BLM and FS plan addresses these threats through land use allocations and other conservation actions**

Objectives of this Meeting (continued)

3. Discuss the adequacy of the land use allocation decisions and other conservation measures to address these threats and any changes in plans required to address inadequacies and/or inconsistencies in response
4. Provide clear and specific guidance to develop draft final administrative plans that are adequate to address the threats to each GRSG population identified in the COT Report

Table 2. Sage-grouse quasi-extinction risk (from Garton *et al.* 2011), and threats, by management zone and population. Populations are those defined by Garton *et al.* (2011), although in some cases sub-populations were identified to help refine threat characterization (see Figure 3). Population estimates and quasi-extinction risk estimates are from Garton *et al.* (2011). Threats are characterized as: Y = threat is present and widespread, L = threat present but localized, N = threat is not known to be present, and U = Unknown.

Population	Unit Number	Population Abundance and Estimated Quasi-extinction Risk					Management Zone	Threats												
		<200 Males/500 Birds	% Chance of <50 birds/20 males in 2037	% Chance of <500 birds/200 males in 2037	% Chance of <50 birds/20 males in 2107	% Chance of <500 birds/200 males in 2107		Isolated/Small Size	Sagebrush Elimination	Agriculture Conversion	Fire	Conifers	Weeds/Annual Grasses	Energy	Mining	Infrastructure	Grazing	Free-Roaming Equids	Recreation	Urbanization
Management Zone I: Great Plains

Conservation Threats: Zone I

APPENDIX A—MANAGEMENT ZONE AND POPULATION RISK ASSESSMENTS

See Figure 3 for a map of management zones and populations.

MANAGEMENT ZONE I: GREAT PLAINS

This management zone consists of four sage-grouse populations as identified by Garton *et al.* (2011), including the Dakotas, Northern Montana, Powder River Basin, and Yellowstone Watershed populations. All of these populations cross state or provincial boundaries. Garton *et al.* (2011) predicted an 11.1 percent chance this Management Zone will fall below 200 males by 2037, and a 24.0 percent chance it would fall below 200 males by 2107. Privately-owned lands are a major constituent of sagebrush landscapes in the Great Plains (66 percent), followed by BLM (17 percent), and then other ownerships (Knick 2011). After Management Zones II and IV, this zone contains some of the most connected networks of sage-grouse leks in the range (Knick and Hanser 2011). On the other hand, sagebrush habitat in 37 percent of this zone is 75-100 percent similar to sagebrush habitat in areas where extirpation has occurred (Wisdom *et al.* 2011). Generally, areas in this zone that are least similar to extirpated parts of the range include the western portions of Northern Montana and Powder River populations and the southeast corner of the Yellowstone Watershed population (Wisdom *et al.* 2011, Figure 18.5).

Conservation Threats: Dakotas Population

Dakotas

The Dakotas's population occurs on the far eastern edge of the range of sage-grouse. Much of the population occurs in the Cedar Creek Anticline. Garton *et al.* (2011) reported the minimum male count for this population at 587 and predicted a 66 percent chance that this population would dip below 200 males in the next 100 years. Population counts in 2012 for North and South Dakota were approximately 300, so this population as a whole very likely still exceeds 500 birds. Priority areas for conservation (PACs) in North and South Dakota are connected by general habitat consisting of limited sagebrush habitat. Sage-grouse movements generally occur east and west between the Dakotas's population and Montana. Connectivity between the sub-populations occurs through Montana's portion of the population (Knick and Hanser 2011). This area was identified as a PAC in Montana due to historically high density of sage-grouse and for the seasonal habitat it provides for birds from North Dakota, a likely conduit for genetic connectivity. The area is heavily influenced by oil and gas development and conversion of native rangeland to cropland is a major threat to the persistence of this sage-grouse population. Over-grazing in localized areas has degraded the sagebrush habitat and can reduce nesting success. Nesting success was positively correlated to grass cover in North Dakota (Herman-Brunson 2007). Overall, this population is small and at high risk.

Conservation Threat Reduction Objectives

Threat Reduction

The following threat reduction objectives and measures are targeted at the habitat threats facing the greater sage-grouse, as identified in the 2010 warranted but precluded finding (75 FR 13910). Successful achievement of these objectives across the species' range will ameliorate the threats to greater sage-grouse, including the Bi-State DPS, and allow for the long-term conservation of the species. In the development of conservation plans to achieve these threat reduction objectives, entities (states, federal land management agencies, etc.) should coordinate with FWS. This will help to ensure that the conservation plans adequately address the threats contributing to the 2010 warranted but precluded finding.

Conservation Measures: Energy

Energy Development

The increasing demand for renewable and non-renewable energy resources is resulting in continued development within the greater sage-grouse range, resulting in habitat loss, fragmentation, direct and indirect disturbance. Development results in sage-grouse population declines.

Conservation Objective: Energy development should be designed to ensure that it will not impinge upon stable or increasing sage-grouse population trends.

Addressing energy development and any subsequent successful reclamation activities in sagebrush ecosystems will require consideration of local ecological conditions, which cannot be prescribed on a range-wide level. Where state sage-grouse management plans have already identified an effective strategy for energy development that meets the above objective, the strategies in those plans should be implemented. In all other situations, the following measures should be considered to avoid, reduce, or mitigate impacts from energy development.

Conservation Measures:

1. Avoid energy development in PACs (Delany *et al.* 2010). Identify areas where leasing is not acceptable, or not acceptable without stipulations for surface occupancy that maintains sage-grouse habitat.
2. If avoidance is not possible within PACs due to pre-existing valid rights, adjacent development, or split estate issues, development should only occur in non-habitat areas, including all riparian structures, with an adequate buffer that is sufficient to preclude impacts to sage-grouse habitat from noise, and other human activities.
3. If development must occur in sage-grouse habitats due to existing rights and lack of reasonable alternative avoidance measures, the development should occur in the least suitable habitat for sage-grouse and be designed to ensure at a minimum that there are no detectable declines in sage-grouse population trends (and seek increases if possible) by implementing the following:
 - a. Reduce and maintain the density of energy structures below which there are no impacts to the function of the sage-grouse habitats (as measured by no declines in sage-grouse use), or do not result in declines in sage-grouse populations within PACs.
 - b. Design development outside PACs to maintain populations within adjacent PACs and allow for connectivity among PACs.
 - c. Consolidate structures and infrastructure associated with energy development.
 - d. Reclamation of disturbance resulting from a proposed project should only be considered as mitigation for those impacts, not portrayed as re-minimization.
 - e. Design development to minimize tall structures (towers, powerlines), or other features associated with the development (e.g., noise from drilling or ongoing operations; Blitckley *et al.* 2012).

Keys to Success

BLM
Sage Grouse Conservation Plan

1. **Retain and restore SG habitats within PACs** (p.37)
2. **Increase occupancy and connectivity between PACs** (p.37)
3. **Restrict or contain fire** (p.40)
4. **Stop the spread of invasive grasses** (p.42)
5. **Avoid energy development in PACs** (p.43)
6. **Avoid sagebrush removal or manipulation** (p.44)
7. **Ensure grazing allotments meet ecological potential and habitat requirements** (p.45)

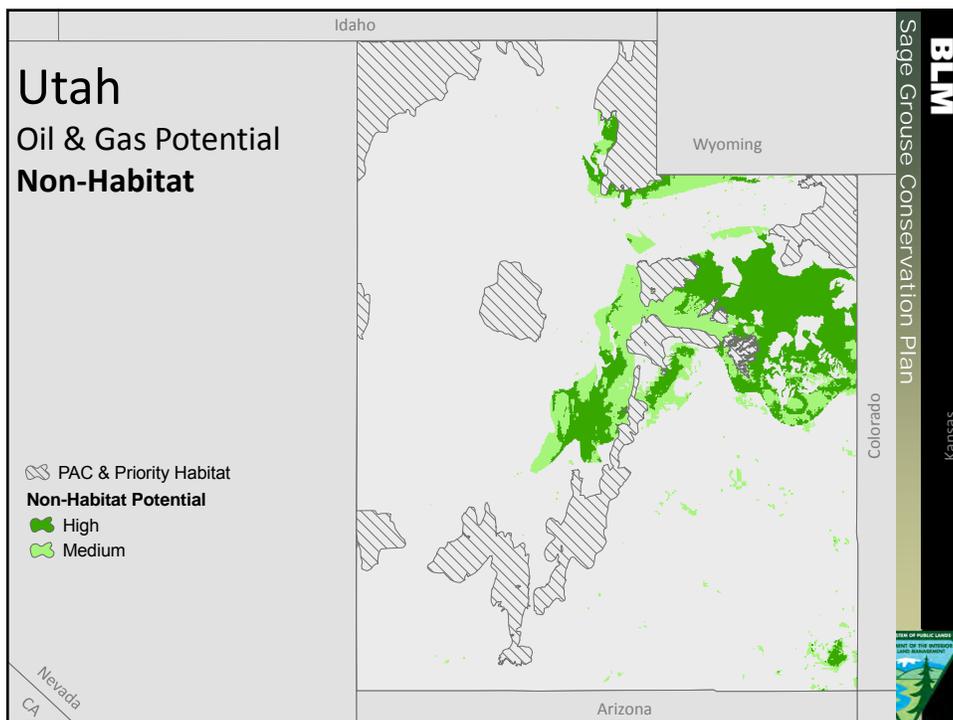

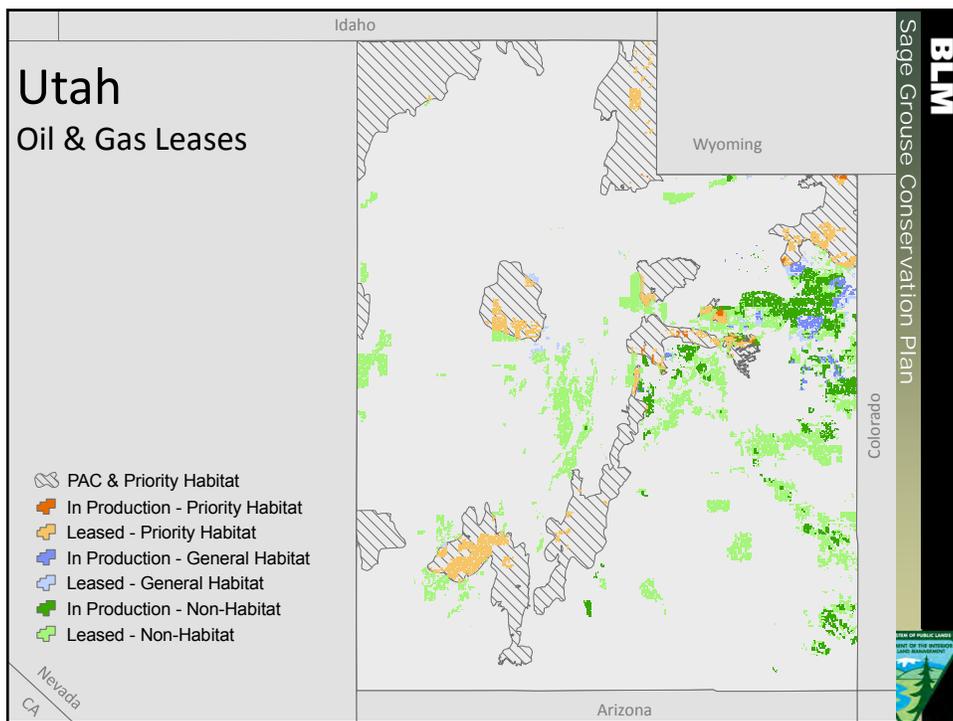

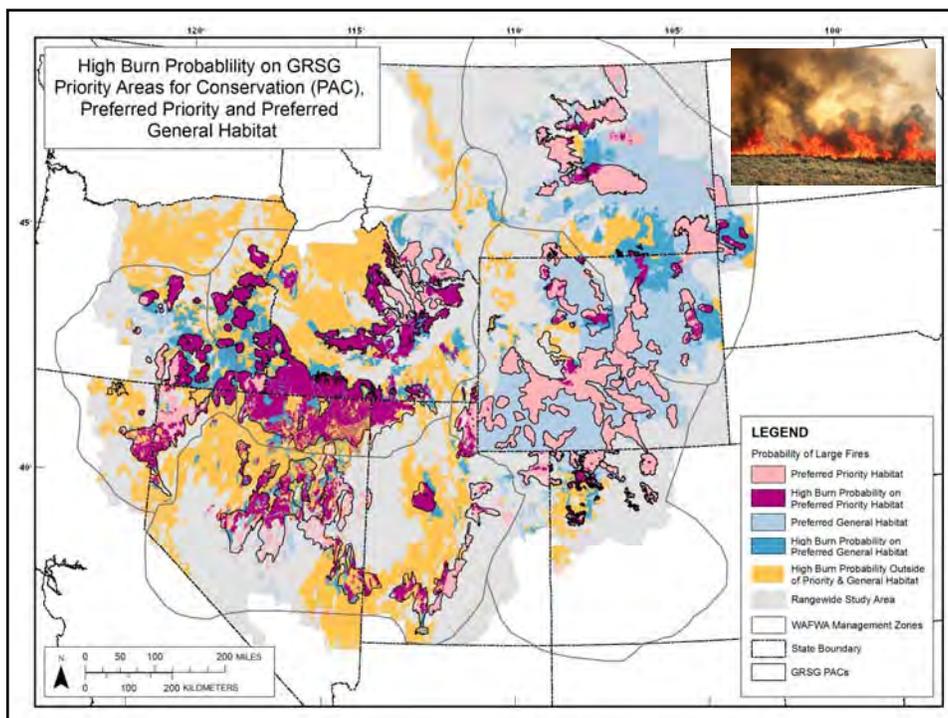

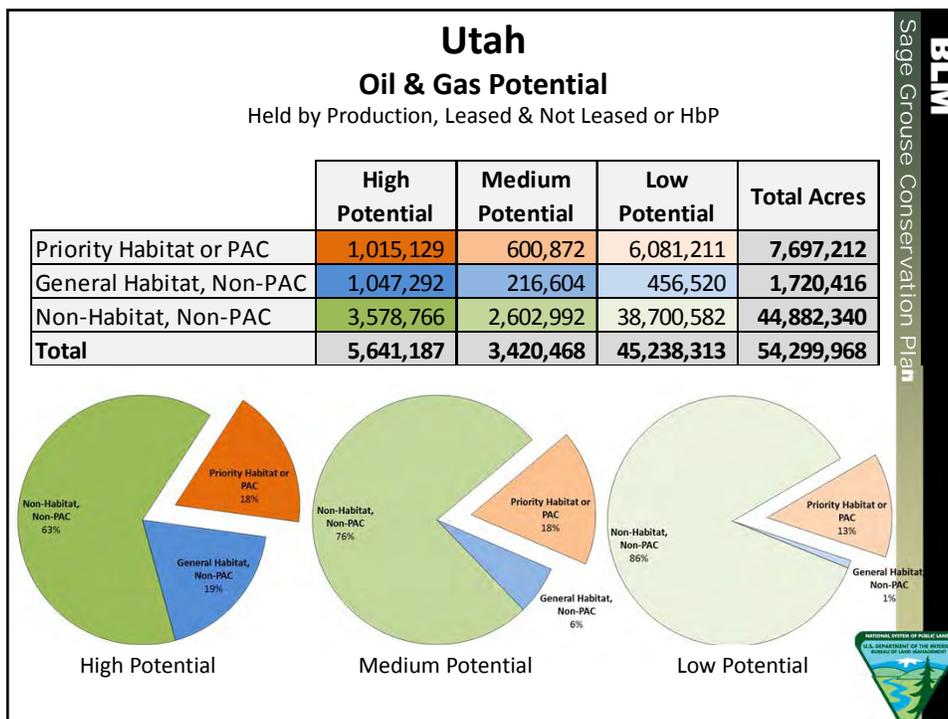

Keys to Success

BLM
Sage Grouse Conservation Plan

8. **Avoid or reduce impacts of range management structures on SG** (p.46)
9. **Protect SG from impacts of free-roaming equids** (p.46)
10. **Avoid further loss of habitat due to agricultural conversion** (p.48)
11. **Avoid new mining activities in occupied habitats and leasing until other suitable habitats can be restored** (p.49)
12. **No new development of infrastructure corridors (e.g., transmission) within PACs** (p.51)

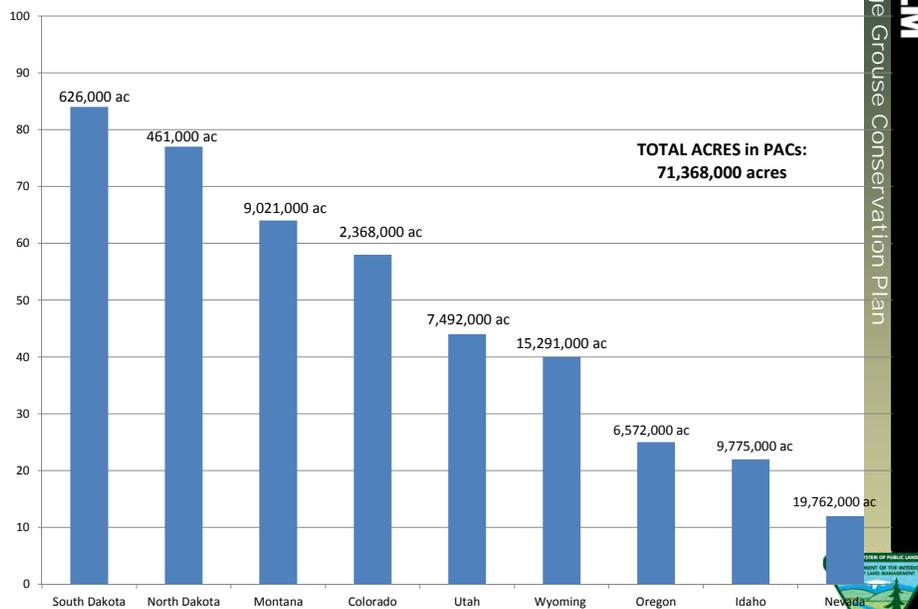

Key Milestones Ahead

Milestone	Date
✓ All draft EISs published/public comment periods closed	Spring 2014
✓ Administrative draft proposed plans in development	June 2014
✓ Draft plan data converted to geospatial displays in order to permit review of conservation strategies in response to identified threats for each PAC/population	July 2014
BLM/FWS planning teams meet to review plans for consistency, adequacy, and cumulative conservation response to threats in each PAC	Aug 2014
States join BLM/FS/FWS planning teams to review plans and combined conservation effort in response to PAC threats	Aug/Sept 2014
Land use plans revised in response to joint plan review	Fall 2014
Proposed land use plan revisions / final EIS protest periods and governor consistency reviews	Fall 2014
Land use plan records of decision are signed	Late Fall 2014/ early 2015

BLM
Sage Grouse Conservation Plan

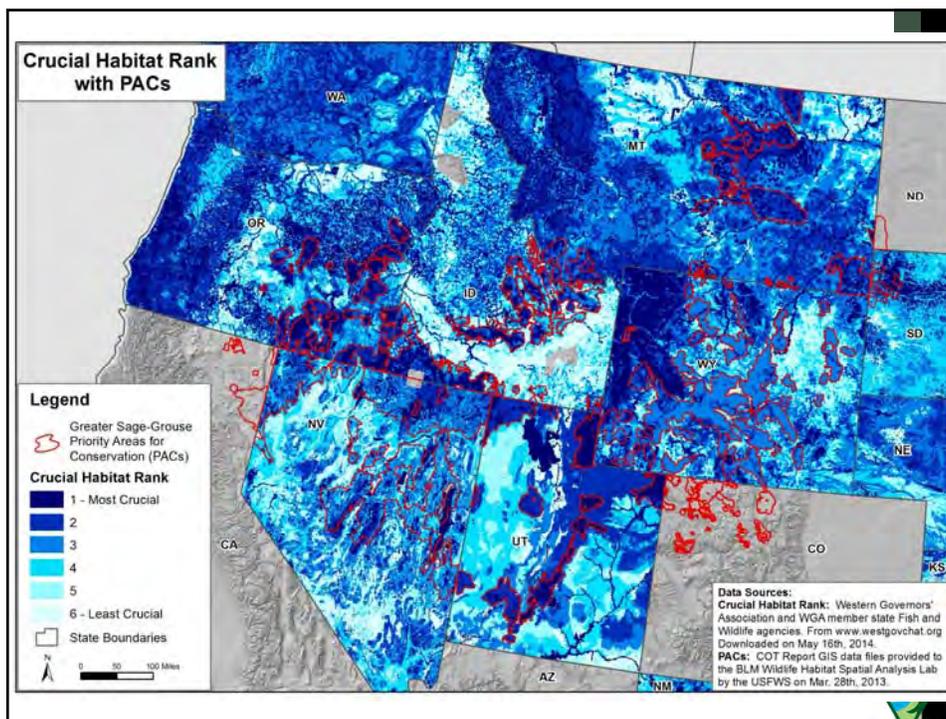

% STATE/PRIVATE LANDS WITHIN SAGE GROUSE PACs

BLM
Sage Grouse Conservation Plan

Key Questions

- Do the BLM and FS plans adequately address the conservation threats identified in the COT report for each population?
- Are the conservation strategies consistent and rational?
- Can differences be justified?
- How do state SG conservation plans align with federal plans?
- Is the cumulative conservation effort (BLM/FS/states) adequate to conserve the species?

BLM

Summary

Remaining tasks:

1. Roll up of BLM/FS plans
2. Discussions with states
 - Assess cumulative conservation effort for FS/BLM/state plans for each population and WAFWA zone
 - Revise ADDPs, as necessary
3. Complete final BLM/FS plans
4. Develop regional RODs
5. Deliver to FWS for listing decision

"The ills of the sagebrush ecosystem are well documented. It is considered to be one of the most imperiled of all ecosystems in the United States."

Michael Wisdom, PNW Research Station in La Grande, Oregon

**BLM Approach to Developing
Administrative Draft Proposed Plans**

**Great Basin Federal Family Meeting
“Roll-up”**

August 19, 2014

BLM
Sage Grouse Conservation Plan

Key Milestones Ahead

Milestone	Date
All draft EIS public comments periods closed	Spring 2014
Draft final proposed plans in development	June 2014
“Roll-up” initiated with compilation of draft plan data	Aug 2014
BLM/FS/FWS planning teams meet to review plans for consistency, adequacy, and cumulative conservation response to threats in each PAC	Aug 2014
States join BLM/FS/FWS planning teams to review plans and combined conservation effort in response to PAC threats	Sept 2014
Land use plans revised in response to joint plan review	Fall 2014
Proposed land use plan revisions / final EIS protest periods and governor consistency reviews	Fall 2014
Land use plan records of decision are signed	Late Fall 2014/ early 2015

BLM
Sage Grouse Conservation Plan

Roll-up Process

- The “Roll-up” will evaluate whether the cumulative conservation efforts in the revised draft plans effectively address the conservation threats to GRSG.
- Regional conservation measures within the populations and the results of the allocation data sent to the NOC were used to measure the overall conservation benefits.
- Chapter 2 of the Draft FEISs were reviewed to identify the threats identified in the COT Report.
- Based on Chapter 2 information population summaries were created as to how these threats are being addressed.

Roll-up Results

- Maps and population summaries will be used to inform decisions at the Federal family meetings
- Make any necessary changes to the ADPPs based on decisions resulting from this exercise.
- Meet with the Governor’s representatives to discuss the State’s Plans (Sept./October).

Questions/Discussion

BLM
Sage Grouse Conservation Plan

5

Schedule Discussion Great Basin Federal Family Meeting “Roll-up”

August 21, 2014

BLM
Sage Grouse Conservation Plan

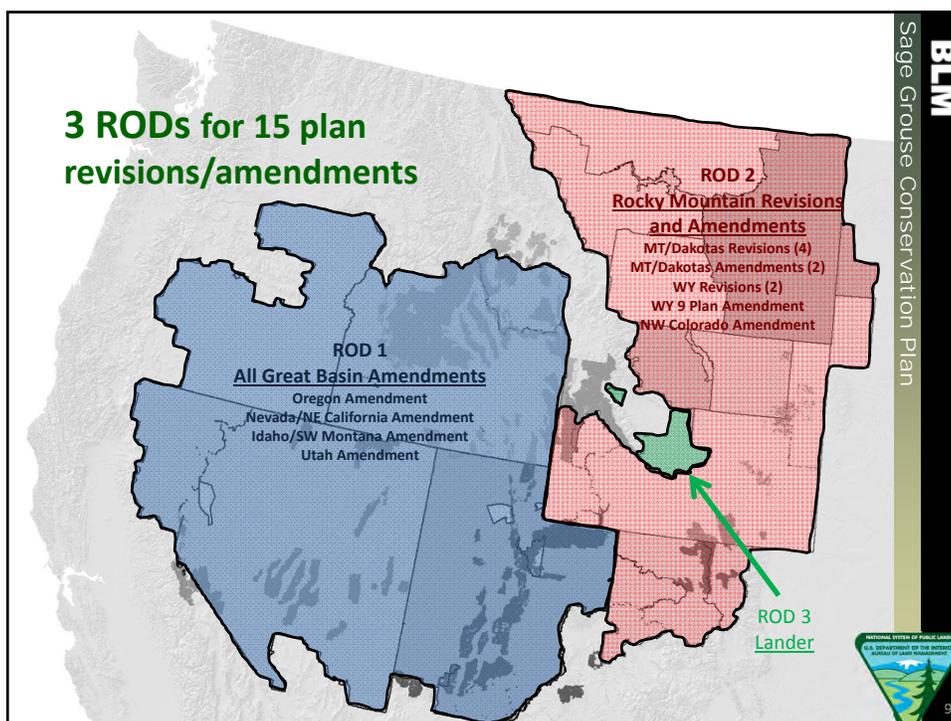

6

Roll-up and Planning Process	
Step #	Roll-up/Planning 12 Step Process
1	Sub-region sends memo to AD-200 for review
2	AD 200 reviews memo and contacts sub-regional SD.
2a	Sub-regions send ADPP data to the NOC.
3	NOC completes WAFWA MZ Tier II CEA MZ tables
3a	NOC completes WAFWA MZ Roll-up land use allocation maps
3b	EMPSi completes Tier II CEA MZ analysis and sends analysis to sub-regions
4G	Great Basin Federal Family Roll-up review meetings
4R	Rocky Mountain Federal Family Roll-up review meetings
5	Meeting with States on Final Federal Plans
6	Final Resolution of Federal Plans (if necessary)
7	Directors brief the Secretary and the Assistant Secretary (status update)
8	WO Review Starts
8a	Sub-region responds to WO review comments
8b	WO resolves any pending concerns that arise out of the WO Review
9	National Policy Team Briefing
10	BLM Director's Briefing
11	Secretaries of DOI and USDA Briefing
12	Publish Proposed Plan EISs (Falls on a Friday per EPA requirements)
Step #	Post PRMP/FEIS Planning Steps
13	Protest Period Ends (30 day mandatory protest period)
13a	Protest Resolution Process Ends (45 days - discretionary)
14	Governor's Consistency Review Ends (60 day mandatory governor consistency review)
15	Director's Briefing
16	Secretaries of DOI and USDA Briefing
17	RODs are signed

- ## Getting to the Finish Line
- **WO and SOL reviews and revisions**
 - **Protest response – expecting large number of protests (30-days after NOA for Final EIS)**
 - **Governor’s 60-day consistency review**
 - **Formal Section 7 consultation would require 135 days before ROD**
 - **Potential FOIA requests**
 - **Preparing RODs**

Records of Decisions (RODs)

- **Desire**: tell story of how the cumulative conservation effort from all FS and BLM management actions achieves conservation objectives for the GSG
- **Objective**: minimize the number of RODs to:
 - illustrate how management actions respond to common threats (e.g. fire in GB/oil and gas in RM)
 - demonstrate a coordinated, cohesive strategy
- **Example**: Western Solar Energy Plan
 - cohesive, coordinated, landscape approach
 - one ROD /amended 89 RMPs across 6 states

BLM
Sage Grouse Conservation Plan

NATIONAL SYSTEM OF PUBLIC LANDS
U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT

Key Points!

1. State/federal partners have framed the strategy to conserve the Greater Sage-Grouse
2. Maintaining the integrity of PACs is critical
3. BLM/FS plans must provide a strong foundation for conserving the GRSG, but...
4. State and private lands comprise 1/3 of PACS
5. Scientifically-sound, consistent, coordinated planning across the landscape is essential
6. “Smart” development can conserve the GRSG and preserve development options
7. Working together on this is *critical* to our success

Questions/Discussion

**National Greater Sage-grouse Conservation Plan
Great Basin Federal Family Meeting**

BLM - Forest Service
Sage-Grouse Conservation Plan

**Portland, Oregon
August 19 - 21, 2014**

**What Have We Been Doing Since The
Last Time We Were In Portland?**

- Addressing public comments on Draft EISs
- Coordinating with Federal and State Partners
- Incorporating changes between the Draft EIS Preferred Alternatives and Administrative Draft Proposed Plans (ADPPs)
 - Great Basin wide changes
 - Subregional changes

BLM
Sage-Grouse Conservation Plan

Global Changes for the Great Basin Between Draft and Final EISs

- Augmented the Monitoring Framework
- Refined the Mitigation Strategy
- Included a 3% disturbance threshold in priority habitat
- Committed to No Net Unmitigated Loss in all habitats
- Incorporated an Adaptive Management Strategy with hard and soft triggers
- Integrated the FIAT Report with the Chambers guidelines and provided direction for completing the assessments

Global Changes for the Great Basin Between Draft and Final EISs (cont.)

- Added measurable vegetation treatment objectives from VDDT modeling
- Inserted consistent ROW avoidance criteria
- Incorporated standalone FS DPPAs with a crosswalk to the BLM ADPPs
- Worked through the NPT guidance on consistent allocation decisions
- Will include a cumulative impact analysis to Sage-Grouse by WAFWA management zone

Major Changes Specific to Utah Between Draft and Final EISs

- Changed from a lek centric Preferred Alternative to applying allocation decisions on all PPMA
- Not applying new allocative/resource restrictions (except for FS) to PGMA, but applying no net unmitigated loss to all habitats
- Added 1/640 density disturbance limitation
- Added additional detail and decisions to address the conifer encroachment threat
- Added new designated ROW utility corridors
- Added the Alton Coal Mine area as PPMA (from PGMA in draft)
- Added additional restrictive management actions to reduce prescribed fire and sagebrush removal in sagebrush habitat

BLM

Sage-Grouse Conservation Plan

Major Changes Specific to Nevada / California Between Draft and Final EISs

- Reduced number of designated utility corridors within GRS habitat
- Incorporated additional wild horse and burro measures/actions from the Nevada State Plan
- Incorporated goals and objectives and some actions tied to predation from the Nevada State Plan
- Added a 3% disturbance threshold to the Proposed Plan, but are currently asking for a variance
- Made a commitment to work with the State of Nevada on mitigation banking

BLM

Sage-Grouse Conservation Plan

Major Changes Specific to Oregon Between Draft and Final EISs

- Changed wind and solar allocations to be more restrictive
- Added specific language to address the key threats in Oregon (conifer encroachment, annual grasses)
- Applied a tiered decadal approach to the 3% disturbance threshold (1% per decade)
- Added more restrictive actions within lek protective zones to General Habitat
- In response to public comment in Research Natural Areas, revised livestock grazing allocations

Major Changes Specific to Idaho/SW Montana Between Draft and Final EISs

- Idaho:
 - Changed oil and gas allocations to be more restrictive in Core Habitat
 - Refined comprehensive avoidance criteria for all anthropogenic activities addressed in the disturbance threshold
 - Incorporated additional specific measures in conjunction with the Idaho State Plan
 - Re-mapped Sage-grouse habitats based on site-specific mapping and ground truthing (approximate change of 300,000 acres less)
- SW Montana:
 - Propose using the DDCT model for disturbance calculations
 - Added more restrictive fluid mineral stipulations
 - Ongoing discussions regarding the use of the FIAT Report and Connelly quantitative vegetation objections table

Was Amy at the meeting?

On Thursday, October 9, 2014, Jeffery Foss <jfoss@blm.gov> wrote:
Mtg attended by Lyons, Bean, Greenberger, Noreen, Dustin n Cally, n State Directors, all states. Steve n Neil had a post mtg last night.

Key points:

- SDs to arrive to ELT day early for Monday mtg on sage grouse
- FWS expressed concerns about 1) how adaptive mgmt will work where populations cross state bdrys and 2) difference in allocations across state bdrys
- Neil asked SDs to work with their SD neighbors to develop a rule set: e.g. If a trigger is tripped in Idaho for a pop that is shared with NV and OR, those states will agree to follow the adaptive mgmt response in Idaho's plan for that population. Other approaches?
- Neil also asked SDs to be prepared at the ELT to address key areas of your plan needing resolution and having a strategy to do that: e.g. Change Idaho plan to match allocation of neighbor or develop a narrative as to how the COT objectives are met with the Idaho allocation. The later is most feasible in most cases... In my view
- I suggested to Neil and Steve that the issue is less of showing how differing allocations across state bdrys are "biologically equivalent", it is more the case of describing how a difference in allocation is not biologically relevant to grouse if the threat in Idaho is very low (e.g. Oil and gas low potential in Idaho).
- need to get list of 12 items (e.g, adaptive mgmt) from ADPPs needing attention and assess how our plan squares up with these issues. I have asked Ed to send that to us.
- best part of meeting was Rich Hanan- Deputy Rgl. Director PNW, say emphatically that "the FWS is 100% behind the 3 zone approach" after my summary of the Idaho plan
- suggest talking w Dustin, Cally, Virgil before the 16th DOI meeting w States... Dustin agrees.

- push to reach closure on plans soon

We can discuss in more detail early next week.

I discussed the 3 zone approach, why it makes sense, and FWS Rich Hanan, Deputy Regional Director @ Portland said "FWS is 100% behind the 3 zone approach- take that concern offer table" and Jim Lyons agreed

Hopefully, past that issue

Subject: RE: Disturbance

Ed,

Sounds like progress one day at a time! Here is the list of criteria that would be applied to anthropogenic disturbance proposed projects that would be evaluated by a team similar to the mitigation approach:

AD-3: Priority Habitat Management Area: Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in Priority Habitat Management Areas, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of Priority Habitat Management Areas. When authorizing development in Priority Habitat Management Areas, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. In addition to the Priority and Important Habitat Management Area Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:

- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
- b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective Priority Habitat Management Area;
- c. The project would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
- d. Cannot be reasonably accomplished outside of the Priority Habitat Management Area; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) ; or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines) (proposed actions would not increase the 2011 authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
- e. Development could be implemented adhering to the required design features (RDF) described in Appendix A;
- f. The project would not exceed the disturbance cap (AD-1).
- g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.

AD-4: Priority and Important Habitat Management Areas: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:

- a. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
- b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and

- c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. The project complies with the applicable RDFs as described in Appendix A.
- f. The project would not exceed the disturbance cap (AD-1).

Brent,
 Thank you for following up with this information. I thought we had a good meeting on Thursday in Boise. We had a call with the State of Oregon on Friday the issue of wind development. The state was looking for criteria to consider for state approvals. I folks them you all had a set of criteria you will run through before approval. I was asked if I could send the list and it protocol. Can you send me the latest. I would appreciate it. Have a great week.

On Oct 29, 2014, at 11:41 AM, Brent Ralston <bralston@blm.gov> wrote:

Tim,

On yesterday's call I heard some talk regarding the Habitat/Vegetation Objectives table we are to include in our GRSG Amendment. We have such a table and the values have been determined based on appropriate research and consistent with the Habitat Assessment Framework (HAF) for GRSG habitat. This table has been included as quantifiable desired conditions that we would manage toward for projects and activities that could affect vegetation conditions.

These would come into play for grazing permit renewals when we complete rangeland health assessments (RHAs), and evaluations to determination whether we are meeting our rangeland health standards. For GRSG our Standard which addresses threatened and endangered and sensitive species habitat would use the HAF assessments to help determine whether this Standard is being met or not. The HAF uses indicators that have been included in the Habitat/Vegetation Objectives table in the GRSG amendment.

The Objectives are desired conditions of the indicators that inform the HAF and help determine whether Standard 8 is met or not in GRSG habitat areas. I would be concerned if we put forward the notion that if one or more of the Objectives is not at the desired condition that necessarily means we have not met our rangeland health standard. In this instance regulations necessitate an evaluation of causal factors and subsequent adjustment in grazing management if grazing were determined to be the cause. This would elevate the condition of an indicator, defined in a plan amendment, to the level of a rangeland health standard, which have been established through formal rulemaking.

Idaho/Montana Sage-Grouse ID Team Meeting

November 4, 2014 1:00 p.m. MST

Attendees: Brent Ralston; Jon Beck; Katie Powell; Kelly Bockting; Don Major; Cally Younger; Paul Makela; Annie Daly

Meeting Minutes

Two main issues to discuss:

1. Adaptive management un-triggering
2. Implementation Team/MOU

Un-triggering

- FWS is concerned that BLM will be constantly turning triggers off and on based on where the baseline is and how the sage-grouse population fluctuates around the baseline.
- Habitats will change year to year, but population baselines are calculated on 3 year averages.
- If the number of birds in one year goes above the baseline, that doesn't necessarily remove the adaptive management, because of the 3 year running average. We can make this more explicit in the document.
- Adaptive triggers won't be removed until we're back at the baseline.
- There's also concern regarding MA 5 - if we reevaluate every 5 years, when we look to readjust the baseline we probably won't adjust the habitat baseline that much off of the population baseline. Brent thinks the baseline adjustments will be focused more on where the habitat is on the ground, than on what the amount of habitat or the population number.
- We can't adjust the baseline down, and to adjust it up isn't necessarily the way to go either. The whole idea is we're trying to manage for higher, not just to be at the baseline.
- Keep in mind that even if habitat changes, some of that habitat will not be supporting GRSG at that 5 year period, but there is the potential is that with time and restoration that population could come back.
- 20% loss of key habitat within the nesting/wintering area means any combination of nesting and wintering habitat that adds up to 20%.
- Should we change wording to "nesting and/or wintering habitat"? Or we could say "loss of 20% of key habitat of nesting and/or wintering habitat within the BSU trips the trigger."
- Whether we mean 20% collectively or separately needs to be clarified.
- Paul will re-word this and will send it out to the group.
- We could just say "20% loss of the BSU trips the trigger," since BSU is made of the wintering and nesting habitat. However, what we care about is the sagebrush within the nesting and wintering habitat and there are some polygons of nesting/wintering habitat that include areas without sagebrush.

- If we meant that triggers are tripped at the loss of 20% of core and 20% of important then you could conceivably lose 19% of core and 19% of important and still not trip any hard triggers. However, soft triggers are in place so hopefully we'd be working towards preventing 19%. The soft triggers will spark discussion on how to prevent the hard trigger from being tripped.
- Soft triggers being tripped opens the door for evaluations, discussions, and decisions about what actions should be taken. If you're at 19% you'll be looking at ROWs and other uses a lot more carefully than you would if you were at 5%.

Decision:

- Untriggering- everyone is okay with defining the baseline values in the discussion.
- Paul will reword the "and/or" language and send out to the group.

Implementation team

- Brent emailed out a draft of the implementation MOU.
- This sets up the process though which projects would be vetted.
- Proposals would be run through this process and would receive (or not receive) a recommendation from the Governor/State Director /BLM on whether the project should move forward.
- If all parties agree that the project should move forward, the BLM will analyze impacts and look at mitigation.
- A WAFWA Management Zone Conservation Board is specifically put together at the zone scale to develop a zone strategy that is consistent. This is a BLM-run board with BLM cooperators at the table. After creating the strategy, maybe this board will get together once a year- we don't yet know what this is going to look like.
- We should focus on this board at the state level.
- The strategy should clearly define how the BLM is going to calculate mitigations and offsets.
- Maybe there's no function of this body after making the strategy. Or maybe after 5 years this body reviews the latest science and updates the strategy. This all is yet to be determined.
- This group would be made up of BLM, NRCS, FWS, and FS personnel. The group would develop a strategy and look at a proposal and assess impacts. BLM would sit down with the strategy and would create mitigation measures. Then this would go to a task force that would look at the strategy again, make updates based on new information, and give back a recommendation.
- How the mitigation money gets stepped out could be determined by the task force.
- The geographic location of some of these projects is important too. We may want to keep the money within the WAFWA zones.
- Could consider a mitigation bank, but structuring mitigation like this might require a law because as of now any mitigation money would go into a general fund.
- We could look at other states and see what they're doing so we can see if it's worth it to contract out.
- The challenge with this is coming up with some kind of consistent token with which to measure mitigation measures.

- We will have to look further into all these questions, but not today.
- How much detail needs to go into the final EIS? Not a lot of detail. In the final EIS we can reference that we're going to create this strategy within a year of signing the ROD, but we don't need to go into the details of the strategy itself in the EIS.
- The task force would look at this strategy pre-NEPA, perhaps during scoping.
- Jason and Katie should take a look at what's in the MOU and let us know if this includes the amount of detail we need at this point.

Adaptive Management Triggers

- Twice a year the task force would evaluate the adaptive management piece.
- There would also be a meeting to talk about population triggers.
- Population is a state data collection effort. Data would go directly to the task force and then would be shared with the BLM (though the task force is separate from the BLM).
- The task force would evaluate data and say whether we're far or close to hitting the triggers, then the task force would spit out a recommendation for the BLM.
- BLM would look at that evaluation. If a trigger was tripped there'd need to be some announcement (state director signature might be required) saying that the trigger has been tripped and management is engaged.

Current Status

- We're holding right now because the WO is still looking at some issues and we're waiting to see how the new memo will impact our work.
- Additional clarifications have been made and guidance has been issued, but we're not sure how these will affect us yet.

Updates on previous issues discussed

- PAC boundaries- having some issues, going back and forth with solicitor about this issue. Are taking care of it internally.
- Grazing management issues between the FS and the BLM- have these been resolved?
 - Grazing management direction was perceived as being different because FS has guidelines having to do with vegetation height, whereas BLM doesn't. However BLM did have a requirement to have grazing management requirements that met the needs of the grouse. People were concerned that these weren't consistent. We may receive national feedback. We've already included a vegetation objectives table to address this.
- We've done a good job addressing the 5 Idaho-specific issues about the Proposed Plan.
- Issues about monitoring with regard to adaptive management strategy- FWS wanted more info on how this worked and what we talked about today will help answer some of those questions.
- There are still some questions about regulating habitat triggers.

- Disturbance is somewhat up in the air still. If a different disturbance decision comes out we'll reconvene to discuss it.
- Adaptive management- Governor says Idaho adaptive management is good.
- Lek buffers- these have been shared back to DC and the national office has given everybody's lek buffers to USGS for them to evaluate and see which can be considered based on the science.
- Rights of way- concerns about inconsistencies across state lines- some discussion is going on about this.
- NSO vs. closures discussion is ongoing.
- Mitigation- commitment to create the strategy within a year (this text has been moved from appendices into the proposed plan)

Other

- Some people have asked for more description about the process by which key habitat was created. Could we add a page of information along with the key habitat map and include it in an appendix? Brent will get appendix out and maybe Don can write a paragraph description about key habitat.
- The 2006 State Plan calls the key habitat map by a different name, should we change it to make it consistent?
- Someone heard concerns about how Idaho is managing for 73% population, but that's not accurate- we're managing not for 73%, but for more like 95%, 73% is a red flag.

Action items

- Clarify 3-year baseline language in the document.
- Paul will reword the "and/or" language and send out to the group.
- Jason and Katie will look at the draft MOU and let us know if it includes the level of detail we need at this point
- Brent will get appendix out and Don will write a paragraph description about the development of key habitat.

Idaho and Southwestern Montana Recommendation for Proposed Plan Amendment

1. Summary Description of the Proposed Plan (Plan)

The Proposed Plan represents a management strategy to address Greater Sage-grouse, their habitat and associated threats within the Idaho and Southwestern Montana Subregion. The Plan has been developed through a coordinated partnership of BLM, Forest Service, the States of Idaho and Montana and the US FWS.

The Plan incorporates appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is also consistent with the objectives described in the USFWS Conservation Objectives Team Report (USFWS 2013) to: ‘Conserve sage-grouse so that it is no longer in danger of extinction or likely to become in danger of extinction in the foreseeable future...’ through ‘Maintaining viable, connected, and well-distributed populations and habitats across [the range of GRSG], through threat amelioration, conservation of key habitats, and restoration activities’.

To achieve these objectives the Plan includes a combination of: Goals and Objectives including vegetation/habitat management objectives to be applied during project development and implementation (Table 3); land allocation decisions (Table 1); delineation of five Conservation Areas (Map 1) to support evaluation of the adaptive management strategy and 3% anthropogenic disturbance cap; delineation of Priority, Important and General Habitat Management Areas (Map 2) with associated program management direction; a mitigation framework and strategy; development of Wildfire and Invasive Species Assessments; and associated monitoring to support these decisions.

Table 1. Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary¹

Solar/Wind/Nuclear/Hydropower – Map 3		
Priority	Important	General
BLM: Exclusion (LR-2) FS: Exclusion	BLM: Avoidance (LR-2) FS: Exclusion	BLM: Open (LR-2) FS: Avoidance
Commercial Service Airports – Map 4		
Priority	Important	General
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills – Map 4		
Priority	Important	General
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
Utility Corridors – Map 5		
Priority	Important	General
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as Priority (LR-7)	Same as Priority (LR-7)
Rights-of-Way and Land Use Authorizations/Permits – Map 6		
Priority	Important	General
Avoidance (LR-1)	Avoidance (LR-1)	BLM: Open (LR-1)

¹ The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

		FS: Avoidance
Land Tenure Adjustments – Map 7		
Priority	Important	General
Retention with exceptions for exchange; available for exchange with no net loss of GRSG Key habitat within Priority and Important. Not available for disposal. (LR-13)	Same as Priority (LR-13)	Available for exchange only
Fluid Mineral Resource Allocation (Includes Geothermal) – Maps 8 & 9		
Priority	Important	General

2. Goals and Objectives

- 2.1. GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of GRSG by conserving, enhancing and restoring GRSG habitat to maintain resilient populations by reducing, eliminating or minimizing threats to GRSG habitats.
- 2.2. GOAL-2: Provide for the needs of GRSG and their habitat while also providing for resource uses in accordance with the agencies' direction for multiple use and sustained yield as described in FLPMA and the NFMA.
- 2.3. GOAL-3: Manage anthropogenic development and human disturbance to minimize the likelihood of adverse population level effects on GRSG.
- 2.4. GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM and USFS management actions.
- 2.5. Management Area (MA) - Objective (OBJ)-1: Maintain a resilient population of GRSG in Idaho and Southwestern Montana.
- 2.6. MA-OBJ-2: Designate GRSG management areas and associated management to maintain a resilient population and to designate strategically located adjacent areas to provide a buffer from unpredictable habitat loss such as wildfire to the resilient population areas.
- 2.7. MA-OBJ-3: Identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.
- 2.8. Vegetation (VEG)-OBJ-1: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.
- 2.9. VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:
 - a. Increasing or enhancing canopy cover and average patch size of sagebrush.
 - b. Increasing the amount, condition and connectivity of seasonal habitats.
 - c. Protecting or improving GRSG migration/movement corridors.
 - d. Reducing conifer encroachment within GRSG seasonal habitats.
 - e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
 - f. Reducing the extent of annual grasslands within and adjacent to Priority and Important Habitat Management Areas.Decadal treatment objectives by population area are identified in Table 2.
- 2.10. Habitat Management (HM)-OBJ-1: Maintain or make progress toward at least 70% of lands within PHMAs and IHMAs capable of producing sagebrush at 10-30% canopy cover and conifers absent to uncommon within 1.86 miles of occupied leks.
- 2.11. HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 3) into the design of projects or activities, as appropriate, based on site conditions and ecological potential, unless achievement of fuels management objectives require additional reduction in sagebrush cover to meet strategic protection of GRSG habitat and conserve habitat quality for the species or at least one of the following conditions can be demonstrated and documented in the NEPA analysis associated with the specific project:
 - A specific objective is not applicable to the site-specific conditions of the project or activity;
 - An alternative objective is determined to provide equal or better protection for GRSG or its habitat (based on appropriate scientific findings); or

- Analysis concludes that following a specific objective would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.
- 2.12. FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
- 2.13. WHB-OBJ-1: Manage wild horse and burro population levels within the established AML ranges to maintain or enhance GRSG habitat.

Table 2. Estimated Acres of Treatment Needed within a 10-Year Period to Achieve Vegetation Objectives²

Population Area	Mechanical Conifer Treatment (VEG-8)	Mechanical Sage (VEG-2)	Prescribed Fire (VEG-9)	Annual Grass Treatment (VEG-2)
Bear Lake Plateau		1000		
East Idaho Uplands	6000		9000	1000
S Central Idaho/N Snake River and Mountain Valleys	4000	14000	11000	162000
Weiser				13000
SW Idaho	48000	4000	10000	444000
SW Montana	50	50	1200	

Table 3. Seasonal Habitat Desired Conditions for Greater Sage-Grouse

ATTRIBUTE	INDICATOR	DESIRED CONDITION
BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)		
Lek Security	Proximity of trees ^{7,13}	Trees (i.e., in Idaho mainly juniper, conifers, and does not include old growth juniper, pinyon pine and mountain mahogany; in

² These acreage figures, based on VDDT modeling, represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward vegetation and habitat objectives [Reference VDDT Appendix]. This accounts for variations in yearly funding availability and does not reflect a maximum acreage for treatment should funding and site specific conditions allow for more or less treatment than described in order to meet vegetation and habitat objectives.

		Montana mainly Douglas-fir) absent or uncommon on shrub/grassland ecological sites within 1.86 miles (3 km) of occupied leks.
	Proximity of sagebrush to leks ¹³	Adjacent protective sagebrush cover within 328 ft (100 m) of an occupied lek
NESTING/EARLY BROOD REARING^{5,10,12,13,14}		
Cover and Food	Seasonal habitat extent ⁸	>80% of the nesting habitat meets the recommended vegetation characteristics, where appropriate (relative to ecological site potential, etc.).
	Sagebrush canopy cover ^{2,8,9,11}	15-25%
	Sagebrush height ⁸ Arid sites ³ Mesic sites ⁴	12-31 inches (30-80cm) 16-31 inches (40-80cm)
	Predominant sagebrush shape ¹³	Predominantly spreading shape ⁵
	Perennial grass cover ^{2,8,13} Arid sites ³ Mesic sites ⁴	≥10% ≥15%
	Perennial grass height ^{8,9,11,13}	Adequate nest cover
	Perennial forb cover ^{2,8} Arid sites ³ Mesic sites ⁴	≥5% ≥10%
	Perennial forb availability ¹³	Preferred forbs are common with several species present ⁶
LATE BROOD-REARING/SUMMER^{1,15} (July-October)¹ Late brood-rearing areas, such as riparian, meadows, springs, higher elevation mesic uplands, etc. may occur within other mapped seasonal habitat areas. Apply late brood rearing/summer habitat desired conditions locally as appropriate.		
Cover and Food	Seasonal habitat extent ⁸	>40% of the summer/brood habitat meets recommended brood habitat characteristics where appropriate (relative to ecological site potential, etc.)
	Sagebrush canopy cover ^{2,8,}	10-25%
	Sagebrush height ^{8,}	16 to 32 inches (40-80cm)
	Perennial grass canopy cover ^{2,8}	>15%
	Upland and riparian perennial forb availability ^{2,13}	Preferred forbs are common with several preferred species present ^{6,}
	Riparian meadow habitat condition	Proper Functioning Condition ¹³
WINTER¹ November-March¹ (Apply to areas of known or likely winter-use)		
Cover and Food	Seasonal habitat extent ⁸	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).
	Sagebrush canopy cover above snow ^{2,8,13}	>10%
	Sagebrush height above snow ⁸	>10 inches (>25cm)
NOTES AND REFERENCES		
<p>¹ Seasonal dates can be adjusted by local unit according to geographic region.</p> <p>² Absolute cover is the actual recorded cover and can exceed 100% when recorded across all species and all layers. It is not relative cover, which is the proportions of each species, and equals 100%. Note that cover is reported for only those species (e.g., sagebrush, preferred forbs) that are sampled to determine suitability of habitat for sage-grouse. Overall cover at the site will be greater than that sampled for sage-grouse habitat, due to</p>		

other species present. Manage areas not currently within a mapped seasonal habitat based on case-by case, site specific analysis arising from habitat assessments, telemetry, research or site specific NEPA.

³ Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

⁴ Mesic corresponds to the ≥ 12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).

⁵Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.

⁶ Preferred forbs are listed in Stiver et al. *In press* . Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

¹⁵ Some late brood habitat occurs at higher elevations outside of mapped nesting habitat and some is embedded within nesting landscapes especially areas such as wet meadows, riparian areas, springs and seeps.

3. Coordination

- 3.1.** CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement and monitor activities to achieve desired conditions and to maximize the utilization of available funding opportunities. Coordination efforts could include: adjacent landowners, federal and state agencies, local governments, tribes, communities, other agencies, resource advisory groups, public lands permit holders and non-governmental organizations.
- 3.2.** CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of Idaho to establish the State of Idaho as a cooperating agency during implementation of the final decision. The MOU would identify responsibilities, role and interaction of the BLM, FS and State of Idaho. Montana BLM will participate as appropriate on Montana's Sage-grouse Oversight Team to facilitate coordination and implementation of BLM's final decision and Montana's Executive Order No. 10-2014.
- 3.3.** CC-3: The BLM and Forest Service would consider any recommendations from the Governor of Idaho as a result of evaluation completed by the Sage-Grouse Implementation Task Force.
- 3.4.** CC-4: The BLM and Forest Service would coordinate with the State of Idaho and Montana and the Idaho Sage-Grouse Implementation Task Force and Montana Sage-grouse Oversight Team regarding proposed management changes, the implementation of conservation measures, mitigation, and site-specific monitoring, related to adaptive management and livestock grazing (Appendix O).
- 3.5.** CC-5: Upon completion of the Record of Decision the BLM will develop an initial Implementation Guide for BLM District and Field Offices within a year of issuance of the Record of Decision. This Guide would define and describe consistent application of the allocations, management actions, required design features, and etc. that are contained within the final plan and would be updated and expanded as needed to respond to issues and concerns.
- 3.6.** CC-6: At the state level, BLM and Forest Service would coordinate with IDFG, MFWP, USFWS, and other conservation partners in collaborative efforts with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG MZs IV and II to evaluate GRSG habitat and population status and trends and make appropriate regional recommendations for GRSG conservation at broader scales.
- 3.7.** CC-7: At the state level, BLM and Forest Service would coordinate with the appropriate WAFWA Sage-grouse Technical Committee to develop consistent population and habitat monitoring approaches that facilitate GRSG conservation at the MZ scale.
- 3.8.** CC-8: All prescribed burning would be coordinated with state and local air quality agencies to ensure that local air quality is not significantly impacted by BLM and Forest Service activities.

4. Greater Sage-Grouse Management Areas

- 4.1. Management Area (MA)-1: Designate five GRSG Conservation Areas within the sub-region to form the geographic basis for achieving population objectives; evaluating the disturbance density and adaptive regulatory triggers; and tailor adaptive management responses. These conservation areas are depicted in Map 1. These areas are referred to as Mountain Valleys, Desert, West Owyhee, Southern and Southwestern Montana Conservation Areas.

Conservation Area Description:

Mountain Valleys Conservation Area – generally located north of the Snake River Plain, and includes habitat in west-central population area. It extends west from Rexburg, north and west of Highway 33 to Howe, north and west of Highway 33/22 to Arco, north and west of Highway 26/20/93 to Carey, north and west of Highway 20 west to Hill City, north and west of Highway 20 to the Dylan Karaus Road, west to Canyon Creek. Canyon Creek to the confluence with the Snake River form the western boundary.

Desert Conservation Area – located north of the Snake River and south of the Mountain Valleys Conservation Area. It extends from the confluence of Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River and Henry’s Fork form the eastern boundary.

West Owyhee Conservation Area – located south of the Snake River and west of the Bruneau River.

Southern Conservation Area – located south of the Snake River and east of the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and the Utah portion of the Sawtooth National Forest in Box Elder County.

Southwestern Montana – located in southwestern Montana - encompassing the Dillon Butte BLM Field Office boundaries (the Butte RMP is not being amended and since there are limited GRSG federal General Habitat Management Areas management actions do not apply in the Butte Field Office).

Additionally, sage-grouse habitats in the Desert and West Owyhee CAs are relatively contiguous, while those in the Mountain Valleys and Southern CAs tend to be more fragmented due to topography, elevational and land use differences.

- 4.2. MA-2: Within each Conservation Area (CA) designate GRSG Habitat Management Areas: Priority, Important and General Habitat Management Areas (Map 2). **Priority Habitat Management Areas (PHMAs)** focus on conserving the two key meta-populations in the sub-region. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. The PHMA encompasses areas with the highest conservation value to GRSG, based on the presence of larger leks, habitat extent, important movement and connectivity corridors and winter habitat. Priority Habitat Management Areas include adequate area to accommodate continuation of existing

land uses and landowner activities. **Important Habitat Management Areas (IHMAs)** contain additional habitat and populations that provide a management buffer for the PHMA and to connect patches of PHMA. The IHMA encompasses areas of generally moderate to high conservation value habitat and/or populations and in some CAs includes areas beyond those identified by USFWS as necessary to maintain redundant, representative and resilient populations (Priority Areas for Conservation (PACs)). The IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower GRSG population status and/or reduced habitat value due to disturbance, habitat fragmentation or other factors. There are no IHMAs designated within the Southwestern Montana CA. **General Habitat Management Areas (GHMAs)** encompass habitat that is outside of PHMAs or IHMAs. It is generally characterized by more marginal habitat and few, if any, occupied leks or other important seasonal use areas.

- 4.3. MA-3: Delineate PHMA and IHMA to encompass 90% of the breeding males in Idaho.
- 4.4. MA-4: Annually prioritize Conservation Areas at the state scale considering results of the annual adaptive regulatory trigger evaluations relative to implementation of restoration and mitigation activities.
- 4.5. MA-5: Prioritize activities and mitigation to protect, enhance and restore GRSG habitats (i.e. fire suppression activities, fuels management activities, vegetation treatments, invasive species treatments, etc.) first by Conservation Area, if appropriate (CA under adaptive management or at risk of engaging adaptive management), followed by Priority Habitat Management Areas, then Important Habitat Management Areas then General Habitat Management Areas within the Conservation Areas. Local priority areas within these areas will be further refined as a result of completing the GRSG Wildfire and Invasive Species Habitat Assessments as described in Appendix D. This could include projects outside GRSG habitat when those projects would provide a benefit to GRSG habitat. Priority restoration and mitigation areas are restoration areas identified on the Key Habitat map (R1, R2, R3 and Recent Burn) within nesting and wintering areas in Priority and Important Habitat Management Areas.
- 4.6. MA-6: The management area map and biologically significant unit baseline map would be re-evaluated in conjunction with plan evaluation processes (i.e. approximately every 5 years). This re-evaluation could indicate the need to adjust Priority, Important or General Habitat Management Areas or the habitat baseline. These adjustments could occur upon completion of the appropriate analysis (plan amendment) to review the allocation decisions based on the map. Results from the Wildfire and Invasive Species Assessments, such as identified focal or emphasis areas would also be used to help inform mapping adjustments during this evaluation.
- 4.7. MA-7: The functionality and capability of GRSG habitat within the project area would be assessed during project-level NEPA analysis within the management area designations (Priority, Important, General) and appropriate annual updates to the Key Habitat map would occur. Areas without the potential and capability to provide GRSG habitat would be identified, areas with the potential to provide GRSG habitat would be appropriately classified on the Key Habitat map. Project proposals and their effects would be evaluated based on the habitat and values affected.

- 4.8. MA-8: Idaho BLM will annually update the Key Habitat map as described in Appendix F, in order to reflect habitat changes resulting from wildfire, succession, and vegetation treatments that occurred or were observed since the last update. Updates to the map will also occur if it is determined that mapping errors or omissions have occurred, or that radio-telemetry studies indicate that sage-grouse are consistently utilizing an area. Updates are also intended to capture recommendations by the field offices, sage-grouse Local Working Groups (LWG), or agency partners in sage-grouse conservation.
- 4.9. MA-9: Areas of habitat outside of delineated management areas identified during the Key habitat update process would be evaluated during site specific NEPA for project level activities and GRSG required design features (Appendix A), seasonal timing restrictions (Appendix B) and buffers (Appendix C) would be included as part of project design. These areas would be further evaluated during plan evaluation and the 5-year update to the management areas, to determine whether they should be included as Priority, Important or General Habitat Management Areas.

DRAFT

5. Adaptive Management

- 5.1. Adaptive Management (AM)-1: Idaho: Use hard and soft population and habitat triggers, evaluated within a Conservation Area, to determine an appropriate management response.
- 5.2. AM-2: Utilize monitoring information collected through the Monitoring Framework Plan (Appendix E) to determine when adaptive regulatory triggers have been met.
- 5.3. AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG), using the process described in Appendix F.
- 5.4. AM-4: BLM and Forest Service would utilize population information collected and maintained by the Idaho Department of Fish and Game to track and identify population changes to assess the population trigger in the adaptive management approach.
- 5.5. AM-5: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management triggers have been met.
- 5.6. AM-6: Adaptive regulatory triggers would be individually calculated across all ownerships within the biologically significant units (BSU). The BSU is defined as the Idaho Department of Fish and Game modeled nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area. The sagebrush component of the BSU is represented by the key habitat within the BSU.
- 5.7. AM-7: Adaptive Regulatory Criteria for Hard Habitat Triggers are defined as:
 - A 20 percent loss of Key Habitat within the biologically significant unit (BSU) (Appendix G) of the PHMA of a CA when compared to the 2011 baseline (the BSU is defined as the nesting and wintering habitat within a Priority and Important Habitat Management Areas (separately) within a Conservation Area, inclusive of all ownerships); or
 - A 20 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.8. AM-8: Adaptive Regulatory Criteria for Soft Habitat Triggers are defined as:
 - A 10 percent loss of Key Habitat within the BSU of the PHMA of a CA when compared to the 2011 baseline; or
 - A 10 percent loss of Key Habitat within the BSU of the IHMA of a CA when compared to the 2011 baseline.
- 5.9. AM-9: Adaptive Regulatory Criteria for Hard Population Triggers are defined as:
 - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within PHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline; or
 - A 20 percent decline in maximum number of males counted and a finite rate of change significantly below 1.0 within IHMA within a CA over a period of 3 consecutive years compared to the 2009-2011 baseline. Significance for the finite rate of change is defined by the 90% confidence interval around the current 3-year average of finite rate of change to evaluate whether the finite rate of change is significantly less than 1.0. If the 90% confidence interval is

less than and does not include 1.0, than the finite rate of change is significantly less than 1.0. The finite rate of change and variance will be calculated following Garton et al. (2011).

- 5.10.** AM-10: Adaptive Regulatory Criteria for Soft Population Triggers are defined as:
- A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within PHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011; or
 - A 10 percent decline in maximum number of males counted and a finite rate of change below 1.0 within IHMA within a CA over a period of 3 years when compared to the average finite rate of change from 2009-2011.
- 5.11.** AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been met the Implementation Team would evaluate causal factors and recommend additional potential implementation level activities Appendix G.
- 5.12.** AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been met then PHMA management actions would be applied to the IHMA within that CA.
- 5.13.** AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified as a probable limiting factor then adjustments would follow the Adaptive Grazing Management Response described in Appendix G.
- 5.14.** AM-14: Remove any adaptive management response when the habitat or population information shows a return to or an exceedance of baseline values within the associated CA.
- 5.15.** **Montana Adaptive Management:**

6. Anthropogenic Disturbance

- 6.1.** Anthropogenic Disturbance (AD)-1: Limit anthropogenic disturbance to 3 percent as calculated within the biologically significant unit (BSU) (Map 3). The BSU is defined as the currently mapped nesting and wintering habitat within Priority and Important Habitat Management Areas within a Conservation Area, inclusive of all ownerships for evaluation. Anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities and includes activities described in Table X. For Idaho this disturbance is measured by direct footprint or by ROW width for linear features (powerlines, pipelines and roads). For Montana this disturbance is measured utilizing the Disturbance Density Calculation Tool process described in Appendix H.
- 6.2.** AD-2: New anthropogenic disturbances within Priority or Important Habitat Management Areas within a CA where the disturbance cap is already exceeded from any source or where the proposed development would result in the cap being exceeded would not be allowed in within that CA until enough habitat has been restored within that CA to maintain the area under this cap (subject to valid existing rights).
- 6.3.** AD-3: Priority Habitat Management Area: Anthropogenic Disturbance Exception Criteria. In order to avoid surface-disturbing activities in Priority Habitat Management Areas, priority will be given to development (including ROWs, fluid minerals and other mineral resources subject to applicable stipulations) outside of Priority Habitat Management Areas. When authorizing development in Priority Habitat Management Areas, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. In addition to the Priority and Important Habitat Management Area Anthropogenic Disturbance Development Criteria (AD-4), the following criteria must all be met in the project screening and assessment process:
- a. The population trend for the GRSG within the associated Conservation Area is stable or increasing over a three-year period and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development);
 - b. The development with associated mitigation would not result in a net loss of GRSG Key habitat and mitigation would provide a net conservation benefit to the respective Priority Habitat Management Area;
 - c. The project and associated impacts would not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA (the project would be outside Key habitat in areas not meeting desired habitat conditions or the project would provide a benefit to habitat areas that are functioning in a limited way as habitat);
 - d. Cannot be reasonably accomplished outside of the Priority Habitat Management Area; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) ; or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines) (proposed actions would not increase the 2011

- authorized footprint and associated impacts more than fifty percent (50%), depending on industry practice.
- e. Development could be implemented adhering to the required design features (RDF) described in Appendix A;
 - f. The project would not exceed the disturbance cap (AD-1).
 - g. The project has been reviewed by the State Implementation Team and recommended for consideration by the Idaho Governor.
- 6.4.** AD-4: Priority and Important Habitat Management Areas: Anthropogenic Disturbance Development Criteria – the following criteria must be met in the screening and assessment process:
- a. The project cannot reasonably be achieved, technically or economically, outside of this management area; and
 - b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
 - c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant CA; and
 - d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
 - e. Development could be implemented adhering to the required design features (RDF) described in Appendix A.
 - f. The project would not exceed the disturbance cap (AD-1).
- 6.5.** AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:
- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
- Electrical Lines – Installation of new rights-of-way (ROWs) adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
- Other Rights-of-Way – The installation of new rights-of-way (ROWs) within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
- Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.
- 6.6.** AD-6: Incorporate required design features (RDFs) as described in Appendix A in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following conditions can be

demonstrated and documented in the NEPA analysis associated with the specific project:

- A specific RDF is not applicable to the site-specific conditions of the project or activity;
- A proposed design feature or BMP is determined to provide equal or better protection for GRSG or its habitat; or
- Analysis concludes that following a specific RDF would provide no more protection to GRSG or its habitat than not following it, for the project being proposed.

- 6.7. AD-7: Conduct implementation and project activities, including construction and short-term anthropogenic disturbances consistent with seasonal habitat restrictions described in Appendix B.
- 6.8. AD-8: Required Design Features and seasonal habitat restrictions would not be required for emergency or short-term activities necessary to protect and preserve human life or property.
- 6.9. AD-9: Incorporate appropriate buffers into implementation and project design to avoid and minimize impacts to GRSG described in Appendix C.
- 6.10. AD-10: Incorporate appropriate conservation measures for slickspot peppergrass (*Lepidium papilliferum*) as described in the 2014 Conservation Agreement (as updated, amended or reauthorized) into implementation and project design within slickspot peppergrass habitat in the Jarbidge and Four Rivers Field Offices to avoid and minimize impacts to slickspot peppergrass. The 2014 Conservation Agreement is included as Appendix ??.

DRAFT

7. Mitigation

- 7.1.** Mitigation (MIT)-1: BLM and USFS would establish an inter-agency WAFWA Management Zone GRSG Conservation Team at the state level (both Idaho and Montana) to help guide conservation of GRSG, within 90 days of the issuance of the Record of Decision. MIT-2: The BLM and USFS, in coordination with the GRSG Conservation Team would develop a Mitigation Strategy within one year of the issuance of the Record of Decision. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (Appendix I).
- 7.2.** MIT-3: Mitigate impacts from anthropogenic developments (Appendix G Table G-1) to GRSG habitats to a net conservation benefit by first avoidance of impacts, minimizing impacts and then compensating for impacts. A net conservation benefit to GRSG would be achieved by implementing restoration conservation actions, applying a no net unmitigated loss standard for authorized uses in all GRSG habitat with PHMA, IHMA and GHMA; and strategically siting compensatory mitigation actions, consistent with the WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits (as outlined in Appendix I).
- 7.3.** MIT-4: Mitigate anthropogenic development (Appendix G Table G-1) impacts to a no net loss of Key habitat standard (Appendix I) through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I), referred to as no unmitigated loss. No net unmitigated loss means that impacts from implementation level actions would fully offset to benefit the species. This would be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.
- 7.4.** MIT-5: Mitigate anthropogenic development (Appendix G Table G-1) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (Appendix I).
- 7.5.** MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in Table 3.

8. Wildfire Preparedness/Prevention

- 8.1. Wildfire Preparedness (WFP)-1: Support development and implementation of Rangeland Fire Protection Associations (RFPAs) in coordination with the State of Idaho.
- 8.2. WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat through the existing coordinated inter-agency approach to fire restrictions based upon National Fire Danger Rating System thresholds (fuel conditions, drought conditions, and predicted weather patterns).
- 8.3. WFP-3: Annually incorporate into existing fire management plans results and updates from the Wildfire and Invasive Species Habitat Assessments (FIAT Assessments) described in Appendix D, to communicate/explain the resource value of GRSG habitat, including fire prevention messages and actions to reduce human-caused ignitions.
- 8.4. WFP-4: Continue to participate with the Wildland Fire Leadership Council, a cooperative, interagency organization dedicated to achieving consistent implementation of the goals, actions, and policies in the National Fire Plan and the Federal Wildland Fire Management Policy.
- 8.5. WFP-5: Continue annual coordination meetings held between cooperating agencies that have fire suppression responsibilities. Incorporate Rangeland Fire Protection Associations and other stakeholders into this coordination. Discuss priority suppression areas and distribute maps showing priority suppression areas at both the Conservation Area and the local office levels as based on the adaptive management strategy and FIAT Assessments.
- 8.6. WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG habitat and sagebrush management issues as related to wildfire suppression.
- 8.7. WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use areas with high frequency of human caused fires within or adjacent to the Priority or Important Habitat Management Areas. Consider these areas during annual fire restriction evaluations, and as appropriate, through site specific management.
- 8.8. WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter prevention programs to reduce human caused ignitions.
- 8.9. WFP-9: Implement activities identified within the FIAT Assessments.

9. Wildfire Suppression

- 9.1. WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT Assessments) as described within Appendix D and incorporate results into appropriate Fire Management Plans as they are completed. FIAT Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of focal and emphasis habitats/treatment opportunities for fuels management, fire management, and restoration. These FIAT Assessments identify focal and emphasis habitats and describe strategies for fuels management, suppression and restoration activities. Focal and Emphasis Habitats identified through the FIAT Assessment to further refine priority areas for treatments to reduce the threats posed by wildfire, invasive annual grass and conifer expansion.
- 9.2. WFS-2: As part of the FIAT Assessments incorporate a wildfire response time analysis focusing on response time to identified priority areas within Priority and Important Habitat Management Areas or on those fires that have the potential to impact Priority and Important Habitat Management Areas. Incorporate findings into Unit Initial Attack program
- 9.3. WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for suppression purposes, including potential private water sources. Provide water availability to respond to fire in or threatening PHMA and IHMA during initial attack.
- 9.4. WFS-4: During high fire danger conditions, stage initial attack and secure additional resources closer to priority areas identified in the FIAT Assessments, based on anticipated fires and weather conditions, with particular consideration of the West Owyhee, Southern and Desert Conservation Areas to ensure quicker response times in or near GRSG habitat after considerations and placement of resources to protect human life and property.
- 9.5. WFS-5: Utilize a full range of fire management strategies and tactics through strategic wildfire suppression planning consistent with appropriate management response and within acceptable risk levels, to achieve resource objectives for GRSG habitat consistent with land use plan direction. Utilizing both direct and indirect attack as appropriate to limit the overall amount of GRSG habitat burned. This could include suppressing fires in intact sagebrush habitats; limiting fire growth in General Habitat Management Areas when suppression resources are available or managing wildfire for resource benefit in areas of conifer (juniper) encroachment.
- 9.6. WFS-6: Suppression priorities: Firefighter and public safety followed by property are the highest priority for protection during suppression activities. Maintaining GRSG habitat will be prioritized immediately after human life and property, commensurate with threatened and endangered species habitat or other critical habitats to be protected.
- 9.7. WFS-7: Ensure close coordination with federal and state firefighters including the Rangeland Fire Protection Associations during suppression activities.

10. Fuels Management

- 10.1.** FM-1: Design and implement fuels treatments that would reduce the potential start and spread of unwanted wildfires and provide anchor points or control lines for the containment of wildfires during suppression activities with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area.
- 10.2.** FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process.
- 10.3.** FM-3: Apply appropriate seasonal restrictions for implementing vegetation and fuels management treatments according to the type of seasonal habitats present. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and would protect, maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into Priority Habitat Management Areas or WUI.
- 10.4.** FM-4: Develop a fuels continuity and management strategy to expand, enhance, maintain and protect GRSG habitat informed by the FIAT Assessments completed as described in Appendix D.
- 10.5.** FM-5: When developing the fuels management strategy as part of the FIAT Assessment described in Appendix D consider up-to-date fuels profiles; land use plan direction; current and potential habitat fragmentation; sagebrush and GRSG ecological factors; active vegetation management steps to provide critical breaks in fuel continuity where appropriate; incorporate a comparative risk analysis with regard to the risk of increased habitat fragmentation from a proposed action versus the risk of large scale fragmentation posed by wildfires if the action is not taken.
- 10.6.** FM-6: Fuel treatments will be designed through an interdisciplinary process to expand, enhance, maintain, and protect GRSG habitat which considers a full range of cost effective fuel reduction techniques, including: chemical, biological (including grazing and targeted grazing), mechanical and prescribed fire treatments.
- 10.7.** FM-7: Existing and proposed linear ROWs could be considered for use and maintenance as vegetated fuel breaks in appropriate areas (this activity may or may not be part of the ROW permit or the responsibility of the permit holder, in cases where this activity is considered part of mitigation for project design then it would be appropriately included as part of the ROW permit and the responsibility of the permit holder for development and maintenance).
- 10.7.1.** FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings), rocky areas or other appropriate topography or features or be located adjacent to existing linear disturbance areas where appropriate. Fuel breaks should be placed in areas with the greatest likelihood of compartmentalizing a fire and/or to foster suppression options to protect existing intact habitat.

- 10.8.** FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and results identified within the Wildfire and Invasive Species Assessments..
- 10.9.** FM-10: Protect seeding efforts from subsequent fire events.
- 10.10.** FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to reduce the potential start and spread of wildfires may be implemented within existing grazing authorizations if feasible such as through temporary non-renewable authorizations, or through contracts, agreements or other appropriate means separate from existing grazing authorizations and permits.
- 10.11.** FM-12: Targeted grazing to achieve fuels management objectives should conform to the following criteria:
- Targeted grazing should be implemented strategically on the landscape, and directly involve the minimum footprint and grazing intensity required to meet fuels management objectives.
 - Allow conformance to the applicable Standards for Rangeland Health and Guidelines for Livestock Grazing Management (Idaho or Montana) at the assessment scale.
 - Where feasible and applicable coordinate with the grazing permittee to strategically reduce fuels through livestock management within the Mandatory Terms and Conditions of the applicable grazing authorizations
- 10.12.** FM-13: Prioritize the use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success. Where probability of success or native seed availability is low or non-economical, nonnative seeds may be used to meet GRSG habitat objectives to trend toward restoring the fire regime. When reseeding, use fire resistant native and nonnative species, as appropriate, to provide for fuel breaks.
- 10.13.** FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-term success, including persistence of seeded species and/or other treatment components while maintaining the integrity of adjacent vegetation.

11. Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation

- 11.1.** ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as part of the FIAT Assessment process described in Appendix D to determine if GRSG rehabilitation actions are needed, based on ecological potential, and direct emergency stabilization and rehabilitation (ESR) (BLM) or Burned Area Emergency Restoration (BAER) (FS) actions after fire.
- 11.2.** ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans based on site potential and in accordance with the Restoration/Rehabilitation Strategy developed as a result of the FIAT Assessments.
- 11.3.** ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of existing vegetation and successful establishment of seeded species. New seedings should not be grazed until at least the end of the second growing season, and longer as needed to allow plants to mature and develop robust root systems which will stabilize the site, compete effectively against cheatgrass and other invasive annuals, and remain sustainable under long-term grazing management. Adjust other management activities, as appropriate, to meet ES&R objectives.
- 11.4.** ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to mitigate the effect of the burn on local GRSG populations.

12. Habitat Restoration and Vegetation Management

- 12.1. VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.
- 12.2. VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous conditions do not meet habitat management objectives (i.e. is minimal or exceeds optimal characteristics). This may necessitate the use of prescribed fire as a site preparation technique to remove annual grass residual growth prior to the use of herbicides in the restoration of certain lower elevation sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned and coordinated to minimize impacts to sage-grouse seasonal habitats.
- 12.3. VEG-3: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Non-native seeds may be used as long as they support GRSG habitat objectives (Pyke 2011) to increase probability of success, when adapted seed availability is low or to compete with invasive species especially on harsher sites.
- 12.4. VEG-4: Implement management changes in restoration and rehabilitation areas, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat (Eiswerth and Shonkwiler 2006). Management changes could be considered during livestock grazing permit renewals, travel management planning, and renewal or reauthorization of rights-of-way.
- 12.5. VEG-5: Consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) to provide a reliable source of locally adapted seed to use during rehabilitation and restoration activities.
- 12.6. VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years when preferred native seed is in short supply. This may require reallocation of native seed from ESR (BLM) and/or BAER (Forest Service) projects outside of Priority or Important Habitat Management Areas to those inside it. Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment of appropriate sagebrush species/subspecies and important understory plants, relative to site potential, shall be the highest priority for rehabilitation efforts.
- 12.7. VEG-7: During land health assessments, evaluate the relative value of existing nonnative seeding within GRSG habitat as: 1) a component of a grazing system allowing improvement of adjacent native vegetation, 2) development of a forage reserve, 3) incorporation into a fuel break system (Davies et al. 2011) or 4) restoration/diversification for GRSG habitat improvement. Where appropriate and feasible, diversify seedings, or restore to native vegetation when potential benefits to GRSG habitat outweigh the other potential uses of the non-native seeding, with emphasis on PHMA and IHMA. Allow recolonization of seedings by sagebrush and other native vegetation.
- 12.8. VEG-8: Utilize conifer (juniper) removal treatments to reduce the extent of conifer encroachment areas in sagebrush habitats. Prioritize treatments closest to occupied

sage-grouse habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. Use site-specific analysis and tools like VDTT and FIAT assessments to help refine the location for specific priority areas to be treated. Refrain from using prescribed fire and conducting removal projects in old-growth juniper stands. Old-growth juniper trees are characterized by rounded tops and spreading canopies, often containing dead limbs and/or spike tops, large branches near the base of the tree, as well as furrowed, fibrous bark, and are typically host to arboreal lichens. Leader growth in the upper quarter of the tree is usually less than one inch. These trees are generally distributed on rock outcrop or rubble land soils, or other soils with coarse fragments in the soil-surface and/or slopes over 12-25%, where juniper vegetation type is the climax plant community (IDFG 2000; Miller et al 2005; USDI and USGS 2007).

- 12.9.** VEG-9: Avoid using prescribed fire in Greater Sage-Grouse habitat unless evaluation of site-specific conditions demonstrate that there would be a net benefit for sage-grouse. If prescribed fire is used in Greater Sage-Grouse habitat, include an analysis in the NEPA document that indicates how Greater Sage-Grouse goals and objectives will be addressed and met by its use, why alternative techniques were not selected, and a risk assessment to address how potential threats to Greater Sage-Grouse habitat would be minimized.
- If prescribed fire is to be used at the implementation level, at a minimum, the burn plan will indicate how land use plan objectives would be addressed and met and why alternative techniques were not selected.
 - Avoid prescribed fire as a vegetation or fuels treatment in Wyoming big sagebrush or other xeric sagebrush species, or in areas with a potential for post-fire exotic annual dominance. However, after other treatment opportunities have been explored and as site-specific variables allow, prescribed fire could be used in these areas to meet specific fuels objectives that would maintain, improve, or restore Greater Sage-Grouse habitat or vegetation (e.g., creation of fuel breaks that would disrupt the fuel continuity across the landscape in stands where annual invasive grasses are a minor component in the understory, burning slash piles from conifer reduction treatments, used as a component with other treatment methods (such as chemical) to combat annual grasses and restore native plant communities).
 - Allow no treatments in areas only providing winter seasonal habitat unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and/or would protect, maintain, increase, or enhance winter range habitat quality.

13. Invasive Species

- 13.1.** Invasive Species (INV)-1: Incorporate results of the FIAT Assessments into projects and activities addressing invasive species.
- 13.2.** INV-2: Implement noxious weed and invasive species control using integrated vegetation management actions per national guidance and local weed management plans for Cooperative Weed Management Areas in cooperation with State and Federal agencies, affected counties, and adjoining private lands owners.
- 13.3.** INV-3: Conduct integrated weed management actions for noxious and invasive weed populations that are impacting or threatening GRSG habitat quality using a variety of eradication and control techniques including chemical, mechanical and other appropriate means.
- 13.4.** INV-4: Require project proponent (projects described in Table X and which are included in the anthropogenic disturbance cap evaluation) to ensure that noxious weeds and invasive species caused as a result of the project are treated to eliminate establishment on the disturbed project construction areas for at least 3 years.

14. Lands and Realty / Infrastructure

- 14.1. Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
- 14.2. LR-2: Priority: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Habitat Management Areas as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate and manage General Habitat Management Areas as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions.
- 14.3. LR-3: Priority: Development of commercial service airports and facilities (as defined by FAA 2014 – publically owned airports that have at least 2,500 passenger boardings each calendar year and receive scheduled passenger service) would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.4. LR-4: Priority: Development of new or expansion of existing landfills would not be allowed within Priority Habitat Management Areas. Important and General Habitat Management Areas are Avoidance and Open respectively for these types of ROW applications as described in LR-1.
- 14.5. LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations in IHMA could be considered consistent with the Important Habitat Management Area Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.
- 14.6. LR-6: If the project is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade) - the existing transmission line must be removed and area rehabilitated within a specified amount of time after the new line is installed and energized.
- 14.7. LR-7: Existing designated corridors, including Section 368 Corridors, will remain Open (subject to the ongoing settlement agreement).
- 14.8. LR-8: Process unauthorized use. If the use is subsequently authorized, it would be authorized consistent with direction for the Management Areas within which it is located and the RDFs, buffers and seasonal timing restrictions. If the use is not subsequently authorized the site would be reclaimed by removing these features and rehabilitating the habitat.
- 14.9. LR-9: Land use authorizations that are temporary (less than 3 years) in nature and are not otherwise excluded or restricted would be subject to seasonal or timing restrictions and mitigation requirements regarding habitat loss as needed.

- 14.10.** LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or amendments to existing water facilities which include additional structures to improve fish passage or benefits to fisheries (new diversions, fish screens) would be allowed on a case-by-case bases subject to RDFs to reduce impacts to GRSG habitat and mitigation requirements regarding GRSG habitat loss as needed.
- 14.11.** LR-11: When a ROW grant expires and is not requested to be renewed, is relinquished, or terminated, the lease holder would be required to reclaim the site by removing overhead lines and other infrastructure and to eliminate avian predator nesting opportunities provided by anthropogenic development on public lands associated with the now void ROW grant (e.g., remove powerline and communication facilities no longer in service).
- 14.12.** LR-12: As opportunities and priorities indicate work with existing ROW holders to retrofit existing towers and structures consistent with RDFs described in Appendix A.
- 14.12.1.** LR-13: Lands within Priority, Important or General Habitat Management Areas for Greater Sage-Grouse will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation benefit to the Greater Sage-Grouse or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the Greater Sage-Grouse. Land tenure adjustments would be subject to the following disposal, exchange, and acquisition criteria, which include retaining lands with GRSG habitat. Retention of areas with GRSG would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria:
- a. Lands within Priority, Important and General Habitat Management Areas would not be available for disposal through sale (Appendix J).
 - b. Acquire habitat within Priority and Important Habitat Management Areas, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns.
 - c. Lands within Priority, Important and General Habitat Management Areas would be retained unless exchange of those lands would increase the extent or provide for connectivity of Priority or Important Habitat Management Areas.
 - d. Evaluate potential land exchanges containing historically low-quality GRSG habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRSG habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of Priority Habitat Management Areas. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within Priority Habitat Management Areas currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the Priority and Important Habitat Management Areas (i.e., areas with fragmented or less in-tact sagebrush).
 - e. Identify lands for acquisition that increase the extent of or provide for connectivity of Priority Habitat Management Areas.

15. Minerals

15.1. Fluid Minerals

- 15.1.1.** Fluid Minerals (FLM)-1: Idaho and Montana: Areas within Priority Habitat Management Areas and Important Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception (FLM-3). General Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.
- 15.1.2.** FLM-2: : Parcels nominated for lease in Priority or Important Habitat Management Areas would be evaluated prior to lease offering to determine if development is feasible when buffers and seasonal timing restrictions are applied. Parcels that could not be developed when these buffers and restrictions are applied would not be offered for lease.
- 15.1.3.** FLM-3: Priority and Important Habitat Management Areas: A lease waiver, exception or modification to the NSO stipulation may be considered where a portion of the proposed lease is determined to be in non-greater sage-grouse habitat, the area is not used by Greater sage-grouse, or it would not have direct, indirect or cumulative effects to Greater sage-grouse or its habitat. The determination would be made by a team of interagency Greater sage-grouse experts, including an expert from the state wildlife agency, USFWS and the BLM.. All exceptions must be approved by the State Director. In the event a waiver, exception or modification were allowed development would still be subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.

Waivers, Exceptions and Modifications (WEMs) (Source IM-2008-032)

A waiver is a permanent exemption from a lease stipulation, the stipulation would no longer apply anywhere within the lease. Waivers, by regulation, require a 30-day public review if the authorized officer has determined, prior to lease issuance, that a stipulation involves an issue of major concern to the public (43 CFR 3101.4) and are approved and signed by the State Director.

An exception is a one-time exemption for a particular site within the lease; exceptions are determined on a case-by-case basis; the stipulation continues to apply to all other sites within the lease. An exception is a limited type of waiver.

A modification is a change to the provisions of a lease stipulation, either temporarily or for the term of the lease. Depending on the specific modification, the stipulation may or may not apply to all sites within the lease to which the restrictive criteria are applied.

- 15.1.4.** FLM-4: Incorporate required design features and best management practices appropriate to the management area as conditions of approval when post leasing activity is proposed into any post-lease authorizations.
- 15.1.5.** FLM-5: Prior to leasing conduct a Master Leasing Plan process when all four of the following criteria are met:
- A substantial portion of the area to be analyzed in the MLP is not currently leased.
 - There is a majority Federal mineral interest.

- The oil and gas industry has expressed a specific interest in leasing, and there is a moderate or high potential for oil and gas confirmed by the discovery of oil and gas in the general area.
- Additional analysis or information is needed to address likely resource or cumulative impacts if oil and gas development were to occur where there are:
 - o multiple-use or natural/cultural resource conflicts;
 - o impacts to air quality;
 - o impacts on the resources or values of any unit of the National Park System, national wildlife refuge, or National Forest wilderness area, as determined after consultation or coordination with the NPS, the FWS, or the FS; or
 - o impacts on other specially designated areas. – analyzing likely development scenarios and varying mitigation levels.

15.1.6. FLM-5: Complete a Master Development Plan, consistent with plan development guide. on leases where a producing field is proposed to be developed.

15.1.7. FLM-6: Encourage unitization when deemed necessary for proper development and operation of an area (with strong oversight and monitoring). The unitization must be designed in a manner to minimize adverse impacts on GRSG according to the Federal Lease Form, 3100-11, Sections 4 and 6.

15.1.8. FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring reasonable protective measures consistent with the lease terms where necessary to avoid or minimize effects to GRSG populations or habitat.

15.2. Locatable Minerals

15.2.1. Locatable Minerals (LOC)-1: Lands would remain open to locatable mineral entry in all management areas.

15.2.2. LOC-2: Apply reasonable and appropriate required design features and best management practices as Conditions of Approval to prevent unnecessary or undue degradation of GRSG habitat when a Plan of Operations is submitted for BLM or FS approval, in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on National Forest System lands).

15.3. Salable Minerals

15.3.1. Salable Minerals (SAL)-1: Priority: No new site authorizations would be approved. Important: New site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions. General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.

15.3.2. SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat management objectives.

15.3.3. SAL-3: Require reclamation bonding that would require restoration of GRSG habitat on new site authorizations for mineral material pits in IHMA (this would not apply to free use permits issued to a government entity such as a county road district, but would apply to non-profit entities).

15.4. Non-Energy Solid Mineral Leasable Minerals

15.4.1. Non Energy Leasables (NEL)-1: Priority, Important and General Habitat Management Areas: Areas within Known Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. PHMA areas outside KPLAs

are closed to leasing and prospecting. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. Exceptions to closures in PHMA and IHMA may be made for lease modifications and fringe leases where valid existing rights may be affected. General Habitat Management Areas: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.

15.4.2. NEL-2: Require seasonal and daily timing restrictions in undeveloped non-energy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as conditions of approval.

15.4.3. NEL-3: Include RDFs as conditions of approval to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.

15.5. Mineral Split Estate

15.5.1. Mineral Split Estate (MSE)-1: BLM Owns Mineral Estate – non-federal surface owner: Where the federal government owns the mineral estate in PHMAs, IHMAs, and GHMAs, and the surface is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures, and RDFs applied if the mineral estate is developed on BLM-administered lands in the management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.

15.5.2. MSE-2: BLM owns surface – non-federal mineral estate owner: In coordination with the state regulatory entity and mineral estate owner apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities in PHMA, IHMA, and GHMA.

16. Range Management/Livestock Grazing

- 16.1. Range Management (RM)-1: Maintain existing areas designated as available or unavailable for livestock grazing. Existing active AUMs for livestock grazing within the planning area would not be changed at the broad scale, though the number of AUMs available on an allotment may be adjusted based on site-specific conditions to meet management objectives during term permit renewals, AMP development, or other appropriate implementation planning. Additionally, temporary adjustments can be made annually to livestock numbers, the number of AUMs, and season of use in accordance with applicable regulations.
- 16.2. RM-2: Prioritize BLM land health assessments and processing of BLM grazing permits consistent with management area prioritization (MA-4), unless other higher priority considerations exist such as threatened, endangered and proposed species habitat that livestock grazing could affect. Where possible, conduct land health assessments at the watershed, or other meaningful landscape-scale.
- 16.3. RM-3: Where opportunities exist, coordinate with other land managers to encourage livestock operations that utilize mixed federal, private and/or state land to be managed at the landscape scale to benefit GRSG and their habitat across land ownerships.
- 16.4. RM-4: PHMA & IHMA: During the land health assessment process, identify the type(s) of seasonal habitat the assessed areas are capable of supporting. Utilize the habitat assessment framework, (Stiver et al. 2014 as amended/replaced) or other BLM or Forest Service approved methodology, in accordance with current policy and guidance to determine whether vegetation structure, condition and composition are meeting GRSG habitat objectives including riparian and lentic areas (HM-OBJ-2; Table 2). Use appropriate Ecological Site Descriptions, reference sheets and state and transition models to inform desired habitat conditions and expected responses to management changes for the land unit being assessed.
- 16.5. RM-5: When modifying grazing management, analyze indirect effects to habitat, including changes in fuel loading and wildfire behavior.
- 16.6. RM-6: When livestock management practices are determined to not be compatible with meeting or making progress towards achievable habitat objectives following appropriate consultation, cooperating and coordination, implement changes in grazing management through grazing authorization modifications, or allotment management plan implementation. Potential modifications include, but are not limited to, changes in:
- 1) Season or timing of use;
 - 2) Numbers of livestock;
 - 3) Distribution of livestock use;
 - 4) Duration and/or level of use;
 - 5) Kind of livestock (e.g., cattle, sheep, horses, or goats) (Briske et al. 2011);
 - 6) ; and
 - 7) Grazing schedules (including rest or deferment).
- 16.7. RM-7: Where opportunities exist, establish forage reserves to facilitate restoration and rehabilitation efforts in sage-grouse habitat areas.
- 16.8. RM-8: PHMA, IHMA & GHMA - When an allotment, or portion thereof, becomes vacant or grazing preference is relinquished, consider retirement of the allotment or grazing preference, or portion thereof, or converting the area to a forage reserve

- (a.k.a. reserve common allotment)/buffer when doing so would maintain or enhance sage-grouse habitat as described in subsequent site specific NEPA analysis.
- 16.9.** RM-9: PHMA & IHMA - Where practical, design pasture rotations to utilize non-native perennial grass seedings and/or annual grasslands, during GRSG nesting season annually or periodically.
- 16.10.** RM-10: Evaluate the locations where salt/supplements are placed. Coordinate salt/supplements placement to reduce impacts to GRSG habitat (e.g., existing disturbed areas).
- 16.11.** RM-11: Incorporate RDFs into Terms and Conditions for crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service-administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats.
- 16.12.** RM-12: Design any new structural range improvements, following appropriate cooperation, consultation and coordination, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
- 16.13.** RM-13: During the land health assessment and grazing permit renewal process, evaluate existing livestock management range improvements with respect to their effect on GRSG habitat. Consider removal of projects that are not needed for effective livestock management, are no longer in working condition, and/or negatively affect GRSG habitat, with the exception of functional projects needed for management of habitat for other threatened, endangered or proposed species or other sensitive resources.
- 16.14.** RM-14: Prioritize removal, modification or marking of fences or other structures in areas of high collision risk following appropriate cooperation, consultation and coordination to reduce the incidence of GRSG mortality due to fence strikes (Stevens et al. 2012).

17. Wild Horses and Burros

- 17.1.** Wild Horse and Burro (WHB)-1: Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives and management considerations for all herd management areas within GRSG habitat, with emphasis placed on PHMA. WHB-2: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Additional prioritization would be given for HMAs that are near AML or where reduction would serve the most beneficial purpose. Herd Areas occupied by wild horses and burros managed for zero wild horses and burros.
- 17.2.** WHB-3: In PHMAs and IHMAs, monitor the effects of WHB use in relation to GRSG seasonal habitat objectives on an annual basis to help inform future management actions.
- 17.3.** WHB-4: Utilize interdisciplinary land health assessments in HMAs containing GRSG habitat to determine whether vegetation characteristics are meeting appropriate seasonal habitat objectives. The priorities for completing assessments are: 1) PHMA, 2) IHMA, 3)GHMA.
- 17.4.** WHB-5: When evaluating AML on HMAs within PHMA and IHMA, evaluate indicators that address structure/condition/composition of vegetation and measurements specific to achieving GRSG habitat objectives. In PHMAs and IHMAs, assess and adjust AMLs through the NEPA process within HMAs when wild horse use within established AML is identified as a significant causal factor in not meeting land health standards. WHB-6: Consider removals or exclusion of WHB during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.
- 17.5.** WHB-7: When conducting NEPA analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects to GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.
- 17.6.** WHB-8: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the WHB program.

18. Travel Management

- 18.1. Travel Management (TM) -1: Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and Upper Snake Field Offices. Upon completion of travel management plans the designation would change to limited to designated roads, primitive roads and trails.
- An off-highway vehicle is any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding: (1) Any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) Vehicles in official use where official use is use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation.; and (5) any combat or combat support vehicle when used in times of national defense emergencies (43 CFR 8340.0 5).
- 18.2. TM-2: Temporary closures will be considered in accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341 (Conditions of Use).
- Temporary closure or restriction orders under these authorities are enacted at the discretion of the authorized officer to resolve management conflicts and protect persons, property, and public lands and resources. Where an authorized officer determines that off-highway vehicles are causing or will cause considerable adverse effects upon soil, vegetation, wildlife, wildlife habitat, cultural resources, historical resources, threatened or endangered species, wilderness suitability, other authorized uses, or other resources, the affected areas shall be immediately closed to the type(s) of vehicle causing the adverse effect until the adverse effects are eliminated and measures implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction order should be considered only after other management strategies and alternatives have been explored. The duration of temporary closure or restriction orders should be limited to 24 months or less; however, certain situations may require longer closures and/or iterative temporary closures. This may include closure of routes or areas.
- 18.3. TM-3: Develop Travel Management Plans for each Field Office as described in the BLM Travel Management Handbook 8342.1 and according to the travel management planning guidelines (Appendix K).
- 18.4. TM-4: During subsequent travel management planning design and designate a travel system to minimize adverse effects on GRSG. Locate areas and trails to minimize harassment of wildlife or significant disruption of wildlife habitats. Give special attention to protect endangered or threatened species and their habitats. Allow for route upgrade, closure of existing routes, and creation of new routes to help protect habitat and meet user group needs, thereby reducing the potential for pioneering

unauthorized routes. The emphasis of the comprehensive travel and transportation planning within Priority Habitat Management Areas would be placed on having a neutral or positive effect on GRSG habitat. Individual route designations would occur during subsequent travel management planning efforts.

- 18.5.** TM-5: Conduct road maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.

DRAFT

19. Recreation

- 19.1. REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.
- 19.2. REC-2: Do not construct new recreation facilities (e.g., campgrounds, trails, trailheads, staging areas) within PHMAs and IHMAs unless the development would have a neutral effect or be beneficial to GRSG habitat (such as concentrating recreation, diverting use away from critical areas, etc.); or the new construction replaces existing facilities and reduces impacts from the existing facilities as in TM-4, or unless the development is required for visitor safety or resource protection.

DRAFT

20. Monitoring

- 20.1. Monitoring (MON)-1: Once FIAT Assessments are complete annually complete a review of FIAT Assessment implementation efforts within GRSG habitat with appropriate USFWS and state agency personnel.
- 20.2. MON-2: Annually monitor the effectiveness of fuels treatment projects.
- 20.3. MON-3: Monitor invasive vegetation post vegetation management treatment
- 20.4. MON-4: Monitor project construction areas for noxious weed and invasive species for at least 3 years, unless control is achieved earlier.
- 20.5. MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to annually assess GRSG population and habitat status in the context of the adaptive management triggers.
- 20.6. MON-6: Continue to support updates to the Key Habitat map to track vegetation changes in relation to GRSG habitat on a yearly basis, until such a time this process is replaced. The process used to update the Key Habitat Map is described in Appendix F.
- 20.7. MON-7: Monitor GRSG habitat as described in the monitoring framework plan (Appendix E) in coordination with IDFG and MT FWP.

Appendices

Appendix A – Required Design Features

Appendix B – Seasonal Timing Restrictions

Appendix C – Application of Buffers

Appendix D – Wildfire and Invasive Species Assessments/FIAT Team

Appendix E – Monitoring Framework Plan

Appendix F – Idaho Key Habitat Map Update Process

Appendix G – Idaho Anthropogenic Disturbance and Adaptive Management

Appendix H – Montana Anthropogenic Disturbance and Adaptive Management Process

Appendix I – Mitigation

Appendix J – Lands No Longer Available for Disposal

Appendix K – Travel Management Planning Guidelines

Appendix L – Functioning of Boards

Reminder - Great Basin GRSG PM conference call tomorrow at 10AM Pacific Time / 11AM Mountain Time. Call in info and draft agenda below.

877-928-4213
 participants: 9009662#

Agenda

1. WO review updates
 - Final ELT meeting packet
 - Schedule update
2. Tier II/CEA Update
3. VDDT- Did everyone get the final numbers?
4. Phase II FIAT meetings
5. Administrative record changes
6. Forest Service Proposed Plan update
7. Other topics?

Sage-Grouse Great Basin Region Project Management Team Weekly Call

November 4, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Brent Ralston, ID; Jon Beck, ID; Joan Suther, OR; Jessica Rubado, OR; Sarah Shattuck, SOL; Stephanie Carman, WO; Matt Magaletti, WO; Frank Quamen, NOC

USFS: Randy Sharp

EMPSi: Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat

Action Items

BLM

- The GB PMs and solicitors will review the Buffalo CEA prior to the November 18th call.
- Quincy will send a follow up email to Don Majors about the VDDT numbers and CC Rob Mickelsen.
- Lauren will follow up with Rob Mickelsen on VDDT modeling for the other alternatives.
- Sarah will give NV BLM feedback on the state's new habitat delineations by the end of the week.
- Sarah, Brent, John and Lauren will have a call about the ID mapping issues on Thursday or Friday of this week.
- Sarah will get back to Quincy on the UT Red area issue.

EMPSi

- EMPSi will send the Buffalo CEA "prototype" out for review at the end of the week.

Meeting Minutes

WO Update

- Most of the leadership team is headed to Boise for the Fire meeting this week.
- On Thursday (November 6), the state directors and task force members will meet to go over the remaining issues that require direction (e.g. buffers).
- On Monday (November 10th) the leadership team will meet with USFWS to discuss any remaining issues.
- There has been no official decision regarding the USFWS memo and Super PAC map.

CEA

- EMPSi has received feedback from John Carlson and is finalizing revisions on the Buffalo CEA. The Buffalo CEA is like a "prototype" for the GB CEAs. The Buffalo CEA is approximately 60 pages (45-50 of actual text) and covers 1 management zone. The other sub region CEAs that may have multiple management zones may be larger but it is unlikely that the number of pages would be multiplied by the number of zones. The Buffalo CEA will be tech edited and sent out to the GB

PM's and the solicitors at the end of the week for their feedback. We will not have a call next Tuesday because of Veteran's day so the November 18th call will dedicate a half an hour to go over the Buffalo document.

Chapter 2 Outline

- Paper size- Not all of the sub regions had the same size paper in Chapter 2 of the DEIS (due to the number of alternatives). Utah used 8.5 x 14; NVCA used 8.5 x 11; Idaho used 11x17. Is it okay if the sub regions have different size paper for the FEIS? The majority of readers will see this electronically. WO does not mind if the different sub regions have different sized chapter 2 sections. But, WO does not want the chapters set up similar to what NW CO did in the DEIS where they showed two alternatives on each page in columns.

VDDT

- Quincy had some questions on the numbers because the USFWS mislabeled some PACs in Utah. Quincy would like to see what GIS layers were used so he can see if it is an easy fix without remodeling. He sent an email to Don Majors and has not heard back. Quincy will send another email to Don and CC Rob Mickelsen.
- Rob had mentioned to Quincy that they might consider running the model on all of the alternatives on the FEIS. Lauren will follow up with Rob.
- All of the other Sub regions have received their numbers.

Consultation Call

- Kim Trip with BLM WO (T&E Rep) wants to meet with the PMs to discuss section 7 consultation. She sent out a doodle poll to have a call. For now it seems like only UT and ID may need to address section 7 consultation:
 - Idaho- Peppergrass is an issue, but there is a new conservation agreement in ID pertaining to peppergrass and when BLM told USFWS that they planned on incorporating the conservation measures as RDFs into the IDMT GRSG FEIS, the USFWS did not think formal consultation would be necessary. But that could change.
 - UT- Prairie Dog issue as a result of conflicting needs. There is an issue with push effect (push impacts from sage grouse onto other species). The impacts on these species will be discussed further with Kim and the USFWS.

Other

- Sarah and the WO would like to see the national and sub-regional public comment responses prior to the full review of the FEIS. The comment responses cannot be finalized until we receive final direction from WO on outstanding items. Once we receive direction, those appendices can be finalized and shared with the WO.
- FIAT implementation meetings are ongoing in all sub regions.

- The State of NV came out with new habitat map and solicitors are evaluating whether to include it or move forward. Sarah will give feedback on map issue this week.
- Sarah, Brent, John and Lauren will also have a call on Thursday or Friday to go over the mapping issues in Idaho.
- Red Area issue in Utah- Utah BLM requests the solicitor's direction in writing. Sarah will look into it and get back to Quincy.
- Keep Brent on Emails for now, but John will be the main ID contact from here on out.

877-928-4213
participants: 9009662#

Agenda

- I. WO review updates
 - Issue resolution - status

- Schedule update
2. Tier II/CEA Update – review working draft Buffalo CEA
 3. Commenter Lists – EMPSi has pulled together the list
 - List consist of all the unique submission commenters and only lists their names and/or organization affiliation; it does not include the form letter submitters.
 4. APRMP/Final EIS
 - Chapter 2 -Section 2.4.3 Selection of and Rationale for Identifying the Preferred Alternative
 - All subregions must provide narrative discussion why specific alternatives were not selected as the preferred alternative.
 - Chapter 2- All subregion's must reference the "COMPARISON OF ALTERNATIVES ALLEVIATION OF USFWS-IDENTIFIED THREATS" (stop-light table) in Chapter 2.
 - Chapter 2- 2.6.1 Development of Proposed LUPA Development- Need text from Matt/ Stephanie on NPT and WO involvement in the development of the Proposed Plan. This should be consistent text for all subregions.
 - Has a core set of adaptive management triggers (especially hard triggers) been developed? And has consistency for this been established for populations that cross sub-regions/state lines?
 - VDDT-The use of VDDT data in the Proposed Plan.
 - Forest Service Proposed Plan update
 - Forest Service Crosswalk - FS to provide?
 5. Other topics?

Sage-Grouse Great Basin Region Project Management Team Weekly Call

November 18, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Joe Tague, NV; Quincy Bahr, UT; Jon Beck, ID; John Carlson, MT; Joan Suther, OR; Jessica Rubado, OR; Sarah Shattuck, SOL; Stephanie Carman, WO; Johanna Munson, WY; Matt Magaletti, WO

USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat

Handouts

- Buffalo CEA and CEA approach document

Action Items

Sub regional PMs and Forest Service

- Matt, Lauren, and Johanna: Review the Master Action Item list from the federal family meeting and send decisions for those items that have been completed/decided.
- Matt and Lauren: Discuss what level of detail is needed for the table showing the alleviation of COT threats in Chapter 2.
- ALL: Send questions on the CEA to Drew by December 2nd.
- Matt: Work with others in WO to provide text describing how the proposed plans were developed for Section 2.6.1.
- Quincy: Send VDDT impact tables.

Meeting Minutes

WO Review Updates

- BLM, the Department, and Solicitors will be meeting with USFWS (Noreen and Gary) Friday and Monday. Will review decisions that BLM is proposing. Meeting with Secretary on Tuesday and hope to get approval on the final decisions.
- Unsure how the decisions will be delivered (i.e., if they will be written up and distributed).
- State Directors will discuss decision points at the ELT meeting today [e.g., stronghold areas; withdrawal versus ACEC; buffers (USGS paper expected this week)].
- Assuming everything gets resolved by Tuesday, the WO will provide a new schedule.
- There was a Master action item list developed during the federal family meeting. Some of these were not part of the 12 issues. Will direction be provided on these? Matt, Lauren, and Johanna will review this list and send decisions for those items that have been completed/decided.

Buffalo CEA

- Goals for the discussion: 1) re-familiarize PMs with CEAs and approach; 2) answer questions about the Buffalo CEA; 3) review process and roles/responsibilities; 4) ensure questions are answered.
- Review of the CEA approach document that provides a blueprint to guide CEAs.
 - Using present and widespread threats from the COT report. Tables not accurate for UT – they should clearly explain these deviations.
 - Some past, present, and reasonably foreseeable future actions need to be called out specifically. EMPSi will work with subregions to determine these.
 - Cumulative effects for other resources will be focused within the subregion, not the WAFWA Management Zone or range of the species. The socioeconomic cumulative report will be prepared as a separate effort.
- Review of Buffalo outline – methods/assumptions; existing conditions for the Management Zone; regional efforts to manage GRSG; relevant cumulative actions; threat-based analysis, includes the NOC data. Will try to incorporate research that is applicable to the correct subregion; conclusions.
- EMPSi will add text to explain that acres presented for the subregion in the rest of the EIS may not match the NOC data.
- Inclusion of maps would be helpful (e.g., where the planning area and populations are in relation to the Management Zone).
- Concerns about including too much subregional information that may conflict with the rest of the document. Should focus on the WAFWA Management Zone. Consider converting the subregional acres to a percentage of those for the total Management Zone.
- Put questions in writing and send to Drew by December 2nd.
- Process – CEA schedule depends on WO schedule; will be in close coordination with Frank to get the data from the NOC. Last schedule had a 6 week window to complete the CEAs. EMPSi will work closely with reviewers to get them integrated. Each WAFWA Management Zone will have one reviewer.
 - MZ III: Joe/Lauren
 - MZ IV: Jon
 - MZ V: Joan
- Conclusions – Should compare back to COT and no action alternatives and remove value judgments. Also discussing the net conservation benefit.
- Pushing impacts to private land – can we really say that if BLM has no jurisdiction on private land. While this is true, we need to acknowledge the effects and potentially qualify any statements that imply otherwise.
- This is the chance to comment on CEA approach. All subregions will be consistent so there will be no changes to CEA approach for individual CEAs.

APRMP/Final EIS

- Chapter 2 maps – WO is requesting maps at the end of each chapter. After some discussion, decided to put the maps in Appendix A and print that appendix.
- Section 2.4.3 – identification of the preferred alternative and rationale for why other alternatives are selected. Some uncertainty as to if this would be legally required, but desire to justify the rationale since we will likely have to answer this question in the future. To maintain the same messaging as the DEIS, it was decided that we will delete this section.
- All subregions must reference comparison of alternatives and alleviation of COT threats in Chapter 2. There is a general table in Chapter 2 that addresses this. NV/CA had included a detailed table in their DEIS that showed which management actions addressed each COT threat. UT and ID/MT did not have such a detailed table. Matt and Lauren will talk offline to determine guidance.
- There is a new map of grazing allotments showing those that meet/don't meet standards and if livestock is a cause or not. Subregions do not need to include it or respond in the FEIS.
- REA and FIAT – what are expectations for including those? FIAT assessments are implementation level and won't be in the proposed plan, but the process will be included in FEIS. If REAs are available, include information.
- Would like consistent text on how the proposed plans were developed. Since WO gave much of the direction, Matt will work with others to provide this text. It will be included in Section 2.6.1.
- Core set of adaptive management triggers are still in progress. Everyone needs to follow NPT guidance. All subregions have hard trigger responses tied to BSU. If needed, have a discussion with Matt. May need to talk more about this moving forward.
- VDDT – It will be an objective in all plans. But UT and ID/MT also used the VDDT outputs for impact analysis (assumes they will get the funding needed). Quincy will send tables from the UT EIS. Presented as trends instead of specific acres. All should use for impact analysis.
- Forest Service – once final direction received from WO for proposed plan, they will prepare a crosswalk to the BLM proposed plan to show how decisions line up.

Other

- We will have a call next week.

Screening Criteria for New Anthropogenic Disturbances (Mineral Development, Rights-of-Ways, Recreational Uses, Grazing Facilities or Other Authorizations That Cause Surface-Disturbance)

A. Priority Habitat Management Area (PHMA)*

1. Precedence is given to development outside of PHMA.
2. If development/activity cannot be placed outside of PHMA, surface-disturbing activities would be authorized in non-habitat areas first, and then in the least suitable habitat for Greater sage-grouse.
3. If development/activity is placed in non-habitat, ensure that the non-habitat does not provide important connectivity between habitats.
4. Development/activity does not exceed the 3% disturbance cap.
5. The population trend for the GRSG within the associated biologically significant unit is stable or increasing and the population levels are not currently engaging the adaptive management triggers (this applies strictly to new authorizations; renewals and amendments of existing authorizations would not be subject to this criteria when it can be shown that long-term impacts from those renewals or amendments would be substantially the same as the existing development).
6. Mitigation is implemented to completely offset impacts to GRSG and their habitats (see Appendix _____, Mitigation Framework).
7. The development/activity with associated mitigation would not result in a net loss of GRSG habitat and mitigation would provide an overall net conservation benefit to the PHMA.
8. The development/activity cannot be reasonably accomplished outside of PHMA; or can be either: 1) developed pursuant to a valid existing authorization; 2) is an incremental upgrade/capacity increase of existing development (i.e. powerline capacity upgrade); or 3) is co-located within the footprint of existing infrastructure (i.e. powerlines).
9. Authorized/permitted activities are implemented adhering to the required design features (RDFs) described in Appendix ____ for specific resources, and the BMPs for locatable minerals. At the site-specific scale, if a RDF/BMP is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity:
 - A specific RDF/BMP is documented to not be applicable to the site-specific conditions of the project/activity;
 - An alternative RDF/BMP is determined to provide equal or better protection for GRSG or its habitat;
 - Analyses conclude that following a RDF/BMP will provide no more protection to GRSG or its habitat.
10. Discrete anthropogenic disturbances or activities disruptive to GRSG (including scheduled maintenance activities) do not occur in seasonal GRSG habitats unless the project plan and NEPA document demonstrate the project would not impair the function of seasonal habitat, life-history, or behavioral needs of the GRSG population. Seasonal avoidance periods vary by GRSG seasonal habitat as follows:
 - In breeding and nesting habitat from _____ to _____

- In brood rearing habitat from _____ to _____
- In winter habitat from _____ to _____

The specific seasonal restrictions may be modified if documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, long and/or heavy winter) reflect a need to change the given dates in order to better protect GRSG, in coordination with the local State-agency biologist.

11. Authorizations/permits would limit noise from discretionary activities (during construction, operation, or maintenance) to not exceed 10 decibels above ambient sound levels at occupied leks from 2 hours before to 2 hours after official sunrise and sunset during breeding season (e.g., while males are strutting).
12. Authorizations/permits would restrict the placement of permanent tall structures within GRSG breeding and nesting habitats. A tall structure is any man-made structure that provides for perching/nesting opportunities for predators that may naturally be absent, or that decreases the use of an area by GRSG; this determination would be made based on local conditions such as existing vegetation or topography.

B. General Habitat Management Area (GHMA)*

1. Precedence is given to development outside of GHMA.
2. If development/activity cannot be placed outside of GHMA, surface-disturbing activities would be authorized in non-habitat areas first, and then in the least suitable habitat for Greater sage-grouse.
3. If development/activity is placed in non-habitat, ensure that the non-habitat does not provide important connectivity between habitats.
4. Mitigation is implemented to completely offset impacts to GRSG and their habitats (see Appendix _____, Mitigation Framework).
5. The development/activity with associated mitigation would not result in a net loss of GRSG habitat.
6. Authorized/permitted activities are implemented adhering to the required design features (RDFs) described in Appendix ___ for specific resources, and the BMPs for locatable minerals. At the site-specific scale, if a RDF/BMP is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity:
 - A specific RDF/BMP is documented to not be applicable to the site-specific conditions of the project/activity;
 - An alternative RDF/BMP is determined to provide equal or better protection for GRSG or its habitat;
 - Analyses conclude that following a RDF/BMP will provide no more protection to GRSG or its habitat.
7. Discrete anthropogenic disturbances or activities disruptive to GRSG (including scheduled maintenance activities) do not occur in seasonal GRSG habitats unless the project plan and NEPA document demonstrate the project would not impair the function of seasonal habitat, life-history, or behavioral needs of the GRSG population. Seasonal avoidance periods vary by GRSG seasonal habitat as follows:

- In breeding and nesting habitat from _____ to _____
- In brood rearing habitat from _____ to _____
- In winter habitat from _____ to _____

The specific seasonal restrictions may be modified if documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, long and/or heavy winter) reflect a need to change the given dates in order to better protect GRSG, in coordination with the local State-agency biologist.

*This screening criteria would not be applicable to vegetation treatments being conducted to enhance GRSG habitat.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

November 25, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Joe Tague, NV; Quincy Bahr, UT; Jon Beck, ID; Paul Makela, ID; Joan Suther, OR; Jessica Rubado, OR; Frank Quamen, NOC; Pam Murdock, WY; John Carlson, MT

USFS: Randy Sharp

EMPSi: Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower

Handouts

- Screening Criteria for New Anthropogenic Disturbances

Action Items

Sub regional PMs and Forest Service

- Lauren: revise and send screening criteria.

Meeting Minutes

WO Update

- State Director call today at 1 pm Pacific to discuss some of the decisions, though limited information will be available. Briefing with Secretary on Monday and should have more information after that time. Lauren will talk with Matt about combining the GBR and RMR calls if the same information is to be released.

Screening Criteria for New Anthropogenic Disturbances

- Lauren has looked at the avoidance criteria for ROWs and wondered why not apply these criteria for all anthropogenic disturbances (like ID/MT has done)? Would like to have all text be the same.
- Review and edits to screening criteria. Lauren will revise and re-send the screening criteria.

Other

- NOC would like a conference call with Lauren, Project Leads, and GIS leads to discuss what needs to be changed in order to start on CEA calculations and respond to USFWS data request by the end of the year.

This is what we have so far for Twin Falls. Let me know if you like how I combined all forms and documentation into one document per assessment area. I have not added any information in your forms, but I will complete what I can before I finalize these.

Have a good night, talk to you tomorrow

**Northern Great Basin and Salmon/Snake/Beaverhead
FIAT Assessment Workshop
Twin Falls, ID
November 6, 2014
Meeting Notes**

Attendees

BLM- Glen Burkhart, Don Major, Travis Cooper, Joe Adamski, Brandon Brown, Jerry Rice, Tara Anderson, Tony Owens, Jim Tharp, Jesse Goodwin, Scott Sayer, Jesse German, Jim Klott, Julie Klott, Julie Hilty, Joe Russell and Dustin Smith

EMPSi- Sean Cottle

FWS- Jason Pyron FWS

IFG- Mike McDonald and Don Kemner

NRCS- Deb Koziol

Upcoming Meetings

A request for a block of time will be sent to Joe Adamski to finalize schedule of when we can meet again for a final review of Assessment areas in Twin Falls.

Expectations of Documentation

Powerpoint from Doug H. will be distributed to team ASAP, this should help clarify what the expectations are for documentation of this process.

Opening Notes

- Joe sent out forms to all team members that need to be filled out and documented as we delineate polygons for the four management strategies. These forms will be used to help write the FIAT Assessment Report.
- We will be looking at leks with > 20 males that occur between the focal habitats to determine if these areas need to be included.
- We will be working through the Northern Great Basin and the Snake/ Salmon/ Beaverhead areas.
- Begin by breaking areas up into separate project planning areas based on movement of GRSG and natural barriers on the landscape.

Powerpoint presentation- Joe Adamski

We are now in Step 2 of the FIAT process. Started in September 2014 and will be completed in mid-January 2015. This is an assessment of three threats across five landscapes. This will aid the USFWS in their decision of listing the GRSG. The Step 1 process included a geodatabase that has been shared with all the assessment team members. We now need to include local information to aid in the utilization of the four management strategies:

- Fuels Management
- Fire Operations
- Habitat Restoration and Recovery

- Post-Fire Rehabilitation Management (ESR)

The FIAT work was based on the COT report which identified the Priority Areas of Conservation (PACs). These describe the key areas for GRSG conservation, key threats within those areas, and the extent to which threats need to be reduced. The COT report Also looked at where the birds actually are to determine the most important places to protect and conserve.

- There were four criteria used for identifying priority PACs for the FIAT process
 1. High density of GRSG. Selected 75% breeding bird density based on Doherty et al 2010. Wanted to use habitat criteria and a static dataset that could be compared across PACs. Downfalls are that it does not capture habitat outside of nesting and strutting periods (e.g. winter habitat) and uses 2009 data, so does not include recent fires.
 2. Sufficient sagebrush cover. Landscape cover has a strong correlation to GRSG persistence (Knick 2013). Includes three classes of sagebrush cover (0-25%; 25-65%; 65%-100%). Existing data is derived from LANDFIRE using 2000 imagery. Using local data as part of Step 2 will greatly benefit understanding of existing cover. There is a good correlation between where Sagebrush is and where the Sage-grouse are found.
 3. Soil temp and moisture regimes. Areas at the greatest risk are the warm dry sites. The degree of resistance and resilience is strongly correlated to amount of invasive species (Chambers et al 2014). Perennial grasses take longer to reestablish in hotter and dryer soils after being disturbed.
 4. Conifer expansion. Derived from the Baseline Environmental Report (BER) (Manier, et. al. 2013). Step 2 will hopefully inform more specific classifications of pinyon and juniper distribution across the landscape and where the best work could be completed.
- For annual grasses, **focal habitats** are a subset of the six priority PACs where application of management strategies will be focused to conserve GRSG. **Emphasis areas** are areas with warm/dry soil regimes within focal areas where management emphasis should be given.
- For conifer invasion, **focal habitats** are within or near conifer expansion in landscapes with greater than 25% sagebrush. **Emphasis areas** are where there is an intersection with 75% breeding bird density.
- There are Four strategies (program areas) in proactive and reactive categories:
 - **Proactive:**
 1. Fuels Management - modify fire behavior and change vegetation structure
 2. Habitat recovery/restoration - reduce undesirable plants, conduct reseeding efforts, and prevent a landscape from passing an undesired threshold. When there is a disturbance, these efforts promote faster recovery. Restoration implies that a threshold has been crossed and needs to be restored

- **Reactive:**
 1. Fire operations - preparedness, prevention, suppression
 2. Post-fire rehabilitation - stabilize species, reduce invasives, establish or allow recovery of desirable vegetation

Available Data from the NOC database

Purple areas include 75% BBD for Northern Great Basin Priority Area. This information will help us identify the Focal Habitat and Assessment Areas.

Lek and telemetry data will help us determine which areas within and near the focal habitat areas we need to focus our efforts on when considering potential treatments.

R&R- Resistance and Resilience

The soil moisture and temperature matrix help us determine which areas may be a higher priority for protection or rehabilitation efforts. This scale ranges from low cover of sagebrush with a high resistance to disturbance to low cover of sagebrush with low R&R.

Boundaries of potential treatment polygons

There is some disagreement of conifer encroachment and where the priority should be placed for potential treatments. Priority important boundaries for GRSG are delineated in other planning assessments and a GIS layer is available and being incorporated into this database for comparison with identified focal habitats. After review they do closely match and the project planning area can be set to follow the priority important boundaries if this will work the best.

Habitat restoration has been occurring in these areas outside of the focal habitats. This is ok, the boundaries can be expanded and contracted to meet what local knowledge tells us are the most sensible areas to plan potential treatments, but the main direction is to identify potential treatments within the focal habitats.

Project Planning Areas in the Salmon/Snake/Beaverhead areas

See Attached Forms

Bennett Hills

Little Wood River

Magic

Bennett Hills Project Planning Area

Bennett Hills Project Planning Area

(XXX Total acres of Project Planning Area)

Located northwest of Hill City and includes Mountain Home in the NW corner. The project planning boundary has been delineated in the GIS layers. The southern boundary has been extended South of Gooding to include important wintering habitat.

- Priorities would be high for all 4 Management Strategies.
- Medusahead and cheatgrass understories occur in the southern areas of the focal habitats.
- ESR treatments and fuel treatments have occurred to control medusahead and cheatgrass.

Potential project areas:

- Conifer encroachment- not a major issue in this FIAT project planning area. Therefore, no applicable treatment strategy for conifer encroachment is needed at this time.
- Bennett Hill Annuals outside- 2B, 2C, 3A, 3B, and 3C areas in and near the southern borders of the focal habitats near Gooding are primary priority areas for potential treatments to control invasive annual grasses. (polygons identifying annuals priority areas have been drafted and will be clipped by Travis to actual boundaries)
- Bennett Hills Annuals inside- 3C and 3B habitats within the focal habitats are secondary priority areas for potential treatments to control invasive annual grasses. (polygons identifying annuals priority areas have been drafted and will be clipped by Travis to actual boundaries)

Completed Veg Treatments (Poly) layer has been added to help determine where treatments have previously occurred.

Fuels Management

Potential for roadside treatments exist, especially from chemical methods. Possible fuel breaks would potentially exist along XXX miles of roads within the Project Planning Area.

Twin Falls team will send the rest of the group the Road Features so this polygon can be finalized.

Fire Operations

The entire focal habitat within Bennett Hills planning area is a high priority for Fire Suppression (Same delineation as the Bennett Hills Project Planning Area).

There is a high potential for invasive annual expansion within focal habitats. High past fire activity has occurred on many acres along the border of the project planning area. Also, there is a very high burn probability due to areas being converted to cheatgrass and invasive annuals existing in the understory.

Habitat Restoration and Recovery

Active restoration need would be limited with higher priority areas being on the edge of the focal habitat. The Bennett Hills restoration polygon is the same as the high priority ESR polygon.

Post-Fire Rehabilitation Management (ESR)

Hill City Blues among other fires have occurred within the focal habitat in this area. There has only been natural recovery in these areas.

1st priority areas for potential treatments would be in the southern areas in the IC habitat and south of this going into the 2B, 2C, 3A, 3B, and 3C habitats (South Bennett Hills ESR High priority). Annual grass presence potential and burn severity make this a high priority area.

2nd priority areas for potential treatments would be in the northern areas in the IA and IB habitat (North Bennett Hills ESR low priority).

Little Wood River Project Planning Area

Little Wood River Project Planning Area

Different management opportunities will exist in these areas than the other focal habitats to the SE, high suppression high ESR but low for proactive restoration.

(XXX Total acres of Project Planning Area)

Potential project areas:

- Conifer encroachment- Local knowledge dictates conifer encroachment is not a main threat.
- Invasive grass- Most annual invasives occur on southern facing slopes in dryer soils. Potential treatment area is the Project Planning Area boundaries, which the limiting factor is aspect (XXX acres of southern aspects).
- Little wood annuals inside- all areas within the focal habitat (192,339 acres).
- Little wood annuals outside- area in the IB and IC habitats outside the focal habitat, but within the project planning area (102,977 acres).

Fuels Management

Possible fuel breaks would potentially exist along XXX miles of roads within the Project Planning Area.

Twin Falls team will send the rest of the group the Road Features so this polygon can be finalized.

Fire Operations

There is a high potential for fire due to invasives and if it does burn, high suppression would help.

High resource values exist for brood rearing habitat, nesting, winter use, watersheds and recreation.

The entire Little Wood River planning area is a high priority for Fire Suppression (Same delineation as the Little Wood River Project Planning Area).

Habitat Restoration and Recovery

The Little Wood River Restoration area polygon would be the same as the ESR polygon.

Post-Fire Rehabilitation Management (ESR)

ESR treatment may be limited due to topography. The entire area is a moderate priority need due to the cool soils, however southern facing slopes would be treated first.

Important riparian and brood rearing habitat exists and is managed by Federal and Private, Current Coop Projects.

Little wood River ESR moderate polygon follows the boundary of the project planning area.

Magic Project Planning Area

Magic Project Planning Area

(XXX Total acres of Project Planning Area)

Former SG habitats near and to the south and east of Gooding and Shoshone are now dominated by annual grasses due to recent fires. The PPA has been drawn further south to include more area that has been converted to invasive annual and noxious weeds. By managing these areas more proactively this will decrease the risk of invasion further into the focal habitat areas. The Southeastern boundary now follows Minidoka Road to include these areas and the Eastern boundary follows the District boundary. Priorities would be high for all 4 Management Strategies.

Potential project areas:

- Conifer encroachment- Local knowledge dictates conifer encroachment is not a main threat.
- Magic Annuals outside- 2B, 2C, 3A, 3B, and 3C near and south of the focal habitats are primary priority areas for potential treatments to control invasive annual grasses. (polygons identifying annuals priority areas have been drafted and will be clipped by Travis to actual boundaries, this should be similar to Bennett Hills)
- Magic Annuals inside- 3C and 3B habitats within the focal habitats are secondary priority areas for potential treatments to control invasive annual grasses (polygons identifying annuals priority areas have been drafted and will be clipped by Travis to actual boundaries, this should be similar to Bennett Hills).

Fuels Management

Possible fuel breaks would potentially exist along XXX miles of roads within the Project Planning Area. Twin Falls team will send the rest of the group the Road Features so this polygon can be finalized.

Fire Operations

The entire Magic planning area is a high priority for Fire Suppression (Same delineation as the Magic Project Planning Area).

Habitat Restoration and Recovery

The high priority Magic restoration polygon would include all areas within the Magic Project Planning Area (excluding any lava rock areas). Some areas in the IA, IB, and IC habitat would want to be restored and recovered based on importance and ability to recover. The relatively flat terrain allows cheatgrass in these areas to be more expansive.

Post-Fire Rehabilitation Management (ESR)

1st priority areas for potential treatments would be in the southern areas in the IC habitat and south of this going into the 2B, 2C, 3A, 3B, and 3C habitats (Magic ESR High priority). Annual grass presence potential and burn severity make this a moderate priority area.

2nd priority areas for potential treatments would be in the northern areas in the IA, IB and IC habitat (Magic ESR low priority).

Subject: Today's FIAT information call notes

Folks;

Below are the discussion points from today's FIAT information call, as summarized by Mike Pellant (thanks Mike!!). Note that all team leads are engaged in meetings, hence none were on the call. By the end of the week I'll have a draft template sent out to team leads, and also by end-of-week I'm intending to have a decision from the WO/partners about the possibility of extending the FIAT assessments one month. Stay tuned on these topics.

No Assessment Team leads on the call. Program Leads present: 1) Krista asked that final input on the definitions that she distributed earlier would be appreciated. Vicki and I said we would provide input by later this week.

We discussed the proposed one month deadline extension. Dawn said that F&WS would like to get the assessment results into their CED (Conservation Elements Database?) by the end of January. I expressed concerns that our FIAT output is not an on-the-ground project (Step 3) and probably would not be appropriate to be included in this database unless the NEPA on the a project was completed. Vicki is coordinating with a F&WS counterpart and will visit with her on this issue and report back to the group.

If the extension is approved before next Tuesday's call, we could add it to the agenda and discuss the revised benchmarks/due dates to fit the proposed March 1 deadline.

Krista brought up a question for her fuels management state leads on if and how the FIAT process will be applied outside the Great Basin. Joe's recommendation was the we would do a lessons learned on the current assessments before doing the next round of assessments.

Subject: Re: Today's FIAT information call notes

All,

Bear in mind that the combination of voluntary, incentive-based efforts, habitat restoration projects, and management through regulatory mechanisms could have a significant influence on the Service's upcoming status review. Whether it is through the CED (or other method of delivery) it will be critical to capture the broader level of prioritization efforts currently being outlined in the FIAT step-down assessments. The information provided by the BLM FIAT assessments will allow the Service to evaluate the extent to which these strategic approaches will ameliorate the threats of wildfire and invasives within the Great Basin. Please consider that an important element of the Service's status review will not only be a compilation of conservation efforts currently being implemented but will also include efforts planned for implementation in the near future, to conserve sage-grouse.

The CED organizes information about planning efforts into 3 broad categories: regulatory plans, incentive-based plans, and fire suppression plans. We understand the BLM's concerns that the FIAT step-down assessments lack an on-the-ground component. However, the fire suppression planning category is specifically designed to capture the important fire suppression actions (e.g., geospatial plans to prioritize fuels management; habitat recovery/restoration designed to improve sage-grouse habitat with greater resistance to annual grasses and/or resilience after disturbances such as wildfire). As described in the CED user guide, fire suppression planning efforts can range from conservation strategies that strategically identify priority areas for fuels management, fuel treatments, fuel breaks, anchors for suppression, and/or coordinated fuels management approaches cross-jurisdictional boundaries to share resources, pre-position resources, or increase water availability, etc. Individual on-the-ground efforts, such as site-specific fuel treatment projects or installation of fuel breaks, could also be entered in the CED as projects when those projects are highly likely to be implemented, or have been implemented.

Under the ESA, the Service must base its decision on whether to list the greater sage-grouse on the best available data. In addition, we must evaluate the threats to sage-grouse in the context of actions and plans that are in place, or in the case of the FIAT assessments, reasonably certain to be in place, to ameliorate those threats. Inclusion of the FIAT step-down assessments will be a critical component of the status review.

The Service supports the completion of the FIAT step-down assessments currently underway and applauds the land management agencies for moving swiftly in this regard. We recommend FIAT assessments be completed by the January 30, 2015 deadline as stated in the Instructional Memorandum. Assessments should be well coordinated with interagency, cross-jurisdictional involvement. We recommend these assessments be quickly developed into implementation plans and that the step-down assessments include specific actions to provide further certainty of implementation for efforts to address this major threat to sage-grouse and its habitat.

Subject: Re: Today's FIAT information call notes

One thing to keep in mind as well:

the FIAT assessments *are also* documenting the projects with NEPA completed within the focal habitats and those same projects will be entered into the CED database through the current national sage-grouse data call. The FIAT is identifying some expansion of current projects however. I just wanted to make sure we are not duplicating information that goes into the CED, so a question to answer may be should we separate out ongoing NEPA completed projects when the final FIAT is submitted?

Attachments: combined buffer table 12_12_14.pdf; ID swMT ADPP Appendix A 110514 RDFs_with additons from Buff.pdf

Hi folks, I want to have a quick call tomorrow. I will be at the ISO in the Mustang Room.
Call in Number = 877-604-9864
code = 95504#

AGENDA:

1. WO Update
2. Schedule Update
3. Buffer Table and RDF update (see attached documents for discussion)

Jon

--

Jonathan Beck
Bureau of Land Management
208-384-3305 Boise District
208-373-4070 Idaho State Office

Disturbance Category	Priority habitat Buffer	Important habitat Buffer	General Habitat Buffer
<i>Surface Disturbance</i>			
Saleable Minerals	(SAL)-1: Priority: No new site authorizations would be approved	Do not construct new saleable development within 0.8 mile (1.3 km) of leks.	
<i>Linear Features</i>			
Pipelines and Other Buried linear Features	Minimize removal of sagebrush within 0.6 miles of leks.		
Roads	Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks.		
<i>Energy Development</i>			
Unleased Fluid Minerals	Open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception. Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek. Limit average well pad density to no more than 1 per 640 acres within nesting and winter habitat.	Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek. Limit average well pad density to no more than 1 per 640 acres within nesting ³ and winter ³ habitat.	
<i>Tall Structures</i>			
Transmission Lines	Site transmission lines at least 600 m from a lek.		
Distribution Lines	Avoid distribution line construction within 600 m of a lek or bury where possible		
Tall structures, Communication and Met Towers	Do not allow communication tower construction within 3 miles (5 km) of a lek unless needed to address public safety needs.	Avoid communication tower construction within 3 miles (5 km) of a lek unless needed to address public safety needs.	

Comment [jmbeck1]: Tie to maintenance levels from the propose plan

Disturbance Category	Priority habitat Buffer	Important habitat Buffer	General Habitat Buffer
Solar	LR-2: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development.	Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek	Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek
Wind	LR-2: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development.	<p>Do not site commercial wind development facilities within 3.1 miles (5km) of a lek (Labeau et al. 2014).</p> <p>Old language: BMP: Important and General: Avoid wind development in nesting and/or winter habitat.</p>	
Low Structures			
Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)	RDF 105: Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	RDF 105: Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	

Comment [BJM2]: Discuss with Partners

Appendix A – Required Design Features

The following required design features (RDFs) are included for consideration and use based upon review of current science and effects analysis (circa 2014) (Table A-1). These may be reviewed during project evaluation and updated through plan maintenance as new information and updated scientific findings become available.

The table is organized by program area grouping the RDFs most relevant to that program. All relevant RDFs, regardless of which program they are grouped under, should be considered during project evaluation and applicable RDFs should be applied during implementation, with the exception that they would be implemented as best management practices for locatable minerals activities, to the extent allowable by law. The table identifies the specific measure (numbered) and its appropriate application – as an RDF – required all the time everywhere; or as an RDF required when the applicable resources are present. In some cases the RDFs may not all be appropriate based on local conditions and would be assessed in the appropriate site specific NEPA analysis, these all should be considered and where determined to be beneficial to achieving GRSG habitat objectives included as part of the site specific project. In other cases additional project design criteria or best management practices could be incorporated into project implementation to address site specific concerns not fully addressed by the RDFs described here.

Table A-1. Required Design Features

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
General		
1. Solicit and consider expertise and ideas from local landowners, working groups, and other federal, state, county, and private organizations during development of projects.		X
2. No repeated or sustained behavioral disturbance (e.g., visual, noise over 10 dbA at lek, etc.) to lekking birds from 6:00 pm to 9:00 am within 2 miles (3.2 km) of leks during the lekking season.	X	
3. Avoid mechanized anthropogenic disturbance, in nesting habitat during the nesting season when implementing: 1) fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events.		X
4. Avoid mechanized anthropogenic disturbance during the winter, in wintering areas when implementing: 1) fuels/vegetation/habitat restoration management projects, 2) infrastructure construction or maintenance, 3) geophysical exploration activities; 4) organized motorized recreational events.		X
Wildfire Suppression		
5. Compile district-level information into state-wide sage-grouse tool boxes. Tool boxes will contain maps, listing of resource advisors, contact information, local guidance, and other relevant information for each district, which will be aggregated into a state-wide document.	X	
6. Provide localized maps to dispatch offices and extended attack	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
<p>incident commanders for use in prioritizing wildfire suppression resources and designing suppression tactics. The Fire Planning and Fuels Management Division (FA-600) hosts a webpage containing up-to-date maps, instruction memoranda, conservation measures, BMPs, and spatial data specific to fire operations and fuels management/sage-grouse interactions. These resources can be accessed at: http://web.blm.gov/internal/fire/fpfm/sg/index.html . Additional BLM sage-grouse information can be found at: http://www.blm.gov/wo/st/en/prog/more/fish_wildlife_and/sage-grouse-conservation.html .</p>		
<p>7. Assign a resource advisor with sage-grouse expertise, or who has access to sage-grouse expertise, to all extended attack fires in or near sage-grouse habitat areas. Prior to the fire season, provide training to sage-grouse resource advisors on wildfire suppression organization, objectives, tactics, and procedures to develop a cadre of qualified individuals. Involve state wildlife agency expertise in fire operations through:</p> <ul style="list-style-type: none"> • instructing resource advisors during preseason trainings; • qualification as resource advisors; • coordination with resource advisors during fire incidents; • contributing to incident planning with information such as habitat features or other key data useful in fire decision making 	X	
<p>8. At the onset of an emerging wildland fire the Agency Administrators and Fire Management Officers will engage a local Resource Advisor to assess sage-grouse habitat that may be affected by the fire or suppression activities.</p>	X	
<p>9. If complexity of the wildland fire warrants the activation of an Incident Management Team, locally refined information regarding important sage-grouse habitat will be relayed during in brief and continually throughout the incident.</p>		X
<p>10. On critical fire weather days, pre-position additional fire suppression resources to optimize a quick and efficient response in sage-grouse habitat areas.</p>		X
<p>11. As appropriate, utilize existing fuel breaks, such as roads or discrete changes in fuel type, as control lines in order to minimize fire spread.</p>		X
<p>12. During periods of multiple fires, ensure line officers are involved in setting priorities.</p>	X	
<p>13. To the extent possible, locate wildfire suppression facilities (i.e., base camps, spike camps, drop points, staging areas, heli-bases, etc.) in areas where physical disturbance to sage-grouse habitat can be minimized. These include disturbed areas, grasslands, near roads/trails or in other areas where there is existing disturbance or minimal sagebrush cover.</p>	X	
<p>14. Power-wash all firefighting vehicles, to the extent possible, including engines, water tenders, personnel vehicles, and all-terrain vehicles (ATV) prior to deploying in or near sage-grouse habitat areas to minimize noxious weed spread.</p>	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
15. Minimize cross-country vehicle travel during fire operations in sage-grouse habitat.	X	
16. Minimize burnout operations in key sage-grouse habitat areas by constructing direct fireline whenever safe and practical to do so.	X	
17. Utilize retardant, mechanized equipment, and other available resources to minimize burned acreage during initial attack.	X	
18. As safety allows, conduct mop-up where the black adjoins unburned islands, dog legs, or other habitat features to minimize sagebrush loss.		X
19. Adequately document fire operation activities in sage-grouse habitat for potential follow-up coordination activities.	X	
Fuels Management Unless otherwise specified as part of the land use plan consider the full array of fuels management treatment types (prescribed fire, mechanical, chemical and biological) when implementing the following RDFs.		
20. Where applicable, design fuels treatment objectives to protect existing sagebrush ecosystems, modify fire behavior, restore native plants, and create landscape patterns which most benefit sage-grouse habitat.	X	
21. Provide training to fuels treatment personnel on sage-grouse biology, habitat requirements, and identification of areas utilized locally.	X	
22. Use burning prescriptions which minimize undesirable effects on vegetation or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of annual grass invasion).	X	
23. Ensure proposed sagebrush treatments are planned with full interdisciplinary input pursuant to NEPA and coordination with state fish and wildlife agencies, and that treatment acreage is conservative in the context of surrounding sage-grouse seasonal habitats and landscape.	X	
24. Where appropriate, ensure that treatments are configured in a manner that promotes use by sage-grouse.	X	
25. Where applicable, incorporate roads and natural fuel breaks into fuel break design.		X
26. Power-wash all vehicles and equipment involved in fuels management activities, prior to entering the area, to minimize the introduction of undesirable and/or invasive plant species.	X	
27. Design vegetation treatments in areas of high fire frequency which facilitate firefighter safety, reduce the potential acres burned, and reduce the fire risk to sage-grouse habitat. Additionally, develop maps for sage-grouse habitat which spatially display existing fuels treatments that can be used to assist suppression activities.	X	
28. Give priority for implementing specific sage-grouse habitat restoration projects in annual grasslands, first to sites which are adjacent to or surrounded by Priority Habitat Management Areas or that reestablish continuity between Priority Habitat Management Areas. Annual grasslands are a second priority for restoration when the sites are not adjacent to Priority Habitat Management Areas, but within Important Habitat Management	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Areas. The third priority for annual grassland habitat restoration projects are sites within General Habitat Management Areas. The intent is to focus restoration outward from existing, intact habitat.		
29. As funding and logistics permit, restore annual grasslands to a species composition characterized by perennial grasses, forbs, and shrubs or one of that referenced in land use planning documentation.	X	
30. Emphasize the use of native plant species, especially those from a warmer area of the species' current range, recognizing that non-native species may be necessary depending on the availability of native seed and prevailing site conditions.	X	
31. Remove standing and encroaching trees within at least 110 yards of occupied sage-grouse leks and other habitats (e.g., nesting, wintering and brood rearing) to reduce the availability of perch sites for avian predators, as resources permit.		X
32. Protect wildland areas from wildfire originating on private lands, infrastructure corridors, and recreational areas.		X
33. Reduce the risk of vehicle- or human-caused wildfires and the spread of invasive species by installing fuel breaks and/or planting perennial vegetation (e.g., green-strips) paralleling road rights-of-way.		X
34. Strategically place and maintain pre-treated strips/areas (e.g., mowing, herbicide application, etc.) to aid in controlling wildfire, should wildfire occur near PHMA or priority restoration areas (such as where investments in restoration have already been made).	X	
35. Design treatments to provide a break in fuel continuity in large, at-risk, expanses of continuous sagebrush. Use local knowledge of fire occurrence, spread patterns, and habitat values at risk to determine the proper placement and size of the fuel break.	X	
36. Use existing agreements with local, county, and state road departments to improve and maintain existing fuel breaks during routine road maintenance. Examples include: blading, mowing, disking, grading, and spraying roadside vegetation.		X
37. Form partnerships with linear right-of-way holders to maintain fuel breaks, which reduce fuel continuity and serve to protect at-risk landscapes.		X
38. Use existing NEPA documentation and authorities, where possible, when conducting road right-of-way maintenance. In many instances, existing authorizations for roads or linear rights-of-way contain provisions for maintenance activities that could be implemented and incorporated into a vegetation and habitat protection strategy without requiring additional NEPA analysis. Document this with a Determination of NEPA Adequacy (DNA).		X
39. Enter into agreements with road departments which may help fund the construction and maintenance of fuel breaks adjacent to roads, as funding permits.		X
40. Spatially depict the locations of existing and planned fuel breaks in a landscape fuel break map and label each vegetation polygon for	X	

Comment [BER1]: Jason Wright - I thought this was going to be updated

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
reference. Offices will make these maps available to suppression resources for use in fire operations.		
Vegetation Treatment		
41. Utilize available plant species based on their adaptation to the site when developing seed mixes. (Lambert 2005; VegSpec).	X	
42. Utilizing the warmer component of a species' current range when selecting native species for restoration when available (Kramer and Havens 2009).		X
43. Reduce annual grass densities and competition through herbicide, targeted grazing, tillage, prescribed fire, etc. (Pyke 2011).		X
44. Reduce density and competition of introduced perennial grasses using appropriate techniques to accomplish this reduction (Pellant and Lysne 2005).		X
45. Utilize techniques to introduce desired species to the site such as drill seeding, broadcast seeding followed by a seed coverage technique, such as harrowing, churning or livestock trampling, and transplanting container or bare-root seedlings.		X
46. Assess existing on-site vegetation to ascertain if enough desirable perennial vegetation exists to consider techniques to increase on-site seed production to facilitate an increase in density of desired species.		X
47. Use site preparation techniques that retain existing desirable vegetation.	X	
48. Use "mother plant" techniques or planting of satellite populations of desirable plants to serve as seed sources.		X
49. Utilize post-treatment control of annual grass and other invasive species.	X	
50. Utilize new tools and use of new science and research as it becomes available.	X	
<p>51. Give higher priority to vegetation rehabilitation or manipulation projects that include:</p> <ul style="list-style-type: none"> • Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009). • Areas where seasonal habitat is limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.). • Re-establish sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order: <ul style="list-style-type: none"> • Recently burned native areas • Native grassland with suitable forb component • Nonnative grassland with suitable forb component • Recently converted annual grass areas • Native grassland • Nonnative grassland • Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate 	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique. <ul style="list-style-type: none"> • Cooperative efforts that may improve GRSG habitat quality over multiple ownerships. • Projects that may provide connectivity between suitable habitats or expand existing good quality habitats. • Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 (≤10% conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 (>30%). • Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat. 		
52. When conduction vegetation treatments in areas inhabited or potentially inhabited by slickspot peppergrass (<i>Lepidium papilliferum</i>) follow the conservation measures in the applicable conservation agreement (revised August 2014).		X
Lands and Realty		
53. Where technically and financially feasible, bury distribution powerlines and communication lines within existing disturbance.		X
54. Above-ground disturbance areas would be seeded with perennial vegetation as per vegetation management.	X	
55. Place infrastructure in already disturbed locations where the habitat has not been fully restored.		X
56. Cluster disturbances, operations (fracturing stimulation, liquids gathering, etc.) and facilities as close as possible.		X
57. Co-locate linear facilities within one mile of existing linear facilities.		X
58. Micro-site linear facilities to reduce impacts to sage-grouse habitats.	X	
59. Locate staging areas outside the Priority Habitat Management Areas to the extent possible.	X	
60. Consider collocating powerlines, flowlines and pipelines under or immediately adjacent to a road or adjacent to other pipelines first, before considering co-locating with other ROW.		X
61. Restrict the construction of tall facilities and fences to the minimum number and amount needed.	X	
62. Use free standing structures where possible, to limit the use of guy wires. Where guy wires are necessary and appropriate bird collision diverters would be used, if doing so would not cause a human safety risk.	X	
63. Place new utility developments (power lines, pipelines, etc.) and transportation routes in existing utility or transportation corridors.		X
64. Construction and development activities should conform to seasonal restrictions.	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
Fluid Mineral Leasing		
65. Use directional drilling and/or multi well-pads to reduce surface disturbance.	X	
66. Apply a phased development approach with concurrent reclamation.	X	
67. Place liquid gathering facilities outside of PHMAs. Have no tanks at well locations within PHMAs to minimize truck traffic and perching and nesting sites for ravens and raptors.	X	
68. Use remote monitoring techniques for production facilities and develop a plan to reduce the frequency of vehicle use (Lyon and Anderson 2003).		X
69. Site and/or minimize linear ROWs or SUAs to reduce disturbance to sagebrush habitats.	X	
70. Design or site permanent structures which create movement (e.g. pump jack) to minimize impacts to GRSG.	X	
71. Equip tanks and other above-ground facilities with structures or devices that discourage nesting of raptors and corvids.		X
72. Control the spread and effects of non-native plant species (Gelbard and Belnap 2003, Bergquist et al. 2007, Evangelista et al. 2011). (E.g. by washing vehicles and equipment.)		X
73. Restrict pit and impoundment construction to reduce or eliminate threats from West Nile virus (Doherty 2007).		X
<p>74. Remove or re-inject produced water to reduce habitat for mosquitoes that vector West Nile virus. If surface disposal of produced water continues, use the following steps for reservoir design to limit favorable mosquito habitat:</p> <ul style="list-style-type: none"> • Overbuild size of ponds for muddy and non-vegetated shorelines. • Build steep shorelines to decrease vegetation and increase wave actions. • Avoid flooding terrestrial vegetation in flat terrain or low lying areas. • Construct dams or impoundments that restrict down slope seepage or overflow. • Line the channel where discharge water flows into the pond with crushed rock. • Construct spillway with steep sides and line it with crushed rock. • Treat waters with larvicides to reduce mosquito production where water occurs on the surface 		X
<p>75. In PHMA, limit noise from discretionary activities to not less than 40 decibels above ambient sound levels (typically 20-24 dBA) at occupied leks from 2 hours before to 2 hours after sunrise and sunset during breeding season.</p>	X	
76. Require noise shields when drilling during the lek, nesting, brood-rearing, or wintering season.		X
77. The BLM/Forest Service would work with proponents to limit project related noise where it would be expected to reduce	X	

Comment [jmbeck2]: Delete because this is above in the general section and is said more clearly.

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
functionality of habitats in Priority and Important Habitat Management Areas.		
78. The BLM/Forest Service would evaluate the potential for limitation of new noise sources on a case-by-case basis as appropriate.	X	
79. Limit noise sources that would be expected to negatively impact populations in Priority and Important Habitat Management Areas and continue to support the establishment of ambient baseline noise levels for occupied leks in Priority Habitat Management Areas.	X	
80. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse core population behavioral cycles.	X	
81. As new research is completed, new specific limitations would be coordinated with the IDFG and MT FWP and partners.	X	
82. Fit transmission towers with anti-perch devices (Lammers and Collopy 2007).		X
83. Require sage-grouse-safe fences.		X
84. Locate new compressor stations outside Priority Habitat Management Areas and design them to reduce noise that may be directed towards Priority Habitat Management Areas.	X	
85. Clean up refuse (Bui et al. 2011).	X	
86. Locate man camps outside of priority sage-grouse habitats.	X	
87. Consider using oak (or other material) mats for drilling activities to reduce vegetation disturbance and for roads between closely spaced wells to reduce soil compaction and maintain soil structure to increase likelihood of vegetation reestablishment following drilling.		X
88. Use only closed-loop systems for drilling operations and no reserve pits.	X	
89. Cover (e.g., fine mesh netting or use other effective techniques) all drilling and production pits and tanks regardless of size to reduce sage-grouse mortality.	X	
Roads		
90. Utilize existing roads, or realignments of existing routes to the extent possible.	X	
91. Design roads to an appropriate standard no higher than necessary to accommodate their intended purpose.	X	
92. Do not issue ROWs or SUAs to counties on newly constructed energy or mineral development roads, unless for a temporary use consistent with all other terms and conditions included in this document.	X	
93. Establish speed limits on BLM and FS system roads to reduce vehicle/wildlife collisions or design roads to be driven at slower speeds.		X
94. Coordinate road construction and use among ROW or SUA holders.	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
95. Construct road crossings at right angles to ephemeral drainages and stream crossings.		X
96. Use dust abatement on roads and pads.	X	
97. Close and reclaim duplicate roads by restoring original landform and establishing desired vegetation.		X
Roads Specific to Priority and Important Habitat Management Areas		
98. Locate roads to avoid priority areas and habitats as described in the Wildfire and Invasive Species Assessments.	X	
99. Establish trip restrictions (Lyon and Anderson 2003) or minimization through use of telemetry and remote well control (e.g., Supervisory Control and Data Acquisition).	X	
100. Restrict vehicle traffic to only authorized users on newly constructed routes (using signage, gates, etc.)	X	
Reclamation Activities		
101. Include objectives for ensuring habitat restoration to meet sage-grouse habitat needs in reclamation practices/sites (Pyke 2011).	X	
102. Address post reclamation management in reclamation plan such that goals and objectives are to protect and improve sage-grouse habitat needs.		X
103. Maximize the area of interim reclamation on long-term access roads and well pads, including reshaping, topsoiling and revegetating cut-and-fill slopes.	X	
104. Restore disturbed areas at final reclamation to the pre-disturbance landforms and desired plant community.	X	
105. Irrigate interim reclamation if necessary for establishing seedlings more quickly.		X
106. Utilize mulching techniques to expedite reclamation and to protect soils.		X
Grazing Required Design Features		
107. Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	X	
108. Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.	X	
109. Utilize temporary fencing (e.g., ESR, drop down fencing) where feasible and appropriate to meet management objectives.		X
110. Fence wetlands (e.g., springs, seeps, wet meadows and/or riparian areas) where appropriate, to maintain or foster progress toward Proper Functioning Condition and to facilitate management of sage-grouse habitat objectives. Where constructing fences or enclosures to improve riparian and/or upland management, incorporate fence marking or other BMPs/RDFs as appropriate.		X
111. During lekking periods, as determined locally (approximately March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.		
112. Work with permittees in locating sheep over-nighting, watering and sheep bedding locations to minimize impacts to sage-grouse seasonal habitats.	X	
113. When trailing livestock during the lekking or nesting season, use roads or existing trails, to the extent possible to reduce disturbance to roosting, lekking or nesting sage-grouse.		X
114. Design new spring developments in GRSG habitat to maintain or enhance the free flowing characteristics of springs and wet meadows. Modify developed springs, seeps and associated pipelines to maintain the continuity of the predevelopment riparian area within priority GRSG habitat where necessary.		X
115. Install ramps in new and existing livestock troughs and open water storage tanks to facilitate the use of and escape from troughs by GRSG and other wildlife.		X
West Nile Virus Required Design Features		
116. Construct water return features and maintain functioning float valves to prohibit water from being spilled on the ground surrounding the trough and/or tank and return water to the original water source, to the extent practicable.	X	
117. Minimize the construction of new ponds or reservoirs except as needed to meet important resource management and/or restoration objectives.	X	
118. Develop and maintain non-pond/reservoir watering facilities, such as troughs and bottomless tanks, to provide livestock water.	X	
119. For most spring developments or wells, mosquito breeding habitat usually is not an issue. Flowing cold (less than 50° Fahrenheit) water and steep sides of the stock tanks are not conducive for egg laying or larvae production. If flows are low, the water is warm, or moss production is an issue in the tank, mosquito breeding habitat could exist in the tank.	X	
120. Maintenance of healthy wetlands at spring sources helps control mosquitoes and their larvae by providing habitat for natural predators such as birds, dragonflies and amphibians. Protecting the wetland at the spring source with a fence is an option to consider.		X
121. Clean and drain stock tanks before the season starts. If never cleaned or drained, many tanks will fill with silt or debris causing warmer water and heavy vegetation growth conducive to mosquito reproduction.		X
122. Draining tanks after the period of use is completed, particularly in warmer weather, also reduces potential habitat by eliminating stagnant standing water.		X
123. Maintain a properly functioning overflow to prevent water from flowing onto the pad and surrounding area, to eliminate or	X	

Measure	Required Design Feature (RDF)	RDF if appropriate and when the resources/values are present
minimize pooling of water that is attractive to breeding mosquitoes.		
124. Clean or deepen overflow ponds to maintain colder temperatures to reduce mosquito habitat.		X
125. Install and maintain float valves on stock tank fill pipes to minimize overflow	X	
126. Harden stock tank pads to reduce tracks that can potentially hold water where mosquitoes may breed.	X	
127. Build ponds with steep shorelines to reduce shallow water (>60 cm) and aquatic vegetation around the perimeter of impoundments to deter colonizing by mosquitos (Knight et al. 2003, cited in NTT report page 61).	X	
128. Consider removing and controlling trees and shrubs to reduce shade and wind barriers on pit and reservoir shorelines if not needed for wildlife, fish, or recreational values.		X
129. Impoundments that remain accessible to livestock and wildlife can cause tracking and nutrient enrichment from manure which can create favorable mosquito breeding habitat. Where this is a concern, it may be desirable to fence the reservoir and pipe the water to a tank.		X
130. Construct dams or impoundments that minimize down-slope seepage or overflow. Seepage and overflow results in down-grade accumulation of vegetated shallow water areas that support breeding mosquitoes.		X
131. On ponds and reservoirs with enough depth and volume, introduce native fish species, which feed on mosquito larvae.		X
132. Line the overflow of a dam's spillway with crushed rock and constructing the spillway with steep sides to preclude the accumulation of shallow water and vegetation to reduce mosquito habitat.		X
133. Where an existing reservoir has filled with silt, consider cleaning to reduce shallow water habitat conducive to mosquito reproduction.		X
134. During confirmed West Nile virus outbreaks in sage-grouse habitat, consider larvicide applications.		X
Travel Management Required Design Features		
135. Designate or design routes to direct use away from priority areas identified in Wildfire and Invasive Species Assessments and still provide for high-quality and sustainable travel routes and administrative access, legislatively mandated requirements, and commercial needs	X	
Recreation Required Design Features		
136. Direct use away from GRSg priority areas as described in the Wildfire and Invasive Species Assessments.	X	
137. Eliminate or minimize external food sources for corvids.		X
138. Avoid development of new campgrounds or recreation facilities in nesting habitat.	X

Sage-Grouse Great Basin Region Project Management Team Weekly Call

December 2, 2014 10:00 a.m. PST

Attendance

BLM:

NV: Lauren Mermejo; Joe Tague

UT: Quincy Bahr;

ID: Brent Ralston; John Beck; Paul Makela, Ethan Ellsworth

OR: Joan Suther; Jessica Rubado

MT: John Carlson

SOL: Sarah Shattuck, SOL

WO: Matt Magaletti; Stephanie Carman

Rocky Mtn. Region: Johanna Munson

USFS:

Glen Stein; Randy Sharp; Madelyn Dillon

EMPSi:

David Batts; Holly Prohaska; Derek Holmgren; Chad Ricklefs; Drew Vankat; Carol Anne Garrison

Handouts

- Avoidance Criteria
- Buffer Questionnaire

Action Items

WO

- Stephanie to coordinate with Pam and Norine at USFWS about highly important landscape boundaries (Super Pacs).
- Stephanie to send out Franks Super Pac Acre comparison table.
- Sarah and Joe to discuss CCS vs. 3% cap issue.
- Sarah and Quincy to discuss
- Matt and Vicki to coordinate with Quincy on question he had about the vegetation objective direction.

Sub regional PMs and Forest Service

- Answer the Buffer Questionnaire and do mapping exercise by Friday December 5th.
- Review and comment on avoidance screening criteria for anthropogenic disturbance and provide comments by next Tuesday.

EMPSi

- Send Sarah Shattuck current sub regional comment response reports.

Meeting Minutes

National, State Director, and SOL updates

- GRSG summit wrapped up last week, meeting with secretary yesterday...decisions, coal mining, transmission, vegetation objectives.
 - Vegetation objective-Following FS table 2.6. UT- If added table but formatted it differently would it be okay (based on elevation or type)? Matt/ Vicki to get back to Quincy.
 - Livestock Grazing Modifications- Took out that there would be annual monitoring...just monitoring and added statement focusing on riparian areas and wet meadows.
 - Mineral materials- PHMA- Closed to new, except for expansion of active pits.
 - Transmission and Major ROWs- Portions of Gateway Energy South was removed.
 - Mapping- Issues worked out in NV-Solicitor gave greenlight. Both NV and ID made adjustments to PPMA boundaries based on new information. WO is still working on issues with the Tavaputs and Anthro areas in Utah.
 - Development in highly important landscapes aka Super Pacs...proposed to be called "sagebrush step focal areas". ADPPs will recommend administrative withdrawal from 1872 mining law in these areas and then NSO without exceptions or modifications, and livestock grazing permit renewals would be prioritized here.
 - Maps- Need to understand how USFWS developed map. Frank put together table showing the distribution of acres in PHMA, GHMA, and non-habitat by land-manager for each state. . Stephanie will follow up with USFWS (Pat and Norine) and ask them to refine map to fit within BLM sideboards.
 - Need to also make sure that cross border issues are addressed in this map.
- Still waiting on decisions on mitigation (language) and coal suitability language.
 - Mitigation language- No net unmitigated loss and mitigation gain language has been changed. Discuss that disturbance would fully offset impacts within valid existing rights and provide a conservation benefit for the sage grouse.
- Secretary is trying to negotiate NSO language between BLM and USFWS (Exception waiver criteria).
- Buffers and NSO language...BLM would like state directors to have final say on exceptions, mods, etc. USFWS wants a biologist to have final say...addresses mixed land ownership issue public had concerns about.
- Buffers and Adaptive Management are still being worked on:
 - USFWS is reviewing AM plans from some states... (NV and UT)...specifically, Norine and Bob (Deputy) and Dan Ash and Terri...are reviewing the plans...seemed pleased with what they saw (even hard triggers)...Idaho's approach has also been cleared...but want to see CO and OR. There is a concern about sub regions without hard trigger responses in plans (e.g. Wyoming) and consistency. Triggers are currently at BSU level, but USFWS wants to see it at PAC level. Issue is with examples like the following: If UT triggers in 26A then Idaho and NV would be affected. If pop tripped in BSU located on state line, hard wire response for original planning are where BSU is and adjacent planning area

would go into effect. UT BLM and state of UT discussed this situation. WO needs to take into account these issues before providing direction.

Q: If we trip a trigger at BSU level, would that trip it for whole population? BLM policy right now is if tripped at BSU, it will be responded to at BSU...but USFWS wants it addressed at population level.

-Secretary will be at WGA and will talk to governors about this issue (This weekend).

- Buffers-Still working on it. Have two weeks to decide. BLM and USFWS are both looking at this issue. Since we have made a lot of planning decisions, may not need buffers...e.g. NSO. Steve and Ed want four questions to be answered by COB Friday December 5th. See questionnaire attached to notes:
 - How was PPH initially mapped initially based on IM-2012-44 (did you include buffers as part of this exercise)? Many states just used habitat maps, but want to make sure.
 - Need to provide WO with rationale for existing buffer distances.
 - Application of Buffer distances in the ADPP-Are you applying allocation decisions into the buffers?
 - Mapping exercise-take minimum range 3.1 mile buffer and show where PHMA and GHMA lie within those lek buffers.

Q: Which leks to use when doing map exercise? 2010 active leks? E.g. UT added about 40 leks between 2012 and 2013. You should use whatever you are using for Chapter 3. And use surface layer within decision area.

Q: Is there directional language that will be provided to the PMs for the ADPP on buffers? Yes, the answer to the questionnaire will help form that direction. Email Matt with questions.

-Science will need to support buffer direction.

- Disturbance- Direction is still being decided. 3% cap (except WYO which has 5%). NV is proposing to use the state of Nevada conservation credit system approach instead, but if doesn't work then will revert back to 3%. WY and NV will have to work with solicitors to develop language on how to monitor and address success. USFWS is concerned that if go with CCS, and we relax allocation direction in one of the strongest plans it will not be good for the bird. But also want to work with the state of Nevada...so solicitors and WO are trying to figure out language. Joe and Sarah to discuss. OR-The state would like to relax allocations for solar and wind in priority habitat....UT will have some concerns with coal allocations in the end...but meeting with state to discuss this week.

Tier II/CEA Update – Comments on the working draft Buffalo CEA

- No comments received to date. Please provide comments by December 5th.

Update from the NOC

-The hold up on getting data to NOC is from changes to Super Pacs and buffers.

Comment response reports – SOL request to review

- The summaries will be sent to Sarah knowing that many have holes, will change based on new WO direction, and she will still need to review the final reports with the FEIS.

Avoidance Criteria

- Review and comment on Avoidance screening criteria for anthropogenic disturbance and provide comments by next Tuesday. Joe is fine with criteria.

Schedule update

- WO is still working on the schedule.

Pre-decisional Deliberative Document – Not for Distribution

The objectives of the below questionnaire are to gather information from the individual sub-regions/states as to how the recent USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse: A Review* could potentially impact the BLM and Forest Service’s existing ADPPs and to identify the proper use of the Report in our final documents. Please respond to the following questions as they relate to your sub-region’s ADPP by COB Friday December 5, 2014.

1. Mapping PPH and PGH: When initially mapping preliminary priority and preliminary general habitat for your sub-region with your respective state wildlife agency (per IM-2012-044), were distances from leks part of this mapping exercise? If so, what distance from the lek was used? Please provide the citation if available. If not, what was the criteria/basis for mapping priority and general habitat?

2. Rationale for existing buffer distances: We recognize that sub-regions provided this information to the WO prior to the Federal Family Meetings, but in order to reflect any changes that have been made since then, what buffer distances and their supportive scientific references are identified in your ADPP for both PHMA (Core and IHMA) **and** GHMA (please note if they are seasonal or year-round buffers)? Do these distances fall within the Report’s interpreted range for surface disturbance, linear features, and energy development (3.1 miles to 5 miles), tall structures (2 miles to 5 miles), and low structures (1.2 miles to 5 miles)?

If the sub-regional buffers do not fall within the Report’s interpreted ranges, do you feel you need to make changes to your existing ADPP buffers? If not, why?

3. Application of buffer distances in your ADPP: Do you attach any BLM land use plan allocations (NSO, ROW exclusions/avoidances, or closures for example) within the buffer distances from leks in your ADPP for both PHMA (Core and IHMA) **and** GHMA? If so, are these buffer allocations depicted in the data that you will be using for cumulative effects analysis and mapping purposes?

If no land use plan allocations are associated within a buffer distance from a lek, how does the sub-region plan to implement the conservation actions associated with the buffer distance?

4. If a 3.1 mile buffer was to be applied to every occupied lek present in the sub-region’s planning area, would BLM managed PHMA and GHMA within this 3.1 mile buffer area be covered by restrictive land use plan allocations? In order to effectively respond to this question, please work with your GIS specialist to develop the following:
 - a. A map of your planning area with the following layers: 1) all known leks with a 3.1 mile buffer (shown as a circle), ADPP PHMA (Core and IHMA), and ADPP GHMA.
 - b. Acreage figures populated for the below categories.

	Acres
Acres of BLM/FS managed PHMA (Core and IHMA) within a 3.1 mile buffer from a lek.	
Acres of BLM/FS managed GHMA within a 3.1 mile buffer from a lek.	
Acres of BLM/FS lands within 3.1 mile from a lek that is not managed as PHMA or GHMA.	

Avoidance Criteria for New Anthropogenic Disturbances (Mineral Development, Rights-of-Ways, Recreational Uses, Grazing Facilities or Other Authorizations That Cause Surface-Disturbance)

A. Priority Habitat Management Area (PHMA)*

1. Priority is given to development outside of PHMA.
2. If development/activity cannot be placed outside of PHMA, surface-disturbing activities would be authorized in non-habitat areas first, and then in the least suitable habitat for GRSG.
3. If development/activity is placed in non-habitat, it would not create a barrier to movement and/or connectivity between seasonal habitats and populations.
4. Development/activity does not exceed the 3% disturbance cap.
5. Adaptive management triggers have not been reached.
6. The development/activity with associated mitigation would not result in a net loss of GRSG habitat, and mitigation would provide an overall net conservation benefit to the PHMA (see Appendix _____, Mitigation Framework). **(TIME FRAME)**
7. If the development/activity cannot be reasonably accomplished outside of PHMA, it could be considered under the following conditions: 1) developed pursuant to a valid existing authorization; 2) is co-located within the footprint of existing infrastructure.
8. Authorized/permitted activities are implemented adhering to the required design features (RDFs) described in Appendix ___ for specific resources, and the BMPs for locatable minerals. At the site-specific scale, if a RDF/BMP is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity:
 - A specific RDF/BMP is documented to not be applicable to the site-specific conditions of the project/activity;
 - An alternative RDF/BMP is determined to provide equal or better protection for GRSG or its habitat;
 - Analyses conclude that following a RDF/BMP will provide no more protection to GRSG or its habitat.
9. Discrete anthropogenic disturbances or activities disruptive to GRSG (including scheduled maintenance activities) do not occur in seasonal GRSG habitats unless the project plan and NEPA document demonstrate the project would not impair the life-history or behavioral needs of the GRSG population. Seasonal avoidance periods vary by GRSG seasonal habitat as follows:
 - In breeding and nesting habitat from _____ to _____
 - In brood rearing habitat from _____ to _____
 - In winter habitat from _____ to _____The specific seasonal restrictions may be modified if documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, long and/or heavy winter) reflect a need to change the given dates in order to better protect GRSG, in coordination with the local State-agency biologist.
10. Authorizations/permits would limit noise from discretionary activities (during construction, operation, or maintenance) to not exceed 10 decibels above ambient sound levels at the

perimeter of occupied leks during the primary lekking periods.

11. Authorizations/permits would restrict the placement of permanent tall structures within GRSG breeding and nesting habitats. A tall structure is any man-made structure that provides for perching/nesting opportunities for predators that may naturally be absent, or that decreases the use of an area by GRSG; this determination would be made based on local conditions such as existing vegetation or topography.

B. General Habitat Management Area (GHMA)*

1. Priority is given to development outside of GHMA.
2. If development/activity cannot be placed outside of GHMA, surface-disturbing activities would be authorized in non-habitat areas first, and then in the least suitable habitat for Greater sage-grouse.
3. If development/activity is placed in non-habitat, it would not create a barrier to movement and/or connectivity between seasonal habitats and populations.
4. The development/activity with associated mitigation would not result in a net loss of GRSG habitat (see Appendix _____, Mitigation Framework).
5. Authorized/permitted activities are implemented adhering to the required design features (RDFs) described in Appendix ___ for specific resources, and the BMPs for locatable minerals. At the site-specific scale, if a RDF/BMP is not implemented, at least one of the following must be demonstrated in the NEPA analysis associated with the project/activity:
 - A specific RDF/BMP is documented to not be applicable to the site-specific conditions of the project/activity;
 - An alternative RDF/BMP is determined to provide equal or better protection for GRSG or its habitat;
 - Analyses conclude that following a RDF/BMP will provide no more protection to GRSG or its habitat.
6. Discrete anthropogenic disturbances or activities disruptive to GRSG (including scheduled maintenance activities) do not occur in seasonal GRSG habitats unless the project plan and NEPA document demonstrate the project would not impair the life-history or behavioral needs of the GRSG population. Seasonal avoidance periods vary by GRSG seasonal habitat as follows:
 - In breeding and nesting habitat from _____ to _____
 - In brood rearing habitat from _____ to _____
 - In winter habitat from _____ to _____

The specific seasonal restrictions may be modified if documented local variations (e.g., higher/lower elevations) or annual climactic fluctuations (e.g., early/late spring, long and/or heavy winter) reflect a need to change the given dates in order to better protect GRSG, in coordination with the local State-agency biologist.

*This screening criteria would not be applicable to vegetation treatments being conducted to enhance GRSG habitat.

Subject: Great Basin GRSG - NEPA PM Call Tuesday

Reminder - Great Basin GRSG PM conference call tomorrow at 10AM Pacific Time / 11AM Mountain Time. Call in info and draft agenda below.

877-928-4213
participants: 9009662#

Agenda

- I. WO review updates
 - WGA Outcomes

- Issue resolution - status
 - Schedule update
 - GRSG Decision tracking sheet
2. Tier II/CEA Update
 3. APRMP/Final EIS
 - Executive Summary and chapter I templates (need for consistency)
 - Revised anthropogenic disturbance screening criteria sent out last week
 - Other?
 4. Other topics?
 5. Action Items from past calls
 - None

Sage-Grouse Great Basin Region Project Management Team Weekly Call

December 9, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Jon Beck, ID; Joan Suther, OR; Jessica Rubado, OR; Stephanie Carman, WO; Matt Magaletti, WO; Michael Hildner, WO; Gordon Toevs, WO

USFS: Glen Stein; Randy Sharp

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- ALL: Send comments on CEA template to Drew Vankat.
- Matt: Draft Executive Summary template.

EMPSi

- Review and respond to CEA template comments from Oregon.
- Send Matt Executive Summary from NV/CA plan.

Meeting Minutes

WO Review Updates

- Decisions/guidance are not ready to send out yet, but anticipate direction will be provided for most issues on Thursday. Adaptive Management and buffers will not likely be resolved this week.
- Staff changes – Michael Hildner will replace Matt who will be going to WY to replace Johanna, who is currently filling in for Kurt Wiedenmann in Idaho, who is on detail in the WO. Expect the staff changes will last 60-90 days with options for up to 120 days.
- Adaptive Management – BLM and SOL working with USFWS to resolve the issue of triggers for populations that cross state boundaries. BLM would like BSU/PAC-level triggers within the state and then discussions for changes needed across state boundaries. USFWS would like to see response at population level.
- Buffers – Matt, Stephanie, and Vicki working to process buffer information that sub-regions provided. Three discussions:
 - High level talking points – BLM's GRSG conservation plans are based primarily on PHMA allocation decisions. Within the 3.1 mile buffer around leks, how much is protected by PHMA/GHMA/not protected? Across BLM lands, 74% contained within PHMA. 24% in GHMA. Only 2% not included and can usually explain why these are not included. If only

used a lek buffer to protect GRSG, this would only cover 57% of PHMA in NV. We are proposing greater and more holistic protection.

- How we did use buffers in our plans? Generally used as a secondary level of protection. Allocations in PHMA are primary level of protection. Buffers mostly occur at project implementation level.
- Suggestions for changes or what we should use based on USGS feedback. Will probably develop a suite of options that would apply at implementation stage, specific to a particular use.
- USFWS is reviewing buffers and hoping to get their suggestions by Friday. Have to discuss with USFWS before giving direction to sub-regions.
- Sagebrush Conservation Areas (e.g. Super PACs) – negotiating with USFWS to amend boundaries to include only federal lands and PHMA and address other mapping errors. Would like official buyoff on this.

Adaptive Management

- Some discussion about using management from other alternatives as a trigger response, but unsure if we need to use management verbatim from the alternative or whether it can fall within the range of alternatives. Grazing was mentioned as an example since grazing actions are limited but the range is large. If you take an action verbatim, NEPA coverage stronger because it was directly analyzed. If taking management within the range, weaker NEPA analysis.
- Hearing from SOL – once you hit hard trigger, immediately implement response. Then can investigate the cause. Regardless, still need LUP amendment to release hard trigger response. Response may not respond to what caused the trigger to be tripped, but USFWS would have certainty that change will be implemented.

Tier II/CEA Update

- Received comments from Oregon and expecting comments from the Forest Service. Send comments to Drew Vankat. Will be responding to comments and may have additional questions or need clarifications from Joan.

Monitoring Language

- Gordon provided guidance that the drop-in language for monitoring is sufficient for planning purposes and no supplementation of monitoring language is needed.
- DSDs have been discussing implementation and Gordon is a member of that team. Trying to coordinate activities and monitoring.
- Forest Service monitoring protocol – will it be across all lands or different by forest? Glen is not sure but thinks they will follow the same protocol as BLM.

APRMP/Final EIS

- Should have consistency across sub-regions for Chapter 1 and Executive Summaries. Chapter 1 started as a template and was tailored by sub-region. Want to make sure that Executive Summaries look the same.
- WO will draft an Executive Summary template. Holly to send current version of NV/CA.
- Revised anthropogenic screening criteria sent out last week. Few minor comments from Joe. Send comments to Lauren. ID/MT and OR to send comments.
- They should be a separate action (e.g. SSS-1) under special status species. In every resource section, the first decision will be to comply with SSS-1.
- Can develop criteria for GHMA, but less important to be consistent across this management area.

Other

- UT received a FOIA from cooperating agency and will be working with Sarah to respond and address concerns.
- No word on the Omnibus. Language to be released to the public today.
- Website: Hoping to update national website. Need to have common responses to schedule concerns.

MEMORANDUM OF UNDERSTANDING

BETWEEN

THE UNITED STATES DEPARTMENT OF THE INTERIOR

BUREAU OF LAND MANAGEMENT

AND

THE UNITED STATES DEPARTMENT OF THE INTERIOR

FISH AND WILDLIFE SERVICE

AND

THE UNITED STATES DEPARTMENT OF AGRICULTURE

FOREST SERVICE

REGARDING

DEVELOPMENT OF THE

ENVIRONMENTAL IMPACT STATEMENTS FOR THE PROPOSED AMENDMENT OR
REVISION OF RESOURCE MANAGEMENT PLANS AND LAND AND RESOURCE
MANAGEMENT PLANS TO INCORPORATE CONSERVATION MEASURES

FOR

GREATER SAGE-GROUSE

**Memorandum of Understanding
Between the Bureau of Land Management,
the Fish and Wildlife Service,
and the Forest Service**

Parties to and Purpose for this Document: This Memorandum of Understanding (MOU) is entered into between the United States Department of Interior (DOI), Bureau of the Land Management (BLM), the DOI, Fish and Wildlife Service (FWS), and the United States Department of Agriculture, Forest Service (FS) (hereinafter, collectively referred to as “the parties”) for the purpose of coordinating and cooperating in conducting an environmental analysis and preparing the draft and final Environmental Impact Statements (EISs) for amendment of land use plans to incorporate conservation measures for the greater sage-grouse. These EISs will be prepared in two regions: a Rocky Mountain Region and a Great Basin Region. The Rocky Mountain Region includes land use plans in the states of Colorado, Wyoming, North Dakota, South Dakota, and portions of Utah and Montana. The Great Basin Region includes land use plans in California, Idaho, Nevada, Oregon, and portions of Utah and Montana.

Within these Regions, sub-regional interdisciplinary teams (IDTs) will be developing individual EISs. Based on the identified threats to the greater sage-grouse and the FWS timeline for making a listing decision on this species, the BLM and the FS aim to incorporate objectives and conservation measures into land use plans by September 2014 in order to provide adequate regulatory mechanisms to conserve greater sage-grouse and its habitat. These measures would be considered by FWS as it makes its final determination on whether to list the greater sage-grouse under Section 4 of the Endangered Species Act (ESA). Therefore, these EISs will be prepared under expedited timeframes.

1. This MOU establishes the FS and the FWS as "cooperating agencies" in the environmental impact analysis and documentation process and establishes procedures through which the FS, the FWS and the BLM will coordinate participation in sub-regional IDTs, the Regional Management Teams, and the National Policy Team, to conduct the analyses and develop the EISs. The FS and the FWS have been identified as cooperating agencies because the agencies have both jurisdiction by law and special expertise with respect to environmental impacts relating to the greater sage-grouse habitat conservation strategy (40 CFR 1508.5).
2. **Authorities:** This MOU has been prepared under the authority of the National Environmental Policy Act of 1969, 42 U.S.C. 4321 et seq., and federal regulations codified at 40 Code of Federal Regulations (CFR) Part 1500-1508, and 43 CFR Part 46; the Federal Land Policy and Management Act of 1976, 43 U.S.C. 1701 et seq. and BLM’s planning regulations (in particular 43 CFR 1601.0-5, 1610.3-1, and 1610.4); the National Forest Management Act (NFMA) 16 U.S.C. 1601 et seq.; 36 CFR 219, et seq. and 220, et seq.; the Fish and Wildlife Coordination Act, 16 U.S.C. 661-668d; Service First Authority, Section 422 of the Consolidated Appropriations Act of 2012, P.L. 112-74; and the Fish and Wildlife Act, 16 U.S.C. 742a-742j.

3. **Background:** In April 2010, the FWS published its listing decision for the greater sage-grouse indicating that listing was “Warranted but Precluded” due to higher listing priorities under the ESA. The inadequacy of regulatory mechanisms to conserve the greater sage-grouse and its habitat was identified as a significant threat in the FWS finding on the petition to list the greater sage-grouse as a threatened or endangered species. In view of the identified threats to the greater sage-grouse, and the FWS timeline for making a listing decision on this species, the BLM and the FS propose to incorporate consistent conservation measures for the protection of greater sage-grouse and its habitat into relevant BLM Resource Management Plans (RMPs) and FS Land and Resource Management Plans (LMPs) by September 2014 in order to provide adequate regulatory mechanisms to conserve greater sage-grouse and its habitat. The BLM and the FS will consider and analyze these conservation measures through the plan amendment processes of the respective agencies. The BLM and the FS expect to prepare EISs to analyze proposed amendments to land use plans that are not currently undergoing amendment or revision. For plans already undergoing amendment or revision, the BLM and the FS will consider incorporating conservation measures through the ongoing amendment or revision processes.

The BLM and the FS intend to evaluate the adequacy of sage-grouse conservation measures in existing RMPs and selected LMPs, and consider conservation measures, as appropriate, in proposed RMP and selected LMP amendments throughout the range of the greater sage-grouse, with the exception of the bi-state population in California and Nevada and the Washington State distinct population segment, which will be addressed through other planning efforts.

The BLM and the FS will seek public and agency input to identify issues to address in the EISs, and the BLM and the FS will coordinate, as appropriate, with other federal, state, and local government agencies in preparing the EISs. The BLM and the FS will conduct detailed environmental studies of proposed conservation measures to be incorporated into RMPs and LMPs and alternative conservation measures, and analyze how incorporation of these conservation measures into RMPs and LMPs may affect the quality of the environment.

The BLM will serve as the lead agency and the FWS and the FS are cooperating agencies for these EISs. Cooperating agency status may be offered to other federal agencies, tribes and local government agencies as the BLM deems appropriate.

All EISs will consider both federal and non-federal lands in its analyses. However, implementation of any decisions that amend RMPs and LMPs would apply ONLY to federal land and minerals.

4. **Organization:**

This coordinated interagency effort to conserve greater sage-grouse populations and habitats shall be supported by the following organizational structure:

National Policy Team - Leadership Support

Regional Management Teams - Implementation and Consistency Support

Sub-Regional IDTs – EIS Development

National Technical Team - Technical Support

5. **Term of MOU:** This MOU will commence upon the date of the last signature made by the duly authorized representatives of the parties to this MOU, and will remain in full force and effect unless terminated in accordance with Section 11i, or through March 2, 2016, at which time it will expire, unless extended by an executed modification, signed and dated by all properly authorized signatory officials.
6. **Responsibilities of the FWS:** Based upon the expedited time frames for this initiative, the FWS will participate in the environmental analysis and documentation process by providing information regarding environmental issues for which or where the FWS has jurisdiction by law or special expertise. A schedule and preliminary timeframe for the respective stages of EIS development where the FWS may participate in the planning process is included in Attachment A.

The FWS will have at least one member appointed to represent its interests and work with each sub-regional IDT, at least one member appointed to represent its interests and work with each regional management team, and at least one member appointed to represent its interests and work with the National Policy Team. These members are identified as FWS points of contact (see Section 11n.). The FWS member(s) may be present, as available, at IDT meetings and may provide supporting documentation and information as necessary. Information provided by the FWS may be at its discretion or upon request by BLM and FS IDT members or the third party NEPA contractor through the sub-regional IDT leader and within the IDT leader's specified time frames.

Through its representative(s), the FWS will have the opportunity for input to preliminary draft documents prepared during the EIS process. The IDT leader may, at any time during the effective term of this MOU, request records or information by contacting the FWS point of contact identified in Section 11n below, and the FWS point of contact will work to respond to such requests within reasonable time frames. Prior to release, all records or information requested of or provided by the FWS pursuant to this MOU will be subject to review by the FWS.

Under this MOU, the FWS is expected to assist the BLM and the FS in identifying key issues, developing reasonable alternatives, providing timely information, and reviewing preliminary environmental documents, so that the EIS process remains on track to adhere to agreed-upon schedules and to meet our mutual goals of sage-grouse conservation. The FWS also agrees to advise the BLM and the FS throughout the EIS development process as issues arise in regard to the conservation measures being incorporated into the respective agencies' land use plans. The FWS agrees to maintain the confidentiality of documents and deliberations during the period prior to the public release of any NEPA documents to the extent allowed by the Freedom of Information Act (FOIA), including drafts; consistent with agreements made with the FS and the BLM to determine appropriate timing for sharing documents with the public or other partners.

7. **Responsibilities of the FS:** Based upon the expedited time frames for this initiative, and the

FS LMP units involved, the FS will participate in the environmental analysis and documentation process by providing information regarding environmental issues which are pertinent to its LMP amendments. A schedule and preliminary timeframe for the respective stages of EIS development where the FS may participate in the planning process is included in Attachment A. It is critical that the FS provide information in a timely fashion to allow completion of EISs by the appointed deadlines.

The FS will have at least one member appointed to represent its interests and work with each sub-regional IDT where FS LMP units are at issue, at least one member appointed to represent its interests and work with each regional management team, and at least one member appointed to represent its interests and work with the National Policy Team. These members are identified as FS points of contact (see Section 11n.). The FS member(s) will be present, as available, at IDT meetings and provide supporting documentation and information as necessary.

Through its representative(s), the FS will have the opportunity for input to preliminary draft documents prepared during the EIS process. The IDT leader will, at any time during the effective term of this MOU, request records by contacting the FS point of contact identified in Section 11n below, and the FWS point of contact will work to respond to such requests within reasonable time frames. Prior to release, all records or information requested of or provided by the FS pursuant to this MOU will be subject to review by the FS.

Under this MOU, the FS is expected to work with the FWS and the BLM in identifying key issues, developing reasonable alternatives, providing timely information, and reviewing preliminary environmental documents, so that the EIS process remains on track to adhere to agreed-upon schedules. The FS agrees to maintain the confidentiality of documents and deliberations during the period prior to the public release of any NEPA documents to the extent allowed by the FOIA, including drafts; consistent with agreements made with the FWS and the BLM to determine appropriate timing for sharing documents with the public or other partners.

The FS will have the responsibility for developing and approving specific Records of Decision for the FS LMPs included in the respective sub-regional EISs. Any FS decisions made associated with the EISs apply only to NFS land. This planning process is subject to resource and funding availability.

8. **Responsibilities of the BLM:** The points of contact for the preparation of these EISs are designated in Section 11n of this MOU. The BLM will keep the FWS and FS representatives apprised of current events and timeframes in relation to the EISs. The BLM will provide information requests and drafts for review with as much lead time as possible to facilitate FWS and FS timely and thoughtful responses. The BLM will incorporate information and proposals provided by the FWS and the FS into the draft and final EIS as appropriate. Any BLM decisions made associated with the EISs apply only to public land administered by BLM.
9. **Mutual Responsibilities of the Parties:** The FWS, the FS and the BLM agree to cooperate

by informing each other as far in advance as possible, of any related actions, issues or procedural problems that may affect the environmental analysis and documentation process or that may affect either party. The parties agree to cooperate in the development and review of any operating guidelines or agreements between the FWS, the FS, or the BLM and other entities involved in the EISs that may affect the environmental analyses and writing of the EISs.

The key contacts identified in Section 11n serve as the MOU core team. The purpose of the MOU core team is to ensure that timely and coordinated communication and exchange of information between the parties to the MOU occurs throughout the planning process.

10. Payment: No payment will be made to any other party by the other as a result of this MOU. Each party will pay its own costs. During the course of the planning process, should it become necessary for one party to purchase from or make payment or reimbursement to any other party, such arrangements will be covered in a separate cooperative agreement in accordance with applicable law.

11. General Provisions:

a. Amendments. Any party may request changes to this MOU. Any changes, modifications, revisions, or amendments to this MOU, that are mutually agreed upon by and between the parties to this MOU, will be incorporated by written instrument, executed and signed by both parties to this MOU, and are effective in accordance with the terms of paragraph 3 above.

b. Applicable Law. The construction, interpretation and enforcement of this MOU will be governed by the applicable laws of the United States.

c. Entirety of Agreement. This MOU, consisting of 10 pages, represents the entire and integrated agreement between the parties and supersedes all prior negotiations, representations and agreements concerning the parties' greater sage-grouse related environmental documents, whether written or oral.

d. Severability. Should any portion of this MOU be determined to be illegal or unenforceable, the remainder of the MOU will continue in full force and effect, and either party may renegotiate the terms affected by the severance.

e. Sovereign Immunity. The FWS, the FS, and the BLM do not waive their sovereign immunity by entering into this MOU, and each fully retains all immunities and defenses provided by law with respect to any action based on or occurring as a result of this MOU.

f. Third Party Beneficiary Rights. The parties do not intend to create in any other individual or entity the status of third party beneficiary, and this MOU must not be construed so as to create such status. The rights, duties and obligations contained in this MOU will operate only among the parties to this MOU, and will inure solely to the benefit of the parties to this MOU. The provisions of this MOU are intended only to assist the parties in

determining and performing their obligations under this MOU. The parties to this MOU intend and expressly agree that only parties signatory to this MOU will have any legal or equitable right to seek to enforce this MOU, to seek any remedy arising out of a party's performance or failure to perform any term or condition of this MOU, or to bring an action for the breach of this MOU.

g. Exchange of Information. All records or information requested of any party by any other party will be reviewed by the releasing party prior to release. To the extent permissible under law, any recipient of proprietary and/or pre-decisional information agrees not to disclose, transmit, or otherwise divulge this information without prior approval from the releasing party. Any breach of this provision may result in termination of this MOU.

h. Administrative Considerations. Nothing in this MOU will be construed as limiting or affecting in any way the authority or legal responsibility of the FWS, the FS, or the BLM, or as binding either the FWS, the FS, or the BLM to perform beyond the respective authority of each, or to require either to assume or expend any sum in excess of appropriations available. It is understood that all the provisions herein must be within financial, legal, and personnel limitations, as determined practical by the FWS, the FS and the BLM for their respective responsibilities. This MOU is neither a fiscal nor a funds obligation document.

Nothing in this MOU will be construed to extend jurisdiction or decision-making authority to the FWS, the FS, or the BLM for planning and management of land and resource uses for any non-Federal lands or resources in the planning area. Nothing in this MOU will be construed to extend jurisdiction or decision-making authority to the FS or the FWS for planning and management of land or resource uses on the Federal lands or mineral estates administered by the BLM. Nothing in this MOU will be construed to extend jurisdiction or decision-making authority to the BLM or the FWS for planning and management of land or resource uses on National Forest System lands except for the mineral estates administered by the BLM. The FWS, the FS, and the BLM will work cooperatively and will communicate about issues of mutual concern.

i. Termination: Any party may terminate this MOU after 30 days written notice to the other parties of their intention to do so. During this period, the parties will enter negotiations to resolve any disagreement(s). If the disagreement(s), if any, have not been resolved by the end of the 30-day period, the MOU will terminate. In the event negotiations are progressing but are not concluded by the end of the 30-day period, the party initiating the termination notice may request that termination be postponed for an additional 30-day period or longer while the negotiations continue.

j. Dispute Resolution: In the event of any disagreement among the parties regarding their obligations under this MOU that cannot be resolved among the parties in a reasonable time, any party may refer the disagreement to the BLM Director to timely resolve said issue. The decision of the BLM Director will be the final decision for purposes of resolving the issue.

k. Participation in Similar Activities: This agreement in no way restricts the FWS, the FS, or the BLM from participating in similar activities with other public or private agencies,

organizations, and individuals.

l. Members of U.S. Congress: Pursuant to 41 U.S.C. 22, no United States member of, or United States delegate to, Congress shall be admitted to any share or part of this agreement, or benefits that may arise therefrom, either directly or indirectly.

m. Text Messaging while Driving: In accordance with Executive Order (EO) 13513, "Federal Leadership on Reducing Text Messaging While Driving," Federal employees shall not engage in text messaging (a) when driving a Government owned vehicle (GOV), or when driving a privately owned vehicle (POV) while on official Government business, or (b) when using electronic equipment supplied by the Government while driving. All recipients and subrecipients are encouraged to adopt and enforce policies that ban text messaging when driving company owned, leased or rented vehicles, POVs or GOVs when driving while on official Government business or when performing any work for or on behalf of the Government.

Jamie

We did have a cooperating agency call yesterday with counties but I am not aware of the mailing list the invites were sent to..... I am checking this AM

If there was an oversight we will correct it ASAP and keep you in the loop.

Kurt, Brent, Jon, if we forgot to include the MT cooperators please make calls today to all those cooperators and ensure they get the letter and documents ASAP

Jamie, I am traveling to Fort Hall for a Govt-Govt mtg today so I will ask Kurt Wiedenmann to followup with you this AM

Jon – Please keep me on all hard copy and email lists for the IDswMT Greater Sage-Grouse issues, especially NEPA documents. I am the sage-grouse biologist working for Custer County and would like to continue to receive all administrative drafts of NEPA documents under the Custer County cooperating agency status, as well as documents that go to the public. I am also requesting information about meetings – as Custer County has been very active in coordination with BLM and other federal agencies on the sage-grouse. We wish to continue to stay very involved.

Thank you. /s/ Mary

Subject: GRS GBR/RMR NEPA Leads Call - Weds 9AM PT / 10AM MT / 12PM ET

Reminder - Great Basin GRSG PM conference call Wednesday at 9AM Pacific Time / 10AM Mountain Time. Call in info and draft agenda below.

Access Number: 1-218-632-0734

Passcode: 807966#

NOTE: The second part of the meeting will focus on BLM and Forest Service coordination. Project leads without Forest Service involvement need not participate (but are welcome).

Agenda:

1. WO updates
 - Upload latest version of proposed plan (Dept wants to see these ASAP)
 - Communication update
 - SGTF update from meeting this week
 - Drop-in language for Chapter 2 Veg Objectives Table
 - Presidential Priority Transmission Lines
 - Disturbance Appendix
 - Net conservation gain (mitigation drop-in language for actions that are required to reach it.
 - Glossary definition for “site potential”
2. Executive Summary and Dear Reader Letter
 - Templates complete
 - Timeline for Ex Sum
3. CEAs Update and Reviews – Drew and Project Leads
4. Socioeconomic analysis update
5. IMT Consistency Review –
 - Submit in MS Word files to extent possible
 - EMPSi developing rule set to efficiently incorporate IMT review
 - Need any qualifiers from PMs to help with the review; also anything you think reviewers should focus on.
6. Schedule – Critical Paths:
 - Review of Direct and Indirect impact analysis – due COB 4/3 (single Word file)
 - Compile PLUPA/FEIS – 4/10
 - IMT Review PLUPA/FIES – 4/17
 - Final CEAs – 4/24 (other reviews before)
 - WO Internal Review Draft EIS – 4/25
7. Round robin on status – all
8. Other topics?

BLM / Forest Service Coordination (FS and BLM CO, WY, UT, ID, NV, and WO)

1. Forest Service update on their review of Chapter 4s and 5s (the NeST is in Ogden this week)
2. Other topics?

Action Items from past calls

WO

- Send additional drop-in language when available
- Provide written guidance for Administrative Record regarding use of PPH/PGH and PHMA/GHMA in FEIS.
- WO will provide briefing schedule on the 6 revisions (Buffalo, etc.).
- WO will draft dear reader letter (s).
- Vicki will provide guidance on Vegetation objectives/standards/ etc.

Sub regional PMs and Forest Service

- All references and acronyms from main document and appendices should be put in their respective chapters in the main document.
- Idaho BSU definition will be provided to the other subregions.
- PMs: Let Glen and Madelyn know when you need impact analysis feedback returned next week.
- PMs: Discuss county cooperator review with your State Director.

Sage-Grouse Great Basin and Rocky Mountain Regions Project Management Team Weekly Call

April 1, 2015 10:00 a.m. PST

Attendance

BLM: Erin Jones, CO; Jon Beck, ID; Johanna Munson, ID; John Thompson, MT; Frank Quamen, NOC; Julie Suhr Pierce, UT; Lauren Mermejo, NV; Randy Sharp, NV; Joan Suther, OR; Quincy Bahr, UT; Stephanie Carman, WO; Michael Hildner, WO; Mitch Snow, WO; Matt Magaletti, WY

Forest Service: Glen Stein; Madelyn Dillon; Rob Mickelsen; Ron Rodriguez; Dale Harber; Tim Metzger; other Forest Service reviewers

EMPSi: David Batts; Chad Ricklefs; Derek Holmgren; Peter Gower; Drew Vankat; Meredith Zaccherio

Action Items

WO

- Send drop-in language when available.

Sub regional PMs and Forest Service

- PMs: Start a list of any qualifiers for the FEIS that the IMT should know about.
- PMs: Respond to ICF regarding when the revised analyses will be available for them to review.

EMPSi

- Drew: Coordinate with Madelyn regarding Forest Service CEA review.

Meeting Minutes

Washington Office Updates

- WGA task force meeting this week. Steve Ellis scheduled a State Director call tomorrow to provide updates. Anticipate updating some language, but unsure of the details. Nearly all states are upset with the plans. Department has asked to see the proposed plans again.
- Still on schedule to do review on April 11.
- Working on providing drop-in language. Will send text for Presidential Priority projects and the disturbance appendix. Still working on vegetation objectives table intro text and mitigation direction.
- Definitions of site potential, grazing language – SOL and the Department looking at this again.
- Communications – department still taking the lead. April 7, Department will have a webinar/call with State Directors and District Managers to talk about the communications factsheet. April 21- a high level webinar regarding GRSG biology and importance.
- Stephanie will be reaching out to some of the sub-regions individually.
- Showing SFAs under BLM management as well as other areas – might be dropping this.

- Concerns from the WGA meeting about habitat objectives table relate to whether they would have to meet objectives in order to graze?
- Dear Reader letters were distributed last week. Executive Summary also sent – based on NV/CA. IMT review will focus on Chapters 2 and 4, so the Executive Summary will not be needed. IMT will want to review appendices as well.
- Still working on approach for NOAs.

CEA Update

- Team is working on CEAs. Some are under review, others, including HiLine, NW CO, and Oregon will be submitted later this week.
- CEAs are split out by sub-region and Management Zone. Both the Management Zone lead and the sub-regional lead will review the applicable CEAs.

Socioeconomic Update

- Julie is the Great Basin socioeconomic specialist and has been working with ICF. ICF turned in revised sections for ID/MT, NV/CA, UT, and OR. NW CO due this Friday. ICF is hoping they will have any opportunity to see any BLM comments and revisions to other sections to see if socio sections need to be changed. They have reached out to each sub-region to determine when the revised analyses will be available.

IMT Consistency Review

- Everyone submit MS word files to the extent possible. The IMT will call PMs if they have questions.
- EMPSi is developing a rule set for the review – e.g., do not change headings/footers; how to insert comments. This will prevent problems when trying to merge multiple files together.
- Please start a list of any qualifiers the review team should know about – send to EMPSi PM or to David. They will give a briefing to IMT team.
- Each person on the IMT will specialize in an area of the plans and they will be in charge of consistency for that section.
- USFWS is doing their own consistency review.
- WO is creating sideboards for review. Jim Lyons committed to ensuring that drop-in language is included but also that the FEISs adhere to the broader goals we're looking to achieve.

Round Robin

- NV/CA – moving forward. Will turn in everything to EMPSi on Friday for formatting.
- OR – working through Chapter 4 reviews. Deputy State Director had a good meeting with the state. Oregon wasn't at the WGA meeting. Need to rework some data. In reviewing mitigation Chapter 4 language – unsure where this text should go.
- ID/MT – discussion with state this morning. Jon will discuss with Stephanie. Jon reviewing CEA Tier II. Working through issues, and finding recalculations and QA issues. On schedule.
- UT – reviewing Chapter 4. EMPSi is in-house with team. Pulling together rest of document. Incorporating Forest Service comments on Thursday. Had a meeting with state and gave them

the Proposed Plans (BLM-UT; FS-UT; and FS-WY). Meeting with the state again on Monday to answer questions on the Proposed Plan.

- CO – same as everyone else. Working with ICF on socioeconomic impact analysis. Meeting with state partners and will meet again today to talk about issues. Check in call with EMPSi to review any outstanding items.
- MT – planning leads asking questions about drop-in language. USFWS also had some questions.
- WY – on schedule. Planning team receiving Forest Service comments this week, incorporating next week. The 9Plan Chapter 4 may not incorporate Forest Service comments on time. Met with USFWS yesterday and they had their own internal checklist. They are providing some comments. They are asking for some rationale as to why WY is deviating from other state direction.
- UT – needs to incorporate any changes to Forest Service plan in WY.

NOC

- Sent data to USFWS with metadata.
- Sent data and tables to EMPSi for CEA and information for the socioeconomic report.

Forest Service Coordination

- NV/CA is done. Reviewing UT and CO today. ID/MT to be completed tomorrow
- Effort focused on fairly specific areas where there may be some differences (e.g., grazing, allocations; language added to GRSG section for grazing effects).
- Struggling with WY and not sure what to do yet.
- Higher level comment is that they are not seeing conclusions that management will lead to improvement in conditions for GRSG. Will be adding some language in GRSG and vegetation sections, including VDDT analysis.
- For VDDT, we will include numbers from draft for the other alternatives, as these alternatives were not re-run for the FEIS. Rob will be writing some proposed plan analysis done by COT population area. Can crosswalk population areas if needed.
- Utah also had some questions about VDDT. Important to talk about the trend and past disturbances.
- WGA concerns about how Forest Service addresses buffers, since some buffers are included as guidelines. Madelyn created a crosswalk and she will provide this to Stephanie. Glen does not think there is a difference in effects.
- Disturbance of 1 per 640 - BLM does discuss this, Forest Service does not. How is this incorporated in plans? This is a management action. Stephanie will check into it.
- How and when will Forest Service review CEA –Drew will coordinate directly with Madelyn.

Reminder - Great Basin GRSG PM conference call Wednesday at 9AM Pacific Time / 10AM Mountain Time. Call in info and draft agenda below.

NO MEETING NEXT WEEK!

Access Number: 1-218-632-0734

Passcode: 807966#

NOTE: The second part of the meeting will focus on BLM and Forest Service coordination. Project leads without Forest Service involvement need not participate (but are welcome).

Agenda:

1. No call next week; next call on April 22nd
2. WO updates
 - Remaining drop in language (Net conservation gain, glossary definition for “site potential”, others)
3. Executive Summary
 - FS input attached (NACA_GRSG_Ch0ES_20150323_md3.docx)
4. NOA package
 - Materials for RMR attached; GBR should modify
5. Printing update
6. CEAs Update and Reviews – Drew and Project Leads
 - Supplement regional analysis or replace
7. IMT Consistency Review –
 - Review expectations
 - Project leads please be available next week for questions, etc.
 - Provide you cell phone number to Matt or Lauren
 - Submit MS Word files for each chapters/section/appendix to SharePoint site EMPSi developing rule set to efficiently incorporate IMT review
 - Need any qualifiers from PMs to help with the review; also anything you think reviewers should focus on.
8. Schedule – Critical Paths:
 - Compile PLUPA/FEIS – 4/10
 - IMT Review PLUPA/FIES – 4/17
 - Final CEAs – 4/24 (other reviews before)
 - WO Internal Review Draft EIS – 4/25
9. Round robin on status – all
10. Other topics?

BLM / Forest Service Coordination (FS and BLM CO, WY, UT, ID, NV, and WO)

1. Incorporation of Forest Service comments
2. BA/BEs beginning tech editing process
3. Other topics?

Action Items from past calls

WO

- Send additional drop-in language when available
- Provide written guidance for Administrative Record regarding use of PPH/PGH and PHMA/GHMA in FEIS.
- WO will provide briefing schedule on the 6 revisions (Buffalo, etc.).
- Vicki will provide guidance on Vegetation objectives/standards/ etc.

Sub regional PMs and Forest Service

- PMs: Start a list of any qualifiers for the FEIS that the IMT should know about.

- PMs: Respond to ICF regarding when the revised analyses will be available for them to review.
- All references and acronyms from main document and appendices should be put in their respective chapters in the main document.
- Idaho BSU definition will be provided to the other subregions. **EMPSi**

Sage-Grouse Great Basin and Rocky Mountain Regions Project Management Team Weekly Call

April 8, 2015 9:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Randy Sharp, NV; Quincy Bahr, UT; Skye Sieber, UT; Jon Beck, ID; Erin Jones, CO; Bridget Clayton, CO; Joan Suther, OR; Jessica Rubado, OR; Matt Magaletti, WY;; Pam Murdoch, WY; Aaron Moody, SOL; Sarah Shattuck, SOL; Stephanie Carman, WO; Michael Hildner, WO; Mitch Snow, WO;

USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Sean Cottle; Drew Vankat

Handouts *(attached below)*

- Transmittal Letter (RM Region Amendments_Transmittal Letter_4_6_15)
- Notice of Availability language for the RMR (RM Region Amendments_FRN_4_6_15)
- Briefing Paper for the RMR (RM Region Amendments_BP_4_6_15)
- NVCA Executive Summary with Forest Service comments (NVCA_GRSG_Ch0ES_20150323_clean md3)

Action Items

Sub regional PMs and Forest Service

- Lauren will facilitate getting the Great Basin Regions NOA completed. All NOA examples are specific to the Rocky Mountain Region, text has been highlighted where the Great Basin Regions will need to update with their applicable information.
- All teams need to fill out a funding form (for printing) and turn into Sherry Barbee-Richey. Matt will resend these forms to all team leads.
- Matt, Lauren, Madelyn and Stephanie will further discuss the printing schedule for Sherry. They will have a call at 2:30 pm later today.
- All teams must check that NOA is posted on their website.

WO

- WO would like to see some examples of what the Executive Summaries will look like. Stephanie will provide additional direction on this.

EMPSi

- No meeting next week, Chad will remove next week's meeting from everyone's calendar invite.

Meeting Minutes

Project Management weekly call

- There will not be a call next week on April 15, 2015. The next project management call will be on April 22, 2015. Chad Ricklefs will remove next week's meeting from everyone's calendar invite.

WO Updates

- The remaining drop in language has not been finalized. Remaining resources and resource uses being finalized include grazing and habitat objectives.
- All drop-in language provided by WO will be sent to team leads and will be in tracked changes for easy inclusion into each FEIS. A general background on topics covered will also be provided.
- Please flag topics that are specific to certain plans such as the Utah Prairie Dog in Utah's plan, this will help explain why plans may deviate from other plans.
- Few policy changes are expected during WO review due to this being a higher level review.
- More direction from WO regarding maps is coming, stay posted.
- EMPSi will help facilitate the WO review, below is how each team plans on delivering each FEIS to WO for their review:
 - NVCA: EMPSi will send to Stephanie at WO via email or FilesAnywhere if needed
 - UT: EMPSi will share document with BLM on Google Drive
 - ID: EMPSi will share document with BLM on Google Drive
 - OR: EMPSi will upload to State Office Sharepoint, then BLM team lead will upload to WO Sharepoint
 - MT: EMPSi will upload to State Office Sharepoint, then BLM team lead will upload to WO Sharepoint
 - WY: EMPSi will upload to State Office Sharepoint, then BLM team lead will upload to WO Sharepoint
 - CO: EMPSi will upload to State Office Sharepoint, then BLM team lead will upload to WO Sharepoint

Executive Summary

- Additional Forest Service components need to be added to Executive Summary (attached below)
- Although not all plans will have an Executive Summary available for the WO review, the WO would like to see some examples of what the Executive Summaries will look like. Additional direction on this will be provided by Stephanie.
- NOA package
- See attached examples (below).
- All NOA examples are specific to the Rocky Mountain Region, text has been highlighted where the Great Basin Regions will need to update with their applicable information. Lauren will facilitate getting the Great Basin Regions NOA completed.
- Further discussion is needed regarding:
 1. Will there be one press release for the Great Basin Region and the Rocky Mountain Region?
 2. Who will be the signatory?

Printing update

- Matt has created a tracking list for printing
- All teams need to fill out a funding form and turn into Sherry. Matt will resend these forms to all team leads.

CEAs Update and Reviews

- Majority of the CEAs have been delivered to BLM and Forest Service for review.
- Final 2 CEAs (South Dakota and Utah) will be delivered on Tuesday and Wednesday next week.
- EMPSi is currently creating a comment tracking sheet. CEAs will be finalized by April 21, 2015 and submitted for incorporation into the FEIS.
- Review process for CEAs was implemented by designating leads for each management zone (MZ) to review, their role as lead was to ensure consistency among plans within the same MZ.

IMT Consistency Review

- Cumulative effects will include all topic areas except Sage-Grouse, Drew will work with Stephanie to ensure at least one GRSG CEA will be available for review next week.
- Drew will email specific thoughts and instructions to help with review of CEAs.
- Skye Sieber needs to be included on email regarding review next week.

Schedule – Critical Paths:

- Stephanie is drafting letter to send to all cooperating agencies counties to let them know when documents will be ready to be reviewed.
- This letter will include a note for cooperating agencies to check for any inconsistencies with their local/state plans. Regulations state that a list of any inconsistencies between the FEIS and local/state plans must be included in the ROD.
- WO will review two plans per day and comments will be sent to teams following each review. Stephanie will send a schedule to teams when comments are expected to be sent back.
- Compile PLUPA/FEIS – 4/10
- IMT Review PLUPA/FIES – 4/17
- Final CEAs – 4/24 (other reviews before)
- WO Internal Review Draft EIS – 4/25

Round robin on status – all

CO: On schedule, getting document compiled for IMT review.

MT: Ask John for update later, no MT team on call.

WY: On schedule, meetings with USFWS and State teams went well.

UT: On schedule, proposed plan was provided to USFWS. Met with state to identify more inconsistency items. Working with EMPSi to finalize documents for review.

ID: On schedule, chapter 2 template was slightly changed because state was not fully pleased. Met with USFWS and no changes were made. Working with EMPSi for delivery on Friday.

OR: On schedule, CEA comments will be sent to Drew today. New numbers will be on hold for this immediate review. State and fish helped with CEA review and it went well.

NVCA: On, schedule, document and appendices shared with USFWS and comments were provided.

BLM / Forest Service Coordination (FS and BLM CO, WY, UT, ID, NV, and WO)

Incorporation of Forest Service comments

- Madelyn is cross checking Forest Service and BLM definitions for terms used in the glossary. No significant differences have been found, but meeting between USFS and BLM will be needed at some point if adjustments are necessary.
- Madelyn will send notes on glossary terms to Glen, Matt and Lauren.
- Forest Service provided comments to BLM regarding changes to grazing and socioeconomics sections. EMPSi is assisting BLM to ensure these incorporated into the plans.
- Next week CEA for SG can be reviewed with Ron at USFS to provide comments for UT, other states will work with USFS to get this input from the State liaison, names of other State liaisons have been provided to team leads at BLM.
- Forest Service requested 52 hard copies of the plans on top of BLM's 100. All quantities of copies of the plans must be clearly listed on funding forms going to Sherry.
- ROD will be posted on websites, they are not required to be printed.

Subject: GRS GBR/RMR NEPA Leads Call - Weds 9AM PT / 10AM MT / 12PM ET

Reminder - Great Basin GRSG PM conference call Wednesday at 9AM Pacific Time / 10AM Mountain Time. Call in info and draft agenda below.

Access Number: 1-218-632-0734

Passcode: 807966#

NOTE: The second part of the meeting will focus on BLM and Forest Service coordination. Project leads without Forest Service involvement need not participate (but are welcome).

Agenda:

1. WO updates
 - WO Review – status
 - SOL Review – process and coordination
2. Maps
3. Executive Summary – templates developed; EMPSi preparing drafts
4. Printing and NOA package update
5. Postcard notification of Final EIS - is this needed?
 - EMPSi has master mailing list through close of comment period
6. Schedule – updated (see attached)
Critical Paths:
 - Final CEAs – 4/24
 - WO Internal Review Draft EIS – 4/25 to 5/9
 - Coop Agency Review – 4/29 to 5/13
 - SOL/Planning Team Task Force Resolve SOL Cmts – 5/11 to 5/15
 - Need Project Leads to be available to work with SOLs on comments.
 - **Action: PLs send WO send a "not available at this time" schedule for week of 5/11**
7. Round robin on status – all
8. Other topics?

BLM / Forest Service Coordination (FS and BLM CO, WY, UT, ID, NV, and WO)

1. Incorporation Forest Service comments
2. Other

Sage-Grouse Great Basin Region Project Management Team Weekly Call

April 29, 2015 9:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Randy Sharp, NV; Arlene Kasic, CA; Quincy Bahr, UT; Jon Beck, ID; Paul Makela, ID; Erin Jones, CO; Bridget Clayton, CO; John Carlson, MT; Sandy Leach, MT; Joan Suther, OR; Stephanie Carman, WO; Michael Hildner, WO; Vicki Herren, WO; Mitch Snow, WO; Pam Murdoch, WY

USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Derek Holmgren

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- Forest Service: Send EMPSi revisions to proposed plans. Work with BLM Project Leads to incorporate any Washington Office edits.
- Project Leads: Send requested information to Sherri for printing.

EMPSi

- Prepare Executive Summaries and get Project Lead review by May 8.

Meeting Minutes

WO Update

- Wyoming 9Plan and Bighorn have been reviewed. Comments have been relatively minor.
- The first 10 minutes of each review will be a quick call with Project Leads to introduce the planning area. There have not been a lot of follow-up calls with Project Leads.
- Solicitor's review is also ongoing.
- Beginning 5/11, WO will set up calls with each Project Lead to discuss solicitor's review. Revisions – three hour time period with SOL to talk through concerns, edits, etc. Mostly Monday and Tuesday. Amendments – two hours scheduled. Stephanie will send a draft schedule.

Maps

- In the Executive Summaries, there will be a map showing PHMA, GHMA, and other BLM lands in planning area. These maps are being produced at the NOC for each planning area.

Executive Summary

- BLM and Department leadership would like all Executive Summaries to have the same look and feel. They created a template for the amendments and revisions. EMPSi will be preparing these and they are due 5/8. They will ask for feedback and review from Project Leads.
- There will be a mention of the SFAs and they will also be shown in the maps.

Printing and NOA Package Update

- Had a call with Communications staff. Each state needs one press release and one COM plan for the state. WO is working on a template for these, hoping to have this by the end of the week.
- Amendments will be covered by the regional NOA. Each revision will have their own NOA package.
- For Montana and Idaho plans, both should mention each other in their press releases.
- Still on schedule for printing. They sent information earlier this week. Project Leads should start sending information to Sherri. She will be out of town the week before we print.
- John has questions regarding printing specifications, but has not heard back from Sherri. John will ask again and will CC Stephanie.

Postcard Notification of Final EIS

- Team feels that a postcard would be useful. Postcard will refer the public to website and from there they can request a CD.
- EMPSi will work with Mitch to get the appropriate links on the national website.

Cooperating Agency Reviews

- Project Leads should remember to let WO (Stephanie and Amy) know if you get questions from cooperators. Questions from the press go to the Department. Questions from Congressionals go to Legislative Affairs.
- Team anticipates that many issues brought up by cooperators will have been brought up during scoping and the DEIS and will have already been addressed.
- WO can write up some talking points that may be helpful. COM plan may be useful to address cooperator concerns on policy issues.

Forest Service Coordination

- Washington Office is reviewing FEIS for fatal flaws until next Thursday. Will work with BLM Project Leads to make changes.
- Madelyn will send comments on all Forest Service proposed plans by COB next Wednesday or sooner. Will be submitting in track changes.
- Forest Service staff are available to assist in Cooperator Review, but they do not have a formal agreement to respond to cooperators.
- BEs under review and will be sent to David. They will be an appendix and will be on the CD. They will not be printed in hard copy.
- Madelyn will send Lauren the appropriate url to use.

Schedule and Other

- EMPSi can be available to help make edits during the week of 5/11. Will incorporate changes from WO, State and field offices by 5/10. Need to receive final edits by 5/4. Then production from 5/15-5/20.
- BAs might be the last pieces to come in.
- Grass bank text changes – Stephanie will send this. “Reserve common allotments” – need definition.
- Dear Reader letter – use June 2015. Needs to be signed and sent to EMPSi as PDF or JPG.

Hello all,

Attached are notes from our call yesterday and updated schedule (note: Cooperating Agency dates are not final). Below is the WO review schedule:

Friday April 24 PM – Kick-off presentation and distribution of materials, including draft plans, detailed instructions about the level of review expected, and comment forms (1 hr).

Monday, April 27 – Tuesday, April 28 – individual review of the plans, SG Team available for questions

Monday April 27 – PM: WY9 RMP Amendment

Wednesday, April 29 – AM: Bighorn Basin RMP Revision; PM: Billings RMP Revision

Thursday, April 30 – AM: Buffalo RMP Revision; PM: HiLine RMP Revision

Friday, May 1 – AM: Miles City RMP Revision; PM: South Dakota RMP Revision

Monday, May 4 – AM: Lewistown Plan RMP Amendment; PM: Idaho and SW Montana RMP Amendment

Tuesday, May 5 – AM: NW Colorado RMP Amendment; PM: Utah RMP Amendment

Wednesday, May 6 – AM: Nevada and NE California RMP Amendment; PM: Oregon RMP Amendment

Thursday, May 7 – AM: North Dakota RMP Amendment

Friday, May 8-Sunday May 10 – Sage-Grouse Strike Team assembles and sends comments to State Planners. Sage-Grouse IMT are also available to assist with concurrent agency comments.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

April 22, 2015 9:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Skye Sieber, UT; Jon Beck, ID; Erin Jones, CO; Bridget Clayton, CO; John Carlson, MT; Joan Suther, OR; Jessica Rubado, OR; Sarah Shattuck, SOL; Stephanie Carman, WO; Michael Hildner, WO; Mitch Snow, WO; Pam Murdoch, WY;

USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat; Angie Adams

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- ALL: Upload files for WO review by COB Friday.

WO

- Stephanie send: drop-in language for SFAs and associated map needs; language for habitat objectives table; letter template for cooperators.

Meeting Minutes

Washington Office Update

- Communications plan came out and there was a call with State Directors yesterday. There are two sections, one that can be shared now, one shared later.
- Cooperator review will begin early next week. Letters have been drafted and Stephanie will send. State Directors will be setting up meetings over the coming weeks.
- PMs can send email to cooperators with a notification that the FEIS will be sent next week. Cooperators will have a two week review (comments due 5/13). Anticipate having a team in WO to review the cooperator comments when received.
- Will send cooperators a PDF and a comment matrix. Asking for comments within the realm of the MOU with the cooperator.
- WO and Solicitor reviews start next week. The schedule of reviews will be included with the notes. PMs should try to be available on the day your plan is being reviewed.
- Meeting to resolve comments will be week of 5/11-5/15. Project leads should send times they are not available to Stephanie and they will set up times to meet and discuss each plan.

- Implementation team moving forward. Working on Smart from the Start prioritization language; outreach to partners and industry; maps and documents for segregation.
- The Department working on additional language for grazing. Habitat objectives language will be revised to clarify how the habitat objectives are rolled up in land health standards and how these standards are applied at the allotment scale. Hope to have the language in the next couple of days. No additional changes to the FEISs are expected.
- Executive summary – Stephanie meeting with Jim Lyons today. Last week, Jim Lyons reviewed the Executive Summaries and wants them to be consistent across the range and show clearly what we are doing to protect GRSG. He sent an outline and Michael created two drafts (one for revisions, one for amendments). Jim wants economic analysis included. EMPSi may be drafting the project-specific Executive Summaries based on the template provided.
- Briefing requests have been sent, being worked on.
- SFAs in Chapter 1 – introduce the USFWS highly important landscapes. Stephanie will send new drop-in language. For plans without SFAs, they do not have to include this.
- Stephanie will send guidance on the map that is needed.
- PPH/PGH versus PHMA/GHMA – Which terms should be used and in what chapters? No consensus was reached and it appears efforts are approaching this issue differently. Plans will do what they feel is most appropriate.
- Call regarding adaptive management today.

WO Review

- Will use SharePoint site again – Michael will send details. WO would like chapters separately in PDF. Will be reviewing two plans per day. They will have a briefing before each review, making sure reviewers are aware of state-by-state differences.
- Will be sending comments back to sub-regions on a rolling basis.
- Review of revisions will be focused on GRSG portion of plan.
- Expectation that all documents will be uploaded Friday COB.

Printing

- Lauren will call Sherri. We are still on track for the dates. Some issues with the Secretary's schedule, but need to get to printer by 5/21 in order to get distributed by 6/9.
- NOA package – PMs going to Denver on 5/26 to review the proof copies and will also work on other items. Can bring word files as a back up.
- EMPSi will work on 508 compliant document while the printer is printing.
- Michael will follow up with the EPA regarding uploading documents to eNEPA. Could hand deliver CDs.
- NOAs – Stephanie determining what is needed for the packages.

CEA Update

- Working on the final edits for all CEAs. Trying to incorporate all feedback and striving for as much consistency as possible. Will be sending to project leads over the next 24 hours.
- Did receive comments from Solicitors during IMT review – some may need to be addressed during the SOL review. The CEAs will be tech edited during WO review.

Biological Assessment

- Can include the BA or a summary of effects calls and rationale in an appendix. Montana will not be doing this – the BA will be included with the ROD.

Forest Service Coordination

- 9Plan is scheduled for 4/27 in the afternoon. Madelyn will get Pam the Forest Service revisions today.
- Glossary – was addressed last week during IMT review. They incorporated the changes based on Madelyn's crosswalk into the version on the crosswalk site. They are not in track changes.
- Will need to work with Kim Tripp to discuss how to transmit the BAs to USFWS.
- Forest Service WO has been reviewing their plans and they have comments. There is not time for review and incorporation before Friday. Madelyn will work with EMPSi to get the current plans in the documents. Includes everything updated since they were sent in February. David and Madelyn will discuss when the WO changes can be incorporated.

	Step	Due Date	Days to complete	Notes	Included Steps
1	Direction to State Directors	1/23/2015			
2	ADPP Data to NOC	2/13/2015	21		The Pink and Blue steps are concurrent and develop in the Purple/Final EIS
3	Data to FWS	2/20/2015	7	The next steps are concurrent

Kathy,

Can you set up an AD Briefing with Amy Lueders, Brian Amme, Jeff Foss, Stephanie Carman, Lauren Mermejo and Jon Beck – for the week of June 29th (preferably June 30 or July 1st)? Attached is a handout/briefing paper that could be shared to facilitate the call.

Thanks!

Brent Ralston

Governor Consistency Review Potential Issues
June 19, 2015

Potential Idaho Governor's Consistency Review Issues

These issues are based on the May 13, 2015 State of Idaho Comment Letter on the Administrative Final EIS review. All of the potential issues are set in the frame that Secretary Salazar encouraged the States to develop their own plan. Idaho did develop its own plan in 2012; however, that plan only applies to BLM and Forest Service lands. The State has subsequently developed an additional plan for State Lands that is consistent with that 2012 plan. The 2012 was included in the Idaho and Southwestern Montana (IDswMT) Draft EIS as a co-preferred alternative. The Proposed IDswMT Plan is a combination of the two co-preferred alternatives. The State has indicated that they will evaluate the consistency of the Proposed Plan in comparison to their 2012 plan, so any changes between that 2012 plan and the proposed plan are potential issues for consistency review. The State has also indicated that there are many pieces of the proposed plan that have been worked on in coordination with the State that they are not likely to object to during the consistency review; however, the primary issues of concern that we expect will be raised during consistency review include:

1. The additional Sagebrush Focal Areas (SFAs)
 - a. Inclusion of non-greater sage-grouse habitat within SFAs
2. The withdrawal of SFAs from locatable mineral entry
3. The application of no surface occupancy restrictions without exception
4. Grass height requirement

State of Idaho Comment: *The SFA designation adds a 4th habitat tier which is inconsistent with direction that the Secretary of the Interior gave the eleven western states to develop a state-specific regulatory mechanism to conserve the species and preclude the need to list under the ESA.6 This direction was received by Governor Otter, and taken seriously, as shown by its memorialization in Executive Order 2012-02. The Secretary's assurance that Idaho would be allowed to develop its own regulatory mechanism was a portion of Idaho's motivation for creating the State Plan.*

BLM Response:

- SFA designation does not add a 4th habitat tier; rather it adds management actions to a subset of priority habitat to address threats, and protect the best remaining GRSG Habitat.
- Idaho BLM worked collaboratively with the State of Idaho and developed a co-preferred alternative for the Proposed Plan that included parts of the Idaho State and BLM Idaho alternatives.
- SFA designation is consistent with direction given to the States. Working with the BLM, Idaho developed its own regulatory mechanism in the form of a State Plan.

However, BLM identified the need to add additional protections to the best remaining habitat. These additional protections only apply to BLM and FS lands.

State of Idaho Comment: *Donkey Hills, Mt. Borah and other FS mountain tops are not habitat, yet they are managed as SFA.*

BLM Response

- These areas are included with SFA because they provide connectivity with surrounding SFA and BLM/FS habitat.

State of Idaho Comment: *The recommended withdrawal of SFAs to locatable minerals is inconsistent with Idaho Code because it disallows Idaho citizens the opportunity to locate mining claims in SFAs.*

BLM Response:

- The recommended withdrawal would only apply to BLM and FS land in SFAs.
- The withdrawal recommendation does not preclude mining claims on private and state lands, or BLM and FS land outside of SFAs.

State of Idaho Comment: *An NSO with no exception is inconsistent with state statutes because it does not allow for the development, production and utilization of oil and gas in SFAs.*

BLM Response:

- Oil and Gas development is allowed on BLM and FS land with a NSO stipulation.
- Although the NSO stipulation makes development more difficult, the area in Idaho currently under consideration for oil and gas development is not PHMA or GHMA and not in an SFA.

State of Idaho Comment: *A 7 inch grass height requirement in the habitat objectives table will result in increased fire potential in GRSG habitat.*

BLM Response

- The grass height objective applies only to native bunchgrasses, not fire-prone invasive annual species.
- Intact native bunchgrasses communities are resistant to invasion of fire-prone grass species (cheat grass), reducing fire potential in GRSG habitat.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

June 3, 2015 9:30 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Johanna Munson, ID; Erin Jones, CO; Joan Suther, OR; John Carlson, MT; Ruth Miller, MT; Sandy Leach, MT; Frank Quamen, NOC; Aaron Moody, SOL; Sarah Shattuck, SOL; Stephanie Carman, WO; Michael Hildner, WO; Mitch Snow, WO; Matt Magaletti, WO; Pam Murdoch, WY

USFS: Glen Stein; Madelyn Dillon

EMPSi: Meredith Zaccherio; Holly Prohaska; Kate Krebs; Derek Holmgren; Peter Gower

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- ALL PLs: Review landscape reports by COB Thursday.
- ALL PLs: Email Stephanie by 5 pm EST Wednesday if your plan has grazing closures or AUM reductions.

Meeting Minutes

WO Updates, Next Steps and Schedule

- Landscape report is under preparation by Frank and a team of staff. Will be completed by COB today and sent to Jim and project leads tonight. Project leads should review the summary of decisions and maps for accuracy. Comments due by COB Thursday.
- Protest period is open. Michael is leading the protest resolution task, which will be completed by the WO by July 27. Not much state office involvement expected.
- Stephanie will send a schedule of upcoming tasks when it is completed. Most tasks are at the WO level, but will be informative to the states.
- WO also working on RODs. Matt Magaletti is leading this task. SOL, Department and others are determining how many RODs will be prepared. Hope to have resolution by the end of this week. GRSg portion of RODs will be drafted by a team comprised of Matt, Karen Kelleher, Stephanie, Johanna and Lauren.
- BLM and FS will write their own RODs, but will use the same template. Draft RODs anticipated mid-July. Likely RODs will be signed by late summer.
- BAs are moving along.

Communications and Congressional Inquiries

- WO has received several congressional inquiries. Common request is for the habitat shapefiles. Encourage all states to post data on their websites. Most states have a data link on ePlanning.
- Another congressional inquiry related to impacts on grazing in the plans. Project leads should email Stephanie by 5 pm EST if your plan has grazing closures or AUM reductions.
- Department holding a meeting with industry, scientists, press, interested parties.
- Keep Stephanie informed of public outreach, meetings, etc., especially if the meeting does not go well.

Implementation Strategy Status

- WGA GRSG task force meeting this week will include a discussion about implementation. Meeting with ELT the week after next, which will include a whole day for GRSG. Expect to see some implementation products soon (e.g., business proposals).

Development of the Approved RMP

- Project leads should plan to develop their own approved RMP based on a template. Can work with contractors to complete this.
- Quincy reviewed the BPA and feels that this work would be covered under Task 10. Description of the task ties to the ROD.

BLM/FS Coordination

- Madelyn will send crosswalk tables to project leads by COB Friday. EMPSi can help make 508 compliant for posting to the websites.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

June 17, 2015 9:30 a.m. PST

Attendance

BLM: Quincy Bahr, UT; Erin Jones, CO; Bridget Clayton, CO; Joan Suther, OR; Ruth Miller, MT; Frank Quamen, NOC; Sarah Shattuck, SOL; Stephanie Carman, WO; Steve Small, WO; Vicki Herren, WO; Mitch Snow, WO; Matt Magaletti, WO; Paul Makela, ID; Ethan Ellsworth, ID; Jon Beck, ID; Johanna Munson, WY; Jennifer Fleuret, OR

USFS: Madelyn Dillon

EMPSi: David Batts; Meredith Zaccherio; Holly Prohaska; Chad Ricklefs; Derek Holmgren

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- ALL: Review Approved RMP template and provide comments to Matt by COB 6/22.
- ALL: Project leads should review maps and determine where there may be issues in separating Forest Service from BLM lands.

Meeting Minutes

WO Updates

- WGA meeting last week –Probably no allocation or major changes. They may be tweaking language to address some issues. Working with grazing program on developing language to address the concern about voluntary relinquishment applying to transfers.
- Working with Sarah regarding language on remapping habitat. Want to ensure that all plans have specific language stating if remapping necessary, it may require a plan amendment. Most plans already have this.
- Should find out this week about the strategy for how the RODs will be prepared.
- Approved plans will only include BLM plans and data.
- Worked on decision record last week. Looking to get a contract for the WO decision record portion by August. Each plan will have its own decision record.
- Have had numerous requests for map data. Each plan is the source for their map data and should post it on your website. Idaho and Nevada already have posted their data. Stephanie will send guidance on the metadata.
- NOC is working to determine the best way to share the national data.

- Governor's consistency – Plan is to work with states to get consistency and start the conservations early. State Directors should work to determine what are the state's big issues and provide Amy with updates.
- ELT meeting this week included a general status update and next steps. Stephanie will send the schedule that was distributed. It shows the ROD to be signed by late summer.
- Also discussed implementation at the ELT meeting. Focus on GRSG plans, FIAT, and Secretarial Order. Group agreed that BLM/Forest Service will focus on funding, actions, resources in PHMA and SFA. No decisions made regarding how implementation teams would be structured and administered across the BLM and Forest Service. People liked the concept of having regional strike teams focused on preparing NEPA quickly.
- Landscape report – Jim has been working with Sarah and Karen to get edits together. Don't have a draft yet to share. Should be done by Friday.

Approved RMP and ROD

- Matt will email a draft template for Approved RMP amendments. Project leads should review the questions in the document and provide track changes to Matt by COB Monday, 6/22.
- Forest Service not included in the approved RMP amendments. Glen is working with the BLM on ROD development.
- In the Approved RMP, there will be no Forest Service acres presented and no Forest Service lands will be shown on maps. This will be a considerable workload for most sub-regions.
- Suggest having a separate meeting on this with PMs and GIS staff. Project leads – look at maps and see where there may be problems for separating out the Forest Service.
- Numerous detailers will be coming to WO to work on protests. Only one letter received so far from Oregon Wild. Expecting more to come in towards the end of the protest period.
- WO does not expect much sub-regional involvement in protest resolution. Teams will be working based on the content of the document. Questions will be vetted through Michael and Matt. There will be 14 separate protest resolution reports. PLs would like to review these reports if possible.

Sub-Regional Status

- Oregon: Excellent briefing with Governor's staff. Another presentation for SageCon group which includes industry and NGOs. Should have all data and metadata posted by next week. Protest/consistency – have been having discussions. Key issues include grazing relinquishment (terminology); OHV designations.
- ID/MT: Has been quiet. Invitation to talk to Office of Energy Resources – interested in mapping and concerned about NSO in PHMA/IHMA. State of Idaho concerned about locatable minerals. One visit with a county commissioner. Governor sent a letter to two Senators to accept the Bishop Bill which would defer sage-grouse listing.
- Utah: Initially, a lot of individuals reaching out with questions. It has been much quieter recently. Within the next week, have two tribal consultation meetings scheduled. One county has requested a briefing. The state has a group similar to SageCon with industry, local, state

government to implement state plan – they asked for briefing on FEIS. No formal meetings with the state office, but have had a few phone calls. Trying to meet with various groups as requests come in. Trying to get local staff up to speed so they can handle requests from Local Working Groups. Have had a consultation meeting with USFWS regarding questions on BA.

- NWCO: Pretty quiet. Gave presentation to RAC and answered questions. Received a visit from Governor’s representative – they are working on protest letter. Concerns about TransWest and Energy Gateway South exemption and NSO exception language. Have been answering a lot of questions about what is in the plan and what it means. Working on AR.
- WY: Pam has been working with WO on some mapping issues and stipulation appendix language. WY BLM talks with the state frequently. One of primary issues is grazing. Forest Service should contact Pam on how to integrate with state comments for WY nine plan amendment.
- MT: Meeting with Tim Baker at Governor’s Office this Friday.
- South Dakota: Had a conference call with cooperators. Questions regarding protest period and Governor’s consistency review.
- North Dakota: State game and fish provided consistency table comparison which showed BLM plan is consistent with their plan. Probably won’t need a meeting with North Dakota.

Publically-Available Data

- Anthony is leading up effort from NOC – they are posting proposed plan PHMA, GHMA, IHMA and SFAs on national public website. Beyond that, hoping to put links to rest of data on the individual sub-region sites. Have PHMA/GHMA available on Geospatial Gateway, making SFAs available likely today. eGIS will be the ultimate holder of the plan datasets. Stephanie has been working with staff at NOC to compile and send out standard mandatory metadata elements so there’s consistency across sub-regions.
- Working with Communications to get data posted to the BLM public website.
- Frank will keep Madelyn in the loop so she will know what links to give to people who are requesting. Forest Service points to BLM websites and will not be hosting their own data.

Subject: Re: Sage Grouse EIS land tenure questions?
To: "Hamann, Lori" <Lori.Hamann@simplot.com>
Cc: "Cundick Jeff (jcundick@blm.gov)" <jcundick@blm.gov>

Lori,

I just received the enhanced map of the land tenure adjustments in the sage grouse EIS. Map 2-10 in appendix A shows the land tenure adjustments. If you look at the attached map, which is based on the GIS layer for map 2-10, you will see that a large part of T09SR44E sec. 6 is designated for retention by the sage grouse EIS. On page 2-17 (chapter 2) of the proposed BLM plan amendment in Table 2, it specifies that "Lands classified as PHMA, IHMA, and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the GRSG. (LR-14)". This section is GHMA habitat. LR-14 on page 2-50 states

"Lands classified as PHMA, IHMA, and GHMA for GRSG will be retained in federal management unless: (1) the agency can demonstrate that disposal of the lands will provide a net conservation gain to the GRSG or (2) the agency can demonstrate that the disposal of the lands will have no direct or indirect adverse impact on conservation of the GRSG. Land tenure adjustments would be subject to the following disposal, exchange, and

acquisition criteria, which include retaining lands with GRS habitat. Retention of areas with GRS would reduce the likelihood of habitat conversion to agriculture, urbanization, or other uses that would remove sagebrush habitat and potentially impact sensitive plants. Criteria: a. Lands within PHMA, IHMA and GHMA would only be available for disposal through exchange (Appendix K). b. Acquire habitat within PHMA and IHMA, when possible (i.e. willing landowner), and retain ownership of habitat within all Areas, except if a land exchange would allow for additional or more contiguous federal ownership patterns. c. Lands within PHMA, IHMA and GHMA would be retained unless exchange of those lands would increase the extent or provide for connectivity of PHMA or IHMA. d. Evaluate potential land exchanges containing historically low-quality GRS habitat that may be too costly to restore in exchange for lands of higher quality habitat, lands that connect seasonal GRS habitats or lands providing for threatened and endangered species. These potential exchanges should lead to an increase in the extent or continuity of or provide for improved connectivity of PHMA. Higher priority will be given to exchanges for those in-tact areas of sagebrush that will contribute to the expansion of sagebrush areas within PHMA currently in public ownership. Lower priority would be given to other lands that would promote enhancement in the PHMA and IHMA (i.e., areas with fragmented or less intact sagebrush). e. Identify lands for acquisition that increase the extent of or provide for connectivity of PHMA."

Section a. of LR-14 states that only land exchanges will be considered for land disposal. I do not believe the list of parcels in appendix K is complete as it only lists lands for three field offices. I believe that these field offices specifically list out these parcels in the land tenure sections of their RMPs while Pocatello divided the lands into zone and therefore individual parcels were not listed. Based on the GIS data for the project it looks like part of the Dairy Syncline land sale falls within the retention area specified in the sage grouse EIS. We are going to talk to Brent Ralston tomorrow and see about the best method to rectify this in the ROD.

Let me know if you have any questions.

David

On Wed, Jun 3, 2015 at 3:56 PM, Hamann, Lori <Lori.Hamann@simplot.com> wrote:

David,

As I mentioned on our EIS call today, I would really appreciate citations to the information you were discussing about land tenure designations in the sage grouse FEIS. Although today would have been better, I can live with getting the information tomorrow.

I found one sentence in Chapter 4 that makes me wonder where it came from relative to this topic, but otherwise I don't know what referencing is causing your concern.

Thank you,

Lori Hamann

Wild Horse and Burros

Action WHB 1: For WHB management activities (e.g., gathers), apply applicable conditions outlined in Actions SSS 2, 4 and 5 when reviewing and analyzing projects/activities proposed within GRSG habitat.

Action WHB 2: Manage herd management areas (HMAs) in GRSG habitat within established AML ranges to achieve and maintain GRSG habitat objectives (Table 2-2).

Action WHB 3: Complete rangeland health assessments for HMAs containing GRSG habitat using an interdisciplinary team of specialists (e.g. range, wildlife, and riparian). The priorities for conducting assessments are:

1. HMAs containing SFA
2. HMAs containing PHMA, which include riparian areas
3. HMAs containing only GHMA
4. HMAs containing sagebrush habitat outside of PHMA and GHMA mapped habitat
5. HMAs without GRSG habitat

Action WHB 4: Prioritize gathers and population growth suppression techniques in HMAs in GRSG habitat, unless removals are necessary in other areas to address higher priority environmental issues, including herd health impacts. Place higher priority on Herd Areas occupied by wild horses and burros in SFAs, as these areas are to be managed for zero wild horses and burros.

Action WHB 5: In SFAs and PHMA outside of SFAs, assess and adjust AMLs through the NEPA process within HMAs when wild horses or burros are identified as a significant causal factor in not meeting land health standards, even if current AML is not being exceeded.

Action WHB 6: In SFAs and PHMAs outside of SFAs, monitor the effects of WHB use in relation to GRSG seasonal habitat objectives on an annual basis to help determine future management actions.

Action WHB 7: Develop or amend herd management area plans (HMAPs) to incorporate GRSG habitat objectives and management considerations for all HMAs within GRSG habitat, with emphasis placed on SFAs and other PHMAs.

Action WHB 8: Consider removals or exclusion of WHB during or immediately following emergency situations (such as fire, floods, and drought) to facilitate meeting GRSG habitat objectives where HMAs overlap with GRSG habitat.

Action WHB 9: When conducting NEPA analysis for wild horse/burro management activities, water developments, or other rangeland improvements for wild horses, address the direct and indirect effects to GRSG populations and habitat. Implement any water developments or rangeland improvements using the criteria identified for domestic livestock.

Action WHB 10: Due to impacts from horses on private land water sources – but can be used by others: Provide new water locations to ensure dispersal or avoidance of sites heavily impacted by wild horses (Feist 1971; Pellegrini 1971; Ganskopp and Vavra 1986; Naiman et al. 1992) in compliance with State Water Laws and subject to valid existing rights.

Action WHB 11: Coordinate with professionals from other federal and state agencies, researchers at universities, and others to utilize and evaluate new management tools (e.g., population growth suppression, inventory techniques, and telemetry) for implementing the WHB program.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

February 3, 2015 10:00 a.m. PST

Attendance

BLM: Frank Quamen, NOC; Lauren Mermejo, NV; Randy Sharp, NV; Quincy Bahr, UT; Skye Sieber, UT; Jon Beck, ID; Joan Suther, OR; Jessica Rubado, OR; Sarah Shattuck, SOL; Michael Hildner, WO; Vicki Herren, WO; Matt Magaletti, WY;

USFS: Glen Stein; Madelyn Dillon

EMPSi: Chad Ricklefs; Meredith Zaccherio; Derek Holmgren; Peter Gower; Drew Vankat

Handouts

- Wild Horse and Burro language updates (emailed on 2/3/15)
- VDDT language (emailed on 2/3/15)
- Schedule (emailed on 2/2/15; Excel version dated 1/30/15)

Action Items

WO, Sub regional PMs, and Forest Service

- **Action Item:** Matt will share with Lauren the WO's checklist of all items that Frank addressed in the data call. This will help project leads know exactly what needs to be submitted.
- **Action Item:** Matt to coordinate with USFS on their attendance and involvement regarding upcoming NOC meeting in Denver.
- **Action Item:** Lauren will send the project leads instructions for coordinating printing with the NOC.
- **Action Item:** All project leads send their VDDT language to Randy who will combine it and share with the group prior to next week's call.

Meeting Minutes

National, State Director, and SOL updates

- Drop-in language from the Federal Family Meeting is being reviewed by SOL. Hope to release it to project leads next week.
- Also working on Chapter 2 language describing the development of the proposed plan. Will not be part of the drop-in language packet because need to work with public affairs team first. This language should be consistent across all EISs once it's approved and provided to the project leads.
- How to show changes between Draft and Final in the EISs? There will be no grey shading or showing of track changes in the final plans. Instead, Chapters 1 through 4 will each have a section that describes the changes between draft and final in that chapter. We will also have an overview of major, broader changes for the entire EIS in Chapter 1.
- The final list of allocation maps that should be sent to Lauren includes the following:

- New habitat delineations
- Land tenure
- ROW (transmission and major pipelines)
- Utility corridors
- Wind energy
- Solar energy
- Fluid mineral leasing
- Geothermal energy (can combine map with fluid mineral if allocations are the same)
- Locatable minerals
- Salable mineral materials
- Nonenergy leasable minerals
- Trails and travel management
- Livestock grazing
- Maps are only needed for the Proposed Plan; don't need maps for all alternatives
- Submit maps via email to Lauren
- **Action Item:** Matt will share with Lauren the WO's checklist of all items that Frank addressed in the data call. This will help project leads know exactly what needs to be submitted.
- **Action Item:** Matt to coordinate with USFS on their attendance and involvement regarding upcoming NOC meeting in Denver.

Schedule Update

- Chapter 2 must be finalized by February 20 so that direct and indirect impacts can be started on time.
- WO is working on identifying the best time and method for engaging cooperating agencies and specifically the counties (in regards to determining consistency with existing plans).
- Note that consultation with USFWS will be completed before signing RODs; schedule will be updated once a date is known.

Printing

- Group reviewed printing cost estimates. Goal is for consistency in document format and printing instructions so that the printer can meet the aggressive schedule. All project leads will work through Sherri Hendran, printing specialist at the NOC. She will obligate that money through the NOC.
 - **Action Item:** Lauren will send the project leads instructions for coordinating printing with the NOC.
- Not all appendices will be printed (instructions forthcoming), but the printed copies will have CDs containing the entire plan and EIS, including all appendices.
- Group determined that all subregions have remaining printing funds, so no need to ask WO for additional funds.

- Will print 100 copies of each plan. If states have additional funding, they may print additional copies as needed.
- Each subregion will go through the submittal process with EPA individually.
- Will have more information on printing as the dates get nearer, including for eplanning (will likely post PDFs to eplanning).
- Question: Can USFS piggyback on the print order? Would likely need 30 copies total (i.e., approximately 6 copies of each of the 5 EISs USFS is involved in). Answer: This should be OK; will have a definitive answer in the next few weeks.

Wild Horse and Burro Actions

- Group discussed Nevada's revised wild horse and burro text that prioritizes assessments in SFAs, etc. Could be used as a model for other subregions.

VDDT Language

- Is there a desire for standard language introducing VDDT in each plan? Ideally, yes. Will discuss and come to agreement on next week's call.
- **Action Item:** All project leads send their VDDT language to Randy who will combine it and share with the group prior to next week's call.

Update from the NOC

- Datasets due at noon February 11 and don't forget that they need to be approved by DSD before submitting them.
- GIS Data Slivers
 - Slivers often occur as a result of overlaying data layers from different sources. NOC's direction is to ignore slivers; don't need to clean them up.

VDDT Reference Language
2/9/15

Idaho-Forest Service (as well as remaining National Forests)

GRSG-GRSGH-O-001-Objective – Every 10 years for the next 50 years, improve greater sage-grouse habitat by removing invading conifers and other undesirable species in the number of acres shown in table 2.

Idaho-BLM

VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:

- a. Increasing or enhancing canopy cover and average patch size of sagebrush.
- b. Increasing the amount, condition and connectivity of seasonal habitats.
- c. Protecting or improving GRSG migration/movement corridors.
- d. Reducing conifer encroachment within GRSG seasonal habitats.
- e. Improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
- f. Reducing the extent of annual grasslands within and adjacent to Priority and Important Habitat Management Areas.

Decadal treatment objectives *by population area* are identified in Table 2.

Idaho-Utah

Within PPMA, increase the amount and functionality of seasonal habitats by:

- Maintaining or increasing sagebrush in perennial grasslands, where needed to meet the canopy cover, height, etc. guidelines as noted above, unless there's conflict with other special status species (e.g., Utah prairie dog, black footed ferrets).
- Reducing conifer (e.g., pinyon/juniper) from areas that are most likely to support GRSG at a rate that is at least equal to the rate of encroachment.
- Reducing the extent of annual grasslands.
- Maintaining or improving corridors for migration or movement between seasonal habitats, as well as for long-term genetic connections between populations.
- Maintaining or improving understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats.
- Conducting vegetation treatments based on the following 10-year (decadal) acreage objectives:

Population Areas	Conifer Treatment ¹	Annual Grass Treatment ¹
Box Elder	18,480	53,760
Ibapah; Hamlin	8,070	4,260

Rich; Uinta	143,300	16,440
Carbon	24,770	4,650
Emery	4,600	0
Bald Hills; Panguitch; Parker Mtn	115,230	44,320
Strawberry	8,000	0
Sheeprocks	75,720	29,490
Statewide	398,170	152,920

Note: 1- These acreage figures represent an objective for treatment over a ten-year (decadal) timeframe to support achievement or progress toward GRSG habitat objectives. This accounts for variations in yearly funding availability and does not reflect a maximum or minimum acreage for any one treatment type or total treatment acreage, should funding and site specific conditions allow for more or less treatment acreage than described in order to meet habitat objectives.

Subject: Great Basin GRSG - NEPA PM Call Tuesday

Reminder - Great Basin GRSG PM conference call tomorrow at 10AM Pacific Time / 11AM Mountain Time. Call in info and draft agenda below.

877-928-4213
participants: 9009662#

Agenda
I. WO review updates

- Any additional questions for WO on guidance
 - GRSG Decision tracking sheet – guidance from Federal Family Mtg
2. VDDT intro language – Randy
 3. CEA update – Buffalo updated per Oregon comments; sent to SOL
 4. Chapter 1 consistency
 5. Schedule – immediate critical paths:
 - Comment response team – need to review responses to new direction (DATE?)
 - Submit data to NOC (due 2/11)
 - Update Chapter 2 (due 2/20)
 6. Review of subregional maps
 7. Other topics?
 8. Action Items from past calls

WO, Sub regional PMs, and Forest Service

- **Action Item:** Matt will share with Lauren the WO’s checklist of all items that Frank addressed in the data call. This will help project leads know exactly what needs to be submitted.
- **Action Item:** Matt to coordinate with USFS on their attendance and involvement regarding upcoming NOC meeting in Denver.
- **Action Item:** Lauren will send the project leads instructions for coordinating printing with the NOC.
- **Action Item:** All project leads send their VDDT language to Randy who will combine it and share with the group prior to next week’s call.

Cumulative Effects Analysis (CEA) Tier II Analysis Proposed Approach

EMPSi will prepare the cumulative effects analysis for each Final EIS in the Rocky Mountains and Great Basin regions. The purpose of this task is to provide a quantitative analysis of effects to Greater Sage-Grouse at the WAFWA Management Zone level. Key features of the analysis include the following:

1. Analysis of effects on Greater Sage-Grouse from threats identified in the US Fish and Wildlife Service's 2010 listing decision and Conservation Objectives Team (COT) Report (2013). Any threat which the final COT Report lists as "Present and Widespread" within at least one population in the focal MZ will be analyzed. For example, the analysis for WAFWA Management Zone I will address Energy Development, Infrastructure, Grazing, Spread of Weeds, Conversion to Agriculture, Recreation, and Fire.
2. A quantitative analysis at the WAFWA Management Zone level based on data provided by the NOC. At the GRSB Planning Strategy Team Meeting in July 2011 it was agreed that this geographic scope is biologically appropriate for the CEA. Additionally, this scale will allow the data to be compiled in a consistent format for the Landscape Report (Tier III).
3. The CEA will use common baseline data that is consistent across planning areas (e.g. from Baseline Environmental Report).
4. Inclusion of past, present, and reasonably foreseeable future non-federal actions occurring in the Management Zone(s).
5. Inclusion of the state plans for each WAFWA Management Zone (using the most recent available information at the time).
6. Quantification of effects occurring at the subregional (i.e., planning area) level, but only to set the context for the subregion's relative influence on effects occurring at the broader Management Zone scale.
7. Delineation of data and the accompanying analysis will be by habitat type (e.g., priority and general habitat). CEA will not provide analysis for Priority Areas of Conservation (PACs) or populations. The "roll-up" process will address these scales for each Management Zone.
8. Analysis of the cumulative effects for each alternative, including the No Action alternative and Proposed Plan, in the Final EIS.
9. Analysis will use the most recent information available. The focal EIS will use data from the proposed plans of the other EISs in the Management Zone.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

February 10, 2015 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Randy Sharp, NV; Quincy Bahr, UT; Jon Beck, ID; Jessica Rubado, OR; Sarah Shattuck, SOL; Michael Hildner, WO; Matt Magaletti, WY

USFS: Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat; Carol-Anne Garrison

Handouts

- VDDT language from plans

Action Items

Sub regional PMs and Forest Service

- National comment response team to reconvene and review national responses in light of the new guidance.

EMPSi

- Review comment response reports to determine which responses may change based on new guidance.

Meeting Minutes

Update from the WO

- New direction provided yesterday. Any questions ask Michael.
- Tribal consultation write-up also provided yesterday which summarizes tribal consultation to date and identifies future steps for tribal consultation.

Mapping

- ID/MT is done and reviewed and will get Deputy State Directory approval today.
- UT is making progress, hoping to finish today and have been reviewing as they go along.
- Oregon sent their maps yesterday but they have some revisions to do.
- Lauren would like PMs and GIS staff to be available over the next couple of days in case they need to make changes.
- Lauren would like a separate map of habitat with PHMA, GHMA, and SFAs, but do not include these habitats on the allocation maps.

VDDT Language

- Randy sent this out earlier today. ID/MT and UT are very similar and both have VDDT broken down by population areas. Population area information was provided by the VDDT outputs.
- Joe was concerned about presenting population area data given that this is a model that may not be accurate at that scale. He wanted to present the data on a statewide basis. Forest Service will be presenting the VDDT by Forest.
- Decision was made to move forward however sub-regions would like to incorporate the data. Some differences between sub-regions is acceptable.

CEA Update

- EMPSi updated the Buffalo CEA working template based on feedback from Oregon. The Solicitor is reviewing now. If project leads have any comments, they can send them to EMPSi by the end of the month.
- The CEA approach and review protocol will be re-sent with the call notes.
- Matt set up a call with David next week, so there might be some additional direction related to the CEAs.

Schedule

- Comment response reports will need to be finalized. Need the national comment response team to review the national responses to see if they need to change based on the new guidance. Deadline is to have it done by 3/27 when direct/indirect is complete.
- If national team makes significant changes, would need to get another SOL review.
- EMPSi will review comment reports to determine which responses may need to be revisited based on new guidance.
- Unsure if Solicitors (BLM and FS) will be able to review complete set of comment responses before WO review, but we will try to make this happen.

Chapter 2

- Due date is 2/20, though some sub-regions may not have all datasets compiled, some may be incomplete. This is a hard date that was used to set up direct/indirect impacts timeframe. If you cannot make 2/20 date, ensure clear/effective communication of information. Do not piecemeal the transfer of Chapter 2. Instead, look into breaking it into bigger segments, such as all the text and then all the data.
- Expectation is that the ADPP will be done by 2/20, not necessarily all of Chapter 2. Need to make sure everything necessary for analysis is ready by that date.

Chapter 1

- Lauren is working to develop a Chapter 1 template that the other sub-regions can use. The Chapter 1 template for the DEIS focused on the DEIS but now needs to be tailored to the FEIS. Also need consistent discussion of the COT, BER, and other guiding documents.

Conservation in Brief

- Summary that addresses each threat and how alleviated in proposed plan. This will go in RODs.

Printing

- Sub-regions should coordinate with Sherry regarding their printing needs.
- Lauren will forward the list from Sherry of what she needs from each sub-region.

Executive Summary

- Michael is working on the template.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

February 17, 2015 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Skye Sieber, UT; Jon Beck, ID; Joan Suther, OR; Frank Quamen, NOC; Stephanie Carman, WO; Michael Hildner, WO; Matt Magaletti, WY

USFS: Glen Stein; Madelyn Dillon

EMPSi: Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower

ICF: Alex Uriarte

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- Alex send Lauren list of socioeconomic analysis questions by Friday.
- Lauren: follow up regarding consistent FIAT appendix.
- Lauren and Carol-Anne: Coordinate to reconvene the national comment response team.
- Madelyn: coordinate with Rob Mickelsen regarding consistent VDDT appendix.

Meeting Minutes

Questions on National Guidance

- Drop-in language should be used verbatim. Subregions should consolidate similar or related management together.

Coordination and Incorporation of Socioeconomic Analysis

- Similar to the process for the DEIS, ICF will be asking various resource specialists for their input regarding the socioeconomic analysis. Alex will be developing a list of questions that he will send to Lauren by the end of this week. Since the schedule is tight, will need to make sure ICF can work closely with specialists and that the document is consistent throughout.
- There are 37 resource areas among the 5 EISs.
- The socioeconomic impacts will be prepared concurrent with the other direct/indirect impacts. Their work should not be too complicated since the model is already set up, just depends how different the proposed plan is from the preferred alternative. What took time for the DEIS was understanding the nuances between alternatives.
- Subregional project leads should be Alex's first point of contact on the sub-regional level.
- Will determine timeframes next week.

Critical Path: Data to the NOC

- NOC has all data for NV/CA and OR.
- Have most of ID/MT – waiting on two data layers needing Forest Service input. Forest Service will be resolving issues today.
- UT – Lauren and Forest Service are reviewing right now.
- Hope to have all GBR submitted by COB today. Lauren would like to be involved with any QA/QC issues. Frank has a google tracking sheet so all call see the current status.

Critical Path: Comment Response Team

- Lauren and others will talk offline to determine when the national comment team will reconvene.

Critical Path: Chapter 2

- Subregions would like consistent appendices for the FIAT and VDDT. Lauren will follow up regarding the FIAT appendix.
- VDDT appendix: Will not likely need a unique VDDT appendix for each sub-region as the methodology was standardized for the FEIS. Madelyn will follow up with Rob.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

February 24, 2015 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Randy Sharp, NV; Quincy Bahr, UT; Skye Sieber, UT; Jon Beck, ID; Paul Makela, ID; Joan Suther, OR; Jessica Rubado, OR; Stephanie Carman, WO; Matt Magaletti, WY; Vicki Herren, NOC; Frank Quamen, NOC; Sarah Shattuck, SOL

USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat; Carol-Anne Garrison

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- Vicki: Create an appendix for the disturbance caps guidance.
- ALL: Submit ADPP and other requested materials by Friday.
- Lauren: Send socioeconomic questions to the team.

EMPSi

- Drew: Work on CEA timeline and coordinate with project leads.
- Carol-Annie: Coordinate with EMPSi PMs to update the comment responses.

Meeting Minutes

WO Update

- Thanks to all for helping to get data to USFWS.
- There will be a call with state directors later today regarding Chapter 2. Everyone should focus now on meeting with state partners, local USFWS, and Governor's office about ADPP. Subregions should not yet discuss the ADPP with counties or tribes.
- WO is working on some guidance for outreach to be conducted, likely starting the second week of March. This would include outreach to counties and tribes. All outreach would occur concurrently. This will also be a key time to be briefing internally, reaching out to WO programs to discuss some of the key issues.
- Schedule has not changed. Subregions voiced concerns about getting GIS calculations and impact analysis completed on time.
- WO is asking for early review copies of ADPPs, RDFs, Adaptive Management, Monitoring, Mitigation – they will send a list of what they want to see. Subregions do not need their GIS completed for this submittal. They would like to see these ASAP, hopefully by this Friday. They

are doing coordination with ICF regarding socioeconomic analysis and Forest Service regarding the Biological Assessment.

- WO is also working on scheduling their FEIS reviews over a two week window. They anticipate spending ½ day to review each plan and compiling WO comments during that time. They will let everyone know of the proposed schedule so key staff can be available for questions. With only 2 days to respond, WO does not anticipate many changes and will be focused on the most critical issues.
- WO will also need to coordinate with Forest Service reviews.
- Guidance – guidance is mostly final but they did hear about two issues from USFWS – 1) land tenure, doesn't affect Great Basin; and 2) prescribed fire drop-in language – there will probably be a minor edit.
- USGS buffers: there is some confusion about how these will be applied. They will not be applied as allocation decisions, but instead will be applied at the implementation stage. Subregions should not map these or provide quantitative analysis in the FEIS. Instead, the buffers should be discussed qualitatively in the analysis. If a subregion has other allocation-level buffers, that is fine.
- Stephanie will be developing a webinar to clarify this.
- Attachment 5 goes into the FEIS as an appendix.
- Disturbance caps: for implementation, BLM is cross-walking the list of disturbances with the six USGS categories. Vicki Herren will work to adapt the disturbance caps guidance into an appendix.
- Vegetation objectives guidance and grazing authorizations guidance will not be appendices.
- Monitoring Framework stands alone and no changes anticipated.

CEAs

- Have been working on how the review process will work, especially on BLM's side. Management Zone (MZ) reviewers will only have a 3-day review period. Goal is to have BLM project lead and Forest Service review the CEA and send comments to the MZ lead reviewer. The MZ lead reviewer will then vet the comments and compile them into one comment form. This will help to ensure consistency and to simplify the process, as well as reducing conflicts.
- For example, MZ IV includes Idaho, NV, and UT. MZ lead reviewer is Jon Beck. Quincy, Lauren, and the Forest Service will review their CEAs and send comments to Jon.
- Would like to stagger review of CEAs as much as possible. Drew is working on a schedule of when each CEAs will be ready for BLM/Forest Service review.
- Will need to carry forward cumulative analysis for other resources and the FEIS will include the cumulative analysis for GRS that was in the DEIS.
- Buffalo CEA – getting final comments from the Rocky Mountain Region. EMPSi will make appropriate edits to all CEA templates. Anticipate receiving SOL comments by end of this week. By end of next week, will have SOL changes incorporated into other CEA templates. Will send everyone a copy of Buffalo.
- Drew will reach out to project leads and MZ reviewers to discuss the scope of their review and answer questions.

Logos

- GIS staff were wondering if maps need to have BLM and Forest Service logos. Group decided that maps will have logos, the disclaimer, and the name of the document on them.

Vegetation Inventory and Vegetation Objectives

- Utah received comments on their DEIS requesting information related to how much GRSG habitat is/is not meeting Connelly standards. They don't have that information in Utah. Without this baseline, this would seem to make impacts analysis very challenging. Does anyone else have these data or have surrogate data?
- Forest Service does not identify where meeting/not meeting. Their analysis examines the potential for changes across allotments. They assume, if they are meeting, there is no change. Will talk qualitatively about changes where they are not meeting.

Comment Response Update

- The national response team had a call and reviewed some of the responses. Carol-Anne will be updating the national responses per the new guidance. She will work with EMPSi PMs to review local comment responses to make sure they are updated with Proposed Plans. Hoping to have all comment response reports final by 3/20. EMPSi will try to make first stab at responses for BLM review.

Schedule – Critical Paths

- Send Chapter 2 pieces to Lauren who will coordinate submittal to WO.

Other

- Socioeconomic questions – Lauren will send them.
- Lauren send the FIAT introduction for subregions to include.
- VDDT – Rob is working on it.

Subject: Additional Direction on GIS Data

Hi All –

A few questions concerning designated corridors, wind, solar, and the ROWs data layers have emerged from a number of GIS specialists. This e-mail is intended to provide further direction and clarification to all of the GIS specialists as they are completing the CEA data layers to send to the NOC.

1. Should the existing designated corridors be shown as “open” on the wind and solar GIS data layers? **Response: NO. The wind and solar data layers should be shown purely as an exclusion or avoidance areas.**
2. Should the ROW data layer (displaying the High Voltage Transmission Lines and Major Pipelines) show the existing designated corridors as “open”? **Response: YES. The ROW data layer should include the existing designated corridor data and show those linear features as “open”.**

If there are any questions concerning this direction, please give me a call.

5.1

Hello NGB / SSB Team -

IN the spirit of facilitating open communication, please be aware the FIAT effort has received a revised Resistance & Resilience data layer to be incorporated in the FIAT 2 reports. Due to the short time frame no action is required at the District and Field Office level. The new R&R data will be processed by Core Team Members at the ISO.

In addition to processing this new data, we are incorporating comments from the districts, partners, WO, Tech Team, and USFWS into a second edition. The second edition is to be completed by Feb 18. From Feb 19-27 the reports will be reviewed by a Writer / Editor. On Feb 27 the FIAT 2 Assessments will be provided to the State Directors.

Again, thank you for your participation and engagement in the process - Joe

Date: Tue, Feb 3, 2015 at 4:27 PM
Subject: The Remapped R&R is posted through SharePoint
To: Douglas Havlina <dhavlina@blm.gov>, Krista Gollnick <kgollnick@blm.gov>, Sandra Gregory

<s50grego@blm.gov>, Michael Pellant <mpellant@blm.gov>, Kenneth Collum <kcollum@blm.gov>, Craig Goodell <cgoodell@blm.gov>, Joseph Adamski <jadamski@blm.gov>, Jolie Pollet <jpollet@blm.gov>, Dianna Sampson <dsampson@blm.gov>

Doug and Teams,

The Remap of the R&R was computed westwide (not currently broken out by assessment area) and posted to the BLM server. The link has been posted in SharePoint.

To reach the data:

- Open the main FIAT SharePoint site [[FIAT \(Fire & Invasives Assessment\) Working SharePoint Site](#)]
- Click on the [DOWNLOADABLE DATA](#) link
- Scroll down or click on the link to the [STEP 2 DATA](#)
- To download Click on the Download Link using the Internet Explorer browser.
The Data Name is: **2015 New Resistance and Resilience Layer (Remap)**

There is an excel spreadsheet attached to this email that was calculated by Susan Goodman (OWF) that is an acre comparison between the original layer and the re-map layer.

Please let me know if any alterations or adjustments are needed. And just as a reminder- this download feature is only available to DOI employees on the network or on VPN. If any outside partners need the data please have them contact me.

Thank you,

Victoria Smith-Campbell

Hello Team -

Here is most recent information of guidance documents.

The most recent version of the MUST DO punch list. Some slight modification in Items 17 and 18.

The most recent guidance of identifying Habitat Matrix Priorities for Fire Ops, Invasive Annual Grass, and Conifer Expansion.

These documents will provide a format for our meetings.

Thanks. Please contact me if you wish to discuss. - Joe

208.994.1534 cell
208.373.3805 fax*

Must Do	Who	Due
1) Present 1 st , 2 nd , and 3 rd order priorities for all mgmt. strategies and potential treatments (all program areas)	FIAT teams	
2) Present or review new fire operations 1 st /2 nd /3 rd order priorities with unit-level folks (because they are being implemented in 2015)	FIAT team leads	
3) Insert “common to all assessments” sections 1. Focal habitats, emphasis areas, PPAs: how derived and used 2. Native plants and seeding boilerplate	Doug Mike	
4) List all districts within assessment area in a table	Teams	
5) Revise priority areas/treatment opportunities, and associated tables/narratives/findings using new prioritization guidance document and updated habitat matrix layer	Teams	
6) Insert summary tables for all program areas in section 5 (see FWS example below)	Teams	
7) Identify and list NEPA-compliant treatments ready for implementation (can include in FWS table below)	Teams	
8) Include new map of the R/R matrix – section 2 or 3?	Teams	
9) Include map of the soil subclasses – section 2 or 3?	Teams (coming from NIFC)	
10) Include soil subclass spreadsheet into assessment – section 2 or 3?	Teams (coming from NIFC)	
11) Describe how fire risk/threat used to identify treatments	teams	
12) Complete and insert Summary Table (see below) provided by USFWS (FWS comment 1)	Teams	
13) Ensure that cross-boundary management strategy/treatment identification occurs. Certain documents have state line boundaries where there are many treatments on one side and none on BLM lands just across the line (FWS comment 3) (OR / ID state line)	Team leads	
14) Provide obvious biological rationale for proposed management actions outside of focal habitats (FWS comment 4)	Teams	

15) Assess fire ops response time, water availability, and prepositioning to enhance suppression capability. Incorporate into Fire Ops mgmt. actions (FWS comment 3 example). Use Central OR as an example for content and detail.	Teams	
16) Analyze acres and % of high and very high burn probability for each PPA. Get the burn probability grid at the sharepoint, clip to your assessment area, and fill put in a table in each PPA....example below		
17) Name each Potential Treatment Area for each implementation strategy (habitat restoration, fuels, fire ops, esr.).	Teams	
EXAMPLE: Burn Probability for Owyhee N. PPA		
Acres Very High BP in PPA % of PPA		
Acres High Burn BP in PPA % of PPA		
Total acres High/Very High BP in PPA % of PPA		

18)

Once the above is presented, we then need to complete the table (below) which USFWS has asked for. In this table, teams should document potential treatments (any on-the-ground management). Note that I added a “project priority” column, **which is needed to refine our very large amounts of potential treatments**. We will present this table for all fuels mgmt., habitat restoration, and on-going rehabilitation for each PPA in Section 4. We will also use the table as a “master summary” for all potential treatments for all PPAs in the appendix. You may wish to have this in the form of a spreadsheet you can fill out in “real time” during workshops, or assign as homework which Districts will complete off line.

(below TABLE 02-17-2015 version)

Project (PPA)	Treatment Type	Project Metrics ¹	Project Priority (1 st , 2 nd , or 3 rd)	Threats Addressed	NEPA Needed	NEPA Complete	Treatment Timeframe ²	Certainty of Effectiveness ³	Maintenance Timeframe ⁴

¹E.g., total acres, total miles.

²Provide incremental objectives and dates for achieving them.

³Describe how the project reduces the threat(s).

⁴Provide quantifiable performance measures to monitor both implementation and effectiveness. If specific, measurable, time-bound, incremental objectives are not available, provide additional information that explains why the project or treatment type is on the correct trajectory to provide functional habitat given adequate time.

EXAMPLE

Priority 1 Treatment Areas:

- Cherry Creek Leks: Removal of phase 1 PJ within 2 miles of the Butte Valley and East Valley leks (no polygon).
- East Medicine Bench: PJ removal/thinning in 3C areas on valley bottoms/alluvial fans adjacent to East Medicine Range.
- Cherry Creek Basin: Conifer removal/thinning in 1B areas in summer habitats in Cherry Creek Basin – priority 1 because of lack of brood rearing habitat.

Water Sage-Grouse Wildfire, Invasive Annual Grasses, and Conifer Expansion Assessment January 2015
Southern Great Basin
Working Draft for U.S. Fish and Wildlife Service Review

4. Focal Habitat and Project Planning Areas

- Cherry Creek Basin Riparian 1: Integrated vegetation management around riparian areas and springs in 3C areas in conjunction with riparian fencing/pipelines/troughs to expand the riparian vegetation area (no polygon).
- Cherry Creek Bench: PJ removal/thinning in 3B areas on valley bottoms/alluvial fans adjacent to Cherry Creek Range (bench areas).

Priority 2 Treatment Areas:

- Butte Mountain Bench: PJ removal/thinning in 3B areas on valley bottoms/alluvial fans adjacent to Butte Mountain Bench.
- Cherry Creek WUI: Assess and strategically treat cheatgrass in the Cherry Creek WUI area.
- Cherry Creek Basin Riparian 2: Integrated vegetation management around riparian areas and springs in 3B in conjunction with riparian fencing/pipelines/troughs to expand the riparian vegetation area (no polygon).

Priority 3 Treatment Areas:

- High Bald Peaks: Conifer removal/thinning in 1B areas in summer habitats in the Medicine Range (High Bald Peak).
- Medicine Range Corridors: Assess the creation or enhancement of corridors from nesting to summer habitat in the Medicine Range (no polygon).
- Snow Creek Seeding: Re-establish native plants within crested wheatgrass seeding using locally collected seed or seedlings.
- Butte Fire: Assess fire rehab areas such as the Butte Fire for possible cheatgrass invasion and re-establishment of native plants.

Summary Table (VERSION 02-10-2015 Punch list for comparison only) – from USFWS comments

Project	Treatment Type	Project Metrics ¹	Project Details	Threats Addressed	NEPA Needed	NEPA Complete	Treatment Timeframe ²	Certainty of Effectiveness ³	Maintenance Timeframe ⁴

¹E.g., total acres, total miles.

²Provide incremental objectives and dates for achieving them.

³Describe how the project reduces the threat(s).

⁴Provide quantifiable performance measures to monitor both implementation and effectiveness. If specific, measurable, time-bound, incremental objectives are not available, provide additional information that explains why the project or treatment type is on the correct trajectory to provide functional habitat given adequate time.

Feb 17 2015

Final Draft (2-17-2015) Prioritization Process for Wildfires and Invasive Annual Grasses and Conifer Expansion

The F&WS review of the draft assessments identified a lack of consistency in applying Tables 2 and 4 in the Chambers et al. 2014 General Technical Report. This resulted in different approaches among the assessment teams in identifying and prioritizing the application of management strategies. The purpose of this guidance is to provide a common approach for prioritization that incorporates the “remapped” resistance and resilience categories in a baseline priority for the nine cells in the Habitat Matrix in the GTR. Table 4 is used to refine these priorities with the input of the assessment teams and partners.

An example of a Project Planning Area and the strategies to prioritize management strategies within it is currently being circulated for review by the assessment team leads and members of the FIAT Technical Team. It will be attached to this document when finalized.

Prioritization Process for Invasive Annual Grasses and Wildfire Threats

The prioritization process identified in the following table is based on the FIAT principles that the low resistance and resilience areas with >25% sagebrush landscape cover are a high priority for application of management strategies. This process was further refined to identify the moderate resistance and resilience areas with >25% sagebrush landscape cover as a higher priority for application of management strategies than the high resistance and resilience areas.

Columns for all management strategies are prioritized by proportion of landscape dominated by sagebrush: first priority = >65% ; second priority = 25-65%; third priority = 0-25%. Application of management strategies in the 0-25% category is limited to projects that protect adjacent higher sagebrush landscape cover areas or reconnect habitat areas with >25% landscape sagebrush cover.

Rows for application of management strategies are prioritized: first priority = low R&R, second priority = moderate R&R; third priority = high R&R. Again application of management strategies in the 0-25% category is limited to projects that protect adjacent higher sagebrush landscape cover areas or reconnect habitat areas with >25% landscape sagebrush cover.

Priorities for Application of All Management Strategies to Address Threats of Wildfire and Invasive Grasses			
Proportion of Landscape Dominated by Sagebrush			
	Low < 25%	Moderate 25-65%	High > 65%
R&R Low-Mod-High	9 th *	6 th	5 th
	8 th *	4 th	3 ^d
	7 th *	2 nd	1 st

*0-25% Sagebrush Landscape Cover areas have significant restrictions in terms of implementing management strategies. Fuels management projects are limited to strategically protecting nearby areas where sagebrush landscape cover is >25%. For example, a road that is planned for a fuel break may be implemented if it makes sense to go through or parallel a small portion of a 0-25% sagebrush landscape cover to tie the fuelbreak into a strong anchor point. Fire suppression may be identified as a priority in these areas if there is a high potential for a wildfire to spread into landscapes with >25% sagebrush landscape cover. Both habitat restoration and post-fire rehabilitation can only be implemented if the project strategically reconnects two or more disconnected habitats with >25% sagebrush landscape cover. Reconnecting habitat with these two programs is limited to within the focal habitat or between gaps or narrow strips between adjacent focal habitats.

Post-fire habitat that is recovering appropriately following wildfire and post-fire seedings that are trending towards meeting Sage-grouse habitat requirements are exceptions to not applying management strategies in areas with less than 25% sagebrush landscape cover. Even though sage-grouse may not be utilizing these areas in the early stages of succession, recovery of these areas are important for the long-term maintenance of habitat given the current rate of loss to habitat to wildfires.

The moderate resistance and resilience category includes a range from the warm/dry to the cool/moist soil moisture and temperature regimes. Based on local knowledge and experience, priorities can be adjusted from the moderate R&R category and justified in the assessments. For example cool/dry sites in some portions of the Great Basin have the same responses after wildfires (conversion to cheatgrass) as the warm/dry sites and could thus be identified as a high priority.

Feb 17 2015

Consult GTR Table 4 for narratives and scenarios that identify different situations that modify the priorities for application of management strategies. Deviations from the priorities in the **Priority Order for All Management Strategies** table must be described and the rationale included in the Project Planning Area descriptions (including GIS figures). In some situations seasonal habitats that are limiting for Sage-grouse populations may be assigned a higher management strategy priority.

Just to reiterate, this prioritization process is not intended to be a “cookbook” to direct the priority for all management strategies. Assessment teams are a critical component in the selection and prioritization of management strategies in or near the focal habitats. **Also, it is recommended that the Invasive Annual Grasses and Wildfire Assessment be conducted prior to addressing conifer expansion treatments. The R&R data from this assessment can provide useful information in identifying areas for conifer expansion treatments (see example).**

There is a recommendation for the five assessments to identify first, second, and third priorities for all management strategies in or near the focal habitats. Assessment teams are advised to conduct their assessments based on the 9 cells and their prioritization in the table above and roll the data up in the following format for a three level prioritization summary.

Reportable Priorities for Application of All Management Strategies to Address Threats of Wildfire and Invasive Grasses		
Proportion of Landscape Dominated by Sagebrush		
	Low < 25%	Moderate 25-65%
R&R Low-Mod-High	Treatments limited to application of management strategies that help to protect or reconnect habitats with >25% sagebrush landscape cover.	Third Priority
		Second Priority
		First Priority

The following tables represent the percent of total Priority Areas for Conservation (PACs) selected for initial assessments that fall within each R&R category and reflects the latest re-map effort conducted in Jan 2015. These tables help to visualize the percent of acreages in each of the nine R&R categories. It is important to note that the “A” column which represents the 0-25% sagebrush landscape cover is a minor component (about 15%) across all five priority PACs. Given the rationale for implementing management strategies described above and the relatively low acreage in this category, the amount of treatments proposed to be implemented in these areas will be correspondingly small.

Feb 17 2015

R&R Matrix Summary of % of Total PAC Acres by Category							
All FIAT Assessment Areas				Snake, Salmon, Beaverhead			
	A	B	C		A	B	C
1	4%	8%	9%	1	1%	11%	30%
2	6%	11%	16%	2	1%	9%	30%
3	5%	14%	24%	3	1%	3%	4%
Central Oregon				Southern Great Basin			
	A	B	C		A	B	C
1	3%	18%	13%	1	4%	8%	9%
2	1%	6%	53%	2	10%	14%	5%
3	<1%	1%	1%	3	7%	22%	23%
Northern Great Basin				Western Great Basin			
	A	B	C		A	B	C
1	2%	9%	11%	1	3%	4%	2%
2	6%	9%	14%	2	6%	9%	27%
3	5%	11%	31%	3	5%	14%	28%

Commented [PML1]: The totals in the five assessment areas don't reflect the averages in the "All FIAT Assessment Areas" table. For example the average value for the 5 assessment areas in the A category is 2.6 not 4% as shown in the summary total. What I am missing (math was not my favorite subject)?

Prioritization for Conifer Expansion Threat per the FIAT Protocol

The process to prioritize conifer removal treatments in areas with conifer expansion (not historic conifer communities) is different from the process used to determine focal habitats based on the invasive annual grasses and wildfire prioritization process. The FIAT protocol doesn't recommend Table 2 and 4 in the R&R GTR to be the primary source to prioritize conifer treatments. However, the R&R spatial data can be used to inform treatment strategies to control conifers (see example). The FIAT protocol excludes areas with 0-25% sagebrush landscape cover from consideration for conifer removal as these areas support only marginal populations of Sage-grouse. FIAT directs that focal habitats (conifer expansion in >25% sagebrush landscape cover in the PAC) are the areas that would receive conifer removal treatments. Conifer expansion occurring in the 75% Breeding Bird Density areas was identified as "emphasis areas" (e.g. higher priority) for treatments than the remainder of the focal habitat.

Based on this approach, the priorities for addressing conifer expansion are:

Feb 17 2015

		Conifer Expansion Prioritization Proportion of Landscape Dominated by Sagebrush		
		Low < 25%	Moderate 25-65%	High >65%
Phase III II I	Treatments limited to application of management strategies that help to protect or reconnect habitats with >25% sagebrush landscape cover.	Third priority		Third priority
		First priority-75% BBD Second-Remainder of focal habitat		First priority-75% BBD Second-Remainder of focal habitat
		First-75% BBD Second-Remainder of focal habitat		First-75% BBD Second-Remainder of focal habitat

The first priority for conifer removal treatments is within the 75% BBD areas in Phase I and II areas. The second priority for conifer removal treatments in the remainder of the PAC is where Phase I or II conifer expansion exists. Treatments in Phase III conifer expansion are a low (third) priority.

It is important to identify and support appropriate management strategies to address multiple threats that occur in the focal habitats. Management strategies for all three threats would be proposed and the rationale described in the assessments. The process for prioritizing other types of treatments, for example fuel breaks or post-fire rehabilitation follows the same strategy as for the invasive annual grass and wildfire strategy described above. For example, conifer removal would not be proposed in the 0-25% sagebrush landscape cover areas unless it was tied to fuels management, habitat restoration, or post-fire rehabilitation as described above. Also, areas with conifer expansion would be prioritized for fire operations, habitat restoration and post-fire rehabilitation according to the invasive annual grass and wildfire strategy.

Similar to the strategy for Annual Grasses and Wildfires, areas of Phase III woodland may be prioritized for fuel breaks where they are adjacent to high priority areas. They also may require rehabilitation following high severity wildfires.

This strategy to address prioritization of management strategies replaces the “Supplement for Using Table 4 from Resistance and Resilience General Technical Report 326 (Chambers et al. 2014) for FIAT Assessments.”

Good morning FIAT Team members -

Here are the latest documents that provide information regarding the R&R remap prioritization process. This will be helpful to review before our district meetings. (Idaho Falls and Winnemucca have already met and followed this process).

Thanks - Joe

All: Attached are the final example and guidance documents for conducting the remap effort. Most changes over previous versions are relatively minor. However, I participated with the N GB assessment team yesterday in a field office webex and it brought up a point that we haven't addressed before. Conifer expansion has been identified as a priority for all areas in the assessment PACs where it is occurring in areas of greater than 25% sagebrush landscape cover not just in the Project Planning areas. I don't think this will make much of a difference in the Project Planning Area emphasis since these areas encircle 75% BBD areas which are the emphasis areas for conifer control.

Final Draft (2-19-2015) Prioritization Process for Wildfires and Invasive Annual Grasses and Conifer Expansion

The F&WS review of the draft assessments identified a lack of consistency in applying Tables 2 and 4 in the Chambers et al. 2014 General Technical Report. This resulted in different approaches among the assessment teams in identifying and prioritizing the application of management strategies. The purpose of this guidance is to provide a common approach for prioritization that incorporates the “remapped” resistance and resilience categories in a baseline priority for the nine cells in the Habitat Matrix in the GTR. Table 4 is used to refine these priorities with the input of the assessment teams and partners.

An example of a Project Planning Area and the strategies to prioritize management strategies within it is currently being circulated for review by the assessment team leads and members of the FIAT Technical Team. It will be attached to this document when finalized.

Prioritization Process for Invasive Annual Grasses and Wildfire Threats

The prioritization process identified in the following table is based on the FIAT principles that the low resistance and resilience areas with >25% sagebrush landscape cover are a high priority for application of management strategies. This process was further refined to identify the moderate resistance and resilience areas with >25% sagebrush landscape cover as a higher priority for application of management strategies than the high resistance and resilience areas.

Columns for all management strategies are prioritized by proportion of landscape dominated by sagebrush: first priority = >65% ; second priority = 25-65%; third priority = 0-25%. Application of management strategies in the 0-25% category is limited to projects that protect adjacent higher sagebrush landscape cover areas or reconnect habitat areas with >25% landscape sagebrush cover.

Rows for application of management strategies are prioritized: first priority = low R&R, second priority = moderate R&R; third priority = high R&R. Again application of management strategies in the 0-25% category is limited to projects that protect adjacent higher sagebrush landscape cover areas or reconnect habitat areas with >25% landscape sagebrush cover.

Priorities for Application of All Management Strategies to Address Threats of Wildfire and Invasive Grasses			
Proportion of Landscape Dominated by Sagebrush			
	Low < 25%	Moderate 25-65%	High > 65%
R&R Low-Mod--High	9 th *	6 th	5 th
	8 th *	4 th	3 ^d
	7 th *	2 nd	1 st

*0-25% Sagebrush Landscape Cover areas have significant restrictions in terms of implementing management strategies. Fuels management projects are limited to strategically protecting nearby areas where sagebrush landscape cover is >25%. For example, a road that is planned for a fuel break may be implemented if it makes sense to go through or parallel a small portion of a 0-25% sagebrush landscape cover to tie the fuelbreak into a strong anchor point. Fire suppression may be identified as a priority in these areas if there is a high potential for a wildfire to spread into landscapes with >25% sagebrush landscape cover. Both habitat restoration and post-fire rehabilitation can only be implemented if the project strategically reconnects two or more disconnected habitats with >25% sagebrush landscape cover. Reconnecting habitat with these two programs is limited to within the focal habitat or between gaps or narrow strips between adjacent focal habitats.

Post-fire habitat that is recovering appropriately following wildfire and post-fire seedings that are trending towards meeting Sage-grouse habitat requirements are exceptions to not applying management strategies in areas with less than 25% sagebrush landscape cover. Even though sage-grouse may not be utilizing these areas in the early stages of succession, recovery of these areas are important for the long-term maintenance of habitat given the current rate of loss to habitat to wildfires.

The moderate resistance and resilience category includes a range from the warm/dry to the cool/moist soil moisture and temperature regimes. Based on local knowledge and experience, priorities can be adjusted from the moderate R&R category and justified in the assessments. For example cool/dry sites in some portions of the Great Basin have the same responses after wildfires (conversion to cheatgrass) as the warm/dry sites and could thus be identified as a high priority.

Consult GTR Table 4 for narratives and scenarios that identify different situations that modify the priorities for application of management strategies. Deviations from the priorities in the **Priority Order for All Management Strategies** table must be described and the rationale included in the Project Planning Area descriptions (including GIS figures). In some situations seasonal habitats that are limiting for Sage-grouse populations may be assigned a higher management strategy priority.

Just to reiterate, this prioritization process is not intended to be a “cookbook” to direct the priority for all management strategies. Assessment teams are a critical component in the selection and prioritization of management strategies in or near the focal habitats. Also, it is recommended that the Invasive Annual Grasses and Wildfire Assessment be conducted prior to addressing conifer expansion treatments. The R&R data from this assessment can provide useful information in identifying areas for conifer expansion treatments (see example).

There is a recommendation for the five assessments to identify first, second, and third priorities for all management strategies in or near the focal habitats. Assessment teams are advised to conduct their assessments based on the 9 cells and their prioritization in the table above and roll the data up in the following format for a three level prioritization summary.

Reportable Priorities for Application of All Management Strategies to Address Threats of Wildfire and Invasive Grasses			
Proportion of Landscape Dominated by Sagebrush			
	Low < 25%	Moderate 25-65%	High > 65%
R&R Low-Mod--High	Treatments limited to application of management strategies that help to protect or reconnect habitats with >25% sagebrush landscape cover.	Third Priority	
		Second Priority	
		First Priority	

The following tables represent the percent of total Priority Areas for Conservation (PACs) selected for initial assessments that fall within each R&R category and reflects the latest re-map effort conducted in Jan 2015. These tables help to visualize the percent of acreages in each of the nine R&R categories. It is important to note that the “A” column which represents the 0-25% sagebrush landscape cover is a minor component (about 15%) across all five priority PACs. Given the rationale for implementing management strategies described above and the relatively low acreage in this category, the amount of treatments proposed to be implemented in these areas will be correspondingly small.

R&R Matrix Summary of % of Total PAC Acres by Category									
All FIAT Assessment Areas				Snake, Salmon, Beaverhead					
	A	B	C		A	B	C		
1	4%	8%	9%	1	1%	11%	30%		
2	6%	11%	16%	2	1%	9%	30%		
3	5%	14%	24%	3	1%	3%	4%		
Central Oregon				Southern Great Basin					
	A	B	C		A	B	C		
1	3%	18%	13%	1	4%	8%	9%		
2	1%	6%	53%	2	10%	14%	5%		
3	<1%	1%	1%	3	7%	22%	23%		
Northern Great Basin				Western Great Basin					
	A	B	C		A	B	C		
1	2%	9%	11%	1	3%	4%	2%		
2	6%	9%	14%	2	6%	9%	27%		
3	5%	11%	31%	3	5%	14%	28%		

Prioritization for Conifer Expansion Threat per the FIAT Protocol

The process to prioritize conifer removal treatments in areas with conifer expansion (not historic conifer communities) is different from the process used to determine focal habitats based on the invasive annual grasses and wildfire prioritization process. The FIAT protocol doesn't recommend Table 2 and 4 in the R&R GTR to be the primary source to prioritize conifer treatments. However, the R&R spatial data can be used to inform treatment strategies to control conifers (see example). The FIAT protocol excludes areas with 0-25% sagebrush landscape cover from consideration for conifer removal as these areas support only marginal populations of Sage-grouse. FIAT directs that focal habitats (conifer expansion in >25% sagebrush landscape cover in the PAC) are the areas that would receive conifer removal treatments. Focal Habitat is all areas within the PAC (not just the PPA) where conifer expansion is occurring (second priority). First priority (emphasis area) is conifer expansion in 75% BBD polygons.

Based on this approach, the priorities for addressing conifer expansion are:

		Conifer Expansion Prioritization Proportion of Landscape Dominated by Sagebrush		
		Low < 25%	Moderate 25-65%	High >65%
Phase I II III	Treatments limited to application of management strategies that help to protect or reconnect habitats with >25% sagebrush landscape cover.	Third priority		Third priority
		First priority-75% BBD Second-Remainder of focal habitat		First priority-75% BBD Second-Remainder of focal habitat
		First-75% BBD Second-Remainder of focal habitat		First-75% BBD Second-Remainder of focal habitat

The first priority for conifer removal treatments is within the 75% BBD areas in Phase I and II areas. The second priority for conifer removal treatments in the remainder of the PAC is where Phase I or II conifer expansion exists (not limited to PPAs). Treatments in Phase III conifer expansion are a low (third) priority.

It is important to identify and apply appropriate management strategies to address invasive annual grass, wildfire, and conifer threats especially where they occur together in focal habitats. In this situation, management strategies for all three threats would be identified and the rationale described in the assessments. The process for prioritizing other types of treatments, for example fuel breaks or post-fire rehabilitation in conifer expansion areas follows the same strategy as for the invasive annual grass and wildfire strategy described above. For example, conifer removal would not be proposed in the 0-25% sagebrush landscape cover areas unless it was tied to fuels management, habitat restoration, or post-fire rehabilitation treatments. Treatments to control conifer expansion where cheatgrass or medusahead is present and could increase with treatment disturbances should include management actions to reduce the threat of annual grass increase.

Similar to the strategy for Annual Grasses and Wildfires, areas of Phase III woodland may be prioritized for fuel breaks where they are adjacent to high priority areas. They also may require rehabilitation following high severity wildfires.

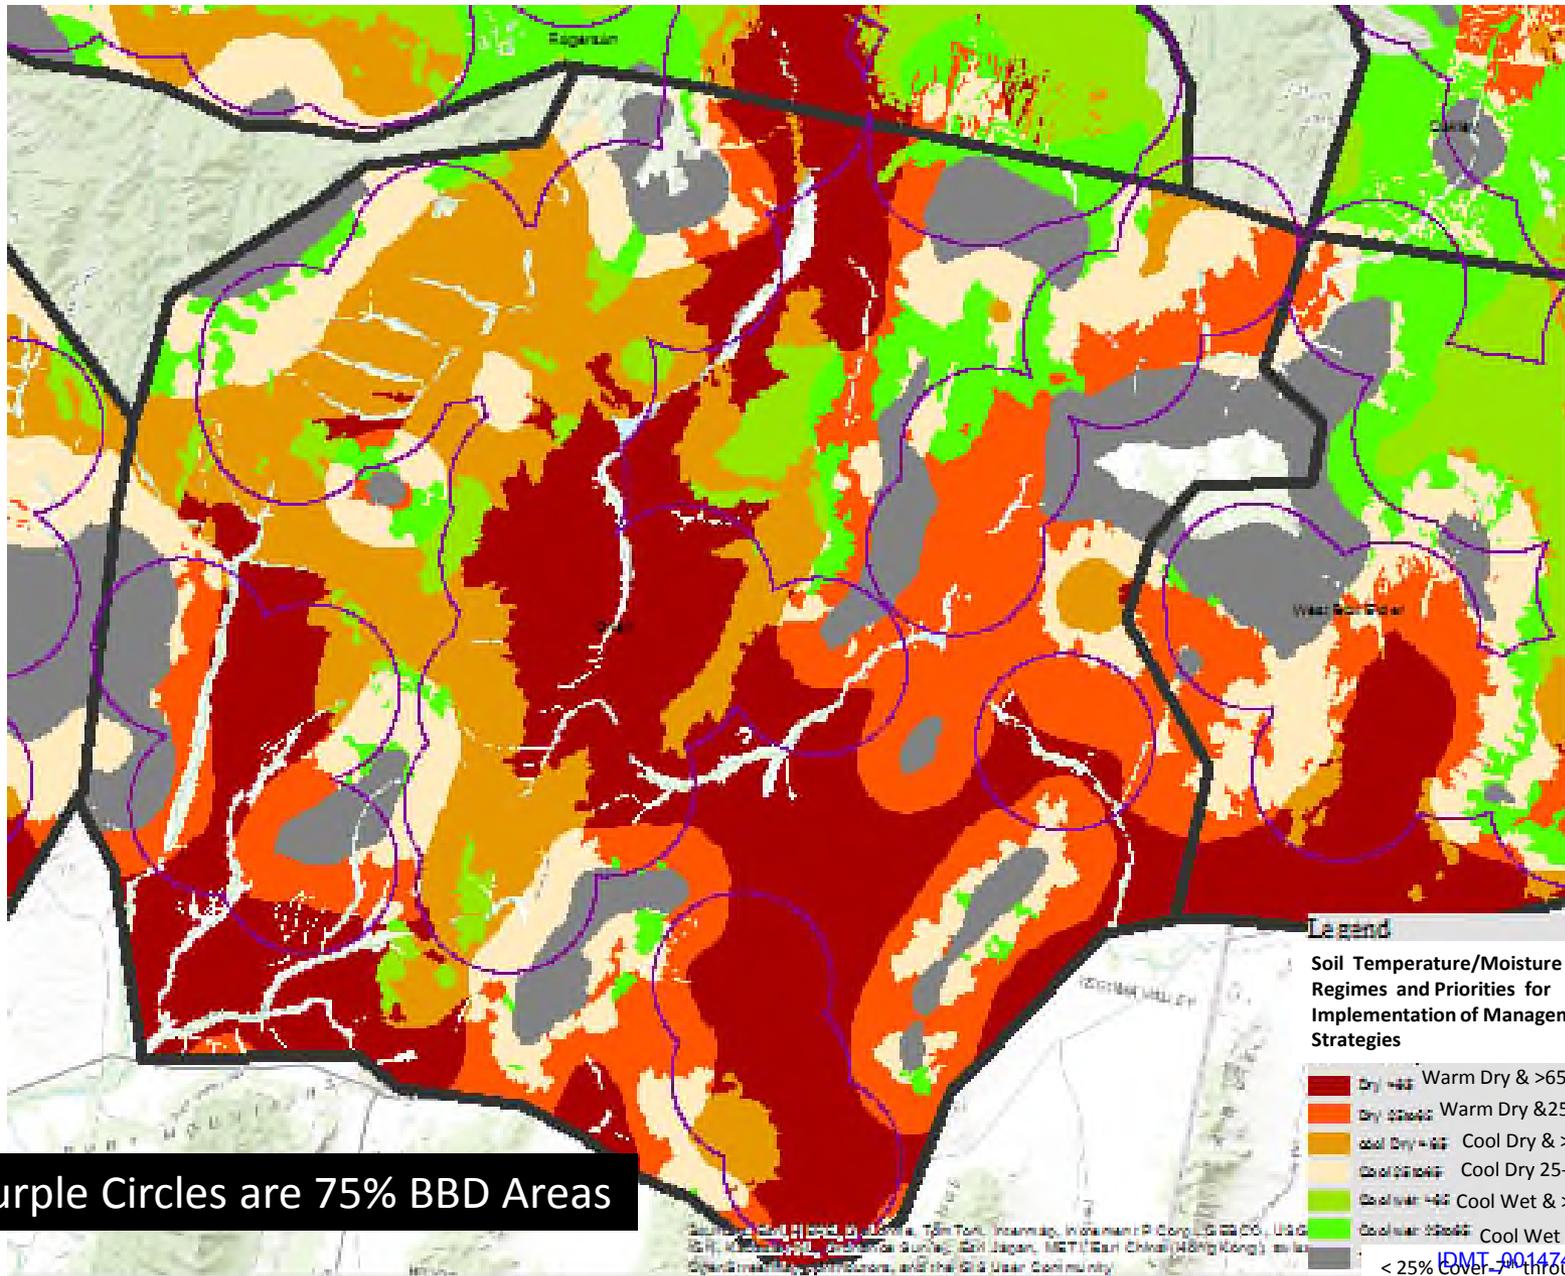

This strategy to address prioritization of management strategies replaces the “Supplement for Using Table 4 from Resistance and Resilience General Technical Report 326 (Chambers et al. 2014) for FIAT Assessments.”

2/19/15 FIAT Example Using “Remapped” Soil Moisture/Temp. Regimes Introduction

- Only an **example** using some hypothetical situations to illustrate application of Step 2 management strategies. This example is more relevant to large PPAs compared to relatively small ones. There may be some PPAs where this approach is not needed due to small size or lack of complexity of landscape.
- Purpose of example is to assist in applying a consistent approach in prioritizing areas for application of management strategies within and among the five assessment areas.
- Approach used in example is to conduct invasive annual grasses and wildfire component of the assessment using R&R first. Then conduct the conifer expansion portion of the assessment using the R&R information to help inform treatment options.
- Example only addresses Invasive Annual Grasses, Wildfire, and Conifer Expansion issues in one Project Planning Area (PPA). Critical that adjacent PPAs be considered and management strategies integrated in the assessment process.

**GOAL: Identify the Best Habitat for the Most Sage-grouse and
Manage, Conserve, and Restore These Areas**

Project Planning Area Example Remapped R&R

Purple Circles are 75% BBD Areas

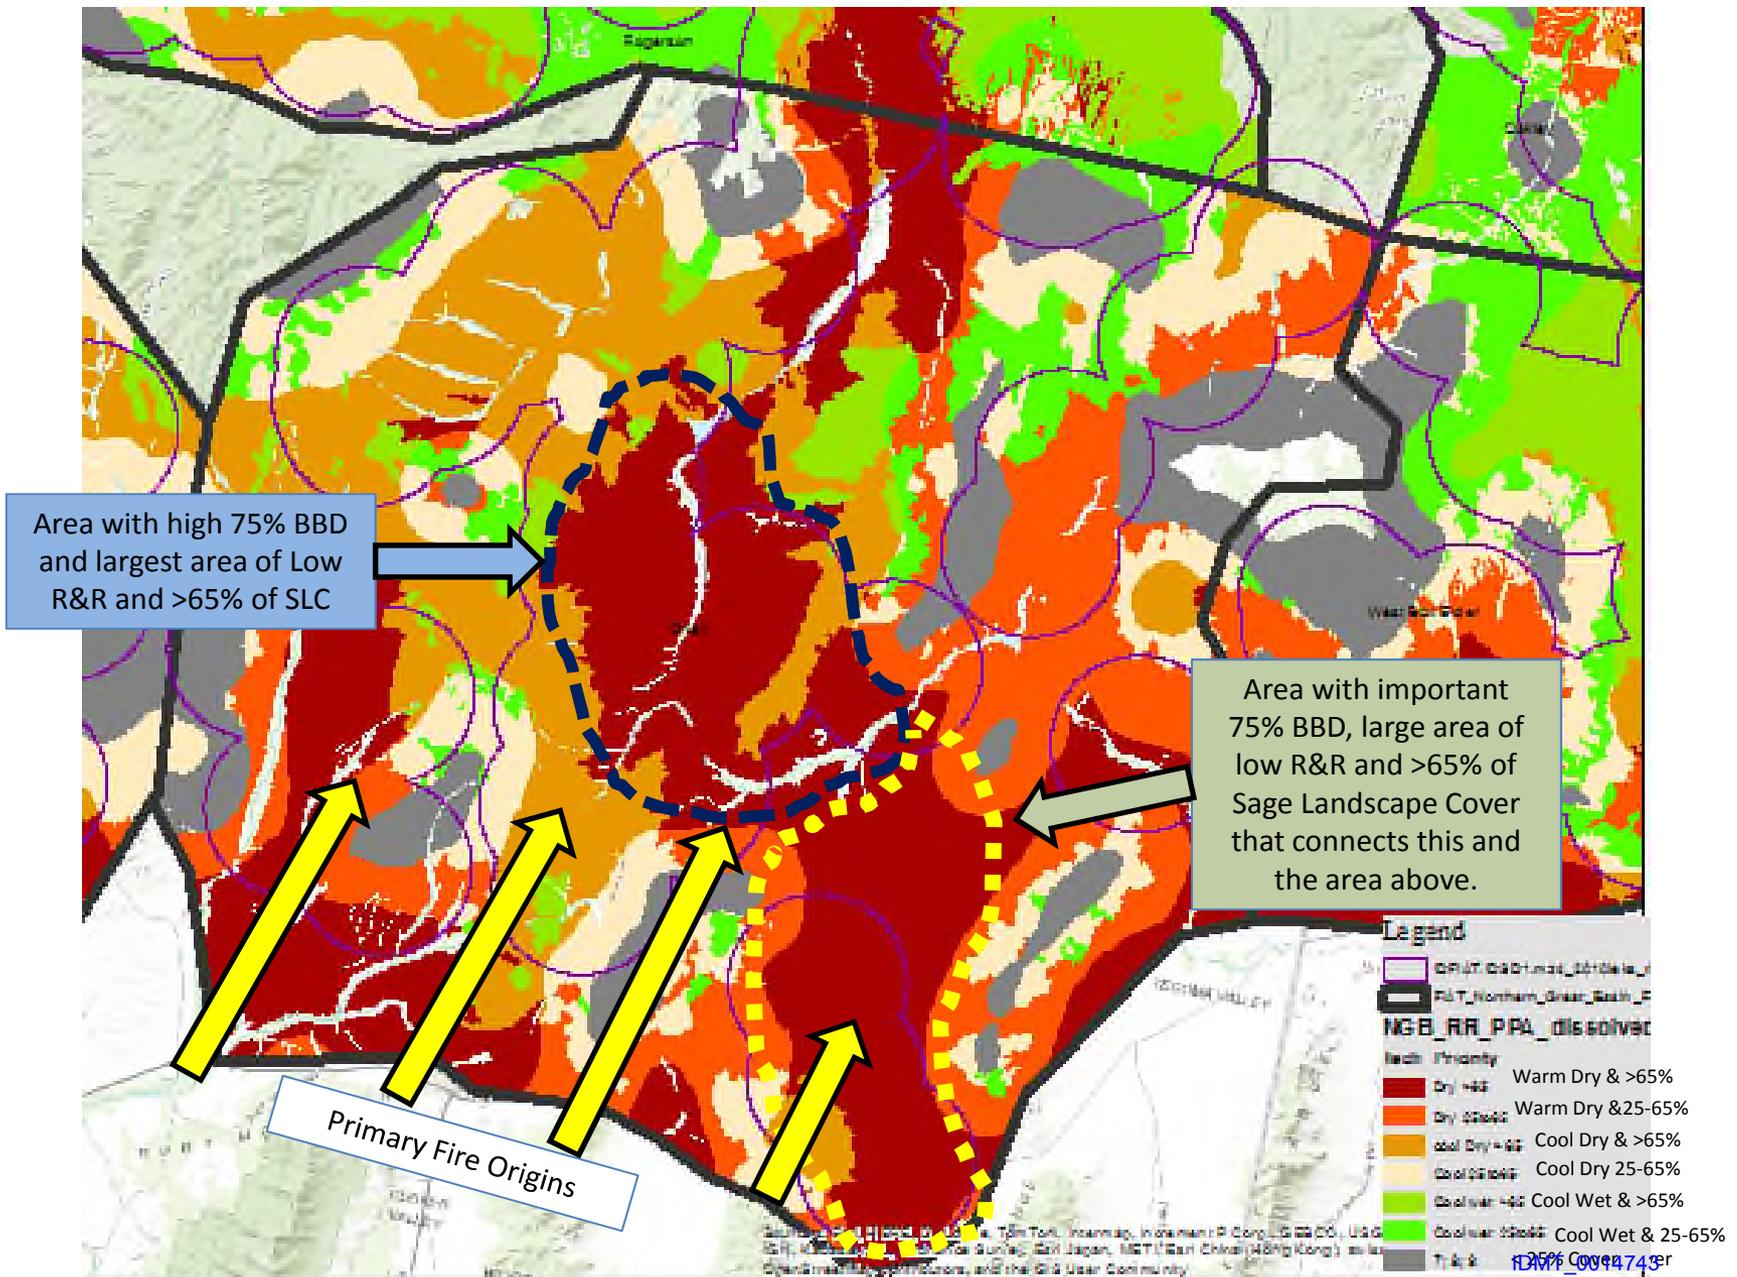

Management Strategy Prioritization (Invasive Annual Grasses/Wildfires) for Project Planning Area (PPA)

- Utilize this table for Management Strategies prioritization:

Priorities for Application of All Management Strategies to Address Threats of Wildfire and Invasive Grasses			
Proportion of Landscape Dominated by Sagebrush			
	Low < 25%	Moderate 25-65%	High > 65%
R&R Low-Mod--High	9 th *	6 th	5 th
	8 th *	4 th	3 ^d
	7 th *	2 nd	1 st

- How can prioritization be more strategic in terms of addressing the “Best Habitat for the Most Sage-grouse” in each PPA?

Potential Linear Fuels Management Projects Identified by Assessment Team

Higher Priority Sagebrush Habit in PPA

- Highest probability of wildfire starts is along a major highway on the Southern portion of the Project Planning Area (PPA).
- Two higher priority, low elevation (warm/dry) sagebrush dominated areas with >65% landscape cover were identified:
 - Dark blue dashed line surrounds a large block of 75% BBD habitat sagebrush.
 - Yellow dashed polygon surrounds a important connectivity area between major high BBD area to the north (dark blue dashed polygon) and a high BBD area to the south.
- Application of Management Strategies to these two priority polygons
 - Fire Suppression and Fuels Management—Utilize fuel breaks identified by Assessment Teams that reduce risk of wildfire in the two priority polygons in PPA (see next slide). May need to supplement and reprioritize fuel breaks in Step 3 to better address the major wildfire origin issue in this example.
 - Areas in polygons would be a higher priority for post-fire rehabilitation and habitat restoration/recovery treatments than other areas in this PPA.

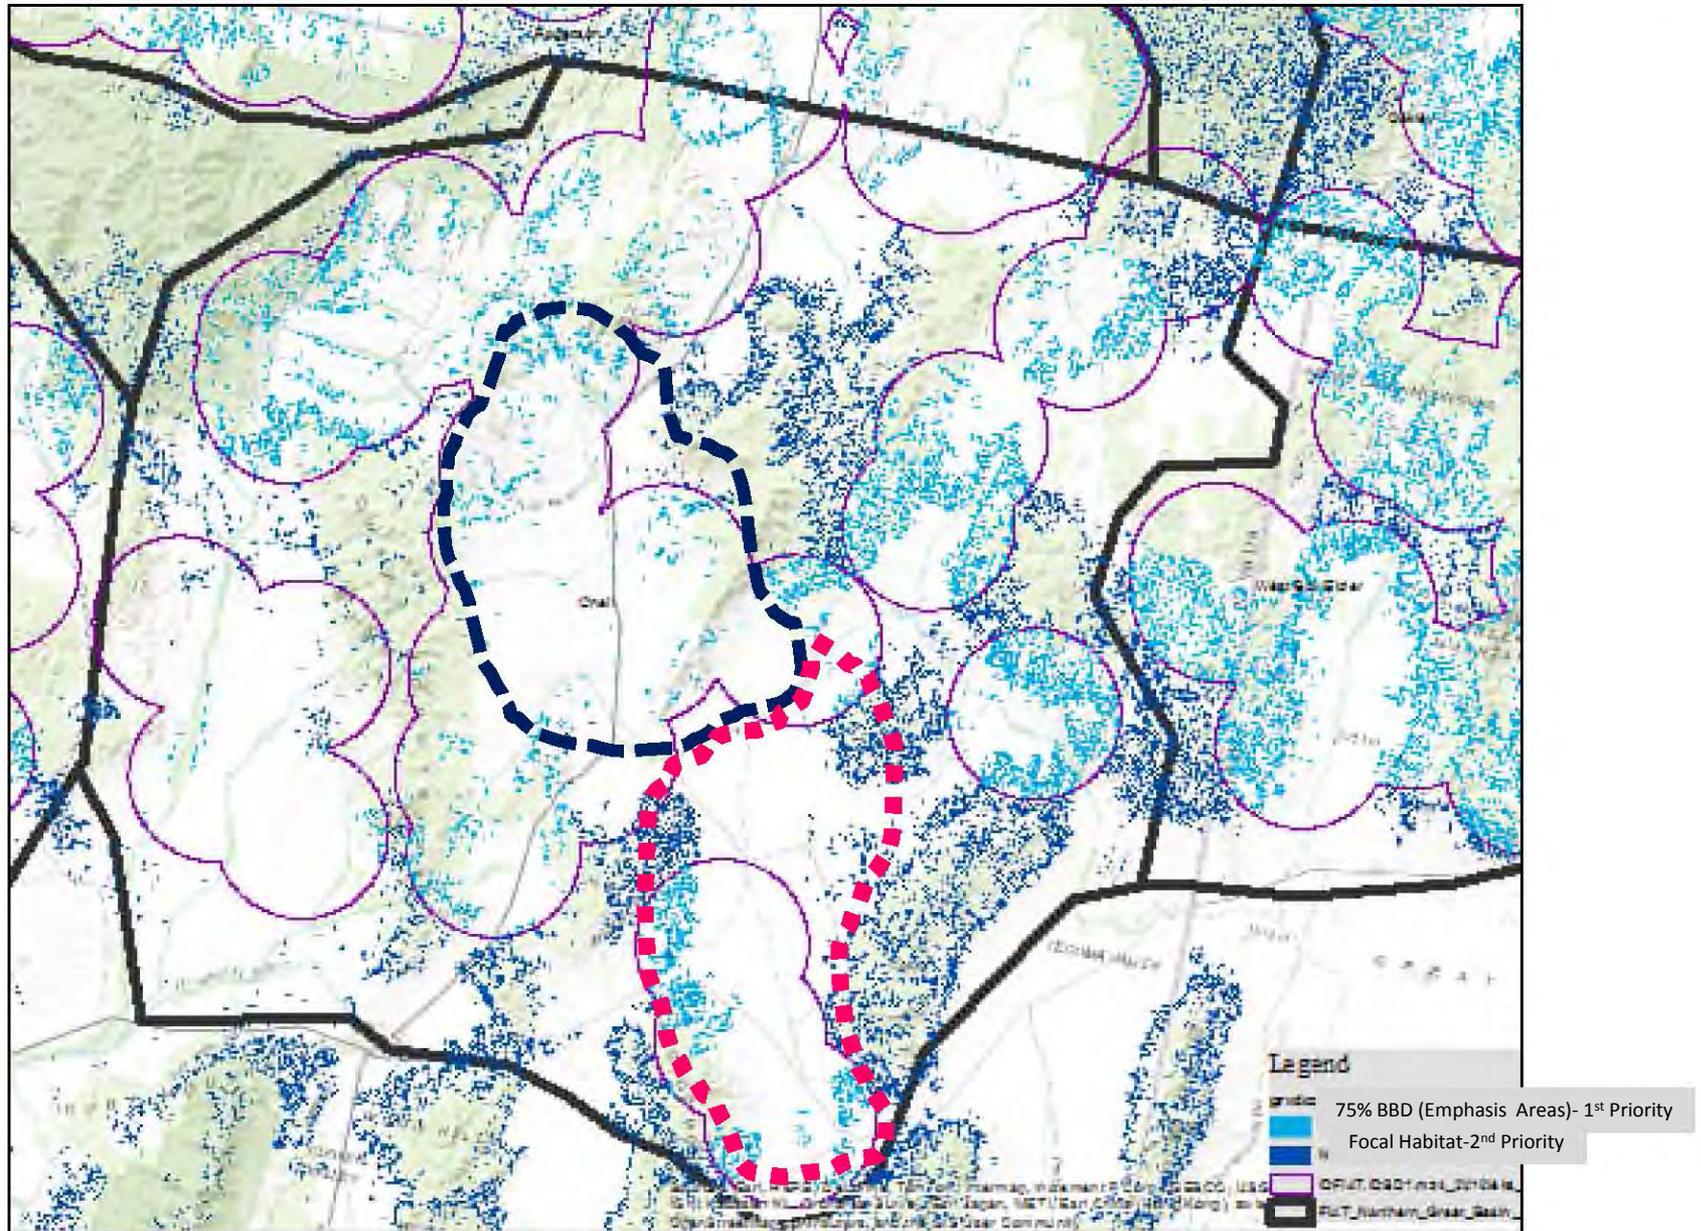

Management Strategy Prioritization for Conifer Expansion in and around PPA

- Focal Habitat is all areas within the PAC (not just the PPA) where conifer expansion is occurring (second priority. First priority is in conifer expansion in 75% BBD polygons).

		Conifer Expansion Prioritization Proportion of Landscape Dominated by Sagebrush		
		Low < 25%	Moderate 25-65%	High >65%
Phase	III	Treatments limited to application of management strategies that help to protect or reconnect nearby habitats with >25% sagebrush landscape cover.	Third priority	Third priority
	II		First priority-75% BBD Second-Remainder of focal habitat	First priority-75% BBD Second-Remainder of focal habitat
	I		First priority-75% BBD Second-Remainder of focal habitat	First priority-75% BBD Second-Remainder of focal habitat

- Based on previous slides, there are two higher priority invasive annual grass/wildfire polygons within the PPA where conifer control could be a higher priority compared to other areas in the PPA (see following slide).
- Conifer phase (I, II, III if available) can help to prioritize treatments in that Phase III conifer stands require expensive restoration treatments to return them to suitable habitat for Sage-grouse and are not cost-effective relative to the benefits.

Conifer Expansion Treatments

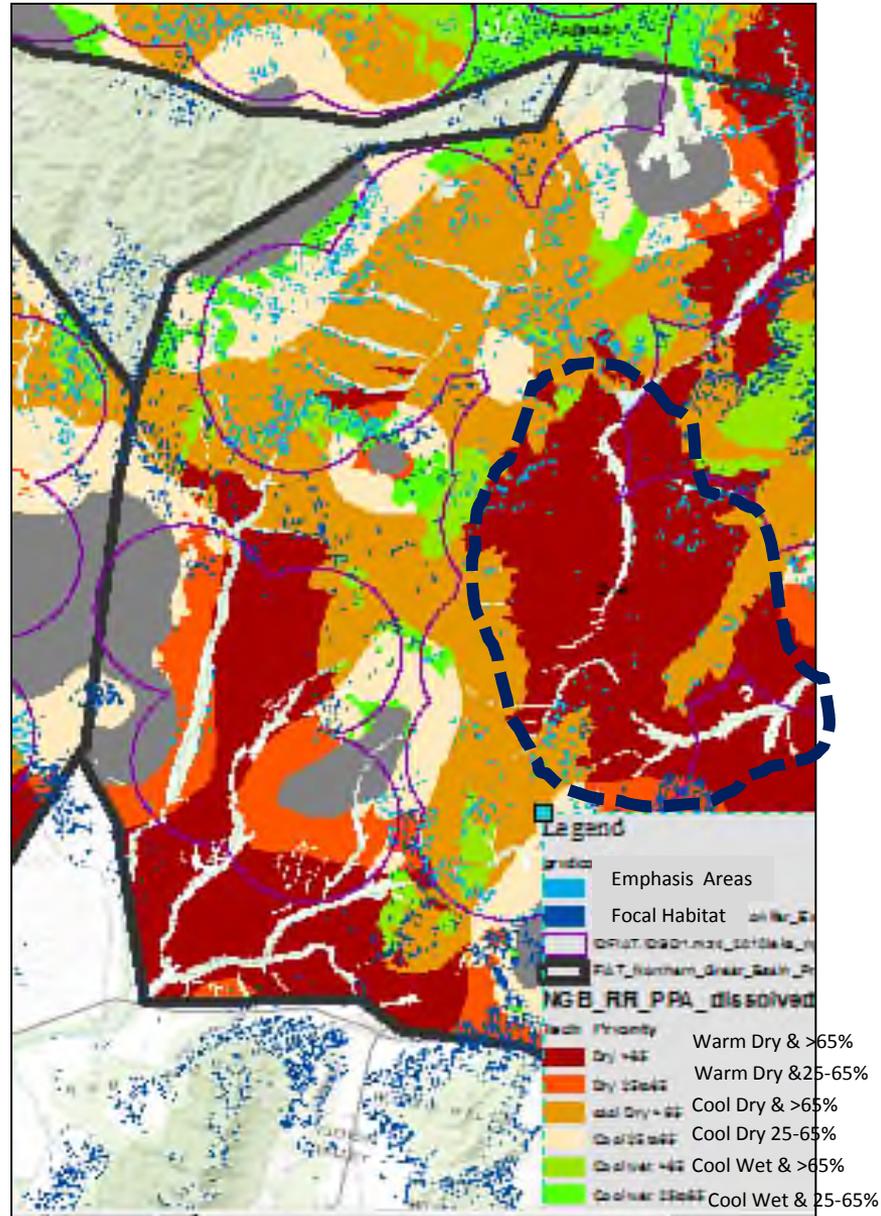

Application of R&R Concepts to Conifer Expansion

- The FIAT protocol did not use R&R concepts to prioritize conifer expansion treatments. However, there is utility in using remapped soil temperature/moisture information to help inform conifer control treatments.
- Treating conifer expansion in cool /dry soil moisture and temperature regimes may be a more cost effective treatment approach than doing the same types of treatments in the warm/dry zone. Surface disturbance associated with conifer control in the warm/dry zone could increase cheatgrass and require additional treatments to address this issue. The same treatments in the cool/dry zone may be implemented with no need for additional treatments.
- Soil moisture and temperature regimes and associated R&R information will help in terms of evaluating the resilience of an area and its potential for native plant recovery.
- The two high priority areas identified as priorities for management strategies for invasive annual grasses and wildfires are not necessarily the highest priority for conifer treatments (see following slide).
- Remember that the Project Planning Area (PPA) is not the focal habitat for conifer expansion treatments. By definition in FIAT the focal habitats are all areas within the PAC that have conifer expansion in greater than 25% Sagebrush Landscape Cover. Areas that meet this criteria inside 75% BBD polygons (emphasis areas) are the first priority. Focal habitat is the second priority. So, it is appropriate to include conifer treatments outside the PPA as a for treatment given their proximity to leks inside the PPA.

Conifer Expansion Example

Conifer treatments may be more effective in terms of native understory recovery and require minimal follow-up treatments in the cool/dry areas compared to the warm/dry areas in the priority polygon (purple dashed line). Habitat response after conifer removal (understory native plants) may be even greater in the cool/wet zones.

Local biologist input into the priorities for conifer control is essential in making recommendations for conifer control within each PPA.

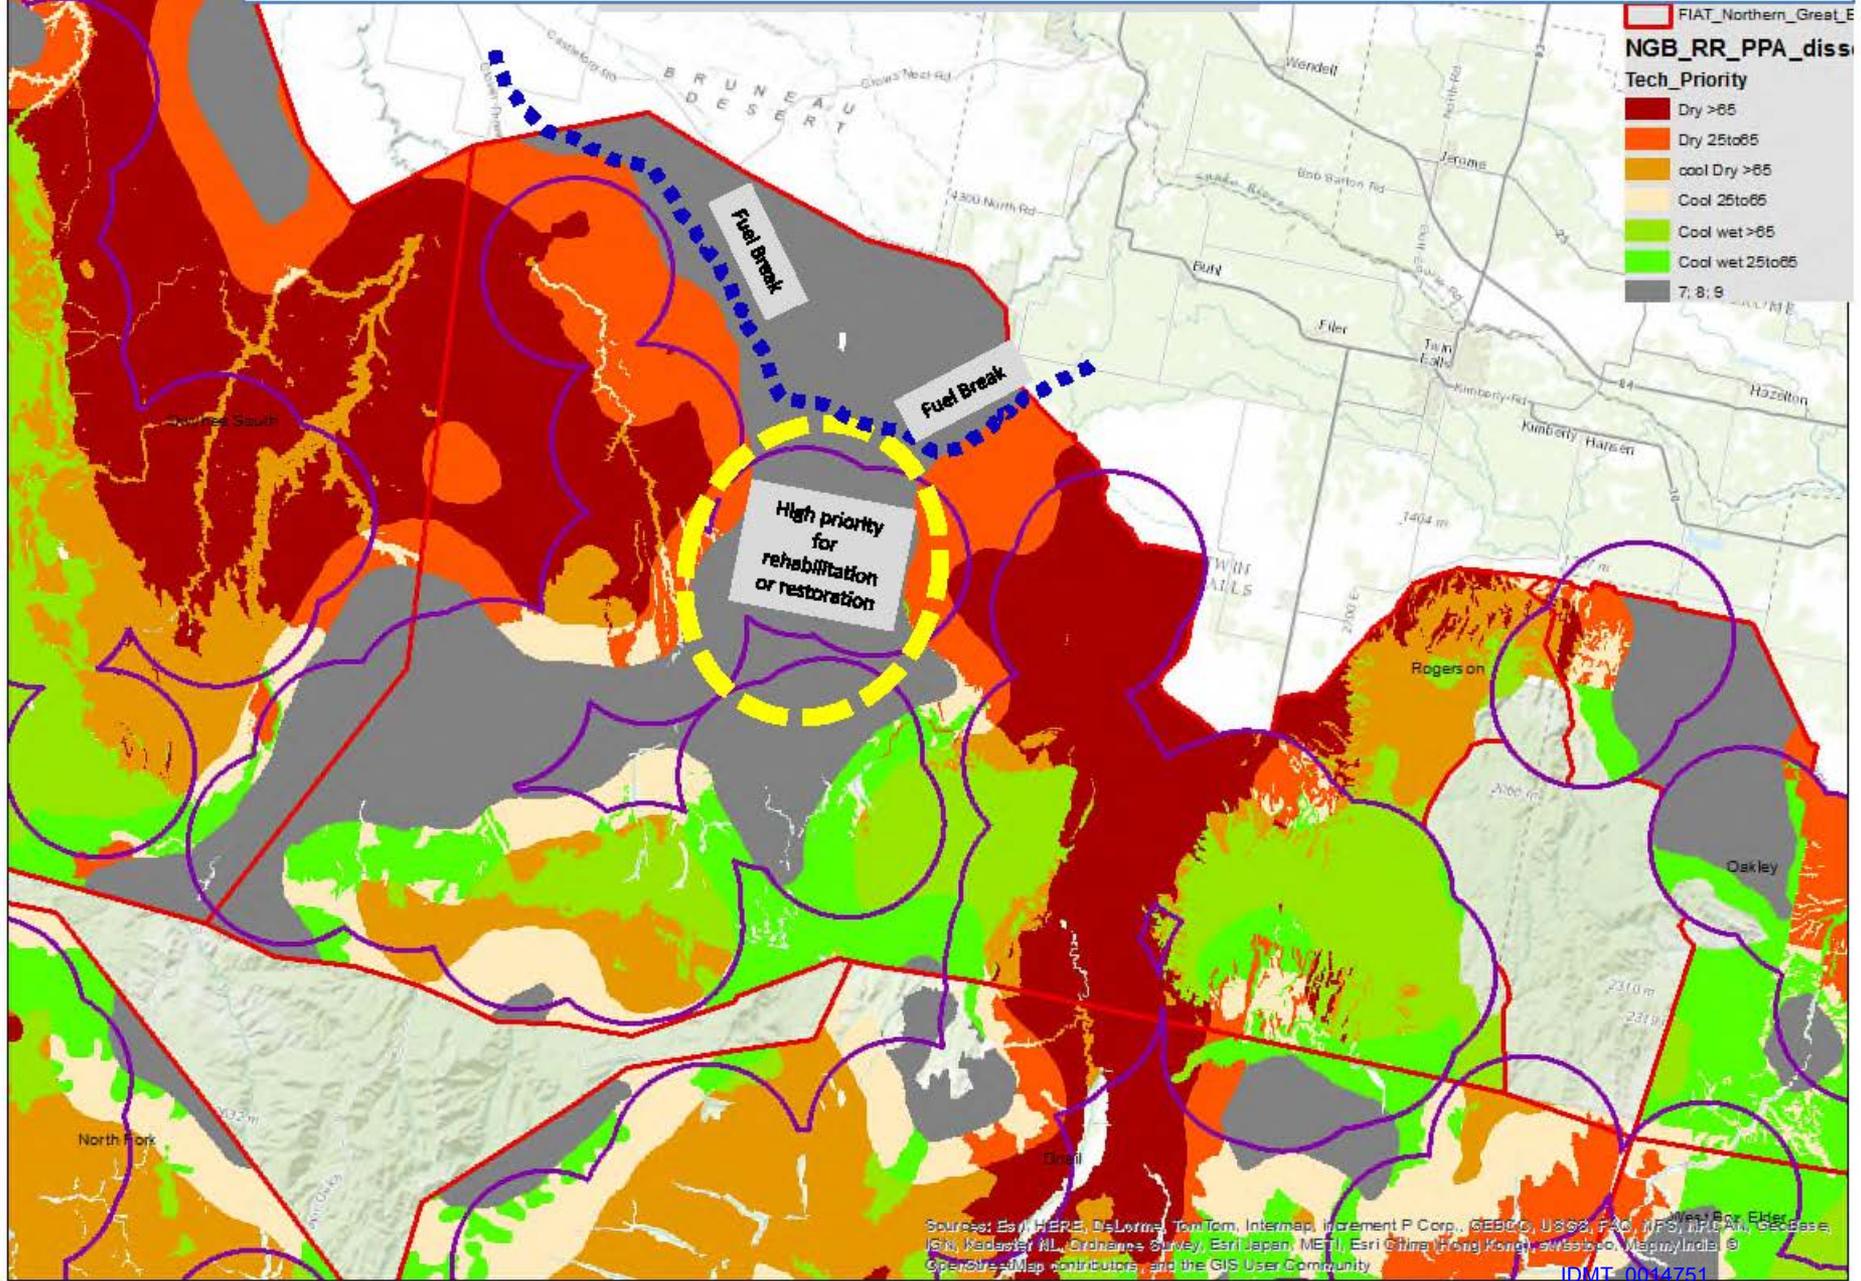

Post-fire Rehabilitation and Restoration/Recovery Priorities Example

- Using a portion of a different PPA than previous example to illustrate application of R&R concepts to post-fire rehabilitation and restoration/recovery treatments.
- Large wildfire perimeter (gray fill on following slide) includes soil temperature/moisture regimes from warm/dry in the North to cool/wet in the South. First priority for post-fire rehabilitation and habitat restoration would be the warm/dry zone inside the yellow dashed polygon. This area is within the 75% BBD and has sagebrush landscape cover >25% on both sides of the burn.
- Cool/dry zone would be the second priority for both management strategies unless there was a potential for cheatgrass becoming a dominant after a wildfire. If this situation exists, it is appropriate to identify these areas as a first priority treatment area as they are functioning as a warm/dry site relative to lower resistance to invasive annual grasses.
- Remainder of cool/dry, the cool/moist and cool/wet zones would be a third priority for habitat restoration and post-fire rehabilitation. However habitat recovery (grazing or off-road vehicle use restrictions) to facilitate the recovery of native vegetation is a priority outside of the warm/dry zones.
- Given the value of this area if it is successfully rehabilitated after a wildfire or has a successful habitat restoration project, it is appropriate to establish fuel breaks (see following slide) on the northern perimeter and to consider this area as a high fire suppression priority.

Post-Fire Rehabilitation & Habitat Restoration Example

Rogerson Project Planning Area

BLM Idaho's Implementation Strategy 3/10/15

BLM Idaho's GRSG implementation strategy can be broken into three distinct parts. The first part is the application of anthropogenic disturbance caps and adaptive management triggers. The Second part is the exception screening criteria and coordination with the State of Idaho for potential projects in PHMA or IHMA. The third part is coordination of GRSG Decisions and Policies with BLMs Existing Plans and/Major Activities in Idaho.

Part 1: Disturbance Caps and Adaptive Management

Idaho BLMs disturbance caps and adaptive management strategy is grounded in the Idaho Key Habitat map that has been updated on a yearly basis for the last 12 years. BLM is using this existing map as the base layer for determining the extent of any anthropogenic disturbance cap of 3% and the adaptive management thresholds of sagebrush loss. There will be one person, at the Idaho State office that is responsible for calculating disturbance and adaptive triggers as proposals are received by the field. This person will coordinate with the field offices, their State of Idaho counterparts and other adjoining States if the calculations trip or approach a trigger.

Part 2: Exception Criteria

The Idaho plan provides exception criteria for infrastructure projects in PHMA or IHMA. Idaho BLM will run the proposal through their screen that consists of the following steps: 1) BLM will determine if the proposal is precluded by the plan. For example, a solar project in PHMA (PHMA is solar exclusion solar). 2) If the proposal is not precluded by the plan and it may meet the exception criteria, BLM will share the proposal with the State to begin their screening process. While BLM Idaho is running the proposal through their screening process the State of Idaho will conduct their own screening process where they determine if the exception criteria are met. Idaho BLM will coordinate with the State of Idaho and receive a recommendation from Idaho's task force, through the State on whether the State recommends a project in PHMA or IHMA meets the exception criteria. 3) If the proposal meets the exception criteria, and the decision is made to move the proposal forward, BLM will analyze the effects. BLM will work with the proponent to avoid and minimize effects. 4) BLM will share residual effects with the state who can determine compensatory mitigation if warranted.

Part 3: Coordination of GRSG Decisions and Policies with BLMs Existing Plans and/Major Activities in Idaho

There are five existing policies that are linked to the GRSG planning effort that need to be coordinated with BLMs existing plans or major activities. The policies are 1) Secretarial Order; 2) FIAT; 3) HAF; and 4) GRSG Vegetation Objectives. These policies will require an update in the Idaho BLMs Fire Management Plans, and ESR programmatic EAs. They will cause fuel break projects, vegetation treatments, any reclamation projects, and grazing permit renewals to be prioritized.

PRELIMINARY - IDAHO SG IMPLEMENTATION STRATEGY SUMMARY

Assumptions:

BLM, FWS/FS and State agencies are currently implementing significant portions of the SG RMP Proposed Plan guidance. Key habitat area maps (source docs for PHMA/IHMAs/GHMA) were developed 12+ years and are updated annually. Idaho BLM and its state and federal partners have been working together to implement conservation measures to ameliorate anthropogenic threats in key SG habitat for many years.

BLM anticipates that changes will be needed in Idaho BLM guidance to ensure effective and consistent implementation of plan allocation decisions and other guidance across the state e.g., Sagebrush Focal Area, adaptive management, mitigation and monitoring directives. The project proposal screening process applied to proposals in Priority and Important SG Habitat will be adapted to address key allocation and other plan decisions.

Cooperative agreements/MOUs with state and federal partners, and internal/external review and analysis processes, will need to be updated to accommodate RMP allocation and other decisions.

The HAF is the primary assessment tool used to determine if grazing allotments are meeting standards and guidelines and vegetation objectives. All programs utilize HAF to complete RHAs for grazing permit renewals.

Monitoring/Data Collection: State and Federal agencies currently collect population data to support monitoring and adaptive management programs, but BLM will likely rely on the State to inform population trigger exceedences. BLM and FS will be the primary source of habitat disturbance data, and are in the best position to make determinations related to trigger exceedences.

Review/coordination process: BLM will work with the State, FS and FWS to further define and implement a coordination process to implement adaptive management, disturbance cap and mitigation direction and policies. Define limitations, authorities and other issues to ensure an effective, collaborative implementation processes.

Vegetation decisions impacting policy/plan/project updates and training: Secretarial Order 3336 and planning decisions including application of the FIAT, HAF and Vegetation Objectives will inform prioritization of projects and be incorporated in:

- Fire management plans
- Fuels and fire break projects
- ESR treatments and programmatic EAs
- Vegetation restoration projects
- Disturbance reclamation projects
- Grazing permit renewals

Subject: Great Basin GRSG - NEPA PM Call Tuesday

Reminder - Great Basin GRSG PM conference call Tuesday (2/17) at 10AM Pacific Time / 11AM Mountain Time. Call in info and draft agenda below.

877-928-4213
participants: 9009662#

Agenda

- I. WO updates – Michael

2. Schedule – immediate critical paths:
 - Chapter 2 Status (due 2/20)
 - Proposed Plan
 - Forest Service Plans
 - GIS for acreage allocations (all alternatives)
 - GIS for impact analysis
 - Supporting appendices (e.g., RDFs, mitigation monitoring, etc.)
 - Chapter write up
 - NOC completes CEA tables – 3/13
 - Comment response – 3/20
 - Direct and Indirect impact analysis - 3/27
3. Schedule and quality
 - EMPSi QA and Submittal Process = write section, technical review, technical edit, formatting and production, management review.
 - Impact of schedule slips and quality
4. CEAs Update – Drew
 - Received SOL Comments
 - Schedule
 - Integration of subregional analysis into the MZ CEA
5. Comment response update – Carol-Anne
6. Other topics?
7. Action Items from past calls

Sub regional PMs and Forest Service

- Vicki: Create an appendix for the disturbance caps guidance.
- ALL: Submit ADPP and other requested materials by Friday to WO.
- Lauren: Send socioeconomic questions to the team.
- All subregions to include logos on maps.

EMPSi

- Drew: Work on CEA timeline and coordinate with project leads.
- Carol-Annie: Coordinate with EMPSi PMs to update the comment responses.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

March 3, 2015 10:00 a.m. PST

Attendance: Lauren Mermejo, NV; Randy Sharp, NV; Quincy Bahr, UT; Skye Sieber, UT; Jon Beck, ID; Johanna Munson, ID; Joan Suther, OR; Jessica Rubado, OR; Stephanie Carman, WO; Michael Hildner, WO; Vicki Herren, WO; Frank Quamen, NOC; Matt Magaletti, WY; Mitch Snow, WO
USFS: Glen Stein; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat; Carol-Anne Garrison

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- Julie: Follow up with ICF regarding when they need their inputs to re-run IMPLAN.
- ALL: Provide inputs to ICF as soon as they are ready.

Meeting Minutes

WO Update

- Department has convened a separate communications team to prepare a communication plan. Initial focus is on outreach to counties and other formal cooperators. Will be presented to State Directors on Thursday and then the WGA during a webinar on Friday. Will also develop national roll outs and coordination with Forest Service, USFWS and NRDC.
- Formal direction (who to talk to, when, talking points) will be provided to sub-regions, so please don't reach out yet to other cooperators. Continue working with states, Forest Service, and USFWS.
- Department wants to approve everything, including state variations.
- WO also working on in-reach, getting the various WO offices up to speed on the decision points.
- WO have been reviewing Proposed Plans, Great Basin looks good.
- Disturbance appendix is under development. No due date yet.

Schedule – Critical Path Updates

- Proposed plans – done
- Forest Service plans – sent out to each of the states
- GIS for acreage allocations
 - OR – remaining acreage allocations will be sent tomorrow; impact analysis not complete until Monday, March 9
 - ID/MT – anticipate impact analysis complete by 3/13.

- UT – anticipate data sets for proposed plans and associated impact analysis complete by 3/13 (originally anticipated 3/11).
- NV/CA – they are behind because they are revising all maps for other six alternatives to send to NOC for CEA. Then will calculate acreages for Chapters 3 and 4.
- Appendices – important these are available for impact analysis (e.g., RDFs, mitigation) since many are highly supportive to Chapter 2. Most sub-regions are close to finishing the appendices.
- Printing – maps and RDFs will be printed. If sub-regions have others that need to be printed, that is fine, but should be cognizant of time needed to print the document (5 day printing window).
- CEA tables – NOC has been incorporating some changes; if they received all NV/CA data and it passes QA/QC, should be on track to finish on 3/13.
- Comment response – internal due date is 3/20. Carol-Anne will be revising the national responses, but additional work will be needed on the sub-regional level to finalize and incorporate in FEIS.

Schedule and Quality

- EMPSi provided an example of the QA and submittal process, including technical review, edit, formatting, and management review. This process is incremental and takes time. When there is a schedule slip, need to eliminate some of the QA measures, which will impact quality.
- Expect some of the QA may not be implemented for some of the reviews (e.g., BLM may review a rougher draft than normal, but the document will eventually get through formatting/tech edit).
- EMPSi will be clear with sub-regions regarding expectations and what/what not to comment on.

Cumulative Effects Analysis Update

- Received comments on the CEA template from Solicitors. May have questions for Sarah/Aaron, and EMPSi is spending this week addressing them. They will be updating all CEA templates.
- Working on calendar dates for when each CEA will be sent to BLM reviewers. Drew will be in touch with Lauren and Matt.
- Integration of sub-regional analysis into the MZ CEA - DEIS included Tier I qualitative sub-regional GRSG analysis. EMPSi is incorporating that analysis as part of the Tier II cumulative.

Definition of High Voltage Transmission

- There has been some conflicting direction and confusion. It is important that we have a consistent definition of what a high voltage transmission line is across all sub-regions. Likely this threshold will be 100-kV.

Other

- Team is unclear when ICF needs their socioeconomic inputs. Julie will follow up with ICF regarding this. Sub-regions should provide the inputs as soon as they are ready. Input for socioeconomic relies on the output from other resources, so delays will trickle down.

- Idaho tripped hard trigger in Owyhee where it abuts Oregon. WO had an extensive discussion with the Solicitors and Department and will meet with Steve Ellis to talk about it. Some concern about tripping triggers that aren't yet triggers (plans not finalized). Hold off on analysis right now while they discuss legal/policy ramifications.
- Lauren and Matt will discuss merging this call with the Rocky Mountain Region's weekly call.

Subject: GRSJ joint GBR/RMR NEPA Leads Call - Weds

Reminder - Great Basin GRSG PM conference call Wednesday at 10AM Pacific Time / 11AM Mountain Time. Call in info and draft agenda below.

NOTE – New call in information:

Access Number: 1-218-632-0734

Passcode: 807966#

Agenda:

1. Confirm day and time for the call
2. WO updates – Michael
 - Response to WO input (Friday)
3. Coordination with FWS and State
4. Need for a dear reader letter and executive summary template for amendments
5. Glossary and references
 - New references and terms - incorporation in appropriate chapters and appendices.
6. Schedule –
 - Reminder of upcoming critical paths:
 - Chapter 2 (due 2/20)
 - NOC completes CEA tables – 3/13
 - Direct and Indirect impact analysis - 3/27
 - Compile PLUPA/FEIS – 4/10
 - Round robin on status – all
7. CEAs Update – Drew
 - Changes to template from internal review of Buffalo CEA
 - Net Conservation Gain. Should we drop this concept from the CEAs or will a definition be created in time?
 - CEA WebEx. Confirm March 25 date for this WebEx.
8. Comment response update – Carol-Anne
9. Other topics?
10. Action Items from past calls

Sage-Grouse Great Basin Region Project Management Team Weekly Call

March 11, 2015 10:00 a.m. PST

Attendance

BLM:

CO: Erin Jones, Bridget Clayton;

ID: Jon Beck;

MT: John Thompson, Ruth Miller

NOC: Frank Quamen;

NV: Lauren Mermejo, Randy Sharp;

OR: Joan Suther, OR;

SOL: Aaron Moody, SOL; Sarah Shattuck, SOL;

UT: Quincy Bahr, Skye Sieber;

WO: Stephanie Carman, WO; Michael Hildner, WO; Mitch Snow

WY: Matt Magaletti; Pam Young

EMPSi: David Batts; Chad Ricklefs; Holly Prohaska; Derek Holmgren; Drew Vankat; Meredith Zaccherio

Action Items

WO

- Stephanie will review NTT guidance and follow up with group on RDF direction.
- WO developing definition for net conservation gain.
- WO will provide briefing schedule on the 6 revisions (Buffalo, etc.).
- Stephanie will follow up with group on what can be shared and with USFWS and the states by the end of the week.
- WO will draft dear reader letter (s).
- Vicki will provide guidance on Vegetation objectives/standards/ etc.

Sub regional PMs and Forest Service

- If questions on WO input on ADPPs please call Michael or Stephanie. PMs should send back table to WO with responses to comments by this Friday (03/13).
- All references and acronyms from main document and appendices should be put in their respective chapters in the main document.
- David and Lauren to check FFM notes and get back to group on PPH/PGH to PHMA/GHMA guidance.
- Idaho BSU definition will be provided to the other subregions.

EMPSi

- Working on Executive Summary Template.
- Chad to send out outlook reminder about new 9 AM Pacific meeting time.

- David and Lauren to check FFM notes and get back to group on PPH/PGH to PHMA/GHMA guidance.

Meeting Minutes

Confirm day and time for the call

- -Change call to 9 AM Pacific / 10 AM Mtn./ 12 PM Eastern
- -Chad to send out outlook reminder

WO updates – Stephanie and Michael

- Response to WO input (Friday)
 - If questions on WO input please call Michael or Stephanie. There is some confusion from the pre-consistency review because some guidance has superseded NPT guidance and comments have not followed those changes. Need to know what is still applicable from April NPT guidance.
 - PMs should send back table to WO with responses to comments by Friday.
- Communications effort: Meghan and Randy were in WO and put together a draft communication packet....probably a couple of weeks until it gets put together. Includes county and tribal consultations all contact except for USFWS, USFS and State liaisons.
- Required Design Features
 - Everyone is applying RDFs all in PHMA. Not all have been applied in GHMA. All RDFs need to apply to PHMA and GHMA.
 - In NTT mostly applied to PHMA. The only guidance for GHMA was applied to fluid minerals.
 - April guidance says RDFs will be applied to sagegrouse habitat= PHMA will now be applied to GHMA.
 - Concern that by saying applicable to GHMA it will increase workload for every site specific project.
 - As a rule of thumb need to apply RDFs from the NTT report to our Proposed Plan that apply to PHMA and GHMA.
 - Stephanie will review NTT guidance and follow up with group on RDF direction.
- High Voltage= 100Kv
- Net conservation gain- WO developing definition.
- Vegetation objectives table questions- The Vegetation objectives table should be based on local ecology as well as bird lifecycle requirements. Question on whether objectives or standards or what? Stay tuned for discussion on this with Vicki.
- Transwest Express- Affects WYO, UT, and CO...WO preparing for briefing with ASLM. Stay tuned on direction. Will not affect our plans, but will affect the Transwest Express plan. Q from TWE- UT said they are consistent by being excused from the plan. But still need to evaluate impacts on the sage grouse in project level analysis and expect it to be addressed in UT plan under cumulative. Also will be included in 3% disturbance.
- Assistant Secretary of Lands and minerals has concern over recent oil and gas sales and sage grouse habitat and appearance. Want to be briefed ahead of time for any projects in sage grouse habitat.
- 6 revisions (Buffalo, Bighorn, etc.)- Request for briefings from front hallway on these ahead of the drafts...expected mid-April. Any news on NOAs on those 6 revisions? Status is not known at this time. Options are review revisions April 24th and brief director second week or brief before and then review after. Stay tuned on direction.

Coordination with FWS and State

- Q: Are planners in the states allowed to share chapter 2 with the states? Most states have already shared their ADPPs on an individual basis. Direction for states is not known from WO.
- Status:
 - NV has shared the draft ADPP with the state of NV rep on the ID team and USFWS.
 - Utah has not shared the plan with state or whole plan with USFWS, just parts of it.
 - Oregon has a state rep on ID team and it has been shared with him. He has shared that up the ladder but not sure how far. Elements have been shared with governor's reps. but enough people in state office have it that it has probably been shared with governor. But, not with county.
 - Idaho has shared with ID Fish and Game and USFWS asked not to share with other departments yet. Sure it has been given to governor.
 - CO told the states what is in document but has not given them a hard copy. Have not shared with Coops.
 - WYO shared with states, but has not had opportunity to work with USFWS. Have not given any hard copies out.
 - MT has done a briefing with USFWS and State of MT but has not shared any hard copies.
- Everyone needs to coordinate with USFWS asap. But only share hard copies.
-Stephanie will follow up with group on what can be shared and with USFWS and the states by the end of the week.
- Q: If still doing pre-consistency review, should we wait to share those documents? Good point. Ideally, prefer you share Chapter 2 instead of just ADPP to provide context.

Need for a dear reader letter and executive summary template for amendments

- Peter Gower of EMPSi is writing Executive Summary template
-Revisions will stick with existing executive summaries from their drafts.
-WYO 9 and NW CO already have an executive summary. But, they will review template and see if it fits and how to incorporate to be as consistent as possible.
- The Dear Reader letter is an important place for outlining how plans are different and protest information, feel there should actually be three dear reader letters- BLM revisions, BLM and FS amendments and BLM amendments.
-WO will draft dear reader letter (s).

Glossary and references

- Q: Should all references from main document and appendices be put in the main document. Yes.

Schedule

- Reminder of upcoming critical paths:
 - Chapter 2 (due 3/20)
 - NOC completes CEA tables – 3/13
-95% done, waiting on NVCA for NA or Proposed (due today at noon) and any Oregon changes on Wind and Solar. No meetings for Oregon wind and solar have been set so think we should move forward on Oregon as is. Then ETA for doc to EMPSI on track for Friday.
-USFWS data deadline has been met. USFWS is requesting metadata. Data request from Frank for a paragraph stating how derived PHMA and GHMA-Need it by March 31st.
-NOC also making progress on landscape report.

- Direct and Indirect impact analysis - 3/27
-Should include subregional cumulative analyses as well. Then review for delivery to WO on 4/10.
- Compile PLUPA/FEIS – 4/10
- April 12-17th-Consistency review for entire FEIS, except CEA...be prepared for calls/questions. Buffalo needs to coordinate with Stephanie.
- April 25th CEA submitted for WO review.

Round robin on status – all

- MT-Met with State FWS, briefed on proposed plan last week. On schedule for plan ...one issue with SD with format that needs to be cleaned up. Need a common definition for a biologically significant unit. Asked USFWS and they said that was a BLM term. Need to determine the definitions. Group of leks and lek clusters? Or equal to PHMA? Concept came out of FFM in Oregon. Need to review notes and follow up. The definition will be different all the subregions. A BSU is defined in working with the state wildlife agency to delineate an area where disturbance monitoring and adaptive management would apply. Definition should start with intent...Idaho language will be provided to the subregions.
- CO-No update.
- WYO-On track for nine plan and big horn...recreating revision for buffalo because of ePlanning issues. Taking PDFs, converting into word and redeveloping entire document. Not sure if entire document will be available for the consistency review. Meeting scheduled with state and USFWS for Friday morning. And meeting with State Fish on Friday or Monday
- OR-Gave all acreage summaries to EMPSi. EMPSi working on impacts. Holding ID team meetings weekly. Meeting with ODFW with ID team today and USFWS later in the week. Continue to meet with WO on wind and solar.
- NVCA- ID team kickoff for impacts, realized proposed plan data had an error so resubmitting meeting with SETT on Monday March 16th. Amy continues to coordinate with governor's office and USFWS.
- ID-Meeting with state last week and discussed SFAs and buffers. Concerns about areas outside of priority habitat that are in SFAs. Following up with Frank and Stephanie. Think they are large areas, but are not. Getting EMPSi appendices and finalizing numbers this week for impact analysis. Talk with USFWS weekly. On track.
- UT- Met with State last Friday and went over concepts and aspects for ADPP. Still some issues with Anthro and West TAV. Also meeting with states about habitat objectives as well and trying to get local level information to determine what those should be. Met with USFWS two weeks ago-Went over changes from Draft. Acreage overlays for impacts to be done this Friday. EMPSi working on impacts. On track.

CEAs Update – Drew

- Changes to template from internal review of Buffalo CEA
-On track to have templates ready to go and start populating them next week. Will coordinate with Frank on receiving data
-March 25th CEA webex.
- Net Conservation Gain. Should we drop this concept from the CEAs or will a definition be created in time?
- CEA WebEx. Confirm March 25 date for this WebEx.

Comment response update – Carol-Anne

- On track with review and updates. She has finished review of four plans and has coordinated with the PMs on those plans.

Other topics

- PPH/PGH to PHMA/ GHMA

Makes sense that talk about pph and pgh in chapter 1 and 3, and PHMA and GHMA in 2, 4 and 5. But not all plans are doing this.

-In MT/DK left it as pph and pgh in chapter 3.

-UT uses occupied in chapter 1 and 3. But Utah has a unique situation with its habitat.

-FFM direction was PHMA and GHMA throughout all chapters with a crosswalk table in chapter 1.

-Is it appropriate to call it a management area in chapter 3?

-David and Lauren to check FFM notes and get back to group.

Subject: GRSG GBR/RMR NEPA Leads Call - Weds 9AM PT / 10AM MT / 12PM ET

Reminder - Great Basin GRSG PM conference call Wednesday at 9AM Pacific Time / 10AM Mountain Time. Call in info and draft agenda below.

Access Number: 1-218-632-0734

Passcode: 807966#

Agenda:

1. WO updates
2. Status of dear reader letter and executive summary templates
3. Drop in language – use as provided; EMPSi is only giving it a basic edit and not changing any content.
4. FS review of impact analysis chapter
5. Comment response process and update – Carol-Anne
6. PPH/PGH vs PHMA/GHMA guidance*
7. Schedule –
 - Reminder of upcoming critical paths:
 - NOC completes CEA tables – 3/13 – finalizing NV/CA
 - Direct and Indirect impact analysis - 3/27
 - Compile PLUPA/FEIS – 4/10
 - Review PLUPA/FIES – 4/17 (WO strike team)
 - Final CEAs – 4/24 (other reviews before)
 - Round robin on status – all
8. CEAs Update – Drew
 - Schedule and handling CA/NV timeline
9. Other topics?
10. Action Items from past calls

WO

- Stephanie will review NTT guidance and follow up with group on RDF direction.
- WO developing definition for net conservation gain.
- WO will provide briefing schedule on the 6 revisions (Buffalo, etc.).
- Stephanie will follow up with group on what can be shared and with USFWS and the states by the end of the week.
- WO will draft dear reader letter (s).
- Vicki will provide guidance on Vegetation objectives/standards/ etc.

Sub regional PMs and Forest Service

- If questions on WO input on ADPPs please call Michael or Stephanie. PMs should send back table to WO with responses to comments by this Friday (03/13).
- All references and acronyms from main document and appendices should be put in their respective chapters in the main document.
- David and Lauren to check FFM notes and get back to group on PPH/PGH to PHMA/GHMA guidance.
- Idaho BSU definition will be provided to the other subregions.

EMPSi

- Working on Executive Summary Template. – submitted
- David and Lauren to check FFM notes and get back to group on PPH/PGH to PHMA/GHMA guidance.

* FFM August 2014 PDX:

- **OUTCOME:** It is agreed that sub-regions will continue to use priority and general habitat (core and important for Idaho) as the geographical delineator for management measures and analysis, but that all plans will include a crosswalk that overlays priority and general habitat with PACs.

- Clarity is needed to demonstrate to others that these ADPPs provide conservation certainty. Changes in boundaries across stateliness will make telling the story difficult. While there might be a reason, we need to assess if it is worth doing it that way. Use only two terms: preliminary priority habitat and preliminary general habitat.

FFM September 2014 Denver:

- **OUTCOME:** Agreed to terms “Priority Management Area” and “General Management Area.” The Final EIS needs to document any changes to nomenclature. Plans can use other subsets for areas with other special management (e.g., restoration areas or connectivity areas).
- **OUTCOME:** Each plan will develop a crosswalk with the BLM management area terms (e.g., priority management area and general habitat area) and State plan nomenclatures in each of the ADPPs.

Subject: GRSG GBR/RMR NEPA Leads Call - Weds 9AM PT / 10AM MT / 12PM ET

Reminder - Great Basin GRSG PM conference call Wednesday at 9AM Pacific Time / 10AM Mountain Time. Call in info and draft agenda below.

Access Number: 1-218-632-0734

Passcode: 807966#

NOTES:

- (1) *The second part of the meeting will focus on BLM and Forest Service coordination. Project leads without Forest Service involvement need not participate (but are welcome).*
- (2) *Please review the action item list below and let me know if anything is complete and should be removed; we want to make sure nothing slips through the cracks and have a useful list for everyone.*

Agenda:

1. WO updates
 - Direction on transmission line analysis
 - Comm plan
 - Drop in language on actions, habitat objectives, disturbance
 - Dear reader and exec summary
2. Path forward for NOAs/WO Briefings
3. CEAs Update – Drew
4. Submittal of the IMT Consistency Review – MS Word files to extent possible
5. Footers to include month and year of Proposed LUPA/Final EIS (June 2015)
6. Schedule –
 - Reminder of upcoming critical paths:
 - Direct and Indirect impact analysis - 3/27
 - Compile PLUPA/FEIS – 4/10
 - Review PLUPA/FIES – 4/17 (WO strike team)
 - Final CEAs – 4/24 (other reviews before)
 - Round robin on status – all
7. Other topics?

BLM / Forest Service Coordination (FS and BLM CO, WY, UT, ID, NV, and WO)

1. Status of BAs
2. Comm Plan review by FS
3. Impact analysis review and incorporation
4. Other topics?

Action Items from past calls

WO

- Provide written guidance for Administrative Record regarding use of PPH/PGH and PHMA/GHMA in FEIS.
- WO will provide briefing schedule on the 6 revisions (Buffalo, etc.).
- WO will draft dear reader letter (s).
- Vicki will provide guidance on Vegetation objectives/standards/ etc.

Sub regional PMs and Forest Service

- All references and acronyms from main document and appendices should be put in their respective chapters in the main document.
- Idaho BSU definition will be provided to the other subregions.

Sage-Grouse Great Basin and Rocky Mountain Regions Project Management Team Weekly Call

March 25, 2015 9:00 a.m. PST

Attendance

BLM: Erin Jones, CO; Bridget Clayton, CO; Jon Beck, ID; Johanna Munson, ID; Sandy Leach, MT; John Carlson, MT; Lauren Mermejo, NV; Randy Sharp, NV; Joan Suther, OR; Jessica Rubado, OR; Aaron Moody, SOL; Sarah Shattuck, SOL; Quincy Bahr, UT; Stephanie Carman, WO; Michael Hildner, WO; Mitch Snow, WO; Vicki Herren, WO; Matt Magaletti, WY; Pam Murdoch, WY

Forest Service: Glen Stein

EMPSi: David Batts; Chad Ricklefs; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat; Meredith Zaccherio

Action Items

WO

- Send additional drop-in language when available

Sub regional PMs and Forest Service

- PMs: Let Glen and Madelyn know when you need impact analysis feedback returned next week.
- PMs: Discuss county cooperator review with your State Director.

Meeting Minutes

WO Updates

- Had a follow up call last week regarding transmission line analysis for Presidential priority projects and a subsequent call with WO staff and SOL. Decided that 1) intention of the language is that Presidential priority projects are not just excepted from the allocation for ROW, but for everything within the plan. GRSG will be addressed during NEPA for the transmission lines; and 2) the priority projects should be analyzed in the CEA, and WO will provide drop-in language to use for the direct and indirect impacts.
- MT would like guidance for any other large projects, such as a proposed pipeline.
- COM plan draft was distributed last week. Having a call tomorrow to discuss comments. Ed and Steve called State Directors yesterday to discuss other communications with partners.
- Other drop-in language that WO is working on (expected this week):
 - Lead in paragraph for habitat objectives table
 - Disturbance appendix
 - Ongoing discussions regarding grazing and some clarifications will be provided, including a definition of site potential.
 - Mitigation language – clarification of what that applies to. Based on Table 2 in the Monitoring Framework.
- There are a lot of moving parts, still changing guidance.

- Working on Executive Summary. Dear Reader letters are ready to be distributed.
- Will be talking to the states at the WGA task force meeting next Monday/Tuesday.
- Submit FEIS to IMT as word files except some appendices which will be PDFs. Let WO know if you won't be able to make the deadline. May be using a SharePoint site.
- Oregon and Adaptive Management –Stephanie will follow up with WO staff for clarification.

Path Forward for NOAs/WO Briefings

- Less than a month to prepare for this. Plan was to have individual NOAs for revisions and one NOA each for amendments in Great Basin and Rock Mountain Regions. Stephanie will check to see if this has been approved.
- WO IMT review of plan revisions – they will focus on GRSG portions for consistency.

CEA Update

- CEA webinar will follow this call. In the webinar, Drew will review the CEA outlines, what they do and don't do. Finishing several initial draft CEAs to be sent out on Monday.
- For each CEA, the lead Management Zone reviewer will coordinate with the affected project leads. Their comments will go to the Management Zone reviewer so EMPSi gets one set of consolidated comments.

Footers

- All footers will have the title of document with June 2015 as the date.

Round Robin on Status

- Most sub-regions indicated that they are continually finding issues that need to be resolved or errors revised. A common error cited was GIS errors.
- Oregon – Continue to find things they need to revise. Very close to being on schedule, but some data requests have been sent to EMPSi late. State Directors have not met with any cooperators.
- Idaho – Finished socioeconomic inputs this morning and sent to Julie. Have provided information to EMPSi and EMPSi is sending impacts analysis this week. Seem to be on schedule. State is not meeting with BLM anymore, they are having phone conversations. Sent Chapter 2 digitally to the state this morning.
- Utah – Have not met with state or USFWS specifically related to GRSG. They would like to see the plan, but have not received approval to distribute. Similar to Oregon, they are barely on schedule, as little things keep requiring revisions (e.g., acreage calculations). Everything is to ICF and EMPSi. Plan is to get inputs from EMPSi this Friday (BLM is writing GRSG and climate change internally). ICF will provide analysis on Monday. Next week, will be reviewing analysis with internal ID team. Preparing language for Chapter 2, and compiling appendices and maps.
- NV/CA – Has also had some issues with acres. They are writing their own analysis and providing to EMPSi for QA and formatting. Plan on having everything to EMPSi by this Friday. No formal meetings with state or USFWS, but talk with USFWS regularly. ICF is supposed to have social/economic analysis by this Friday. Warning that IMT review draft will be in rough shape.
- WY – They are not meeting with state or USFWS this week. Discovered potential issue related to data submitted to NOC. Some errors in data for two alternatives, may affect the CEA, but unsure. WY on schedule.
- CO – Met with local USFWS last week and meeting with Governor's office and DNR this Friday. Supposed to have socio/economic analysis on 4/3. Otherwise will submit everything to EMPSi by this Friday.

- MT – They are on schedule, but finding small issues as they go. Received permission to share Chapter 2 hard copy with state partners. Unsure whether they are approved to share with USFWS. Regarding the coalition of counties that challenged the NTT/COT/BER under the Data Quality Act, most of the Montana county cooperators have signed on to this challenge. Does this affect how they interact with them? SOL are looking into it.

Forest Service Updates

- Biological Assessment is nearly final, but Glen was unsure of dates. Joan will follow up with Chris Colt regarding timeframe. BA will be included as an appendix.
- Utah and Montana were two plans that were under consideration for formal consultation. MT will be informal. The 135 day review period for USFWS is a concern, but Utah heard that they won't need the full review period.
- Forest Service reviewed the COM plan and are developing their own. Concerned about release of FEIS on website since they don't have an external GRSG website.
- Impact analysis review – need to know from each sub-region when they need input. All sub-regions will let him know.
- Reasonably foreseeable future actions – updated these for all project leads. Let Glen know if there are any issues with the list.
- UT – another change regarding Anthro. Glen and Quincy will discuss.
- Next week, getting together in Ogden to review impacts analysis. Looking for fatal flaws.
- Consistency review will look at both Forest Service and BLM, where applicable.

Other

- Chapter 6 – Is there language that can be used consistently regarding coordination with counties between draft and final? Decision was made to focus chapter 6 discussion on federal coordination, as county coordination is discussed elsewhere.
- Unsure when county cooperators will review plans. Project Leads should discuss with their State Director.

Hi Everyone,

I appreciate you taking the time to attend today's CEA call and presentation. Attached to this email is a copy of the presentation. Please do not hesitate to contact me with any questions, comments, etc. (my phone number is in my signature below, or feel free to email me). The first CEAs will be delivered to the BLM/FS for review starting early next week!

Thank you,

Drew

Subject: GRSG CEA Review Presentation

When: Wednesday, March 25, 2015 1:30 PM-2:00 PM (UTC-05:00) Eastern Time (US & Canada).

Where: GoToMeeting

Hi Everyone,

I will be hosting a conference call and online presentation for the GRSG CEAs on Wednesday, March 25 at 10:30am Pacific. This will be an opportunity to familiarize yourselves with the CEAs, their methodology and content, and the review process and schedule.

Please use the following link to **view the presentation** during the call:

<https://global.gotomeeting.com/join/657249565>

And please use this phone number and code **for audio** during the call:

218-632-0734

Code: 3775#

Thank you and talk with you on Wednesday,

Drew

GRSG Cumulative Effects Analyses (CEAs)

Analyzing cumulative effects on GRSG
at the WAFWA Management Zone
level (i.e., Tier II analysis)

For 14 separate EISs

Builds off of, and replaces, the Tier I
analysis in the Draft RMP/As

Methodology and Assumptions

- Developed with staff at the NOC and vetted and approved by GRSG leadership team (2013-2014)
- Utilizes MZ-wide datasets provided by the NOC
 - RMP/LUP allocations for each alternative
 - Delineated by PHMA and GHMA
- COT report used to identify “present and widespread” threats in each Management Zone

Methodology and Assumptions

- List of past, present, and reasonably foreseeable future actions for each MZ
 - From Draft RMPs and correspondence with planning leads
- Quantitative analysis focused at the Management Zone level
- Quantification of effects occurring at the subregional level, but only to establish context for subregion's relative influence on the larger Management Zone

Methodology and Assumptions

- Analysis for each alternative
 - Always assumes the Proposed Plans in the rest of the Management Zone are being implemented
- Timeframe for analysis is 10 years
- Utilizes “net conservation gain” concept

CEA Outline

- Introduction
- Methods and Assumptions
- Existing Conditions in Management Zone and Planning Area
 - GRSB Populations and Habitat (MZ level)
 - Planning Area Habitat Conditions
 - RMP alternatives themes
 - Population Trends in the MZ

CEA Outline

- Regional Efforts to Manage Threats to GRSG
 - Statewide efforts
 - Working groups
 - NRCS
 - Other Regional Efforts (e.g., tribal efforts, state plans under development, local conservation plans, etc.)
- Relevant Cumulative Actions (past, present, reasonably foreseeable)

CEA Outline

- Threats to GRSG in Management Zone
 - For each threat:
 - Nature and Type of Effects
 - Conditions in the Management Zone
 - Impact Analysis by Alternative (NOC Data)
 - Present and describe NOC data
 - Follow with discussion of past, present, reasonably foreseeable future actions
 - Conclude with cumulative impact of each alternative in conjunction with past, present, reasonably foreseeable future actions

CEA Outline

- Conclusions
 - For each alternative
 - Management Zone focus
 - Inclusive of past, present, and reasonably foreseeable future actions
- Also included: References and Appendix of Relevant Cumulative Actions

Presidential Priority Transmission Lines

- Currently receiving guidance on how these will be analyzed in the CEAs.
- These projects are exempt from all requirements in the GRSR EISs (but are still subject to other applicable laws and regulations, IMs, etc.)
- Will be analyzed by name in the CEAs
- Developing text right now

What the CEAs Do

- Landscape-scale NEPA analysis
- Includes a mix of quantitative and qualitative analysis
- Includes “coarse” grain data
- Focuses on the MZ, not the planning area
- Focuses on “present and widespread” threats
- Uses PHMA as a proxy for key items such as leks, early brood rearing habitat, etc.
- Focuses conclusions on impacts on the bird

What the CEAs Don't Do

- Do not include modeling (USFWS is running their own models)
- Do not include data by PAC or population
- Do not focus on the planning area
- Do not specifically analyze predation (omitted from list of threats in Final COT report)

CEA Process and Schedule

- NOC Data – Delivered to EMPSi
- Crunch data and insert into Word tables
- Internal Draft CEA reviewed by EMPSi project manager
- Draft CEA sent to BLM/FS for review
 - Management Zone lead reviewer(s) and planning lead
- CEA included in larger EIS for WO review

CEA Process and Schedule

- Management Zone Reviewers:
 - MZ I: John Carlson
 - MZ II: Jenny Morton
 - MZ III: Randy Sharp and Arlene Kusic
 - MZ IV: Jon Beck
 - MZ V: Joan Suther

CEA Process and Schedule

- BLM/FS reviewers have three business days to review each CEA
- Matt and Lauren developed process for coordinating edits between MZ leads and planning leads
- All comments in track changes
- Submit one track changes CEA to EMPSi at end of each review period

CEA Process and Schedule

- MZ I CEAs Submitted by Close of Business:
 - 9-Plan: COB April 9
 - Billings: COB April 6
 - Buffalo: COB March 30
 - HiLine: COB April 2
 - Lewistown: COB April 9
 - Miles City: COB April 6
 - North Dakota: COB April 6
 - South Dakota: COB April 15

CEA Process and Schedule

- MZ II Submitted by Close of Business:
 - 9-Plan: COB April 9
 - Bighorn: COB March 30
 - Billings: COB April 6
 - NW Colorado: COB April 3
- MZ III Submitted by Close of Business:
 - Nevada/California: COB April 10
 - Utah: COB April 14

CEA Process and Schedule

- MZ IV Submitted by Close of Business:
 - Idaho/SW Montana: COB March 30
 - Oregon: COB April 2
 - Utah: COB April 14
- MZ V Submitted by Close of Business:
 - Nevada/California: COB April 10
 - Oregon: COB April 2

GRSG Implementation and Coordination

The BLM, Forest Service, US Fish and Wildlife Service and the State of Idaho have coordinated on GRSG monitoring and management for numerous years as part of the 2006 Idaho Sage Grouse Conservation Plan. Much of this ongoing work provides a firm foundation from which to build future coordination efforts, especially in regard to implementation of the GRSG RMP Amendment. With some specific adjustments and additional inclusions in those efforts the effective implementation of the GRSG RMP Amendment can be achieved.

There are several decisions, or components of decisions that would benefit from close coordination between the State of Idaho, BLM, Forest Service and the US Fish and Wildlife Service. These include: application and assessment of the adaptive management strategy; application of the right-of-way screening process; and development and implementation of any potential project mitigation efforts.

Figure 1 describes a conceptual relationship between the agencies for coordination and project evaluation/implementation.

Figure 1 – Conceptual Relationship Between Agencies

For description an example project proposal will be tracked through the consideration and evaluation process.

I. Project Proposal is Initially Screened by BLM or Forest Service

This initial screened would evaluate whether the proposal conforms to the land use plan allocation decisions (Open, Open with Limitations, Closed). The BLM/Forest Service Field Office or Ranger District would work in coordination with the State or Supervisor's Office to evaluate this conformance.

For BLM if the proposal is not in conformance then a non-conformance letter from the State Director would be sent to the project proponent and the project would not be considered further.

If the project were found to conform to the land use plan allocations then consideration would continue.

II. Project Proposal would be Coordinated with State and USFWS

The State Implementation Task Force (set up through Idaho Executive Order) would convene to apply the right-of-way screening process to the proposal, informed by GRSG population monitoring accomplished by IDF&G. This evaluation would be vetted through the Governor's Office and a recommendation from the Governor would be provided to the BLM/Forest Service.

The BLM and/or Forest Service would work with local offices to apply the right-of-way screening process to the proposal, informed by the disturbance level (cap), and habitat conditions (amount).

The BLM/Forest Service decision maker would utilize the information from internal review and State recommendations to determine whether the project conforms to all land use plan guidance and whether to consider the project further.

For BLM if the proposal is not in conformance then a non-conformance letter from the State Director would be sent to the project proponent and the project would not be considered further.

If the project were found to conform to the land use plan guidance then consideration would continue.

III. BLM and/or Forest Service would Initiate Project NEPA

The NEPA analysis would be developed by the local unit office in full consideration of local habitat conditions. This process would describe alternatives to the proposal that would reduce or eliminate impacts and full identify residual impacts to GRSG.

IV. Share Residual Impacts with the State of Idaho and USFWS

The State Implementation Task Force would consider the residual impacts and work to develop an appropriate mitigation package to be included within analysis of the project proposal. This Governor would recommend to BLM the inclusion of the mitigation package within the project proposal.

V. BLM Incorporates and Analyzes Mitigation in NEPA Evaluation

VI. State of Idaho would Administer Mitigation Consistent with the Mitigation Strategy

As part of the implementation of the GRSG RMP Amendment the BLM and Forest Service will work cooperatively with the State to develop a Mitigation Strategy. Part of this strategy will define the operating procedures such as credits, banking, funding process, etc. This component is likely to strongly involve State oversight, with the specifics remaining to be determined.

VII. Mitigation is Implemented

Brent Ralston

Idaho/Montana Sage-Grouse ID Team Meeting

June 19, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Nika Lepak; Trisha – NRCS; Natalie Cooper; Mike McDonald; Bruce Schoeberl; Dustin Miller; Cally Younger; Katie Powell; Brandon Knaptan; Gloria Jakovac; Jason Wright; Rob Mickelsen; Jesse Rawson; Jesse German; Elena Shaw

Meeting Minutes

Project Update

- Over the last 6 weeks, have been responding to National Policy Team direction and have submitted several memos to the Washington Office (WO). USFWS has been briefing through their channels as well. No official word yet, but there is a meeting this afternoon and expecting approval to move forward. UT also still waiting, but NV/CA and OR have received approval.
- The delay is likely due to concerns with other plans that have been a higher priority for WO.
- Forest Service has been working on their proposed plan. Received and incorporated comments from forests and have been conducting final reviews. Expecting an approved proposed plan today. The plan was developed on a rangewide scale and will be used as a framework on a subregional basis. We will modify it to reflect the subregional EIS (e.g., incorporating the 3-tiered habitat system).
- Forest Service has also begun some preliminary effects analysis because the FS approach to grazing is different from BLM.
- BLM map has been finalized, preparing to send GIS to the NOC.
- Brent has been incorporating comments on the proposed plan and compiling associated appendices. Hoping to send out final proposed plan within a week.
- Next steps – once final approval for the proposed plan, then send out to team and pull together for a 2 week cooperating agency review.
- Then developing the final EIS –make edits to the DEIS based on internal and public comments;
- Natalie has been looking at some corridor-related information. Preparing data layer and sending to Marcia at EMPSi by the end of the week. She will compile the maps to look at disconnects between state boundaries on a regional level.

Preparation of FEIS

- Document is separated into chapters. Brent has been revising Chapter 1 and proposed plan. EMPSi revising Chapter 2. Some format decisions to be made (removing the big table of alternatives; inclusion of Alternatives D and E).
- Appendices – most in support of proposed plan. Some other appendices have supporting information for the other portions of the document.
- Chapters 3 and 4 – ID team will review each resource section and identify changes in response to public comments as well as other changes to improve the section. Ensure we have laid the

foundation in Chapter 3 for what we say in Chapter 4 (e.g., GRSG – population information is not discussed in Chapter 3 but is analyzed in Chapter 4).

- Brent reviewed the list of resource sections and who will take the lead. Some resources only have a Chapter 3 section, while others have both Chapters 3 and 4.
- Teams can look at NV/CA and OR DEIS analyses to see what they've done.
- If we get approval, will likely set up a call early next week to start moving forward.

Idaho/Montana Sage-Grouse ID Team Meeting

July 24, 2014 10:00 a.m. MST

Attendees: Brent Ralston; Rod Collins; Diane McConnaughey; Paul Makela; Nika Lepak; Karen Porter; Natalie Cooper; Bruce Schoeberl; Kathleen Hendrick; Kelly Bockting; Brandon Knapton; Karen Rice; Jason Wright; Rob Mickelsen; Jesse German

Handouts

- None.

Action Items

- BLM IDT will review comment report and send revisions to EMPSi.
- EMPSi will send the latest comment report.
- EMPSi ID team will send their current drafts of the proposed plan impacts analysis to their BLM counterparts.

Meeting Minutes

Project Status Update

- Administrative draft proposed plan went out to internal team and cooperators. Comments due tomorrow. Brent will be making changes in response to comments.
- Forest Service proposed plan has been in development for a while. Forest Service developed a template that would apply to all subregions. Rob has been customizing it for the subregion, incorporating the adaptive management strategy and biologically significant unit for the disturbance calculation. Intent is that the approach and scale is the same as BLM, just needs to be put into FS direction. Some questions remain on MT management.
- Next week – review of Forest Service proposed plan by all forests in ID and make necessary revisions. Final FS plan is due to FS management August 1.
- Comment report – EMPSi will send a new report by early next week. BLM IDT to review responses.
- Montana – working to determine their adaptive management and anthropogenic disturbance management. Anticipate that anthropogenic disturbance will be consistent with WY direction. Still unsure of the adaptive management strategy.

Schedule

- Short-term goal is to finish proposed plan, including Forest Service and BLM components.
- Hope to get GIS completed in the next few weeks to finish impacts analysis.
- EMPSi keeping a list of changes for the other alternatives, but this is not the focus right now.
- NOC is nearly done with their calculations for the roll up and cumulative effects analysis.

- Another federal family meeting in August for BLM, FS, USFWS to discuss proposed plans, mapping across state boundaries. Unsure whether there will be state involvement.
- Compare proposed plan and comments from USFWS. How they were addressed.
- After federal family meeting, FEIS will be prepared within 2 weeks to share with National Policy Team and cooperators, then go to print in the fall.
- ROD – unsure whether there will be one ROD for the western US or for the Great Basin Region, with sub-decisions for each sub-region.

ESA Consultation and Biological Assessment

- Scott Hoefer is the local contact. Agreement was that Forest Service would write the BAs and do most of the consultation since a lot of the species are on Forest land. However, in Idaho, have slickspot peppergrass – concerns that there will be impacts on this species from GRSG management. BLM may need to help prepare the BA for this species.
- Would like to incorporate the conservation measures in the latest conservation agreement. Meeting tomorrow morning to review and agree on the 2014 version of the conservation agreement.
- USFWS indicates that BLM will need formal consultation for this species. Want to ensure that consultation for the LUPA will be sufficient when site-specific consultation is needed.
- Make sure the team is in contact with Level I team for Boise (Brandon) and Twin Falls (Kate Forster) districts, as this might help streamline the process.
- Chris Colt (Forest Service) updated the group on the status of the BA. The consultation group (BLM, USFWS, FS) has been meeting and reviewing the list of species. Main species at issue is the slickspot peppergrass. Have been tailoring the BA template to the ID/MT subregion. Completed GIS overlay (acres and maps) of GRSG habitat on the different critical habitats.

New and Ongoing Components

- Received final FIAT report. Wildfire and invasive species assessments will be included as part of the plan and appendices. There will be an associated IM which is supposed to be out by the end of this week. Will be identifying members of teams by field office that will be conducting the assessments. Will likely start assessments prior to the final. Timeframes are uncertain.
- Monitoring framework plan will be incorporated.
- Still working to define the biologically significant units (BSUs) to calculate the adaptive management and anthropogenic disturbance. Hoping to finalize this with Forest Service and USFWS today.

Document Status

- Chapter 1 – Brent is making some changes
- Chapter 2 – Meredith has been making changes
- Chapter 3 – making a few GIS changes.

- Chapter 4 – teams have met, reviewed assumptions, GIS requests, and proposed plan. Assumptions almost complete – need to finish up minerals.
- EMPSi will send the current versions of their impact analysis to their BLM counterparts and will CC Brent.

Idaho/Montana Sage-Grouse ID Team Meeting

August 7, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Nika Lepak; Mike McDonald; Dustin Miller; Jason Pyron; Josh Sidon; Gloria Jakovac; Vince Guyer; Rob Mickelsen; Jesse Rawson; Elena Shaw

Handouts

- ID swMT ADPP BLM Decisions 080614 Working

Action Items

- Send comments/revisions to the comment response report to Brent by Friday, 8/8/14
- Send comments/revisions on the first draft of the proposed plan impact analysis to EMPSi counterparts and CC Brent by Friday, 8/8/14

Meeting Minutes

Forest Service Plan Update

- Rob still working on the FS plan. Addressing comments from Forest Service management and making sure it's consistent with FS direction. Comparison table shows that the Forest Service plan is very consistent with the BLM plan, but is more specific and does not include as many management actions. Some of the language is specific to Idaho, and Rob is explaining this to Forest Service management. Hoping to finalize tomorrow.
- Working on habitat desired conditions table.
- Will the two plans require separate impact analysis? Will keep plans separate in Chapter 2. Intend to do the effects analysis for the planning area without breaking out Forest Service and BLM in the discussion of effects.

Reminder for Work Assignments

- Send comments/revisions to the comment response report to Brent by Friday, 8/8/14.
- Send comments/revisions on the first draft of the proposed plan impact analysis to EMPSi counterparts and CC Brent by Friday, 8/8/14.

Review of Comments on the Proposed Plan

- Ongoing discussions about whether adaptive management measures would apply to all Core/Important or all nesting/wintering habitats within Core/Important.
- Coordination of mitigation with state effort – not sure how much detail will go in EIS. Have talked about an implementation plan, can maybe fill some of the details in.
- Meeting next week with USFWS and the state to resolve some questions and inconsistencies.
- Rob working on VDDT modeling for acres of treatment. Should have treatment acres and projected habitat conditions in the next 1-2 weeks.

- Seasonal habitat desired conditions – Jesse will work with others to resolve questions. FS changed “perennial grass height” to adequate nest cover, not 7 inches.
- Proximity of trees – Jesse, Rob, and Nika will work to review comments on this table.
- Mapping –if there is habitat outside of core/important/general during project level activities, should this area be managed as general habitat? A team will review this idea and how we would incorporate this.
- MA-4: A lot of discussion about no net unmitigated loss of GRSG habitat. Other subregions have no net loss in all GRSG management areas. However, this would affect mitigation opportunities. It would be best to do mitigation in core/important that needs restoration, but no net unmitigated loss would not allow for this. Instead, could state no net loss of key habitat within core/important – use key habitat map to delineate where there is effective habitat and restoration opportunities. Added language in MA-4 for this. Would provide a net conservation benefit to GRSG. Applies to both on- and off-site mitigation.
- Why mitigate for disturbance in non-habitat? Needs further discussion.
- MA-6: Pull key habitat in as a more functional piece. Included to help update the map.
- Adaptive management and anthropogenic disturbance – comments to help strengthen the administrative record. Would like to have a discussion with biologists on these questions.
- RDFs – they are required. Added that they would be COAs in any post-lease activities. And they would be included as BMPs for locatables to the extent allowable. In RDF appendix – deleted BMP column and moved to column with BMPs that are required when conditions occur.
- Clarifications added to mitigation actions.
- FLM-7 added for consistency with Great Basin Region.
- Several comments for Nika that Brent will pass on.
- RM-1: Forest Service makes decisions about changes in management for grazing allotment at the site-scale, not plan-scale. Put in triggers/guidelines for grazing that will be applied for annual adjustments if necessary.
- Travel – need to include administrative use text. Clarification added for subsequent travel management planning.
- Appendices – baseline map – need to include description
 - Need to identify areas no longer identified for disposal for each plan.
 - Functioning of Boards – needs a description developed.

Other

- GIS team is providing revisions to the NOC for some rollup questions.
- COT objectives – how alternatives do/do not meet these objectives. Would like to see this more clearly specified in Chapter 4. Use the stop light table.

Idaho/Montana Sage-Grouse ID Team Meeting

August 14, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Nika Lepak; Natalie Cooper; Katie Powell; Kelly Bocking; Robin Fehlau; Mike Kuyper; Jason Wright; Rob Mickelsen; Jesse Rawson; Jesse German; Elena Shaw

Handouts

- None.

Action Items

- EMPSi incorporate GIS and revisions into proposed plan analysis.
- EMPSi and BLM GRSG team to meet and review proposed plan analysis.
- EMPSi compile proposed plan analysis into one document and send to Brent by Wednesday, August 27.
- EMPSi incorporate changes to the comment response report.

Meeting Minutes

Project Updates

- Team has reviewed the comment response report and Brent has sent comments to EMPSi. They will make changes and provide another version.
- EMPSi has sent a first draft of effects analysis, BLM/FS provided comments. EMPSi incorporating those revisions. Since the GIS is mostly done, EMPSi will incorporate the numbers and the GRSG team will have another conference call to ensure that expectations are met, including USFWS. EMPSi will then compile the sections into one document and send to BLM.
- Most of the EIS will be the same, but we'll be changing Chapter 2 to incorporate the proposed plan.
- Had a meeting with the state to review and address their comments on the proposed plan. Two main topics were discussed:
 - BSUs: Will have 10 BSUs within the subregion for anthropogenic disturbance and adaptive management calculations. One is SW MT, one is UT Sawtooth, then 2 units per Conservation Area in Idaho – one for Core and one for important. Includes nesting and wintering habitat in these areas. Further work needs to be done by Rob, Brent, and Kelly for the UT and sw MT areas.
 - What happens if you have reached the 3% disturbance threshold in a BSU? Then, no further development in that BSU. Core and Important are calculated separately and the base map based on 2011 lek and habitat data. BSUs will be updated every 5 years.
- Changes to the key habitat map will be made annually based on restoration effort, fires, etc. to determine new acres of key habitat.

- The ability to change things is limited now, due to concerns about consistency between subregions at a higher level.
- Brent will be finishing the proposed plan. Rob is working on the proposed plan and will be final by the end of this week.
- Vegetation modeling – working with Don Major to take the NOC data for LANDFIRE and separate it by land ownership. They created one dataset across the Great Basin. At the end of the re-run, will have outputs for projected conditions for 10/50 years; also, the amount of acres estimated for treatment that would be needed to restore habitat up to 70%. Will have numbers for BLM and FS ownership. Should be available in the next two weeks.

Idaho/Montana Sage-Grouse ID Team Meeting

August 28, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Paul Makela; Natalie Cooper; Don Kemner; Mike McDonald; Bruce Schoeberl; Katie Powell; Kasey Prestwich; Karen Porter; Gloria Jakovac; Rob Mickelsen; Chris Colt; Jesse Rawson

Meeting Minutes

Section 7 Consultation Update

- Working closely with Boise and MT FWS offices. Finishing the northwest CO biological assessment this week and will use that as a template for the ID/MT biological assessment. Most significant issues is slickspot peppergrass, but will also consider impacts to grizzly bear, wolf and lynx. Will prepare a preliminary draft over the next three weeks for USFWS review. Afterwards, will determine the need for formal consultation.

Federal Family Meeting

- Meeting in Portland last week. Met with all state directors and staff from the Department. Meeting looked at whether management direction for each GRSG population was consistent with National Policy Team guidance. A lot of discussions over the week and items identified that need resolution. Some of the topics got pushed off until after the Rocky Mountain Region federal family meeting in two weeks.
- For ID/MT plan, concerns raised, but no major changes made at the meeting. Issues included fluid minerals management; solar/wind energy and difference between avoidance/exclusion in Important areas; disturbance threshold is now a “disturbance cap”; buffers.
- WO working on buffers. ID/MT did a good job citing references and including rationale, but other subregions need better rationale/citations.
- Waivers language for fluid minerals: In the current plan, Core is closed in low/no potential areas; NSO and waiver in moderate/high potential areas (e.g., Bear Lake). Waiver tied to anthropogenic disturbance criteria. This will be changed to state that the NSO can be waived if you’re developing in non-habitat areas as determined by an interagency group of biologists.
- Fluid mineral allocations: will change our allocations so that Core and Important will be NSO with no waivers, exemptions, and modifications except for the one waiver above.
- Not much discussion about transmission lines, roads, etc.
- Disturbance cap – Frank Quamen from the NOC described the formulas for calculating disturbance. Some confusion about how the three percent cap will be calculated. Final decision was to send it back to the disturbance and monitoring subteam which will meet today. WO will finish their white paper on disturbance but will not release until after the Rocky Mountain federal family meeting.

Next Steps

- Larger schedule is that final decisions and adjustments from the Department should come in mid-October after the Great Basin, Rocky Mountain, and state meetings are completed.
- Brent will be working to finish proposed plan by the end of next week. Will then update the GIS and effects analysis and hope to have a working draft by the end of September.
- Not a lot of work for the team until the proposed plan is final.
- Next week, will review the Forest Service plan and GIS/maps.

Anticipated Development

- Call today to discuss the description of potential impacts and likely development in the planning area in the foreseeable future. Unsure of the scale of the effort at this point, but more details likely forthcoming on the call.

Other

- Treatment objectives for VDDT should be distributed by the end of next week. BLM acres will be presented by population area, Forest Service acres by Forest.

Idaho/Montana Sage-Grouse ID Team Meeting

September 4, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Rod Collins; Natalie Cooper; Bruce Schoeberl; Jason Pyron; Katie Powell; Kasey Prestwich; Karen Porter; Dustin Miller; Kelly Bockting; Brandon Knapton; Karen Rice; Gloria Jakovac; Jason Wright; Rob Mickelsen; Jesse Rawson; Jesse German; Elena Shaw

Handouts

- None

Action Items

- None

Meeting Minutes

Project Update

- Having a federal family meeting for the Rocky Mountain Region next week. Compiling numbers on existing rights and activities for the USFWS. Utilize numbers from the DEIS for Montana.
- White paper on Biologically Significant Unit (BSU) – Brent shared with some staff for review and will also send to Kelly. Using 2011 data for population and habitat. In general, we are not close to the disturbance cap. May receive national guidance on how the disturbance cap will be calculated, but Brent has been working on some new possible calculations. Call at 10 am today to discuss disturbance.
- Process – waiting to hear about changes in the proposed plan. Have changed to a disturbance “cap” and the waiver, exemption, modification language has been changed. Will likely change Core habitat from closed to NSO for fluid mineral leasing.
- Meeting with GIS and Rob to review the Forest Service plan. Would like to ensure that maps are consistent across BLM and FS boundaries.

Proposed Plan Follow Up

- Lands –Core/Important are not available for disposal/sale. Need to review existing plans for any description of lands identified for sale. Check if these lands are in Core/Important and if so, need to clearly identify that they are no longer available for sale (by parcel description). 1) Review LUPs; 2) take legal descriptions and compare to map; 3) make separate appendix that states which parcels are no longer for sale.
- Forest Service Wild Horse Territory – none in our subregion.
- Comments related to livestock grazing and fire – Brent will have to follow up with some staff about this.

- Some concern over prescribed fire in less than 12 in precipitation zones. Pat was supposed to provide language. This language will be sent with the notes from the Great Basin federal family meeting.
- For areas post-rehabilitation, when do they meet the criteria to be called effective mitigation? Must meet the key habitat standard and needs to be consistent within the plan (e.g., Table 2).
- Anthropogenic disturbance criteria – regarding co-location in Important habitat, will rephrase to say that it would be located to minimize effects, if possible, through co-location in Important. This is because co-location may not be the best way to minimize impacts in all areas.
- Need to review the proposed plan to make sure we have addressed Montana appropriately.

Idaho/Montana Sage-Grouse ID Team Meeting

September 11, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Paul Makela; Nika Lepak; Don Kemner; Bruce Schoeberl; Jason Pyron; Katie Powell; Karen Porter; Ethan Ellsworth; Connie Breckenridge; Kelly Bockting; Brandon Knapton; Karen Rice; Gloria Jakovac; Vince Guyer; Jason Wright; Rob Mickelsen; Jesse German

Handouts

- None

Meeting Minutes

Project Update

- Brent is almost done editing the proposed plan. A few items to follow up on.
- Disturbance meeting tomorrow. Have discussed doing a moving window analysis for the anthropogenic disturbance calculation. Showed that much of WY, eastern MT, UT, and OR are over the 3 percent cap. Other areas are under the 3% cap. This calculation doesn't roll up easily to a larger scale.
- Have been responding to questions from the Rocky Mountain meeting, such as a justification for three-tiered habitat management system.
- Brent will send out the BLM and Forest Service proposed plans with the allocation maps in the next couple of days.
- Brent scheduling a meeting with Montana staff in mid- to late October to make sure the proposed plan reflects their needs. Also reviewing the MT state GRSG plan that was just signed. Will need to incorporate that to some extent. Disturbance calculation and adaptive management still a question.
- Brent will share the BSU paper with the team.

Proposed Plan Additional Information/Work

- Implementation-related details needed (probably would not require changes to the proposed plan): 1) mitigation team and strategy (e.g., how the boards work); 2) the adaptive management evaluation process.
- Need definition of "high voltage" versus "minor rights-of-way". Check to see what the FS has and NPT recommends. Might be 100 kV.
- Brent will send Montana the habitat objectives table to review from their perspective.
- Rob is working on VDDT acres. Had a webinar yesterday to go over the results with Craig.
- How to manage habitat that is lost or gained? Lost habitat will still be managed for GRSG until there is a mapping plan amendment/adjustment on a five year basis. Some thought that gained/new GRSG habitat could be managed as general habitat, but since allocations are tied to

general habitat, changes would require a plan amendment. Don, Paul, and Ethan will work on criteria to include, such as following RDFs, seasonal restrictions, and buffers.

- Included broad prioritization language from the Great Basin Region federal family meeting that discourages use in Core/Important habitat and pushes uses outside of GRSG habitat.
- Continuing to work and identify lands for disposal in existing plans. When you acquire lands, they're not automatically open to mineral entry. Need to say that lands acquired would be managed for the appropriate management zone except not automatically open to minerals.
- Will need to augment the appendix describing project-level key habitat map adjustments based on site conditions/surveys. Ethan and Paul will work on this and share with others.
- Regarding disturbance, need to make sure that we are consistent in how ROWs are counted as disturbance. In the BSU description, it says we would follow the monitoring framework, but elsewhere it mentions ROW width.
- Waiting for the *Lepidium* conservation agreement to be signed. Will ensure those conservation measures are in our RDF appendix.
- Need to provide justifications/rationale for the decisions we made in the administrative record. List of items: Why 2011 for baseline? Why 10% and 20% change for adaptive regulatory triggers? Why is maximum number of males the appropriate measure? Why is 3% the disturbance cap? (need USFWS input on some of these).
- Questions about Forest Service versus BLM standards for grazing and what can be changed. Forest Service standards are designed to meet viability requirements for wildlife because of the certainty of implementation. Certainty of implementation is the same for Forest Service standards and guidelines, except that a standard needs a plan amendment to change. Biological benefit would be the same. Will have a meeting to discuss how GRSG concerns were incorporated into the Owyhee permit renewals. Implementation plans should help with consistency.
- Once the final EIS is out for internal review, would like to have a series of half-day or one-day workshops in each of the BLM district offices and including nearby Forests. Will have a presentation to the field on what the decisions are by program area. Then will work through some examples, to help with implementation Probably November at the soonest.

Idaho/Montana Sage-Grouse ID Team Meeting

September 18, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Nika Lepak; Natalie Cooper; Katie Powell; Trisha Cracroft; Brandon Knapton; Gloria Jakovac; Vince Guyer; Jason Wright; Jesse German

Meeting Minutes

Meetings This Week and Ongoing

- Meeting in Reno regarding implementation of the FIAT.
- Another meeting in Reno with Deputy State Directors to talk general implementation planning.
- Meeting in DC this week with regional leads to discuss the federal family meeting outcomes. Brent has been responding to more questions on our plan.
- Coordination meeting with the states will be the week of October 9th. Unsure what the agenda is or intended outcomes.

Project Update

- We have been finishing GIS calculations and developing maps.
- Brent sent the next version of the draft proposed plan which highlights the actions that have been changed. Some further changes are being made to conifer objectives and additional language in mapping section regarding management areas. Very nearly complete.
- Brent will try to include the maps with the next version.
- Brent will be following up with state director Tim Murphy and sending final version to field and district office managers likely within the next week. Would like to put together a day-long workshop for each of the district offices (including BLM and FS staff), likely after the FEIS goes to WO for review.
- EMPSi starting on effects analysis and including revisions based on feedback from BLM and Forest Service, changes to the proposed plan, the Forest Service proposed plan, VDDT, and GIS. EMPSi staff will contact BLM staff if needed for input. Goal is to send all sections to lead BLM counterpart by next Friday and CC Brent and Meredith.
- Disturbance team met last Friday. Goal was to determine definitive scale and how it will be measured. Did not get conclusions on these topics. Will set up another call, but probably not this week due to other meetings.
- Awaiting outcomes and possible changes from federal family meetings, though some of the GBR outcomes have been incorporated into the current version of the plan.
- Staff have been working on the land tenure assignment. Some of the parcels are split between GRSG management zones. Decision was to take the whole parcel out of consideration for disposal if part of it is within GRSG habitat. Staff should identify split parcels. Due by the end of the month.

Idaho/Montana Sage-Grouse ID Team Meeting

September 25, 2014 11:00 a.m. MST

Attendees: Brent Ralston; Nika Lepak; Kelly Bockting; Gloria Jakovac; Jason Wright; Karen Rice; Vince Guyer; Kasey Prestwich; Trisha Cracroft; Brandon Knapton; Rob Mickleson

Meeting Minutes

Project Update

- There was a project management call for the Great Basin Region with an update on the project from the Washington Office
- A schedule has been prepared and is under review at the department level.
- At this point, specific dates have not been shared.
- Should be seeing the schedule in the next week or so.
- A couple policy decisions (below) have been made, though most won't specifically affect IDMT.
 1. A *No Net Unmitigated Loss* approach has been adopted across both RM and GB regions. IDMT's approach is linked to Key Habitat. We'll need to figure out and define what this means for MT.
 2. Lek Buffers: Right now a team of USGS scientists is reviewing literature on lek buffers in order to determine an approach on which lek buffers are best for various activities. IDMT did this already and submitted that information to the Washington Office and WO has commissioned the USGS to do the same thing.
 - The USGS team should have results back to BLM by October 6th. USGS is considering pulling in outside scientists and the Solicitor is looking into whether this would violate FACA (Federal Advisory Committee Act).
 - IDMT's approach won't be modified too much by the results of this research, since IDMT has already done this work within their subregion. This work is more likely to impact other subregions.
 3. Cumulative Effects Analysis: All the *Important* management zones will be lumped together with the *General* management zones for the CEA. This was a decision made by the WO Solicitors and is more of a worst-case-scenario look at cumulative effects. The tentative deadline of getting the CEA data to the NOC is the 2nd or 3rd week of October. For the most part it's all ready to go. This timeframe will be easy to meet.
 4. Record of Decision: Currently leadership is leaning towards the idea of having two RODs, one for each region (GB and RM).
 5. The final review of the FEIS won't be due to Washington until after the holidays. We're looking to have our pieces pulled together by after Thanksgiving and then hand that over to EMPSi for editing etc. so that we'll be on track to get everything to Washington by January.
 6. *This decision DOES impact IDMT*
 - We're changing the names of our management areas again.
 - We still have 3 habitat categories: Priority, Important, and General.

- These will now be referred to as *Habitat Management Areas*. We will now need to refer to our habitat categories as: PHMAs, IHMAs, and GHMAs.
- Other subregions will be using a similar naming convention.
- This will result in a lot of changes to our document, but it won't be impacting any substantive decisions we've made.
- This is most likely the final name change.

Work Items In Progress

- Brent has been working on a paper that describes the anthropogenic disturbance and adaptive management science and calculations. Brent will share this paper more broadly after it's been reviewed by Rob. Brent should be able to share this out by early next week.
 - October 24th will be the deadline to express any questions and concerns about this paper to Brent. If there are significant questions or concerns, please give Brent a call so these can be discussed.
- There is an information bulletin (IB) that will go out likely next week. It is currently being reviewed in the State Office. The IB transfers the Administrative Draft Proposed Plan and the Admin Appendices to District and FO managers that are involved in this process. This will probably result in workshops in January. The purpose of the workshops will be to share out pieces of the implementation strategy that have already been discussed, and also to discuss how to develop a final implementation plan to be included as part of the FEIS.
- EMPSi will send out revised sections to the BLM tomorrow (Friday). Please make sure you read through them and make sure they've captured all the important parts. When looking over the sections, consider the big picture and make sure the analysis captures that. Consider whether the section has captured all the management actions, whether the effects have been talked about, whether all administrative units have been accounted for (BLM, BLM MT, FS, FS MT, Sawtooth NF), and whether cumulative effects have been considered.
 - The timeline for the review of the section is as follows: EMPSi will get revised section to BLM on September 26th. The BLM will have until October 24th to review those sections and provide comments back to EMPSi. EMPSi will have until November 1st to turn those comments around and get the revised sections back to the BLM. The BLM will review the draft between November 1st and Thanksgiving. A pseudo-final draft will then be ready after Thanksgiving. The BLM will get one final look before the WO review in January.
 - These next 4 weeks are the last big look the BLM will get at these sections, so look carefully and be thorough.

Other

- There is a meeting scheduled in Montana at the Dillon Field Office on October 21st to go through the administrative draft proposed plan to make sure everything is captured for Montana. Kelly will look at the plan ahead of time to flag potential issues.
- There will be no call next week. Brent will be on leave starting next Wednesday.

Idaho/Montana Sage-Grouse ID Team Meeting

October 30, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Paul Makela; Nika Lepak; Natalie Cooper; Don Kemner; Mike McDonald; Karen Porter; Jon Beck; Kelly Bockting; Karen Rice; Gloria Jakovac; Vince Guyer; Jason Wright; Rob Mickelsen; Jesse German; Elena Shaw

Handouts

- None.

Action Items

- Meeting next Tuesday in the ID SO at 1 pm to discuss task force and adaptive management items (tentative, pending attendee availability).
- Meredith will follow up with Zoe regarding the livestock grazing GIS request.

Meeting Minutes

Update on Washington Office Direction

- Several meetings with the state and the Department regarding state plans and adjustments by state. Twelve overall issues that USFWS is looking at (discussed below).
- Last week, state directors met prior to ELT meeting and reviewed these 12 issues. Refined the issues and will be providing direction. Had expected direction last week, but new USFWS memo has delayed this. No direction yet on how the memo will factor into the direction. Still numerous discussions ongoing. USFWS memo is not widely distributed. Should have final approach communicated either tomorrow or early next week.
- Dan Ashe and Neil Kornze briefing Sally Jewell tomorrow.

USFWS Issues to be Resolved

- In addition, 5 related sub-issues for ID/MT to address.
- 1. PAC boundaries in UT and NV. Does not apply to ID/MT.
- 2. Management decisions for populations that cross state lines (e.g., SW Idaho, SE Oregon, NW Nevada; Bear Lake in ID/UT/WY). Once national guidance received, may have further discussion about these differences in management and develop rationale for how the outcomes for the bird would be similar.
- 3. Monitoring, specifically regarding adaptive management. ID/MT plan is fairly descriptive: population triggers collected by the state; BLM will track habitat through key habitat map and annual updates.
- 4. Disturbance calculation. Unsure on how this will affect the ID/MT effort but hopeful we will be consistent with WO guidance and white paper that will be released.

- 5. Adaptive management. ID/MT has a good description of how adaptive management works in Idaho; need to finalize for MT. Will have a call/meeting next Tuesday at 1 pm to discuss remaining issues (removing adaptive management once measurements are below trigger level. In other words, reversing a tripped trigger).
- 6. Mixed ownership lands and allocations – state/private/BLM lands. Does not apply to ID/MT plan.
- 7. Lek buffers – USGS is reviewing lek buffers related to anthropogenic disturbance. They will provide feedback on what is the best science for each of the buffers. They are not providing the buffers, but reviewing the science. It was supposed to be received in early October, but has not been received.
- 8. ROW Avoidance and exclusion areas – some potential changes for ID/MT.
- 9. NSO and oil/gas – all core/important areas in ID/MT identified as NSO. RDFs include a 2 mile lek buffer around any occupied lek. Probably no changes for ID/MT.
- 10. Closures related to limiting disturbance in priority habitat. Probably no changes for ID/MT.
- 11. Mitigation – USFWS would like to see a commitment to do a mitigation strategy after the ROD. This language was in the appendix and will be pulled into our proposed plan.
- 12. How to address improper grazing. WO looking at this and developing different approaches. Brent and Nika have been providing feedback.
- 5 sub-issues for ID/MT – 1) commitment to mitigation; 2) management direction across state boundaries; 3) disturbance; 4) additional detail on how the implementation task force would function. Would be similar to the Idaho Roadless Rule- Brent has drafted an MOU to describe the intent behind how the task force would work; 5) adaptive management and untripping hard triggers – define criteria for removing a tripped trigger.

Effects Analysis

- Resolution of a few issues.
- Vegetation – in the DEIS, we used one layer for vegetation and VDDT. Now, new layer (LANDFIRE EVT) from NOC for VDDT. Should we use the old DEIS layer or the new NOC VDDT layer to calculate all vegetation?
- Rob recommends using EVT just for VDDT. For proposed plan, use old vegetation layer used in the DEIS. Will only need to calculate Alternative G vegetation requests.
- VDDT – likely need to run other alternatives with the new EVT vegetation layer.
- Livestock grazing and seasonal habitat – GIS request to identify acres open to grazing and AUMs in different GRS habitat (related back to the habitat objectives table). Forest Service will be providing the same details and BLM will share what they have been working on with Forest Service.
- Paul proposes lumping nesting and late brood-rearing habitat as there is no map available for late brood-rearing. Will call it “breeding/late brood” and will encompass lek, nesting, early and late brood-rearing habitats. This will be one map. MT is providing their inputs. Initially talked about calculating AUMs in winter habitat, but grazing is less important in winter habitat. Paul feels there would be no value added to quantify that for grazing analysis. He will include a table

in Chapter 3 (GRSG section) to quantify seasonal habitats and undetermined areas by population areas. For effects analysis (grazing section), table for each alternative showing acres open to grazing and AUMs but only focusing on breeding/late-brood habitat. Forest Service analysis will be pretty similar. Have a description in the table or text regarding why winter habitat was not calculated.

- Meredith will follow up with Zoe to make sure this meets the intent of her GIS request.
- Minerals – Karen will revisit the issues they were working through regarding locatable minerals.
- Jon may have some follow up calls with resource specialists.

Schedule

- Schedule is changing, but the last schedule had final EIS to WO after the holidays. Effects analysis completed by end November, early December. FEIS release mid-late March. Will get a new schedule once direction from WO comes out.

Next Week

- Will have another 2 hour call next week and may have a webinar to go through various items and new direction.

Idaho/Montana Sage-Grouse ID Team Meeting

December 11, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Paul Makela; Nika Lepak; Don Kemner; Jason Pyron; Katie Powell; Karen Porter; Dustin Miller; Gloria Jakovac; Vince Guyer; Jason Wright; Elena Shaw

Handouts

- None.

Meeting Minutes

Washington Office Updates

- No guidance has been provided yet on the outstanding issues. Told that we would receive direction today.
- BLM and USFWS still discussing adaptive management triggers across state lines.
- Data call last week to compare buffers developed in ADPP to USGS report.

Schedule

- No updated schedule.
- Idaho meeting scheduled for next week to discuss the project.

Buffers

- Informational meeting yesterday to review buffer table provided for buffer data call. Discussed inconsistencies between buffer table and USGS table. Did not decide anything, but wanted to start discussions.
- Noticed some of the buffers were below the USGS recommendations. Determined that, in combination with other management actions (e.g., disturbance criteria), the buffers are adequate.
- Had further conversations regarding unleased fluid minerals and transmission lines.
- RDF table and buffer table don't always match. Would like buffers and RDFs in one location. Some RDFs would be required all the time, other would be required when/where appropriate. Told that we could not have BMPs. Need to cross reference RDFs with NTT RDFs. Major difference between original RDFs are the West Nile virus changes.
- Want to make sure the RDFs aren't conflicting with the disturbance criteria.
- Suggest keeping BMPs in the buffers table instead of pulling into RDFs table.
- Diane has been making maps showing different buffers around the leks.

Other

- Brent is almost done with ADPP. Need to pull in adaptive management flow chart and describe implementation team. Will be done by tomorrow.

- Responding to SOL about mapping adjustments. Description of management areas and how they changed between draft and final to ensure they are within the range of alternatives. Will be included in FEIS as an appendix.
- Cooperators – No call today and put team on hold until we get direction. Hoping to have a call in January once information is available. Can send notes from the Next Step conference.

Idaho/Montana Sage-Grouse ID Team Meeting

December 18, 2014 9:00 a.m. MST

Attendees: Jon Beck; Diane McConnaughey; Paul Makela; Natalie Cooper; Don Kemner; Trisha Cracraft; Johanna Munson; Kelly Bockting; Karen Rice; Gloria Jakovac; Jason Wright; Jesse Rawson; Elena Shaw

Handouts

- Combined buffer table
- RDF table

Action Items

- None.

Meeting Minutes

Update from the Washington Office

- No call next week. Next call on Jan 8th.
- Expect to get direction from WO on a number of issues soon, possibly today. Issues we are expecting guidance on include: highly important landscapes; mitigation; mapping direction (UT and NV only); disturbance language; vegetation objectives; grazing modifications; salable minerals; major pipelines/ROW/corridors; fluid minerals; and NSO and exception/modification language.
- Still outstanding – buffers and adaptive management (tripping triggers for populations that cross state lines).
- NOC waiting for data to start on CEA.
- No schedule yet.

Review of RDF Table

- Worked to consolidate buffer table and remove duplicates with RDF table. Want the tables to be useable by the managers/field. Reviewed buffer table and cross-checked with ADPP and RDF. Moved buffers into a stand-alone table.
- Review of RDFs table and concerns.
- Questions about column headers. If not appropriate, why would the RDF be applied? Should we delete the 2nd column? Text prior to the table explains the columns. Consider changing column 2 header to “RDF when appropriate to meet GRSG habitat objectives”
- #2: Concerns about specifying 10 dbA. Specify that disturbance would be from mechanized equipment and permitted commercial activity. Check national guidance from Lauren.
- #31: Delete.
- #138: Jon will check against national direction.

Review of Buffer Table

- Roads – maintenance levels specified in Appendix G.
- No buffer for locatables and leasables because these are included in the RDF table.
- Keep wind energy management as it is unless we hear otherwise from WO. Change RDF from “avoid” to “discourage” new development in nesting/winter habitat.

Other

- Should practice implementing buffers and ADPP on a sample project.

Idaho/Montana Sage-Grouse ID Team Meeting

January 8, 2015 9:00 a.m. MST

Attendees: Jon Beck; Paul Makela; Bruce Schoeberl; Ethan Ellsworth; Karen Porter; Josh Uriarte; Dustin Miller; Trisha Cracroft; Sandy Leach; Kelly Bockting; Brandon Knapton; Karen Rice; Gloria Jakovac; Vince Guyer; Jason Wright

Meeting Minutes

Project Update

- Have been waiting for guidance from the Washington Office (Department of Interior level). Most issues they were working on have been finalized. Direction expected Jan 15/16 and they will have a webinar to roll out the direction. Jon will send webinar details to the team when he receives them.
- Still waiting on decision regarding how to use buffers.
- Expect another webinar on January 20th with the NOC to kickoff the data call for the cumulative effects analysis.
- There are also questions that arose from the Federal family meeting last year that have yet to be resolved. We are waiting on further direction on these.
- No schedule has been delivered yet.
- Team had questions regarding “SuperPAC”s. We are unsure of how these will be applied, but this was one of the issues that they have been working on. Expect direction on January 15/16.
- Intend to have weekly calls at this time.

Idaho/Montana Sage-Grouse ID Team Meeting

January 22, 2015 9:00 a.m. MST

Attendees (incomplete list): Brent Ralston; Jon Beck; Diane McConnaughey; Paul Makela; Ethan Ellsworth; Elena Shaw

Handouts

- None.
- None.

Meeting Minutes

Brief Project Update

- We are still waiting for direction on the unresolved items from the WO. Meetings and briefings have been ongoing this week and we anticipate having the final resolution tomorrow. Jon will send the final direction once it is received.
- Timeline – Will be submitting data for the Tier II CEA to regional PMs by 2/17. Jon will schedule a webinar for next week to review the allocations prior to submittal to ensure the data are correct. Once submitted, the data will not be changed.
- While not formal schedule has been received from the WO, anticipate a WO review draft in May.
- Forest Service has a separate plan that will be included in the EIS. Some of the allocations may be different and will need to be submitted with the BLM allocations for the CEA analysis.

Idaho/Montana Sage-Grouse ID Team Meeting

October 23, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Paul Makela; Karen Porter; Natalie Cooper; John Beck; Ethan Ellsworth; Vince Guyer; Jesse German (or another Jesse in Shoshone) [Brent – I came on a minute late and may be missing a few individuals]

Meeting Minutes

News on Management Transition

- Brent will be transitioning to a new opportunity and John Beck will be taking over Brent's role as the Sage-Grouse planning lead.
- Brent will stay involved to complete the proposed plan (goal is to complete this over the next 2 weeks) and John will step in to work on the effects analysis. John will be working with EMPSi and the ID Team to review and revise sections.

Five Major Concerns about the Proposed Plan that need to be addressed

- FWS expressed concerns about mitigation. They'd like to see a commitment in the plan regarding the timeline for the implementation of mitigation measures. This information already exists but it is in an appendix. Brent will pull this information out of the appendix and put it in the plan.
- FWS also had questions about adaptive management- "untriggering." What does BLM plan to do if an adaptive management trigger is tripped, but then the habitat/population recovers? Is there a reversal of triggers set up?
 - Brent will set up a call for early next week to discuss this.
- FWS also is concerned about how triggers and adaptive management will work for populations that cross the border.
- FWS would like to see more specifics on how BLM plans to work with other players like the state implementation team, adaptive planning team, etc. on implementation. The plan needs to discuss the details of this.
- The Solicitors want to understand where IDMT stands regarding disturbance.

Update on RMP/EIS Efforts

- There have been several meetings recently between state directors and the states, and each state is being met with one-on-one to discuss the specific state plans and how that integrates with the federal plan. Idaho's was last week and went well.
- This week state directors got together to talk about consistency. Until we see what they discussed, it doesn't make sense to talk about and make decisions on adaptive management.

Proposed Plan

- Any comments/questions/concerns about the Proposed Plan are due to Brent by COB tomorrow, Friday, 10/24.
- We'll make the changes we can based on comments and if there are things that can't change due to direction from higher up, we'll note that in the record and move on.
- Have PAC boundaries changed? At this point the boundaries are the same- no one has yet mentioned changing them. The FIAT identifies "focus" and "emphasis" areas and it would be highly problematic if the FIAT recognized a high priority focus or emphasis area that is outside of priority habitat. To address this concern, the BLM will be including language about how habitat maps can be re-evaluated if FIAT identifies focus/emphasis areas that are in general habitat areas.
- EMPSi has created a new template for us to use.

Next Steps

- Once the Proposed Plan is done, it should be complete other than format tweaking. There will be no more discussion or revisions after that. After that we'll need to get GIS, numbers, tables and maps done. Then GIS will be completely done. There may be a little GIS/map clean-up work after this point, but that's it. The next big piece will be the effects analysis. We have about 6 weeks from today to get that done- aiming to finish that by the end of November. After that we can disband the sub-regional ID Team.
- After that point we'll just be stepping forward with the decision. During the 1st or 2nd week of December we should be pulling together the final EIS so we can send it to DC around the first of the year.
- The next three pieces are the Proposed Plan, the comment report, and the effects analysis.
- We currently have all the sections for Chapter 4. John will be looking at them and sitting down with each of the teams to address comments/concerns.
- There will likely be one more version of the effects analysis sent out for review, and then after that, the final version will be the last version.
- When the final comes out there will be a protest period and governor's review, and then the ROD, which says whether we are deciding to go forward with the Proposed Plan.
- There will be one major work effort between the Final and the ROD. We're going to have to step through the Proposed Plan and all our old plans and look at all management actions in existing plans to determine which management actions are being replaced by the Proposed Plan. That way we can include in the ROD which decisions in existing plans are no longer applicable due to the Proposed Plan. The time frame for this will be sometime between February and April.
- This effort will require some IDT folks, but the push may be more at the district/field manager level.

- When we're comparing the Proposed Plan to existing plans to see if we need to replace any management actions, will we have the ability to tweak language? Or will we need to take actions 100% as they are?
 - We will need to take actions as they are- no tweaking.
- Will there be meetings when the FEIS is on the street?
 - There will be implementation meetings which will involve all program leads. Protest response may require some district and field office help, but may be an effort that focuses primarily on the program leads in the state office.
- Brent hasn't made many changes to Chapter 1 since April. Plans to make a few changes and then will send to EMPSi. For Chapter 2- the Proposed Plan is in the works and Meredith is working on the rest of Chapter 2. Brent will send to that to EMPSi who will put it in the new format. Chapter 3 and Chapter 4- these are the pieces that we're working on now with the effects analysis. We will need to deal with similar sections in both these chapters at the same time.
- We will not putting the text of the document into ePlanning. We'll pdf all chapters and upload those to ePlanning so people can download them.

Other

- There will be a call next Thursday. Plan on an hour-long Thursday call every week from now until we're done with the effects analysis. Next Thursday's meeting may be in a webinar format and may be a little longer than an hour.

Dillon Sage Grouse RMP Amendment Coordination Meeting
February 07, 2013

GOAL: ensure that all parties involved are familiar with the work that has been completed to date and the deadlines that are approaching, also to reach a consensus on alternatives and future involvement.

Location: Dillon Field Office Conf. Room

Time: 1:00-5:00pm

Key Invited Participants:

- Idaho/SW MT EIS Team Lead (Brent Ralston)
- BLM Dillon Field Office (Kelly Bockting, Pat Fosse, Cornelia Hudson)
- BLM Montana State Office (Theresa Hanley, Sandy Brooks, John Carlson, John Thompson)
- BLM Western Montana District Office (Rick Hoteling)
- Montana FWP (Catherine Wightman, Craig Fager)
- US FWS (Jeff Berglund, Brent Esmoil)
- FS Sub-regional Coordinator (Rob Mickelson)
- FS Beaverhead/Deerlodge National Forest (Dave Myers, Chuck Mark, Peri Suenram, Art Rohrbacher)

Agenda:

Facilitator: Pat Fosse

1:00-1:20 Project Status and Timeline (Brent Ralston)

1:20- 2:20 How the alternatives relate to the current Dillon RMP/ Dillon RMP decisions in need of Amendment (Brent Ralston/Kelly Bockting)

2:20 - 3:20 How the alternatives relate/will be adapted to the Beaverhead/Deerlodge Forest Plan (Rob Mickelson)

BREAK – 10 minutes

3:30 - 4:00 NTT compliance meeting the 3% disturbance threshold and BMP's, discussion on how to maintain consistency with other MT RMP revisions. (John Carlson, Brent Ralston, Kelly Bockting)

4:00 – 4:15 Resource Specialist needs from B-D and DFO for Chapter 4 impact analysis review. (Brent Ralston, Rob Mickelson)

4:15- 4:30 Regional Management Team and National Policy Team Reviews and the involvement of local FWS and MT FWP personnel. Governor's consistency review/ Decisions signed by MSO/FS. (John Thompson)

4:30 - 5:00 Questions, other topics open for discussion.

**National Greater Sage-Grouse
Idaho & Southwestern Montana Sub Region
Summary of Alternatives To Be Analyzed in Detail**

1. **Alternative A – No Action**
 - a. Idaho BLM & FS - Continuation of present management
 - b. Montana BLM & FS – Continuation of present management
2. **Alternative B – National Technical Team Report**
 - a. Idaho & Montana BLM & FS – Management action and guidance described in the National Technical Team Report. Occupied habitat is prioritized into Priority (preliminary priority habitat or PPH) and General (preliminary general habitat or PGH) areas with associated goals, objectives and management actions
3. **Alternative C – Citizen Proposed Conservation Recovery within Occupied Habitat (PPH & PGH) including No Grazing**
 - a. This alternative would follow direction submitted to BLM during scoping, primarily from Western Watersheds Project. It includes nomination of ACECs and removing grazing (potentially allocation decision) from occupied habitat (PPH and PGH) public lands, to assess the impact to sage-grouse habitat of removing livestock. All occupied habitat (PPH and PGH) is addressed with the same priority.
4. **Alternative D – ID/swMT Sub Regional Agency Alternative**
 - a. Idaho BLM & FS and Montana FS – Management actions addressing threats by BLM programs area. Occupied habitat (PPH and PGH) is prioritized into Core, Important and General areas, similar to the State approach, although the spatial size and location of these areas differs. Each area has specific goals, objectives and management actions identified.
 - b. Montana BLM – Continuation of present management with additional direction from specific components of the Idaho BLM & FS sub regional approach.
 - i. The Dillon RMP is a recently completed plan that considered the relevant science and direction delineated in the NTT Report. Dillon has completed and evaluation of the existing RMP guidance and found it to be largely consistent with the NTT Report.
5. **Alternative E – Governor’s Task Force Approach/State Alternative**
 - a. Idaho BLM & FS – Management actions addressing primary threats: wildfire, invasive species, and infrastructure; and to a lesser extent, addressing secondary threats: recreation and livestock grazing. Occupied habitat (PPH & PGH) is prioritized into Core, Important and General areas with associated goals, objectives and management actions identified.
 - b. Montana BLM & FS – Continuation of present management with additional direction from specific components of the Idaho BLM & FS sub regional approach. The State government worked with the BLM in developing the existing management.
 - c. Utah FS – Management actions provided from Utah Governor.
6. **Alternative F – Publically Proposed Conservation/Recovery**
 - a. Idaho and Montana BLM & FS - Management actions designed to promote recovery of habitat and sage-grouse described in a detailed proposal submitted through the scoping process. Occupied habitat is delineated into Priority, General and Restoration areas (PPH & PGH) with associated management direction for each area.

SD & state coordination

No net conservation loss

Virgil - Idaho - state and private would await federal approach
have now begun to move forward

1. Key elements of state plan are the things integrated into BLM ADPP
will use those components as state addresses state & private lands

CoT Threats - some yeses should be depicted as smaller or more limited
threats

Dustin - stay focused on RMP process for work on federal properties
strong working relationship with state/BLM/USFWS
looking at complementary approaches on non federal properties.

2. Discuss approach with state lands department

3. mitigation, monitoring & AM - 3 tiered habitat approach which supports the adaptive
management and mitigation. Approach

4. USFWS supports 3-tiered approach

Gilly - RFPAs - impact on major threat - wildfire, funding from legislature for monitoring

Virgil - USFWS supports - still developing mitigation, USFWS supports the entire approach
described in BLM ADPP for Idaho. Great support for 3-tier

Neil Horne - USFWS support of Idaho 3-tier? ^{USFWS} But have not made a final determination on
anyones plans.

Further formal USFWS feedback? No clear answer.

9/23/19

Idaho/Montana Sage-Grouse ID Team Meeting

July 24, 2014 10:00 a.m. MST

Attendees: Brent Ralston; Rod Collins; Diane McConnaughey; Paul Makela; Nika Lepak; Karen Porter; Natalie Cooper; Bruce Schoeberl; Kathleen Hendrick; Kelly Bockting; Brandon Knapton; Karen Rice; Jason Wright; Rob Mickelsen; Jesse German

Handouts

- None.

Action Items

- BLM IDT will review comment report and send revisions to EMPSi.
- EMPSi will send the latest comment report.
- EMPSi ID team will send their current drafts of the proposed plan impacts analysis to their BLM counterparts.

Meeting Minutes

Project Status Update

- Administrative draft proposed plan went out to internal team and cooperators. Comments due tomorrow. Brent will be making changes in response to comments.
- Forest Service proposed plan has been in development for a while. Forest Service developed a template that would apply to all subregions. Rob has been customizing it for the subregion, incorporating the adaptive management strategy and biologically significant unit for the disturbance calculation. Intent is that the approach and scale is the same as BLM, just needs to be put into FS direction. Some questions remain on MT management.
- Next week – review of Forest Service proposed plan by all forests in ID and make necessary revisions. Final FS plan is due to FS management August 1.
- Comment report – EMPSi will send a new report by early next week. BLM IDT to review responses.
- Montana – working to determine their adaptive management and anthropogenic disturbance management. Anticipate that anthropogenic disturbance will be consistent with WY direction. Still unsure of the adaptive management strategy.

Schedule

- Short-term goal is to finish proposed plan, including Forest Service and BLM components.
- Hope to get GIS completed in the next few weeks to finish impacts analysis.
- EMPSi keeping a list of changes for the other alternatives, but this is not the focus right now.
- NOC is nearly done with their calculations for the roll up and cumulative effects analysis.

- Another federal family meeting in August for BLM, FS, USFWS to discuss proposed plans, mapping across state boundaries. Unsure whether there will be state involvement.
- Compare proposed plan and comments from USFWS. How they were addressed.
- After federal family meeting, FEIS will be prepared within 2 weeks to share with National Policy Team and cooperators, then go to print in the fall.
- ROD – unsure whether there will be one ROD for the western US or for the Great Basin Region, with sub-decisions for each sub-region.

ESA Consultation and Biological Assessment

- Scott Hoefer is the local contact. Agreement was that Forest Service would write the BAs and do most of the consultation since a lot of the species are on Forest land. However, in Idaho, have slickspot peppergrass – concerns that there will be impacts on this species from GRSG management. BLM may need to help prepare the BA for this species.
- Would like to incorporate the conservation measures in the latest conservation agreement. Meeting tomorrow morning to review and agree on the 2014 version of the conservation agreement.
- USFWS indicates that BLM will need formal consultation for this species. Want to ensure that consultation for the LUPA will be sufficient when site-specific consultation is needed.
- Make sure the team is in contact with Level I team for Boise (Brandon) and Twin Falls (Kate Forster) districts, as this might help streamline the process.
- Chris Colt (Forest Service) updated the group on the status of the BA. The consultation group (BLM, USFWS, FS) has been meeting and reviewing the list of species. Main species at issue is the slickspot peppergrass. Have been tailoring the BA template to the ID/MT subregion. Completed GIS overlay (acres and maps) of GRSG habitat on the different critical habitats.

New and Ongoing Components

- Received final FIAT report. Wildfire and invasive species assessments will be included as part of the plan and appendices. There will be an associated IM which is supposed to be out by the end of this week. Will be identifying members of teams by field office that will be conducting the assessments. Will likely start assessments prior to the final. Timeframes are uncertain.
- Monitoring framework plan will be incorporated.
- Still working to define the biologically significant units (BSUs) to calculate the adaptive management and anthropogenic disturbance. Hoping to finalize this with Forest Service and USFWS today.

Document Status

- Chapter 1 – Brent is making some changes
- Chapter 2 – Meredith has been making changes
- Chapter 3 – making a few GIS changes.

- Chapter 4 – teams have met, reviewed assumptions, GIS requests, and proposed plan. Assumptions almost complete – need to finish up minerals.
- EMPSi will send the current versions of their impact analysis to their BLM counterparts and will CC Brent.

Agenda

1. Coordination
 - a. Social and Economic Workshop
 - i. Thanks to all participants
 - ii. Several attendees in person and via web-ex
 - b. Cooperating Agencies
 - i. Finalizing MOUs
 1. Cassia, Power, Jefferson, Owyhee, Lemhi and Twin Falls.
 - ii. Work on INL, ID OSC and MT FWP
 - iii. Next Call July 5th 10-12
 - c. Tribal Coordination
 - i. Meeting with Wings and Roots after this call
2. Alternative Development – ID/swMT Alt
 - a. Process
 - i. Final Product – a comprehensive approach addressing all PPH/PGH in ID/swMT. Organized into a hierarchical structure with specific goals and objectives related to sage-grouse, accompanied by management actions to support those goals and objectives.
 - b. Components
 - i. ACECs
 1. Relevance and Importance evaluation is 90% complete – need to finish Idaho Falls, Dillon, MT and Forest Service.
 2. Preliminary Report to be share with managers for final approval – likely in August.
 3. Preliminary findings that areas within PPH meet relevance and importance values. Some nominations overlap and in many cases the different boundaries proposed do not inform or reflect specific conditions within the nomination.
 4. All PPH nominations will be carried forward in Conservative (Recovery) alternative. Internal proposals will be displayed in ID/swMT Specific Alt. Others will be displayed where appropriate.
 - c. Valid Existing Rights/Authorizations/Uses
 - i. Discussed mapping and display concern. Approach will be to describe groupings of existing developments, rights, etc. that have similar effects to sage-grouse and associated specific conservation measures/management actions that would be applicable and appropriate to apply in those areas when appropriate to help reduce impacts to sage-grouse or their habitat.
 - ii. Some Districts have provided an initial list, need to compile a comprehensive list across the sub region. Initial list will be utilized with additions – will finalize this in the Fall.
 - d. PPH/PGH Adjustment – areas missed by models/ground truth.
 - e. ID/swMT Alt
 - i. Stratification – Meeting in Pocatello next week to look at the state from the birds view and delineate some organizational structure through which to define goals, objectives and management actions.
 - ii. Goals, Objectives and Management Actions – each resource use identified in NTT to review NTT, other alternative approaches, no action description,

scoping alternative suggestions to develop goals and objectives (caveat) and management actions to support those goals and objectives.

- iii. Work Assignments
 1. Team assignments
 2. Expectations - GOAs
3. Administrative Record
4. Existing Condition Write-ups
5. Anything else that we have time for
6. Summary
 - a. Today – assign teams, post on Sharepoint applicable useful documents
 - b. Monday – PPH Stratification
 - c. Next Week
 - i. Develop stratification map and share with team
 - ii. Each Team to work on developing applicable area delineations and goals, objectives and management actions within those areas
 - d. July 13th – Each team to submit rough area descriptions with map if possible and associated goals, objectives and management actions
 - e. July 16-20th – SO to review these descriptions and guidance; develop mapps for discussion
 - f. July 24th – All Sub Regional ID Team Meeting – Alternatives Development Workshop in Boise, 8:00 a.m. – 4:30 p.m.
 - g. July 25th – August 3rd – Teams for finalize descriptions and goals, objectives and management actions
 - h. August 6th – Teams submit final versions to SO
 - i. Follow-up as necessary.

DRAFT MEETING SUMMARY

IDAHO SAGE-GROUSE ADVISORY COMMITTEE MAY 28 AND 29, 2014

LOCATION: Idaho Department of Fish and Game Headquarters
600 S. Walnut, Boise, Idaho

Attendance

The following individuals attended all or part of the May 28 and 29, 2014 Idaho Sage-grouse Advisory Committee (SAC) meeting:

John Beals (OSC)	Stephen Goddard (IWF)	Katie Powell (USFWS)
Donna Bennett (Owyhee LWG)	Wendy Green (West Central LWG)	Wendy Pratt (East Idaho Uplands LWG)
Jared Brackett (Jarbidge LWG)	Vince Guyer (Challis LWG)	Brent Ralston (BLM)
Lynn Burtenshaw (Upper Snake LWG)	Don Kemner (IDFG)	John Robison (ICL)
Sam Chandler (Big Desert LWG)	Karen Launchbaugh (Univ. of Idaho)	Kabel Satterwhite (Shoshone LWG)
Courtney Conway (Univ. of Idaho)	Paul Makela (BLM)	Megan Satterwhite (Shoshone LWG)
Jack Depperschmidt (DOE)	Dustin Miller (OSC)	Richard Savage (ICA)
Brett Dumas (Idaho Power)	Ann Moser (IDFG)	Scott Scroggie (PF)
Dave Ellis (Challis LWG)	Dallan Nalder (Curlew LWG)	Alison Squier (Facilitator)
Diane French (IDL)	Rochelle Oxarango (IWG)	Will Whelan (TNC)
Chris Gaughan (IDFG)	John Peavey (North Magic Valley LWG)	

MEETING OBJECTIVES: Support restoration and recovery of sage-grouse and their habitats
Provide venue for information sharing and discussion

Wednesday May 28, 2014

1. Welcome, introductions and review agenda

Don Kemner with Idaho Department of Fish and Game (IDFG) welcomed everyone to the meeting. Alison Squier, the facilitator reviewed the agenda and asked if there were any suggested changes or additions; there were none.

2. Update on BLM/FS Sage-grouse EIS Process

Brent Ralston (BLM) provided an update on the Idaho and Southwestern Montana Greater Sage-grouse Draft Land Use Plan Amendment and Environmental Impact Statement (EIS).

He explained that they are currently in the step between the Draft and Final EIS and reviewed the schedule for the next steps:

- November 2013 – Release Draft Environmental Impact Statement
- November 2013 to January 2014 – Public Comment Period

- January 2014 – Public Comment Meetings
- February to June 2014 – Analyze Public Comments and Response
- March to June 2014 – Develop Administrative Draft Proposed Plan
- July to September 2014 – Internal Review
- September to December 2014 – Release Final Environmental Impact Statement

Over 15,000 individual comments were received on the draft EIS. Those 15,000 comments included form letters from four different groups. There were approximately 300 unique and substantive submissions. Multiple comments were categorized into 33 separate categories. Sub-regional interdisciplinary teams have developed initial responses. Regional teams are currently reviewing and refining those for consistency.

Brent said that at this time he couldn't go into detail regarding the plan right now because it is not releasable to the public. But he did review the basic plan components, which include:

- Delineation of Sage-Grouse Conservation Areas and Management Zones
- Incorporation of Sage-Grouse Vegetation/Habitat Objectives
- Required Design Features
- Seasonal and Timing Restrictions and Buffers
- Adaptive Management Strategy and Anthropogenic Disturbance Cap
- Mitigation Board and Strategy
- Wildfire and Invasive Species Assessments by Field Office
- Program Direction
- Monitoring

The EIS includes conservation areas and management zones. The conservation areas include definition of the scope and scale for adaptive management and disturbance measurements. Three management zones are identified: core, important and general. Management zones identify areas of application for program management actions.

Best management practices are required not optional and are now called required design features. These are common and consistent among all alternatives. All projects conducted in sage-grouse management zones would incorporate: habitat (vegetation) management objectives, have required design features, incorporate seasonal and timing restrictions, and include appropriate lek buffers.

The proposed plan will incorporate an Adaptive Management Strategy with specific habitat and population triggers. The proposed plan will include an anthropogenic disturbance cap to inform development activities and function as an adaptive management trigger. Both are applied and measured within a conservation area – not the whole state. The Adaptive Management Strategy says that if you lose some habitat or birds in core areas, what we want to do is further protect those by making management action more restrictive.

Mitigation for projects would be required in all sage-grouse habitat. The mitigation hierarchy is to 1) avoid, 2) minimize, and 3) compensate. The proposed plan will include delineation of a State Interagency Mitigation Board. The Board's first task will be to develop a mitigation strategy for the WAFWA region.

The details for the wildfire and invasive species assessments are still under development by the fire and invasives assessment team. After the ROD each field office will develop a wildfire and invasive species assessment. The Wildfire and Invasive Species Habitat Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas/treatment

opportunities for fuels management, fire management, and restoration. These assessments identify priority areas and describe strategies for fuels management, suppression and restoration activities. This brings it down to the ground level.

The proposed plan will include a monitoring strategy that incorporates indicators and approaches to inform broad, mid and fine scale assessment.

Questions and Discussion:

- Dave E. – One of the concerns from our area where we have a lot of high quality sage-grouse habitat, and there may be higher restrictions, is are we going to end up in situation where resource users in those core areas would be so highly restricted that we're almost being penalized for actions we've taken in the past to manage that habitat and take care of it?
 - Brent R. – I've heard that concern that we've got good habitat in our area and we've taken care of it, we don't want impacts from what's happened in other areas to affect us. That's why we've got the conservation area approach so that we can localize responses as appropriate, so that if something happens in the south, that doesn't affect folks in the north.
- Dave E. – Yes, that was part of the concern. But it is more the concern that we've got so much high quality habitat up there; so are we going to be held to such high standards that we can't operate at all. We want to acknowledge that we've taken good care of our habitat and not be punished for that.
 - Brent R. – The delineation of management zones will mean that if you're in a core area the bar will be higher. It's through that approach of managing that core area that we keep the bird off the list. But when we start looking at activities, there are some narrow exemptions. That's where some of the other management applications dovetail to give you some flexibility.
- Wendy P. – Can you clarify the level at which 3% disturbance applies? Is that a management zone or conservation area?
 - Brent R. – It would be within the conservation area, but would focus more within the habitat. It wouldn't be the general areas.
- Steve G. – When I read the plan and am looking at the difference of size of the 3 different areas I see that there was tremendous variation of the size depending on which alternative you looked at. Not only is there a huge difference in size, but also a drastic difference between restrictions that apply in those different areas. What's been done to deal with those conflicts?
 - Brent R. – When you're doing an interdisciplinary team process with biologists, etc. we're always taught there's one answer. But as a planner to go through process you have to consider multiple answers. I made the case across the great basin sub-region that we need to look at variations of what that map really is. When you look at our draft, we have a very broad range of mapping allocations among the alternatives. We wanted to describe that there are differences of effects depending on where you draw the lines regardless of the management applications. Also, we've developed a range within the map too. We've had lots of discussions about what's in and what's out, and why, on the final map. The map that we have has been vetted a lot more than it would have other ways. We have the rationale in the record for why what is there is there.

- Steve G. – You didn't address why there are different management applications and different triggers. What's been done with review to resolve those differences?
 - Brent R. – It is a similar answer to the map, I have to be a little vague at this point because we can't release it to the public yet. We've had a lot of robust discussions around the adaptive management strategy. The adaptive management strategy and map are part and parcel of the decision. We've talked a lot about what are the triggers, what are the triggers based on, and what is the rationale for those triggers.
- John P. – What happens to designation of core, general etc. when a fire comes and burns through a designated area?
 - Brent R. – We've wrestled with that question. You are all familiar with the key habitat map. The key habitat map is where we track all that information about fire, etc. We tried to marry those up with the core habitat map. We want to be able to adjust that annually, but once we do that it becomes a plan amendment decision to change that map. That's kicks you into a two-year process. That's not where we want to be. So what we did is set up the core management zones as fixed map for 5 years, then every 5 years we would look at the key habitat map and link them up. The key habitat map will still be updated annually, which provides directions for fuels treatments, etc. We set up process where we have management application areas, e.g., core, etc. But within the core are we have a key habitat map that's behind that. So when you decide you're going to do a fuel treatment in a core area, you would go to the key habitat map. That will help guide where you go to maximize you funds application. We'll change the map if there are enough changes in five years on the key habitat map.
- Lynn B. – A concern I have is that we're seeing leks depredated by wolves. You said you have biologists sitting in the room talking about what would happen, but you didn't have ranchers in same room talking about what they see happening, and also talking about economics. I'm concerned about that. Now we've got a voracious predator like the wolf on top of the raven. Is there going to be any mitigation for the new super predator that's been introduced? How do you address that in this framework? Will there be someone on the mitigation board that represents ranchers?
 - Brent R. – That's a good question for the mitigation board to think about how that plays into the strategy and framework. I don't have a good answer to that that right now. That's something that will be looked at by the mitigation boards.
- Lynn B. – You talked about lek buffers, on one ranch we have IDFG put a two-mile buffer zone around known leks, so I couldn't use my ranch at all. Then they overlaid the brood area and I couldn't use my ranch during that season. I've never seen leks there. I'm concerned about leks and lek buffers. You could end up having a situation where you never see birds.
 - Brent R. – The lek buffers we've looked at are trying to tease out anthropogenic effects e.g., wind farm, power lines, etc.
- Jared B. – With fire being #1 threat I'm glad to see fuel treatments identified, but I have questions about what fuel treatments include. In our area we've seen a lot of improper livestock grazing e.g., 5 to 10% grazing instead of 20% or more to do fuel reduction. It a knee jerk reaction to just restrict grazing altogether not taking into account that it is one of our best protections against fire. If we continue the cycle of restrictions instead of proper management, and we have nothing left to protect for our livelihoods, there's no reason for us to stay out

there. I'm using the term proper livestock grazing intentionally. If you don't graze that fuel it builds up and builds up. That's the concern I have with core habitat and disturbance levels. It isn't just one thing that's going to save the birds; it is many things.

- Brent R. – We've kept grazing as a tool in the toolbox.

3. Livestock Grazing and Sage-grouse

Karen Launchbaugh (University of Idaho) gave an update on research being conducted to look at potential influences of livestock grazing on sage-grouse populations.

Karen noted that grazing is really interesting because it is tied to so many things. She provided a handout titled, *Livestock Grazing and Sage-grouse Habitat: Impacts and Opportunities*, from the *Journal of Rangeland Applications* (Volume 1, 2014; authors Chad S. Boyd, Jeffery L. Beck, and John A. Tanaka). (See Attachment A for abstract.)

She talked about the fact that historically grazing has always been part of sagebrush ecosystems, including buffalo 10,000 years BP, deer, elk, antelope, jackrabbits, etcetera, and cattle in the last 200 years or so. It is a natural thing in these ecosystems; it is a natural disturbance. In the last 200 years we added a different critters – cattle and sheep. In this presentation and in the study they are mostly looking at cattle since they are the most abundant livestock animals in Idaho.

In the modern grazing regime there are two types of livestock grazing. Beginning in the early 1900s there was heavy unregulated livestock grazing. The modern regime has the potential for more extensive management.

Modern grazing is managed and controlled. It incorporates grazing systems, deferment and rest, reduced stocking rates, and ways to assess grazing effects. Today the rangeland is in better condition than it was 50 or 100 years ago as a result of modern grazing practices. We are generally making progress except for invasive plants.

Karen explained that both the article she distributed and the research efforts they are doing look at both direct and indirect effects of livestock, but the primary focus is on indirect effects. Direct effects can include trampling of nests and eggs, or nest disturbance. Cows are big and they might cause birds to flush, although this generally isn't a big problem unless maybe there's a raven there at the time. The four major indirect effects are reduction of hiding cover, changes to vegetation mix, reduction of fuels, and alteration of the insect community.

Reduction of Hiding Cover

Perennial grass provides both cover and forage. It also provides fuel for fires. Looking at high, amount and where that grass is. To look at this the approach often is to throw down hoops and measure the grass, but that doesn't include looking at where that grass is. In this study they are looking at that question more directly. Cows eat grass in open areas before they eat grass that is under cover. What they see is that it levels off at about 90% before you start to see use of perennial grass under shrubs. Many times livestock would be moved as part of a rotation plan before or at that point. In the study they wanted to specifically see how those levels play out in Idaho and how that might affect management.

Change in Vegetation Mix

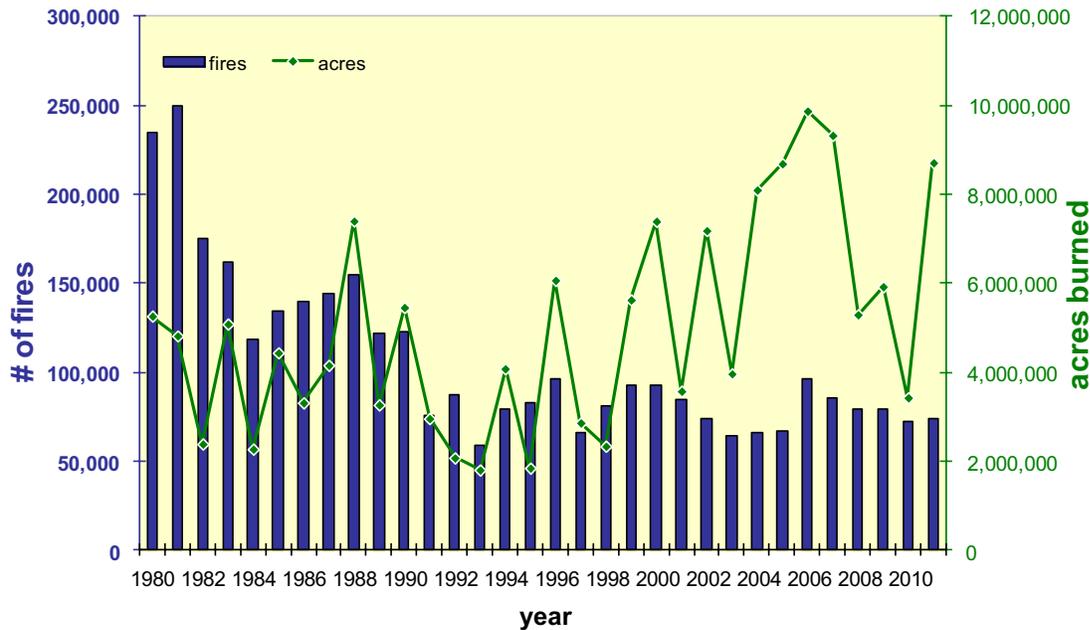

Cows can increase or decrease grass, shrubs or forbs. The only way to increase grass is to decrease shrubs or forbs. There's only so much nitrogen or water in the system. If you need to reduce shrubs, sheep and goats are good at that. Forbs are really important to sage-grouse. And forbs really are more

abundant in grazed systems. Most of the competition in a healthy sagebrush shrub is grasses. The problem is all of these things are pieces in the puzzle; we need to know how this plays out at a landscape scale. So towards that end the question is, does everyday grazing reduce forbs or grass?

Fuel Reduction

We know grazing has an affect in fuel reduction. We see it often, but not always. The question is, can we use grazing to reduce fuels? Managed grazing can change the perimeter or extent of fuels, or change the intensity, patchiness and flame length. Karen said she had also heard of another study that said grazed pastures have a shorter fire season. There are a lot of other effects of grazing and fuels that haven't been identified yet. They are proposing another study to be funded with NRCS Sage-grouse Initiative funds looking at use of grazing to reduce fuels.

Karen noted that if we stopped fire altogether on the Idaho landscape, no one would want to live there because it would be a moonscape. But we can manage the length and intensity of fire (see graph below from the National Interagency Fire Center data).

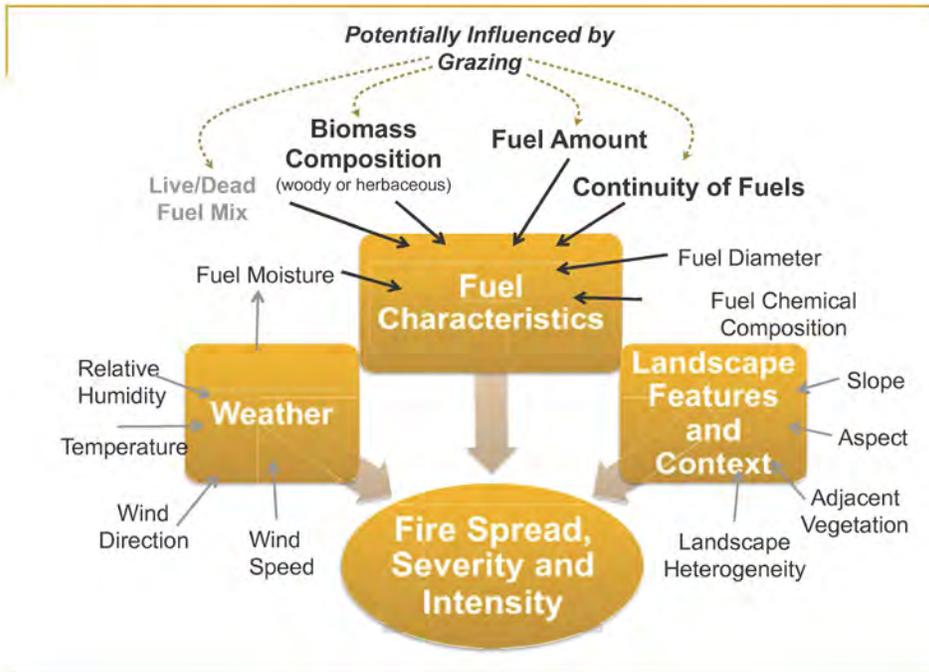

Historical Patterns

Karen noted that we have less cows on the landscape than we did historically. However, cheatgrass and other annual grasses are increasing. Human development is increasing and there are also more human caused fires. In addition, we are having longer, hotter drier summers and longer fire seasons. So, where does grazing fit in? They are looking at grazing on fuels with Ava Strand. She's looking at how grazing patterns are influencing fuels and how annual grazing influences annual grasses.

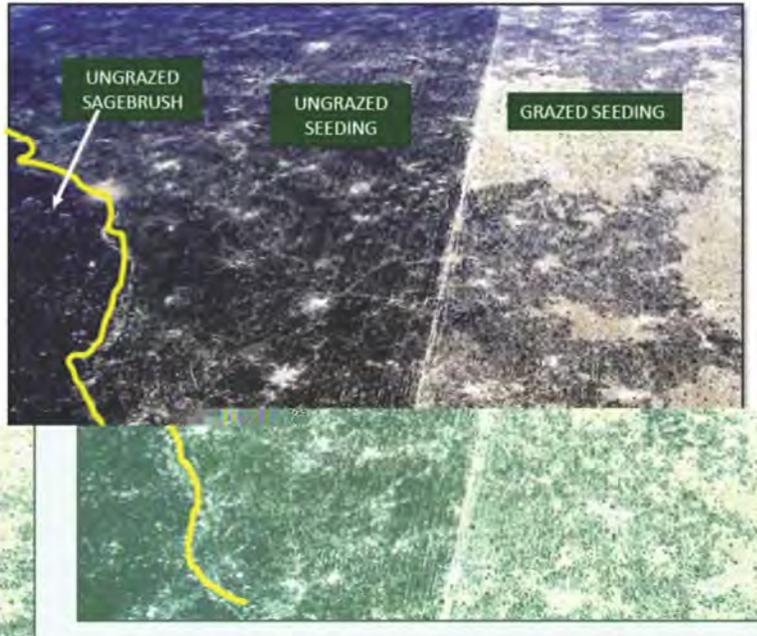

Where Does Grazing Fit In?

There are lots of factors that influence fire. Only a few of those can be addressed with grazing. Characteristics that could be potentially influenced by grazing include the live/dead fuel mix, biomass composition (e.g., woody or herbaceous), fuel amount, and continuity of fuels (see first image next

page). Everyone has historically been fixated on the amount of fuel, but continuity of fuel is really important too. Grazing can also affect fuel loads (see second below).

Grazing affects Fuel Loads

Annual grasses including cheatgrass, medusahead and red brome, were introduced in the 1800s. They are fine-textured and easy to ignite. Because they are early maturing they extend the fire year. They also increase the ignition risk and decrease the fire return interval, which affects sagebrush survival and recovery.

An 8-year grazing study in northern Arizona (Loeser et al. 2007) showed that areas with moderate grazing had less cheatgrass than areas with no grazing, areas with moderate grazing also had less cheatgrass than areas with heavy high impact grazing, and areas with high impact grazing caused a great increase in cheatgrass after a drought year. Karen said that study is needed to see what it looks like here in Idaho.

The key is to figure out how do we turn that crank to get less cheatgrass. It is not IF to graze; it is HOW to graze. Based on studies to date, in the absence of livestock grazing, cheatgrass will likely increase to its ecological potential for the site. Early spring grazing can suppress cheatgrass and promote perennial grasses. If grazing occurs as perennial grasses begin to flower, cheatgrass will likely increase. Grazing during the dormant season does not affect cover of perennial grass but can reduce fuel loads and the density of cheatgrass. New studies looking at winter grazing on cheatgrass suggest that when grazing occurs in the winter it removes dead biomass, which makes it harder to new seedlings to establish.

Fuels and biomass interact with each other. Without grazing there is an accumulation of biomass and litter including a distribution of litter around perennial grass crowns. In a study by Davies et al. (2009) they looked at four treatments: 1) ungrazed unburned, 2) ungrazed burned, 3) grazed unburned, and 4) grazed burned. The site had been grazed at moderate levels (approximately 30-40% utilization) since 1936. Litter and biomass was almost two-fold higher in the exclosures, which wasn't a big surprise. What was surprising was that when fire went through the ungrazed areas in the exclosure, the amount of cheatgrass skyrocketed after the fire. The explanation is that the fire burned hotter through the ungrazed areas killing off the perennial grasses. Conventional wisdom is that if you didn't graze the perennial grasses they would be stronger and healthier; however, that's not what happened.

Other indirect effects from grazing include changes in the insect community. Primary insects that are fed upon by sage-grouse include ants, June/dung beetles, and darkling beetles. Grazing could change the type of insects, distribution and abundance. Grazing effects on insects are not well understood. We do know that insects are important to sage-grouse in their diets. It may be that some day we have a grazing system where the goal is to modify insect communities.

Grazing also comes with ranching and there are a lot of other things that come with ranching that may have impacts to sage-grouse including fences, water tanks, roads, fragmentation and general activity.

4. Effects of Spring Livestock Grazing on Sage-grouse Demographic Traits

Courtney Conway (University of Idaho) gave a presentation on the study to look at the effects of spring grazing on sage-grouse demographic traits. He said that Karen talked about how grazing can influence vegetation, and also commented that there's been research showing how vegetation effects sage-grouse. But there have not really been any well-designed studies done looking at direct or indirect effects of grazing on sage-grouse parameters. There have been some studies done, but any one of those studies can be criticized. He explained that the team that is working on this study wanted to fill that void by implementing an independent, replicated study on direct effects of spring grazing on sage-grouse demographic traits.

This will include looking at: nesting propensity (i.e., the probability that a female will initiate a nest), nest initiation date, clutch size, daily nest survival (i.e., the probability that a nest survives), re-nesting rate

(i.e., the probability that if nest fails the hen will reinitiate another nest), brood size (i.e., number of chicks), brood survival, post-fledging movements (i.e., how far they have to go to find brood habitat), natal recruitment (i.e., probability the a chick will return to that site as to nest), hen survival, inter-annual nest-site fidelity, and site occupancy (i.e., where females nest relative to grazing activities).

Study Design

The study design is a 10-year replicated study. They will put radio transmitters on female sage-grouse at nine study plots in Idaho. At each of the nine study sites, they will set up three grazing treatments per plot. They will be able to see where the sage-grouse place their nest. They will base the location of the study sites based on where females go. There will be three pairs of grazing intensities at each site. The study area will include areas with greater than 40% grazing, 20-40% grazing, and no use. They plan to work with local permittees to change grazing intensities.

Study Areas

They identified a list of criteria to decide where to place the study sites. They will be using primarily BLM managed areas and focusing on spring grazing, since that's one of the most contentious areas. They also need to have known sage-grouse nesting at the study sites. They set an arbitrary threshold that the site has to have at least 1 lek with 25 or more males. They selected the arbitrary number of males so that they would have enough females to collar. In addition, the sites have to have at least 15% sagebrush cover, and specifically, Wyoming big sagebrush. They also want sites that have had predominantly native understory. Sites selected will be at 1,300 to 2,300 meters in elevation. They also wanted at least 1 or 2 cooperative permittees who would be willing to work with them over a one-year period. Additionally, they will need to be able to get vehicles to the sites as early as late February so they have to have road access in the spring. Finally, they also wanted sites with limited amounts of infrastructure and for the sites to be pretty consistent with each other in the amount of existing infrastructure.

They reviewed a map of sage-grouse leks that are potentially suitable and to date have identified four sites; they still need to get five more lined up. The four selected sites include Browns Bench, one at Jim Sage, Table Butte, and Sheep's Creek.

This year will be the first year of work on the ground. They began collaring sage-grouse on March 1. So far they have put out 49 transmitters at Browns Bench (29 nests) and 51 transmitters at Jim Sage (19 nests). They hoped to put out transmitters at all four sites this spring but had setbacks. They will get the rest out in the spring of 2015. They will be following the females to their nest and, depending on where they nest, they will manipulate grazing per the study design. They will measure vegetation, insect abundance, and forage quality. At each site they will be monitoring parameters for two years before they begin changing the grazing intensity.

A multi-disciplinary planning team has been working for two-years to get the study up and running and work through the details. The team meets regularly approximately every two weeks for about an hour. Team members include: Jack Connelly and Don Kemner with IDFG; Paul Makela with BLM; Courtney Conway, Karen Launchbaugh, Eva Strand and Dave Gotsch with University of Idaho; Jericho Whiting with Gonzales-Stoller-INL; John Robison with Idaho Conservation League; Chris Black a livestock operator and member of the Idaho Rangeland Resource Commission; and Wendy Pratt with Pratt Livestock an the East Idaho Grazing Association.

Questions and Discussion:

- Lynn B. – What are you using for transmitters?

- Courtney C. – We’re using regular VHF transmitters that require antenna. We’re also putting out a view satellite and transmitter and GPS transmitter. The satellite transmitters cost about \$4,000 each and you can’t walk out to find individual nests. The satellite data will allow us to find clusters. We’re also experimenting with GPS transmitters, which give you locations via cell towers. They are heavier and require that the birds are periodically close enough to a cell tower to download the data. Most of the transmitters are VHS transmitters.
- Dave E. – You said you’re gathering data for the first two years. When you get to the grazing treatments, do you have any idea of how long those grazing periods will be to get that type of utilization? How many days? Two months or a week?
 - Karen L. – For research it would be best to do it in short period of time, but it will probably be two to two and a half months.
- Dave E. – It would be great if you could get BLM to throw open the door and see what would happen in a really short time.
 - Karen L. – We have to work within BLM permits.
 - Courtney C. – There are so many variable that we could assess. We have always viewed this as potentially being able to add more treatments and nuances. We want to evaluate one set of affects really well and then depending on that, we hope people will keep coming to the table to allow us to look at other sites if they realize that we’re impartial and are doing this in a transparent way.
- Brent D. – It seems like some variables might be quick to respond while others might take a long time.
 - Courtney C. – We just don’t know. We have an ambitious study plan that we keep revising. From the outset we have to work with INL and other areas that haven’t had cattle grazing for a long time so that we can have a bit of a baseline. That will allow us to compare an area that’s resting to an area that’s never been grazed. We’re currently at about 40-50% of desired funding level to implement the whole study plan. INL is on the team from the outset because we want to add that non-grazed area. We wrestled with how many years to rest. How many years are we going to keep this experimental grazing system in place? From a scientific study perspective the more the better, but we don’t want to drive people away either. We’ve asked for at least three years.

5. Update on Sagebrush Nutrition Research

Jennifer Forbey (Boise State University) gave an update on nutrition research that she is working on. The work was initially funded by the SAC and was then expanded to include a National Science Foundation Grant. Jennifer is working with a graduate student, Marcella Fremgen as well as Jack Connelly with IDFG and Gail Patricelli at UC Davis.

Jennifer explained that not all food is created equal and animals very selective in what they consume. Wild animals are trying to get as much protein as possible and avoid toxins. Sage-grouse are no different and not all sagebrush is created equal. One hundred percent of the food that sage-grouse consume in winter and spring is sagebrush. Not all sagebrush is tasty and palatable to sage-grouse. Selection of sagebrush occurs at a variety of spatial scales and is driven by the amount of toxins in the

sagebrush. There are 30 or more volatile compounds found in sagebrush. Both sage-grouse and pygmy rabbits care a lot about the compounds that are found in sagebrush.

Study Objectives and Predictions

Objective 1 deals with selective foraging. The prediction is that grouse will select for high protein content, low toxin content and moderate canopy cover and height.

Objective 2 deals with diet quality impacts to movement. The prediction is that sage-grouse will move farther away from leks to find higher quality food.

Objective 3 addresses diet quality impacts to reproductive effort. The prediction is that males foraging at the highest quality patches will have the highest display effort. Basically both objective 2 and 3 are about – if you eat better, you can reproduce and do things better.

Jennifer reviewed the previous and new research focus and sites, which include: within a site within winter at Browns Bench (previous), between sites within winter at Raft River versus Craters (new), within a site among seasons at Raft River (new), and between sites within spring at Raft River and a Wyoming site (new).

What is new in this study is that they will compare across a season, they will look at selection within diverse patches, and selection within three-tip sagebrush. In the past they looked at Browns Bench, now they will be looking at a site with multiple types of sagebrush. Also, Jennifer noted that she has been told anecdotally that sage-grouse don't eat three-tip sagebrush, but they are seeing lots of birds eating three-tip. For field methods they will look for pellets, if there's snow on the ground they will look for tracks, and they will look for bite marks on the plants. Jennifer said that relative to random sites, they have seen sage-grouse using black sagebrush more, and not using Wyoming sagebrush sites for foraging. The proposed explanation is that Wyoming sagebrush has fewer monoterpenes.

Field Methods (Selective Foraging)

Field methods consist of: approaching and flushing sage-grouse or using GPS data to find foraging sites, sampling browsed and un-browsed plants, measuring structural characteristics of the site, and sampling randomly selected points.

Sage-grouse avoid toxins at multiple spatial scales. To study this they used hierarchical information – theoretical approach to model selection (Burnham & Anderson 2002, Doherty et al. 2008). They completed two 30-meter perpendicular transects centered on the estimated center of the used (or random) patch. The center was estimated on the basis of browsed plant distribution at used sites and on the randomly generated coordinates at random sites. They were randomly oriented transects. They used a plumb bob along a taut string to identify where any branches/foilage intercepted the transect, then they subtracted gaps in the "continuous" foliage of five centimeters or greater.

At the habitat scale, sage-grouse selected habitats with black sagebrush to avoid toxins. There is evidence for selective foraging by sage-grouse at Browns Bench in winter. Sage-grouse select plants with both higher crude protein and lower concentrations of toxins.

They have a backpack style tag on the sage-grouse. Information gets uploaded to receivers at the lek. They can differentiate between flying, running, walking and pecking with the tags.

Raft River Results

At Raft River they observed a diversity of morphotypes (i.e., large *A. t. wyomingensis*, medium *A. arbuscula* and *A. t. wyomingensis*, and small *A. arbuscula*). Patch selection was influenced by species and patch diversity. Patch use depended on the presence of *A. arbuscula* (50 of 50 used patches had *A.*

arbuscula; 25 or 49 available patches had *A. arbuscula*). Every time they found small *arbuscula* they were the thing being browsed. Path use depends on morphotype diversity within the patch (44 of 50 used patches had more than one morphotype; 25 or 49 available patches had more than one morphotype). They probably used sites with more diversity because you have good cover there plus other types that were good eating.

They also wanted to measure how far they are going for food. Sagebrush responds to browsing by inducing its chemical defenses. So the more sage-grouse browse on sagebrush, the more toxic it becomes and the farther they have to go from the lek. The birds seem to be spreading out; they don't go to the same places every day. At most of the roost sites they couldn't find browsed plants. They measured diet quality close to and far from the lek. And they measured diet quality at foraging sites and reproductive efforts and success, and body condition. They found that males foraging at the highest quality patches had the highest display effort.

Sage-grouse have an energetically expensive breeding season immediately following winter, when they consume a diet of 100% sagebrush. The energy used to display is up to four times greater than the basal metabolic rate. Therefore, grouse must obtain highly nutritious food before and during the display season in order to maintain body condition. Additionally, grouse are ideal to study both forage and reproduction because their foraging is evident on sagebrush leaves (making their plant selection obvious), and their reproductive displays are easily viewed because of their leking habits. Males gather on open grounds to display for females, who select the best male based on his display effort and quality. This is partly why they will be examining male reproductive effort rather than female reproductive effort. Additionally, female reproductive effort is related to spring diet (with more forbs) rather than winter diet only. They will also evaluate male reproductive effort using display effort (time spent on lek, strut rate, copulations) rather than fitness because fitness is difficult to measure in long-lived, free-ranging species. It is important to understand what makes males successful on the lek because only a small number of males actually breed, so knowing what makes those individuals successful is important for management.

To look a reproductive effort they began in mid-March and observed collared males attending the lek. They conducted a time budget analysis, which looked at the time spent on the lek, copulations, and display (strut) rate. They also followed the birds to off-lek foraging sites and collected plant samples there. Birds usually flush naturally within an hour after sunrise and move to daily off-lek foraging sites.

Next Steps

The next steps are to process the samples they have collected to date and begin the chemical analysis of those samples (monoterpenes, coumarins, protein); conduct habitat transects; analyze behavioral videos from the leks; and begin the data analysis.

Management Implications

Jennifer identified a number of management implications. She noted that winter habitat is limited and there are high energetic costs during the winter. In thinking about diet, what is good for the cock is good for the hen in terms of diet quality and success. The information generated through the study will help to assess the impacts of habitat management and climate change (juniper removal, mowing, fire and drought). Additionally, this research will help managers to identify the most palatable plants for conservation and restoration.

Questions and Discussion:

- Dave E. – What were the nutritional differences between Wyoming sagebrush and three-tip?

- Jennifer F. – We haven't analyzed that yet. We'll also look at biomass effect.
- Brent D. – Have you looked at how individual plants vary from year to year? Is it genetic quality, age, or other?
 - Jennifer F. – We have three years of data at a pygmy rabbit site. There's more between

The result was a new Salmon regional seasonal use area map with 6,000 data points (see below).

The LWG decided to just start with a clean slate and add data as they collected it. If you have a map of a soil unit, you are able to pretty well represent vegetation on the ground. They had an order three soil survey to start from.

In the last couple years they are really starting to see the connectivity in

Next steps include: an on-going radio-collaring project with BLM and USFS, monitoring historical leks for renewed activity (Badger and Park Creek), and searching for new leks (IR flights). Management applications include providing information to inform the key habitat map, information for NEPA required for grazing allotments, and project prioritization.

Questions and Discussion:

- Paul M. – So this is probably a pretty conservative estimate of nesting habitat since you don't have a radio on every bird? Are you accounting for potential nesting habitat?
 - Vince G. – Yes, this is conservative. There's this and the other areas that we've identified as potential nesting areas. The LWG wanted this to be areas that we know are actual nesting habitat. That was a key distinction. Any observation data that people bring that we can confirm goes into this; it isn't just telemetry data. We recognize that there are other areas that potentially have sage-grouse use.
- John R. – Have you located any key areas where all the birds congregate, like the Freeman Airport that turned out to be really important for a short period of time e.g., hot spots?
 - Vince G. – There are some, but most of them we already knew about. For instance, there's an area right below Lemhi. That's our biggest wintering area.

7. Update on Raven Management Activities in Idaho

Ann Moser (IDFG) gave an update on raven management activities in Idaho. She explained that the State Legislature directed the Department of Agriculture and IDFG to conduct a study and associated monitoring. Specifically, the language regarding the intent of the legislation read:

It is the intent of the Legislature that the Department of Agriculture work together with the Department of Fish and Game to fund up to \$100,000 for a project to evaluate and monitor the impacts of raven control on sage grouse survival.

The rationale was that sage-grouse are a candidate for listing under the Endangered Species Act (ESA), with a final decision expect in September 2014. Sage-grouse populations have declined for a number of reasons including infrastructure development, fire, habitat loss and fragmentation, etcetera. The USFWS has also noted a lack of regulatory mechanisms.

Breeding bird survey data indicate that raven numbers in Idaho have increased 3.4% per year since 1966. Raven numbers have also increased throughout the west. Ravens have increased because of a variety of subsidies e.g., landfills, road kill, power lines that give them places to nest where they didn't have places to nest before, water sources, etcetera.

There is direct evidence that ravens predate on sage-grouse eggs. For an example, Ann showed a video of nest predation taken by Zack Lockyear.

In terms of indirect evidence, IDFG has wing data going back to 1961. This is probably better data than lek data because it has a really good sample size. Looking at the number of juveniles per hen there is a clear decline over time. This indicates a problem with productivity, not adult birds. The three worst years in terms of productivity were 2007, 2012 and 2013. It is not clear what the cause of this decline is.

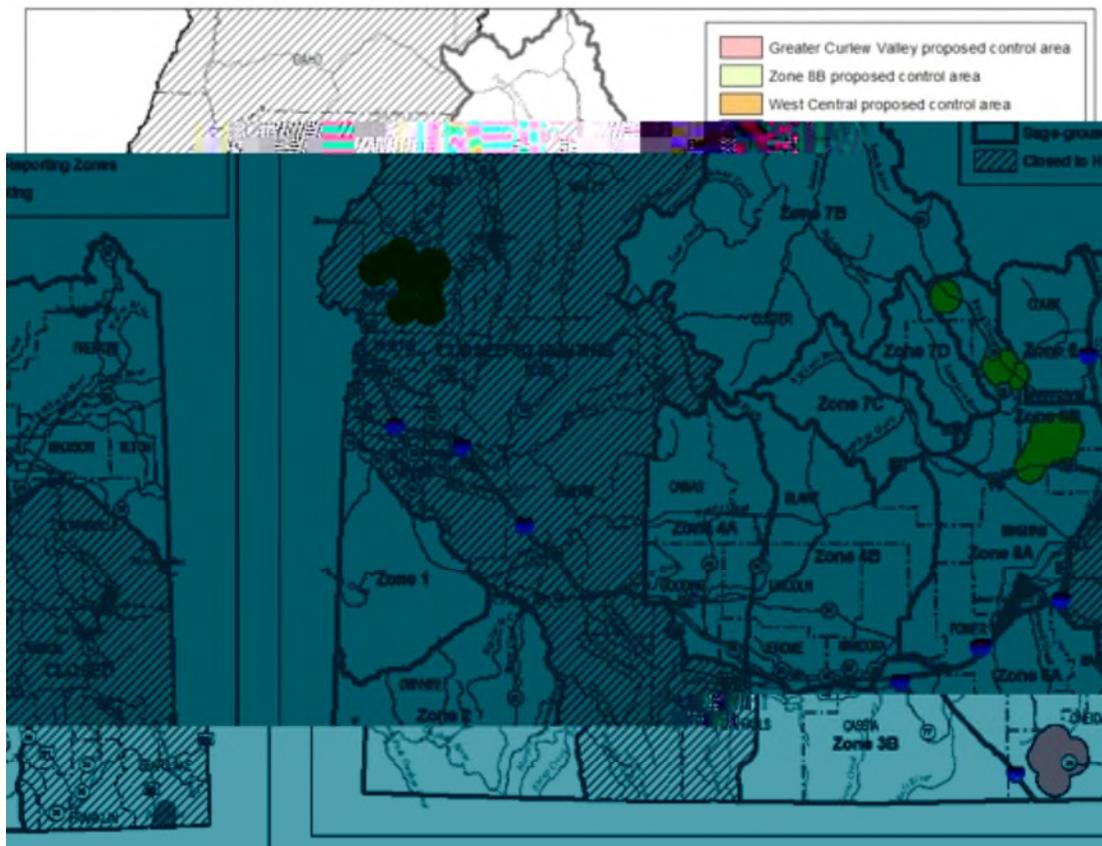

Raven Control

Ravens are protected under the Migratory Bird Treaty Act. In order to take ravens in Idaho a permit is required. When they first received this direction from the Legislature, IDFG asked Wildlife Services to

help. Wildlife Services thought they could take ravens under their current permit with USFWS, which is primarily designed to benefit livestock operations. However, the USFWS said that was not acceptable and that IDFG needed to be the permit holder. Therefore, IDFG had to apply for a scientific collecting permit to do the study. While IDFG can apply for and hold the permit, Wildlife Services is the only entity in the U.S. that can use the chemical that would be used to kill the ravens. To do that, Wildlife Services had to complete a Supplemental Environmental Assessment (EA) to the current EA they are working under.

Ann noted an additional challenge associated with the Legislature’s direction to fund up to \$100,000 to evaluate and monitor the impacts of raven control. It will cost approximately \$50,000 to pay for the poison and for Wildlife Services work. The remaining \$50,000 is not sufficient to conduct monitoring that would be able to provide an informative answer regarding the impacts of raven control. So a challenge is figuring out what can actually be accomplished with that amount of funding that would have informative value. Additionally, just so everyone understands, the \$100,000 is not funding that was added to IDFG’s budget, it is funding that will come out of the existing IDFG funding and would have otherwise been directed to other activities.

Given the limited funding, they are trying to figure out how to most effectively achieve the Legislature’s intent. They looked at raven populations around the state and at congruent sage-grouse populations. They are proposing to do raven control in a very small area. A few years ago the SAC agreed to fund a project in the Curlew LWG looking at raven densities and the relationship to resources. That is one possible site. Five other possible study areas were identified. INL has the highest raven density, and the Curlew LWG area is the third highest.

Ann noted that we know that when a predator is removed from an occupied area, other predators will move in. So in order to have an impact the number of ravens removed is going to have to be high. To determine an estimated number of ravens to remove for the study they looked at raven densities in the Curlew (0.70 ravens/km²), INL (0.85 ravens/km²), and West Central (no date so they used an average). They extrapolated those numbers out to get an estimated number of ravens to remove.

Given the limited budget for monitoring they have determined that what they can do is continue to monitor lek route trends statewide, conduct raven surveys statewide, and record anthropogenic subsidies. In the past on almost all of the lek routes throughout the state they did the lek routes, and after that on the way home they did raven surveys. That is providing IDFG with some baseline data statewide. In addition, on the data sheet the people doing the surveys are recording what's on the landscape (e.g., landfill, power lines, etcetera).

Status Update

IDFG received the scientific collecting permit to take 1,750 adult ravens and 250 eggs each year for two years. Under that permit ravens may be shot or poisoned with DRC-1339. Wildlife Serviced did not complete the Supplemental EA. IDFG Conservation Officers are assisting with the raven removal to the extent possible. So far, 11 adult ravens have been killed, 15 nests were removed and 59 eggs destroyed in the Curlew LWG area. The permit expires on June 1, 2014 so at that point actions will end. Almost all the ravens were shot off nests; none were shot off bait. They didn't find any nests in INL or West Central. In the Curlew the nests were mostly in Russian olive trees. The Conservation Officers have found that it is very, very difficult to kill ravens.

Ann posed the question to the SAC, what can we do to help with this issue? How can we manage ravens in the future?

Questions and Discussion:

- Richard S. – I suggest in the Upper Snake area you need to move east to the Interstate 15 area where the road kill is. If you're going to kill them the fall might be the best time when they start flocking up. We also notice that there's a raven's nest on all the water tanks. Our group thought there might be value in helping educate ranchers to eliminate places for ravens to nest near water tanks. For instance, the old 10,000-gallon tanks – maybe putting something on them to prevent them nesting.
- John R. – You're instructed to monitor impacts of raven control on sage-grouse survival – subsidies for ravens, infrastructure, perching areas are a legitimate threat. You can get credit from USFWS for doing something that addresses a threat. Instead of looking at individual critters, look at the underlying subsidies. Look at ways to address subsidies that have broader support from everyone. For instance targeting Phase 1 and Phase 2 junipers is a pretty good way to address this. Subsidized water, better ways to manage road kills, siting power lines so they're not going through sage-grouse habitat. Clean things up. Removing junipers are a way of raven control that is arguably more effective in the long-term. Is there a way to redirect this towards other projects that have a lot of momentum? Maybe other ways that are more efficient than targeting one raven at a time.
- Lynn B. – I used to run cattle in Wyoming. The Game and Fish officers in Wyoming said all they use is poisoned eggs and they do it all the time. Wondering if there's a way to not reinvent that wheel and as a state have that going on. If you treat one area, it is like a vacuum and they're just going to drop back into that area. I understand that they are doing that in Montana as well.

- Ann – We haven't quite figured out all the rules that APHIS Wildlife Services operates under. They have difivet opernidits diAnn n ynielpngeypGe pehapndAnn nepGeepveyypehapdehapAr

- Jared B. – I see a lot of ravens. Every spring they show up at the sage-grouse lek. I don't think killing ravens is going to solve all our problems. We need to get rid of subsidies. We need to bury dead piles, educate the public, and we have to continuously do things. Poisoning ravens will save 20 sage-grouse over the years and that adds up. My wife has turkeys; it took three ravens a day and a half to kill all of those baby turkeys. They are incredibly smart birds. As far as the livestock carcasses, that's a drop in the bucket compared to the gut piles that are left after every hunting season. Road kill is a huge one too. If we're looking big picture, lets go true big picture.
 - Ann M. – On a related note, our Conservation Officers have recently observed that there is less road kill out there after the road kill salvage law passed.
- Paul M. – So did APHIS just table that Supplemental EA?
 - Ann M. – They're still working on it.
- Lynn B. – For our local landfill it cost \$25 million to line the landfill. Fortunately we had clay that we could line it with. In Mud Lake you bury the trash every day. One thing IDFG could do is find out which landfills can't bury their trash and maybe target ravens in those areas.

In conclusion Don Kemner noted that some of the things that LWGs could do to help are to identify subsidies, use local knowledge to identify other subsidies, have them help map these things so that IDFG could knit that together.

8. 2014 Lek Counts

Ann Moser (IDFG) explained that the 2014 surveys are done but the data is not all entered into the database yet; IDFG staff is working on that. They have until June 1 to get it done and then Ann has about a week to get the summaries of the data pulled together and out to everyone.

There are 78 normal lek routes that are counted every year. This year they got a little extra money through OSC to visit more leks. Using that they visited leks that hadn't been visited in more than five years; leks that were determined to be unoccupied at some point. Also, they incorporated some of the management triggers that Brent Ralston described in the morning presentation. One of those is how the lek count is changing year to year. So they wanted to make sure that any leks that were visited last year were visited again this year so that they could see the change from one year to the next. Ann said they probably got maybe an extra thousand leks that were visited this year. They had some leks in the Sand Creek desert that hadn't been visited since the late 1980s. Some of those were still active and were pretty big (i.e., 50-60 birds).

Anecdotally, people are saying that lek numbers appear to be the same or maybe a little better this year. Ann thought this was a little surprising given the earlier discussion about declining productivity trends. A presentation a few years ago at WAFWA that suggested that more males show up to the lek when productivity is lower. It is kind of like when a bunch of coyotes are killed, they will subsequently put more energy into reproducing.

Don Kemner (IDFG) added that in terms of doing the extra lek counts; OSC made a supplemental funding request for fiscal year 2014 and received an additional 50,000 to do the additional counts. Also in fiscal year 2015 an additional request was made for up to \$75,000 to do more lek counts. IDFG will be working with the regional offices to determine if it would be possible to actually get out and count leks if there was some additional funding. They are getting to the point in Salmon where they've counted all the leks that they can from the ground and now have to check from the air.

9. Hunting Season Setting

Ann Moser (IDFG) reminded the group that the Local Working Groups have been following a process to make recommendations for the upcoming hunting season every year since 2008. The process follows the framework and guidelines that were included in the 2006 state plan.

When regional staff gets lek data entered, Ann sends that information to the regional biologist. The IDFG representatives then compare the current data (the three year running average) to the hunting season and bag limit guidelines in the state plan to make an initial recommendation. The LWG members also review this recommendation and factor in additional local considerations. This process also allows for input at the local level. Even if the trend graphs show that we still have a huntable population, there might be things on the ground that you want to make sure are considered such as fire or other conditions. Or for another example, West Nile Virus doesn't usually hit until July or August; if people were to start seeing dead birds in that time frame we need to make sure the IDFG regional biologists know so that they could close the season. The IDFG regions make recommendations to the Wildlife Bureau the first week of July. These recommendations incorporate input from the LWG members. Once the regional recommendations are in, Ann M. and Don K. brief the IDFG Commission and put the recommendation on the IDFG web site as a proposal. At that point public comments are also taken. The public comment period usually extends through the end of July. Then IDFG staff develops the final recommendations for the Commissioners for their August meeting. The Commission sets the hunting season at their August meeting.

Questions and Discussion:

- Lynn B. – Eventually the bird either will or won't be listed. I keep thinking we're dropping the ball because we haven't set a population guideline for each of those areas that we determine is a healthy population. So that when the Service decides whether or not to list they can take that into consideration.
 - Don K. – As far as the sage-grouse hunting season setting guidelines, the USFWS has indicated that they're good with the guidelines we're using. But in terms of the point you're making, there is work being done in Colorado trying to develop the techniques that would potentially allow for doing surveys that would give you a population estimate rather than doing a lek trend count. In the future there may be a methodology that could be applied that would come up with population estimates for sage-grouse. As far as hunting seasons, a couple years ago when we were developing the habitat and population triggers for the Governor's alternative we sketched out if that actually did get adapted and implemented in the land use plans how could we use that same protocol in determining hunting seasons. It ties how we set hunting seasons into the same way of determining other multiple uses of the land.
- Brent D. – I took the annual report that Ann sent out with the numbers and looked at where we're at with the Governor's plan. Right now the Upper Snake, Magic Valley, Curlew, etc. have already hit the trigger. Looking at this regulatory environment we're in, we're harvesting a lot of birds. Is this really worth it where we're at right now that we're going to continue hunting birds and we have a listing decision coming up? Hitting these triggers is going to impact our industry, the livestock industry and our state. I think from a SAC perspective maybe there's something we can do.

- Don K. – I think that is a decision for the LWGs not the SAC. In the past the SAC has always wanted to let the LWGs take the lead in their own areas and not dictate decisions at a statewide scale.
- Sam C. – We’ve talked about this before and a number of people on the SAC have said no to hunting.
- Rochelle O. – Right now in most of the LWGs, the members are mostly agency people. It may be important for the SAC to have more of a voice in this.
- Don K. – We’ve closed seasons in some areas in the past and we’ve kept seasons really low too.
- Steve G. – Would like Ann to let us know if areas with closed seasons have experienced a jump in the leks?
 - Ann M. – West Central has conflicting conditions. Jarbidge closed due to fire but has stabilized with maybe some increase. The Curlew closed for many years and then reopened because numbers improved. East Idaho Uplands is closed.

Alison S. noted that the issue of whether to close hunting altogether in Idaho has come up multiple times over the years in the SAC and that there are a range of views on the topic. She noted that the SAC membership has changed a great deal over the last three years and asked the SAC members if they would like to just record everyone’s current thinking on the matter, given the current composition of the SAC. Alison suggested it might be valuable for IDFG to hear the current SAC participant’s thoughts on the issue and participants agreed that they would like to have a chance to state each of their views at this time.

Following are the results of the poll of current member’s and SAC technical advisor’s views of the hunting issue. This was not a vote or a change in current policy, but was intended to record member’s current thinking on the hunting issue:

- Jared B. (Jarbidge) – Jarbidge elected to close their local season. I support closing more
- John P. (North Magic Valley) – We have a LWG that’s pretty well agency dominated. Last year we had a real fight in the committee about whether to close the season because of fire. We got our lek counts last night, the lek counts look pretty good in the North Magic Valley. We started with the 2005 peak, then the West Nile Virus hit. But every lek but one is showing an increase. We voted last night to support a one bird two-bag limit. But I hadn’t seen Ann’s productivity information at that point.
- Rochelle O. (IWG) – Personally, have hard time getting my head around hunting not affecting population levels. I don’t understand that argument. With a listing decision coming out I think we should close hunting statewide.
- Sam C. (Big Desert). I think it is at the point of being listed, I think you should close it until after the listing decision. Big Desert is one of the better areas in the state right now. We could go to a longer season, but I think we need to close it.
- Diane F. (IDL) – On personal level I agree with Rochelle. I’m a hunter but this close to a possible listing, I’m not sure that hunting makes sense.
- Paul M. – Think the low productivity figures that we’re seeing are disconcerting. It is hard to pass the red face test to defend hunting but then we take all these other measures. I get that

the wing data gives us our productivity data. Without that it's hard to get that data. But I keep coming back to that red face test.

- Kabel S. (Shoshone Basin). – Our group is agency dominated right now, but I'd like to see the season closed.
- Wendy P. (East Idaho Uplands) – East Idaho Uplands is closed. I would like to see it kept on a case-by-case LWG decision. If it is a way to get producers there to make that decision, that would be good. It is hard to for agency folks to run over ranchers.
- Dallan N. (Curlew) – The Curlew closed for a few years and recently opened on a restricted basis. If you don't have enough birds that they should be listed is one argument, but you need to know how many birds you have. You're kind of behind a rock and a hard place. I don't think they're getting enough wings out of the wing barrels.
- Dave E. (Challis) – This information that Ann just showed us about productivity isn't new. When we ask the IDFG about how to go about this differently they says that we need this data that comes from hunters. But the red face test is more of an issue. We're hitting the trigger in the Challis. I think it is time to find some other way to gather this information. Don't know if we're even getting enough anymore. I personally think we're going to get a listing anyway.
 - Ann M. – At the statewide level its okay, at the local level it is not enough.
- Richard S. (ICA) – It's a hard discussion. Politically the pressure is there to have a season. People have talked about the reason why that's necessary. But at the same time, we've had regulatory triggers in place for quite a while. It seems like there was some wisdom when that mechanism to guide the decision was put in the state plan. There may be wisdom in continuing that system. But as Brent pointed out its pretty limited where that hunt is justified at this point.
- Lynn B. (Upper Snake) – Would like to see it closed. Think we've got an adequate population to justify having a hunting season, but I don't know what the Service thinks. I'd like to be able to say, if the Service says list it, to be able to say we have this much population. But this close to a listing, I don't think we should have hunting.
- Wendy G. (West Central) – West Central hasn't had a season in 25 years, and it hasn't saved our population. But we have had this discussion. A lot of the landowners and producers in our LWG ask why am I putting all this time and energy into protecting the bird when they're hunted somewhere else in the state. But I think there would be reluctance to dictate what other LWGs will do.
- John R. (ICL) – There's no one thing that's gotten us into this and no one thing that will get us out. This should be on the table. It does confound judgment to have a hunting season on the table in the face of listing. Everyone has given something else up.
- Steve G. (IWF, Mountain Home) – I feel very strongly, and think Service has spoken, that listing will not be based on whether or not the bird is hunted. The Service has already said that hunting as currently regulated does not pose a threat. People talked about the lack of productivity but I don't think that's related to hunting. That's related to the quality of the habitat, the environmental situation we face at a time the chicks are most vulnerable. Drought has a bigger effect. Look at the list of threats. Hunting is listed as number 14 as a factor. We have data on the number of birds lost to fence strikes. We said we'd follow the state plan, it hasn't been amended, and to this point we've consistently gone with what the plan says. My

position would drastically change if there were anything that said hunting was having a significant impact and that banning hunting would cause the population to increase.

- Don K. (IDFG) – The Department’s position is to follow the plan. Also, LWG input and local knowledge and recommendations are taken into account. We’ve gone outside of the guidelines at times based on local input. From my perspective we should continue following the plan. This group developed it. The Service has said that from their perspective this operates as a regulatory mechanism. Our neighbor, Montana is going to propose closing the season statewide. That will be a big topic at the grouse workshop in a couple weeks.
- Brent D. (Idaho Power) – I want to say I agree with everything Steve said. The thing that scares me is the trigger mechanism. We’ve established a trigger mechanism that we’re close to hitting in some areas. In a triage situation, hunting is something that we should seriously consider.
 - Don K. – We did talk about if this whole trigger mechanism does get incorporated into the land use plans we’re looking at considering if we need to change the hunting season guidelines to incorporate other changes.
- Kathleen H. (USFWS) – It wasn't identified as a primary threat range wide in some local areas. Thinking about the Montana decision, hunting is a cultural tradition. Hunting is an important outreach tool. I am also concerned about some trigger that might have been tripped. But from the Service’s perspective there are very strong regulatory mechanisms there right now. From a listing perspective if hunting was taken away that wouldn’t affect the listing decision.
- Dustin M. (OSC) – It's a double-edged sword. If you’re doing all this great work for grouse on the ground it makes you ask why are we doing this great work and hunting the bird. But like Kathleen said, are we going to alienate the hunter and sportsman? When will you be able to open up areas again, once you shut them down?

10. Local Working Group and Agency Updates

Local Working Group members and other SAC participants gave the following updates:

- Kathleen H. (USFWS) – We continue to work with the state, BLM and Forest Service to put forth a plan. The biggest hurdle is to sell it to headquarters. We have to sell that it is consistent across the range of the species. We’re letting them know the plan is good, and in some cases exceeds it, we’re far ahead of the other states. Also, USFWS just hired nine new people to get out on the ground and start working with landowners. Kate just took on new position doing that. We’ve learned a lot of lessons through the West Central CCAA and are looking to try to use this tool throughout the state. We are trying to get out to the LWGs.
 - Don K. – We can let the LWG’s know about opportunity and for those that are meeting.
 - Brent D. – Is there enough time to get a CCAA in place?
 - Kathleen H. – There’s a template that’s been developed if the species were proposed for listing in the next year. Carney County, OR just signed a CCAA last week. For those landowners who wish to sign up, they would sign up with a letter of intent, which would put them in the cue. Then the Service will prioritize those by core habitat, etc. If you’ve signed a letter of intent you’d still get assurances. But you’ll have to have a site-specific agreement on your lands.

- Brent D. (Idaho Power) – A couple projects of interest, we have a new line going up in the Wood River Valley. We're working on the EA right now. The Hailey/Ketchum area only has two lines going into it and we are proposing to build new line structure by structure. The other project is Gateway West. The majority of that line has been approved and the sage-grouse mitigation plan is still being finalized. The Gateway West decision through the Birds of Prey land is an ongoing discussion.
- Jack D. (DOE) – No new projects to report on. Within next month or so we will sign a CCA. That agreement basically includes conservation measures, triggers, etc. similar to what is in the EIS. We modified the CCA pretty extensively to be more consistent with how everyone else is going to manage the species.
- Dustin M. (OSC) – OSC and IDFG have been at the table for the last few months as cooperators hammering out the proposed final EIS. We're in a unique situation having the state alternative as a co-preferred alternative. A lot of that is to the credit of the Sage-grouse Task Force, LWG members, etc. USFWS has been providing feedback to us all along. We're getting close to meshing the alternatives together. Higher-level Federal bureaucrats are calling for consistency across the range now. A document came down from DC that's intended to provide guidance across the range. If we can show that our plan is consistent with the objectives, etc. we should be able to deviate from the national guidance. We'll be meeting soon to advocate for our state effort. Up until this national guidance came out, we've been moving cohesively with the state and Federal effort.
- Scott S. (NRCS) – Our farm bill passed which is good news. It includes a lot of new programs but follows the same lines of the old programs. The old programs are wrapped into one act. The payment limitation has been increased. For all of the producers that may have been capped under the 2008 farm bill, they can now get up to \$450,000 under the new bill. I am located in the Burley office and will be presenting on a project tomorrow.
- Sam C. (Big Desert) – The Big Desert LWG hasn't met this year. We had a tour last year to look at the range and reseeded from 10-15 years ago. They're starting to really see some of the fire strips now. Our leks are a little better than last year.
- Rochelle O. (IWG) – *[Alison was interrupted during Rochelle's update and wasn't able to get notes.]*
- John P. (North Magic Valley) – We met last night. There has been a lot of fence marking going on in our LWG. People are feeling pretty good about things.
- Jared B. (Jarbidge) – Jarbidge LWG is struggling a little with lack of funding for things to do. Our idea is to try to review and submit meaningful comments on the annual grazing permits for BLM. We have most of the fence marking done. We had a good tour with Shoshone Basin.
- Ann M. (Mountain Home, IDFG) – We were going along pretty well until the Pony Complex Fire burned up most of our sage-grouse habitat. Within our planning area only about one quarter to one third had sage-grouse, and most of that burnt last year. We only have four active leks, and two of those burned. Our group kind of stalled on that emotionally, it affected the grazers, permittees, and everyone.
- Don K. (IDFG) – Dustin summed up things in terms of the EIS. The grazing study is another big piece of IDFG's direction on sage-grouse. Jared mentioned a lack of funding. I'd like everyone to think about if you had funding what kind of habitat projects could you do right now and bring

that to the table tomorrow. Jack Connolly and Ann Moser were very involved in developing task for recommendations, etc. Also, regarding possible additional project funding. Like happened last year, we're coming to end of fiscal year and there is possibly a little pot of money that we might be able to get out on the ground quickly. Last year we got some funds out for cheatgrass control. Right now I don't know for sure if there's money left. But if we had some ideas in hand we might be able to access it if there is money there.

- Steve G. (IWF) – The Mountain Home group is trying to collar more birds. We found they do move quite a bit. One lek is lot bigger than last year.
- John R. – Kudos to Don and Dustin and BLM, and Service on working together on the RMP revision process. It is a really a good effort.
- Wendy G. (West Central) – West Central hasn't met since last summer. A few landowners will be very encouraged to hear that the CCAA process is alive. The lek counts in West Central are discouraging. What is encouraging has been working with Jason Pyron on field trips with school kids and fence marking. Also, landowners continuing to do projects through the NRCS funds.
- Lynn B. (Upper Snake) – Not much to report on in the Upper Snake. They got together in January but I wasn't able to be there. They are getting pretty much finished up on the fence marking. They will want to have a meeting on the hunting season. It is tough to meet and do reporting and then meet and do the hunting. Terry has been really good.
- Richard S. (ICA) – Our group believes that we're going to have regulation; it's a matter of who is going to do it. The closer to the ground that occurs the better off we'll be. We continue to engage with OSC, the Governor's office, and IDFG to develop a management plan that sees the need of the bird is met and meets the multiple use mandates that we have on public lands. We continue to work hard on that. Also, in 2012 ICA recognized that some decisions coming from agencies weren't science based. We've been working in the appeals process to make sure the best thing on the ground happens.
- Dave E. (Challis) – The Challis LWG met in January, Dave didn't attend but got an update from Vince Guyer. We have the LWG plan done and want to make sure that it gets implemented wherever it can. We want to keep things are local as we can. We plan to update the seasonal map every year and use that to update our plan. We think the more good information we have about where the birds are, that will give us more leverage. We hardly have anyone show up to the meetings any more.
- Dallan N. (Curlew) – We met during the winter. There were three or four of us. Not much going on in the Curlew. We're starting to see a bug invading, the black grass bug. Maybe someone should start looking at it, it could have an effect on habitat.
- Wendy P. (East Idaho Uplands) – You do the plan, you make these goals, and then nothing happens. Now we're just focusing on what do we know about the bird. There's just a little bit of life in the group. We had a tour of brush control projects that a few ranchers attended. Jack Connolly still does the survey with his hunting dog. It is basically IDFG, Wendy and one or two other agency people who come to the meetings. We need more communication between the state, IDFG, Governor's Task Force, etc. I feel like we were left out of the Governor's plan in terms of mapping.
- Kabel S. (Shoshone Basin) – Our group hasn't met this year. Agency folks are working on nesting habitat.

- Paul M. – We’ve spent the last several months working closely with the state, Forest Service, and IDFG on the final proposed plan. That’s taken a lot of time. We’re all pretty much on the same page now. Back in December we visited at the field office with folks to talk about edge boundaries. We are trying to tie features on the land to boundaries. We’re going to continue that work over the next few months. This past winter we completed an update to the key habitat map. That’s been posted on the Inside Idaho website and is available to the public. That's the vegetation side of the sage-grouse habitat map. It reflects fires, and other things too. For the last few weeks I’ve been working on fire organization for the Sage-grouse Fire Resource Advisors resource tool kit. Basically it is a set of geo-spatial tools that is available to the fire resource advisors. It allows them to bring up lek data, winter habitat data and other layer available when they are making fire fighting decisions in the field.
- Diane F. (IDL) – IDL continues to work with lessees and private landowner through the NRCS program. That includes the Owyhee juniper project and fence marking. We are also working with The Nature Conservancy (TNC) and IDFG on some rehabilitation and juniper removal

Sheep ranchers and farmers moved in. Ketchum was once the busiest sheep shipping train port in the US and the second largest in world (the largest was in Sidney, Australia). Sun Valley Resort was established in 1936 and set the stage for the recreation economy in the Wood River Valley. The area to the east centered around Carey maintained more of its agricultural heritage. The area also features one of the most intact long-distance migratory sheep ranching cultures in the West.

Environment

Elevations range from 4,000 to 12,000 feet and precipitation is about 15 inches a year. The area hosts a number of species including sage-grouse, pronghorn, mule deer and elk. There is a 150-mile pronghorn migration route through the pioneers. The topographical diversity supports seasonal migrations of both wildlife and livestock.

The agricultural and ranching community and culture are pretty much intact in the area. But with the greater Sun Valley metro-recreational area just over the hill, it is not hard to imagine a future of subdivision and development. Because of the elevations the area is a little bit cooler, a little bit wetter, and a little bit higher than a lot of sagebrush country. Therefore it is somewhat less vulnerable to cheatgrass and less vulnerable to fire. The great recession also helped keep Sun Valley expansion in control for a little while, it bought some time.

Bas reviewed a map showing the lek locations where one or more males were observed. It is hard to monitor in the area because of the winter conditions. From 2002-2007 there were just 11 leks documented north of Highway 20 but local knew that there were more birds there. After increasing the number of surveys, partners have documented 28 leks north of the Highway. Many of them are on private lands protected through the Sage-grouse Initiative and Pioneer Alliance.

Ingredients of Success

The project happened in a very short period of time but built on longer-term relationships within the community. Leadership from NRCS, local leaders and landowners was critical. There was also continuity in terms of the source of funding. The partnership got started in response to the proposed transmission line going through area. They got the route of the line changed.

The values for the Pioneers-Craters landscape that were embraced by the alliance include: working farms and ranches, wildlife habitat, water resources, recreational values and cultural heritage.

Next Steps

Next steps include continuing to protect critical lands, addressing resource concerns including water resources (Fish Creek, Little Wood River), fence modifications for pronghorn, the Craters Resource Management Plan amendment, and recreational opportunities.

A major challenge is continuing to find non-federal match money. Under the old Farm Bill the project was possible because under the grassland reserve program there wasn't a match requirement. Under new farm bill there's a one-to-one match requirement. It is hard to get to the scale of the investment that the NRCS is required to make.

Questions and Discussion:

- Don K. – Does that have to be a cash match? Are there in-kind opportunities?
 - Bas H. – For the Agricultural Lands Easement program, it is more like old program with 50% non-federal, up to 25% cash and up to 25% land.
- Wendy P. – Is the grassland reserve is a permanent easement?

- Bas H. – Yes.
- John P. – We had a ranch that was heavily indebted, there's no debt now. There are problems working in Blaine County related to a non-lethal requirement that one of the commissioners wants to attach. This is perpetual and stuff like that shouldn't appear in a conservation agreement, it should be in a management plan that is revisited every 5 years or 10 years.
 - Don K. – I want to clarify that this business on the non-lethal control is because Blaine County has put some money into this. That isn't something related to NRCS or TNC.
- Donna B. – What other restrictions are there?
 - John P. – There are some oversight management regulations that you have to accept. It's been a great relationship with TNC.
 - Bas H. – Different land trusts or entities differ on the philosophy on the easements. We like to make the easements less prescription but ask for a management plans so there's flexibility to deal with a changing environment.
- Sam C. – On the easements, don't you sign away your water rights to the government?
 - Bas H. – No. The wetland reserve program is different, because they don't consider it a working lands program. With the new agricultural lands easement program you can by and large keep doing what you've been doing. The main thing is keeping these places from being subdivided. It's a big commitment.
 - Brent D. – We have a wetland reserve easement on some of our lands and haven't had to give up water rights.
- Jared B. – Did you say 78,000 acres is what you've reserved? With the increased conservation, what have you seen as an increase of sage-grouse in those areas?
 - Bas H. – It is too short a time to say. We've found more grouse because we're looked harder.
- Rochelle O. – I saw you had a fence modification for pronghorn, what does that involve? Who pays for it?
 - Bas H. – NRCS has a standard program.
- Dave E. – These are really good programs. It is nice to see it's got this far. They can be hard to get into sometimes. In our area we're trying to do some conservation work and we've explored everything we can. Maybe under this new farm bill we can figure something out. The grassland stuff hasn't fit in the Lemhi area. This easement thing is a good tool. You have to have some responsibility going in to it. You have to take responsibility as a landowner for how you want it to play out.
 - Bas H. – This was special case because NRCS identified this as a priority. But I think there will be more opportunities under new farm bill because the Columbia River Basin is critical habitat.
 - Don K. – When you say the NRCS decided to focus in this area, besides the SGI, wasn't one of the other important reasons the landowner interest?

- Bas H. – There was support from the chief of the NRCS on down. He was enthusiastic about the project but because the Pioneer Alliance was in place he was able to make the investment in this.
- John P. – We run sheep and cattle and the three-wire fence isn't going to turn sheep. If we want to put a net wire fence up what happens?
 - Scott S. – We can't do that with a wildlife friendly fence.
- Jared B. – Think there's a lot of potential here. From a ranching standpoint as a private landowner if we do a conservation easement that's only part of the picture. For this to work good on a landscape scale you have to find a way to tie the conservation easement to BLM or Forest Service lands. You'll need to have assurances about future grazing. If that happens you'll have considerable buy in from ranchers.
- John P. – That was one of the draws from our side. TNC was on our side if we get sued. That's why I emphasize the importance of those federal lands and being able to work into more fall and winter grazing and put infrastructure in place like pipelines and troughs, etc. There's a lot of stuff that needs to happen. We were confident that TNC would be with us supporting good conservation and well managed rest rotations.
 - Bas H. – Getting buy-off from federal agencies is a long-term project.
- Jared B. – If we're serious about conservation that should be written into the conservation agreement. If you've got 5,000 AUMs on your permit it needs to be written in there that those AUMs will be maintained, or you release what you've tied up on the private lands.
- Lynn B. – What has to happen is you have to rebuild the trust. Most of the ranchers in our area had agreements in place. In our case agreement was with the Forest Service and BLM and we put these water troughs in place. We got one year into a seven-year project and they backed out. My concern is the ability to make the Federal agencies stand by our agreements.
- Dave E. – Jared needed to be here about four or five years ago. We had the same conversation about the CCAAs. The failing was that they would not tie federal lands to those entities. That is critical that this group can have some input to that. It is critical to tie those together.
- Bas H. – From a TNC perspective we're happy to work with you. But we also don't have control over what the feds do.
- Donna B. – Coming from a rancher's perspective, we've been there on the land sometimes for many generations. The Federal and state people are in there until they retire or move somewhere else. We have to have more than someone signing on the dotted line. That's the trust we've talking.

12. Update on Range-wide Local Working Group Conference, November 2014

Don Kemner (IDFG) said that Dr. Terry Mesmer at Utah State University is pulling together a conference in November that they are calling a LWG conference. There was one similar to this in Nevada in the mid 2000s. It was an invitation to representatives from all LWG across the range of sage-grouse to come together. Don wanted to make sure folks are aware of that conference. They have a committee that's working on putting together the conference agenda.

Don extended an invitation to anyone here who would like to join that planning committee. If you want to be on this committee there would be a couple of meetings. They are going to have some kind of stipend that would help offset the cost of LWG representatives attending the conference. The conference will be in Utah on

Having a definite goal helped a lot. They will complete as much work as possible before 2015. Partnerships are key to strengthen the success and effectiveness of the project. Everyone needs to be on board with the project for success.

This is a model for western land management. More areas at a landscape level are getting treated. We have to work at a local level, but at the same time the bird is across 11 states. All 11 are meeting and discussing ways of getting work done on the ground. Without those coordinated efforts our work wouldn't go as far.

Scott said that he just found out that NRCS has about \$1 million left for sage-grouse work. If you're a permittee holder or private landowner and have ideas please let NRCS know as soon as possible. Just get in and fill in an application, it is on a rolling basis and that will get things started.

Questions and Discussion:

- Dallan N. – You said it burned, but you didn't treat it? Is there part of the program to remove the dead trees?
 - Scott S. – Yes, we're trying to work on that this fall. We're working on doing multiple treatments on that private space. On private land it's a little different. With BLM your grazing plan is already determined. On private land we require a grazing plan, we just want to see improvement.
- Diane F. – There are three people with NRCS who are in the position that Scott is in.
 - Scott S. – Josh White was out of Mountain Home, Ed has taken over his portion. He covered Elmore and Owyhee. Scott covers Cassia, Minidoka and _____. Laura who is in Rexburg covers the Big Desert. NRCS is working with TNC to try to understand the new easement programs. NRCS gets this sage-grouse money and then finds out it needs to be spent in a really short time. So, don't wait until the money is there to sign up for an application; even if it's on BLM land or Forest Service land and you have to wait for an EA – you should still sign up if you're interested.
- Donna B. – Juniper eradication has been the main focal point for our LWG. Art Talsma with TNC has been really helping us. Yesterday was the third tour we've had. It is amazing the difference once you get rid of those trees in terms of what's coming back. We treated some trees around the reservoir. Art flushed so many sage-grouse there that he had to hold his horse down from bucking. Also the water comes back once you take the trees off. The only problem is that we're about 50 years too late.
- Scott S. – That's what we're hoping to show the Service; that some of these treatments like juniper, can make results overnight. But the NRCS has also been working with the Service this whole time to let them know that what we're doing may not yield immediate results.
- Dave E. – You said Pheasants Forever contracted for that work. Were you able to find enough local contractors to do that work?
 - Scott S. – Pheasants Forever puts out a bid process, their national office is in Minnesota. The contractors came out of Oregon. If there are people who are interested in that I can direct you're to my boss.
- Dave E. – We have fir encroachment. That specialized training sometimes limits our ability to find people. BLM has fire crews but that money is being spent chasing fires, etc.

- Scott S. – This approach has worked out great, it has freed up a lot of BLMs time. When we certify those treatments, they have to meet BLM and NRCS specs. The BLM fuels crew was drastically reduced in our area. We'll do cut and pile and the fuels crew will come back and do those piles.
- Lynn B. – Do they grind the stumps too?
 - Scott S. – Yes, right down to the ground. You can come out and visit in September; we'll have people out there.
 - Donna B. – Our guy has two different kinds. One is on a skid and the other spins.
- Jared B. – What' cost per acre?
 - Scott S. – It varies, mastication varies from \$400 to \$600. It's tricky because the cost share varies.
- Wendy G. – We need to get ahead of the game because the cost later on has to be massive. We need to be able to go in where there are just a few.
 - Scott S. – Phase 1 is that very scattered tree here or there situation. Phase 2 is thicker but your understory is still intact. In Phase 3 the understory is really depleted so you have thick trees and have to go back in and reseed. We're pushing to do every acre with the Phase 1 encroachment.
- Donna B. – We were amazed at how fast the understory comes back, it holds the moisture in there so new plants can get started. Even a Phase 3 comes back.

14. Update on Sage-grouse Funding

Jon Beals (OSC) said he works for Dustin M. at OSC as is the project manager for the sage-grouse funding. The initial sage-grouse funds that the SAC had historically allocated for projects came from a \$1 million congressional earmark. Jon provided a spreadsheet summarizing the allocation of those funds (see Attachment B).

Dustin Miller noted that the state legislature provided some additional funding last year, a total of \$50,000 for additional lek monitoring. The legislature is keying in on this now and recognizes that there may be more opportunity for OSC to work in the future for funding for this group.

Don K. explained that there is approximately \$35,000 that is still unassigned. Dustin Miller also indicated that there might be some additional unassigned funds that were in the OSC pool that could supplement the \$35,000, maybe as much as \$50,000 total for the combined money. March 2015 is deadline to finish it out; but it is possible to extend that. Don recommended that later in the meeting SAC members make a recommendation regarding what to do with those funds.

15. Potential Projects for Funding if Funds Come Available

On the first day of the SAC meeting Don K. asked for ideas for projects if there was funding available. SAC meeting participants suggested the following:

- Jared B. – Dixie Harrowing sections. If we had funding there's probably at least two or three sections that we could get permittees to sign up for in short order. The LWG owns part of a Dixie Harrow so we'd just need money for a seed source. They'd provide the tractor and Dixie

Harrow. It works well to break up dead brush, then put seeds in. When you break open the canopy in areas that are 40% canopy the seeds really take off the following year. You can vary how much manipulation you do. Seeding happens as harrow goes.

- Jared B. – Another project is that there are always people who want to do pipeline spring developments. Those are harder because it will take a BLM permit because you'll need an easement or an EA to do some of that. You'll have to go across BLM land. They're in the permit renewal process in the Jarbidge so they could maybe do this while they're in the renewal process.
- Sam C. – BLM has been cutting the Big Desert up into little parcels for fire. They've been rotovating along the roads. That's an ongoing project with the BLM and something we could do. They already have the assessments done.
- Richard S. – Thinking about what Brent brought up about Upper Snake. If you're familiar with the Upper Snake, Kilgore and the Red Road area is very productive sage-grouse country. I went up there on the Sage-grouse Days tour recently and that sage canopy has gotten up to about 40%. The shepherd is saying that they move in and get disoriented. If the Idaho plan was in place and being used right now, that trigger would be tripped and we'd be forced to do something to manage that level of sagebrush. That might be an example of where we actually have too much sagebrush. Think the resources would be there if managers would come together.
- Ann M. – BLM has funding to start a sage-grouse telemetry project in that area. BLM has a good history of where they've done brush treatments in the past. We could really see with telemetry on those birds at what age are they coming back to that area or are stopping using the area because it is too thick.
- Dave E. – I'd have to talk to others in the Challis group for ideas, but right now, Scott's presentation gives me some ideas about fir encroachment. But we would need an EA. Another potential project is an allotment in the northern part of the valley with lots of birds. We are already in the process of partnering with the National Riparian Team to look at different management. It is a small allotment, about 15,000 acres with 15 permittees. It would be hard to get everyone together but there are some different outcomes that are necessary. There is an opportunity to change management there.
- Dave E. – Another idea, BLM pamphlets include nothing about ongoing efforts or potential efforts to change actual land use practices to benefit sage-grouse. We could put together something that informs people that could be put out in the public areas.
- Lynn B. – One of biggest losses in our area is the Birch Creek range. They diverted Birch Creek and put it into a pipeline and with that 15-20 miles of habitat was lost. If they would go down the old creek beds, run pipeline down, and put bubblers every 0.5 and 0.25 miles up there that would make a big difference. Think the IDFG and BLM could get together on putting a pipeline down through there. Don't think the people who own the water would object to a 2-inch line diverting the water. When I was a kid that's where you'd find the birds along the creek there. You'll never be able to recruit until there's water there. Another area is up by Howe where there's a lot of Phase 1 juniper encroachment going on.
- Donna B. – For us our goals are juniper treatments and more of that berm work. Also there's lots of state land that we could do work on.

- Diane F. – We’ve got Annie Valley in the works with TNC. We’re trying to work closely with BLM as they finish the EA on the allotment up there. On the juniper biomass tour we were trying to figure out a project with private landowner, BLM allotment, and state land. We have grant funding that we could use. Finding the right property and partnerships is what we’re looking for.

16. Future of the SAC, What’s Next?

Don Kemner asked the SAC to consider what they would like to see happen next in terms of the SAC. Alison reviewed the notes and recommendations from the previous SAC meeting (see December 2012 meeting summary). The major near-term recommendation was to have a meeting in 2013 (it shifted to 2014) to review progress on the EIS and share information.

He suggested that there’s a lot of value that comes from getting together and it is a good opportunity for discussion and information exchange. Don is still trying to figure out how to best get information out to the LWGs, that’s why we’re videotaping some of the presentations. Other options include video conferencing from the regional offices, teleconferences or webinars. He asked if the SAC members wanted to get together again in 2014 or 2015 and how, or other?

Alison noted that another topic that has come up repeatedly is how (or if) to get more interest going in the LWGs. Some of the topics that have been discussed in the past include: the need for funds to do something on the ground as a way to engage LWG members, the need for professional facilitation, general apathy, questions about the appropriate role of the LWGs now that the Task Force has provided their recommendations.

Alison noted that one of the challenges of the ESA is the single species focus of the Act. As such it tends to not support larger scale ecosystem thinking about how to recovery and conserve species. She noted that there may be

Discussion:

- Wendy P. – What happened with implementation plan?
 - Don K. – People were working on the implementation plan, then the 2010 decision happened and all efforts got diverted to assisting with the Governor’s Task Force. That took over everything for the last two or three years.
- Wendy P. – Does that process include the state plan and implementation plan?
 - Don K. – Yes, the 2006 plan was used as a foundation to build on. There’s lots of new information since 2006 that was not in state plan that was also taken into consideration in development of the state’s alternative.
 - Paul M. – A lot of it was rolled into the sub regional Alternative D.
- Dustin M. – Keep in mind that the EIS process and the state having a seat at the table was an effort to address the regulatory processes on federal lands.
- Don K. – The concern with 2006 plan was that it did not have a regulatory mechanism. We’re in waiting mode to see what the outcome of the Federal land management agency EIS will be. Waiting to see if the Idaho EIS is something that the state ends up supporting or if it is changed to the degree that we can’t support it.

- John R. – Suggest that the LWGs get together once a year and the SAC gets together once a year. This is a great mechanism for learning.
- Brent D. – Going back a long way the split between the LWGs and agencies, state, etc. was so far apart that everything had to happen in the LWGs. Through time the SAC has been the mechanism to bridge that gap. Whatever the decision, there will be some type of group needed to bridge on the ground stuff with these big landscape plans. This group could help suggest agendas for LWG meetings, e.g., here are things you could meet on, here are materials we could provide. We can help do that. I think a minimum meeting frequency for the SAC is once a year.
- John R. – LWG and SAC communication needs to go both ways. It is really important for information to flow in two directions. I like the idea of having presentations available online.
- Donna B. – When we started IDFG, BLM and others didn't know what each other was doing. It has gotten a lot better.
- Steve G. – Agree with people that these meetings are essential, the membership has changed and a lot of the new members need to come up to speed. That's a big plus. We do now know a lot. It is important to develop mechanisms to talk around the state and talk to LWGs. If you don't have information sharing you don't know how you're going to maintain momentum.
- Sam C. – Most of the non-agency LWG members that are active; those people are here at this meeting. Most of the LWGs are primarily agency people.
- Rochelle O. – Don't know how you deal with the apathy.
- Lynn B. – I would like if it is possible, to meet when the lek counts are done.
- Donna B. – We may need a meeting after the EIS is complete.
- Dave E. – Think these meetings are important. It is one of the things I get most out. If we continue following this path of all these regulatory mechanisms, every time we do that we go this single species path and then something else comes along that doesn't work. This group is where I get ideas for how we can do things across the board. We're not going to get more participation in the LWG groups.
- Paul M. – I second what Donna said about the value of rallying around a common cause. In the Mountain Home group, it didn't come together until we started doing things on the ground.
- Wendy P. – Is there any more talk about a LWG facilitator? The IDFG guys they don't even do introductions. Would like money just to hire Wendy back.
- Brent D. – Maybe we also need to look at expanding the SAC to think more broadly. How can we go out to weed meetings? My staff goes to Washington County every month; they don't talk about sage grouse. We could at least expose them to what's going on.
- Wendy G. – The Washington County WMA is a great example. Washington County has a banquet every year. Key partners engaged in CMA are also in the sage-grouse group. But people get burned out on just planning they need to do something. In the West Central it is harder to find a single issues.
- Brent D. – We could figure out a way to leverage what is going on in Washington County. Rather than thinking about our own project, what can we do to help them too? What they all have in common is the RACs. Maybe there's an opportunity to parlay that into something.

- John P. – That’s an opportunity to address other broad scale problems. Last night Jeff Sidoway was in the restaurant and we chatted. The Forest Service is going to come up Tuesday and tell the leadership of the woolgrowers that they are going to eliminate 60% of the grazing allotments in southern Idaho. We need the right people to tell the stories and also the right people to implement them.
- Dave E. – As a way to end this meeting and give us something to do I would like to take home this message of more inclusion. It would be good to have some presentations or ideas that we could share with people.
- Don K. – If you’re in an area with fire you might want to create a fire organization. You could promote that to whomever you need to. It would also be good to identify agenda items that we could provide to LWGs.
- Wendy – How many LWGs submitted and annual report?
 - Ann M. – All 11 did. Most of what was reported on was reported by BLM, NRCS, and IDFG staff.
- Brent D. – If OSC and other believe that LWGs are the key ingredient to making this work, we need to do something different. In that case someone needs to be out there building LWGs.

The group brainstormed the following list of potential LWG and/or other groups to share information with:

- Groups to share information with or coordinate with
 - Rangeland Fire Protection Associations
 - Weed Management Areas
 - Grazing Associations
 - University of Idaho Extension
 - Washington County CMA
- Agenda topics/presentations for LWGs and/or other groups
 - Update on the EIS status and what’s next.
 - Sage-grouse Initiative funding opportunities. Note have web site that connects all 11 states and projects that they are working on www.sagegrouseinitiative.com
 - Presentations around getting CCAAs going. USFWS has staffed up to help with this. Possible presentation on how the Harney County CCAA works and is able to cross private and federal borders.

SAC recommendation on next SAC meeting:

- Participants recommended that the next SAC meeting in 2014 or 2015 after the EIS is done, or if there is some other major trigger. Depending on the need for the meeting a teleconference followed by a meeting at a latter point would also be acceptable.

17. Funding Recommendations

Don Kemner requested at the end of the meeting that the SAC members return to the topic of what to do with the funds that are left unspent and unassigned at this time.

The group discussed the possibility of doing another solicitation and agreed that that didn't make sense given the small amount of funding. After brief discussion the SAC members agreed that the grazing research project should be funded with the unassigned funds.

Don also asked the group what to do if additional IDFG funds did come available, e.g., how to select projects. Participants recommended that Don let everyone know and make a recommendation for how those funds should be spent based on the amount of funds and discussion with potential sponsors to determine what is ready to go.

SAC Agreements

- SAC members present unanimously recommended providing the remaining unassigned sage-grouse (OSC funds) to the grazing research project (Karen Launchbaugh and Cortney Conway, etc.)
- SAC members agreed that if additional IDFG funds become available, Don will suggest what to fund from the list of potential projects (based on amount of funds, and ease of getting project going) and send an email to the SAC members requesting that they let him know if anyone has any objections. If there are objections an "emergency SAC teleconference will be convened."

Livestock Grazing and Sage-Grouse Habitat: Impacts and Opportunities

Chad S. Boyd, Jeffrey L. Beck, and John A. Tanaka

Journal of Rangeland Applications

Volume 1, 2014 pp. 58-77, ISSN: 2331-5512

Abstract

Sage-grouse obtain resources for breeding, summer, and winter life stages from sagebrush communities. Grazing can change the productivity, composition, and structure of herbaceous plants in sagebrush communities, thus directly influencing the productivity of nesting and early brood-rearing habitat. Indirect influences of livestock grazing and ranching on sage-grouse habitat include fencing, watering facilities, treatments to increase livestock forage, and targeted grazing to reduce fine fuels. To illustrate the relative value of sagebrush habitats to sage-grouse on year-round and seasonal bases, we developed state and transition models to conceptualize the interactions between wildfire and grazing in mountain and Wyoming big sagebrush communities. In some sage-grouse habitats, targeted livestock grazing may be useful for reducing fine fuels produced by annual grasses. We provide economic scenarios for ranches that delay spring turnout on public lands to increase herbaceous cover for nesting sage-grouse. Proper rangeland management is critical to reduce potential negative effects of livestock grazing to sage-grouse habitats.

Subject: Fwd: a topic I may have omitted in earlier response for meeting on sage-grouse next week is ACEC designation

Brent - most likely I will be heading back to Boise on Tuesday, so we can still plan on having this meeting. I know, you are thinking "darn"..... I will check with Sylvia to get a room for the meeting. Thanks.

Kurt Wiedenmann

Subject: Upcoming Sub Regional Call - Thursday Aug 7

We will have our regularly scheduled call tomorrow – our topic of conversation being the proposed plan contained in this email. There are still several pieces needing some additional attention that we will assign tomorrow.

As a reminder please review the Comment Response Report and send me any comments you have.

Also be reviewing the initial draft of the Alt G effects analysis and get those comments back to your EMPSi team lead with a cc to me.

Idaho/Montana Sage-Grouse ID Team Meeting

August 7, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Nika Lepak; Mike McDonald; Dustin Miller; Jason Pyron; Josh Sidon; Gloria Jakovac; Vince Guyer; Rob Mickelsen; Jesse Rawson; Elena Shaw

Handouts

- ID swMT ADPP BLM Decisions 080614 Working

Action Items

- Send comments/revisions to the comment response report to Brent by Friday, 8/8/14
- Send comments/revisions on the first draft of the proposed plan impact analysis to EMPSi counterparts and CC Brent by Friday, 8/8/14

Meeting Minutes

Forest Service Plan Update

- Rob still working on the FS plan. Addressing comments from Forest Service management and making sure it's consistent with FS direction. Comparison table shows that the Forest Service plan is very consistent with the BLM plan, but is more specific and does not include as many management actions. Some of the language is specific to Idaho, and Rob is explaining this to Forest Service management. Hoping to finalize tomorrow.
- Working on habitat desired conditions table.
- Will the two plans require separate impact analysis? Will keep plans separate in Chapter 2. Intend to do the effects analysis for the planning area without breaking out Forest Service and BLM in the discussion of effects.

Reminder for Work Assignments

- Send comments/revisions to the comment response report to Brent by Friday, 8/8/14.
- Send comments/revisions on the first draft of the proposed plan impact analysis to EMPSi counterparts and CC Brent by Friday, 8/8/14.

Review of Comments on the Proposed Plan

- Ongoing discussions about whether adaptive management measures would apply to all Core/Important or all nesting/wintering habitats within Core/Important.
- Coordination of mitigation with state effort – not sure how much detail will go in EIS. Have talked about an implementation plan, can maybe fill some of the details in.
- Meeting next week with USFWS and the state to resolve some questions and inconsistencies.
- Rob working on VDDT modeling for acres of treatment. Should have treatment acres and projected habitat conditions in the next 1-2 weeks.

- Seasonal habitat desired conditions – Jesse will work with others to resolve questions. FS changed “perennial grass height” to adequate nest cover, not 7 inches.
- Proximity of trees – Jesse, Rob, and Nika will work to review comments on this table.
- Mapping –if there is habitat outside of core/important/general during project level activities, should this area be managed as general habitat? A team will review this idea and how we would incorporate this.
- MA-4: A lot of discussion about no net unmitigated loss of GRSG habitat. Other subregions have no net loss in all GRSG management areas. However, this would affect mitigation opportunities. It would be best to do mitigation in core/important that needs restoration, but no net unmitigated loss would not allow for this. Instead, could state no net loss of key habitat within core/important – use key habitat map to delineate where there is effective habitat and restoration opportunities. Added language in MA-4 for this. Would provide a net conservation benefit to GRSG. Applies to both on- and off-site mitigation.
- Why mitigate for disturbance in non-habitat? Needs further discussion.
- MA-6: Pull key habitat in as a more functional piece. Included to help update the map.
- Adaptive management and anthropogenic disturbance – comments to help strengthen the administrative record. Would like to have a discussion with biologists on these questions.
- RDFs – they are required. Added that they would be COAs in any post-lease activities. And they would be included as BMPs for locatables to the extent allowable. In RDF appendix – deleted BMP column and moved to column with BMPs that are required when conditions occur.
- Clarifications added to mitigation actions.
- FLM-7 added for consistency with Great Basin Region.
- Several comments for Nika that Brent will pass on.
- RM-1: Forest Service makes decisions about changes in management for grazing allotment at the site-scale, not plan-scale. Put in triggers/guidelines for grazing that will be applied for annual adjustments if necessary.
- Travel – need to include administrative use text. Clarification added for subsequent travel management planning.
- Appendices – baseline map – need to include description
 - Need to identify areas no longer identified for disposal for each plan.
 - Functioning of Boards – needs a description developed.

Other

- GIS team is providing revisions to the NOC for some rollup questions.
- COT objectives – how alternatives do/do not meet these objectives. Would like to see this more clearly specified in Chapter 4. Use the stop light table.

Attachments: IDMT SG IDT Meeting Notes 2014-08-14.docx

Hi Brent,

Attached are notes from this morning's meeting, also on the Sharepoint site.

Regarding Alternative F for lands and realty, the WEG proposal stated: Occupied sage-grouse habitat areas shall be exclusion areas for new ROWs permits. So that sounds like PPMA and PGMA.

About accessing the files on the Q drive, I think I am just not doing it correctly. I'm accessing it through a VPN connection from my BLM computer and tried using these links:

\\ILMIDSO3DS2\id\loc\GIS\projects\wildlife\sage_grouse\Greater_Sage_Grouse_Initiative\FINAL_EIS\Tables

Q:\loc\GIS\projects\wildlife\sage_grouse\Greater_Sage_Grouse_Initiative\FINAL_EIS\Tables

But I'm wondering if maybe I'm just not using the right link?

Thanks,
Meredith

Idaho/Montana Sage-Grouse ID Team Meeting

August 14, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Nika Lepak; Natalie Cooper; Katie Powell; Kelly Bocking; Robin Fehlau; Mike Kuyper; Jason Wright; Rob Mickelsen; Jesse Rawson; Jesse German; Elena Shaw

Handouts

- None.

Action Items

- EMPSi incorporate GIS and revisions into proposed plan analysis.
- EMPSi and BLM GRSG team to meet and review proposed plan analysis.
- EMPSi compile proposed plan analysis into one document and send to Brent by Wednesday, August 27.
- EMPSi incorporate changes to the comment response report.

Meeting Minutes

Project Updates

- Team has reviewed the comment response report and Brent has sent comments to EMPSi. They will make changes and provide another version.
- EMPSi has sent a first draft of effects analysis, BLM/FS provided comments. EMPSi incorporating those revisions. Since the GIS is mostly done, EMPSi will incorporate the numbers and the GRSG team will have another conference call to ensure that expectations are met, including USFWS. EMPSi will then compile the sections into one document and send to BLM.
- Most of the EIS will be the same, but we'll be changing Chapter 2 to incorporate the proposed plan.
- Had a meeting with the state to review and address their comments on the proposed plan. Two main topics were discussed:
 - BSUs: Will have 10 BSUs within the subregion for anthropogenic disturbance and adaptive management calculations. One is SW MT, one is UT Sawtooth, then 2 units per Conservation Area in Idaho – one for Core and one for important. Includes nesting and wintering habitat in these areas. Further work needs to be done by Rob, Brent, and Kelly for the UT and sw MT areas.
 - What happens if you have reached the 3% disturbance threshold in a BSU? Then, no further development in that BSU. Core and Important are calculated separately and the base map based on 2011 lek and habitat data. BSUs will be updated every 5 years.
- Changes to the key habitat map will be made annually based on restoration effort, fires, etc. to determine new acres of key habitat.

- The ability to change things is limited now, due to concerns about consistency between subregions at a higher level.
- Brent will be finishing the proposed plan. Rob is working on the proposed plan and will be final by the end of this week.
- Vegetation modeling – working with Don Major to take the NOC data for LANDFIRE and separate it by land ownership. They created one dataset across the Great Basin. At the end of the re-run, will have outputs for projected conditions for 10/50 years; also, the amount of acres estimated for treatment that would be needed to restore habitat up to 70%. Will have numbers for BLM and FS ownership. Should be available in the next two weeks.

Idaho/Montana Sage-Grouse ID Team Meeting

August 28, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Paul Makela; Natalie Cooper; Don Kemner; Mike McDonald; Bruce Schoeberl; Katie Powell; Kasey Prestwich; Karen Porter; Gloria Jakovac; Rob Mickelsen; Chris Colt; Jesse Rawson

Meeting Minutes

Section 7 Consultation Update

- Working closely with Boise and MT FWS offices. Finishing the northwest CO biological assessment this week and will use that as a template for the ID/MT biological assessment. Most significant issues is slickspot peppergrass, but will also consider impacts to grizzly bear, wolf and lynx. Will prepare a preliminary draft over the next three weeks for USFWS review. Afterwards, will determine the need for formal consultation.

Federal Family Meeting

- Meeting in Portland last week. Met with all state directors and staff from the Department. Meeting looked at whether management direction for each GRSG population was consistent with National Policy Team guidance. A lot of discussions over the week and items identified that need resolution. Some of the topics got pushed off until after the Rocky Mountain Region federal family meeting in two weeks.
- For ID/MT plan, concerns raised, but no major changes made at the meeting. Issues included fluid minerals management; solar/wind energy and difference between avoidance/exclusion in Important areas; disturbance threshold is now a “disturbance cap”; buffers.
- WO working on buffers. ID/MT did a good job citing references and including rationale, but other subregions need better rationale/citations.
- Waivers language for fluid minerals: In the current plan, Core is closed in low/no potential areas; NSO and waiver in moderate/high potential areas (e.g., Bear Lake). Waiver tied to anthropogenic disturbance criteria. This will be changed to state that the NSO can be waived if you’re developing in non-habitat areas as determined by an interagency group of biologists.
- Fluid mineral allocations: will change our allocations so that Core and Important will be NSO with no waivers, exemptions, and modifications except for the one waiver above.
- Not much discussion about transmission lines, roads, etc.
- Disturbance cap – Frank Quamen from the NOC described the formulas for calculating disturbance. Some confusion about how the three percent cap will be calculated. Final decision was to send it back to the disturbance and monitoring subteam which will meet today. WO will finish their white paper on disturbance but will not release until after the Rocky Mountain federal family meeting.

Next Steps

- Larger schedule is that final decisions and adjustments from the Department should come in mid-October after the Great Basin, Rocky Mountain, and state meetings are completed.
- Brent will be working to finish proposed plan by the end of next week. Will then update the GIS and effects analysis and hope to have a working draft by the end of September.
- Not a lot of work for the team until the proposed plan is final.
- Next week, will review the Forest Service plan and GIS/maps.

Anticipated Development

- Call today to discuss the description of potential impacts and likely development in the planning area in the foreseeable future. Unsure of the scale of the effort at this point, but more details likely forthcoming on the call.

Other

- Treatment objectives for VDDT should be distributed by the end of next week. BLM acres will be presented by population area, Forest Service acres by Forest.

Subject: Important Meeting Reminder: Disturbance and Monitoring Team

Disturbance and Monitoring Subteam:

The recent Great Basin federal family meeting identified a number of inconsistencies. One of those was the various approaches to dealing with disturbance. We (this team) are tasked to have a proposal to resolve this issue BEFORE the Rocky Mountain federal family meeting in two weeks. It is extremely critical that you participate in the call on Thursday and the subsequent follow-up calls next week. Please make sure your supervisor knows the importance of these meetings and allocates the needed time to participate. If you or your supervisor have any questions, please give me a call.

Background: This team presented a number of options in the GRSG Monitoring Framework for calculating the amount of disturbance on the landscape in both the sagebrush availability measures and the habitat degradation measures. However, for the purpose of managing disturbance under a cap, having multiple ways to calculate disturbance is confusing and does not lend itself to the assurance we hope to provide to the FWS during their status determination next year.

Therefore, this team needs to clarify and define the relationships of the following:

- * What are the management decisions the disturbance calculations will inform (cap for authorizing disturbance vs Adaptive Management triggers)
- * How does the analysis area used in the calculation relate to the management decisions (population, BSU and/or project)
- * Why is the BSU scale necessary
- * What is the analysis area for calculating disturbance (PAC/PH or habitat)
- * What data are used in the calculations (national, or national and local combined)
- * How is fire included in the calculations.

We will be using the Webex to display this relationship in a table, so please log in prior to the start of the call so we can start as quickly as possible.

If we have time on Thursday we would also like to start the discussion on the formulas to determine the amount of disturbance as it relates to the disturbance cap.
