Last Thursday, several of use started an inventory of the disturbance inventories going on in the state and, while this is still really important, it is somewhat on hold because this is a higher priority.

Thank you,
Gordon

Subject: Materials for 10am EST/8am MST Meeting
Attachments: Proposal as to how to Incorporate Forest Service ADPPs_8_5_14.docx

Good morning everyone,

Attached is a proposal as to how we plan to incorporate the Forest Service ADPPs into the existing BLM ADPPs. This document will be discussed on this morning's call.

Thanks,

--

Matthew Magaletti
Planning and Environmental Analyst
Bureau of Land Management (WO-210)
(202) 912-7085

Proposal as to how to Incorporate Forest Service ADPPs

Chapter 2

2.X Introduction

2.X.1 Public Input that resulted in new alternative (proposed plan).

2.X.2: Crosswalks between BLM and FS planning language (**Template will be provided**).

2.X Proposed Plans

2.X.1 BLM's Proposed Plan (Organized by Goals, Objectives, and Management Actions/Allowable Uses)

2.X.2 FS's Proposed Plan (Organized by Desired Conditions, Objectives, Standards, and Guidelines)

2.X.3 Alternatives Analyzed in Detail (Table)

Chapter 4

4.X Impacts from Resource X

4.X.1 Impacts from BLM and FS Proposed Plan

If variations between BLM and FS Proposed Plans exist, state the following:

Same as BLM, except: (e.g.)

- *Variations in allocations (managing general differently)*
- *Vegetation*
- *Livestock Grazing*

4.X.2 Impacts from Alternative A ...

Appendix

Internal Working Document – Not for Distribution

- Crosswalk table comparing FS proposed plan to the BLM proposed plan. Provide citations where current management does not match BLM management direction **(Template will be provided)**.

DRAFT

Subject: Re: Great Basin GRSG - NEPA PM Call Tuesday

Is this in relation to consistency with state and local plans?

Q

On Mon, Aug 4, 2014 at 5:22 PM, Holly Prohaska <holly.prohaska@empsi.com> wrote:

Regarding #9: Other Topics:

The following text was added to each of the Sub regional public comment response reports:

[NOTE TO BLM from SOL: need to review all of the noted plans/policies for consistency. Update Proposed LUPA/FEIS to include statement (paragraph) to confirm that there are no inconsistencies. Or if there are inconsistencies, how BLM has chosen to resolve them. Include rationale for why or why not inconsistencies were corrected.

In response, include direction to the reader where they can find the new/updated information in the FEIS. E.g., "See Section XXX in the Proposed LUPA/FEIS for additional details."]

NVCA would like to discuss a consistent approach to addressing this response.

Thanks, Holly

Sage-Grouse Great Basin Region Project Management Team Weekly Call

August 11, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Brent Ralston, ID; Joan Suther, OR; Frank Quamen, NOC; Kathy Stangl, WO; Matt Magaletti, WO; Vicki Herren, NOC

USFS: Glen Stein; Randy Sharp; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat

Handouts

- None.

Action Items

- None.

Meeting Minutes

Federal Family Meeting

- Meeting materials should arrive by Wed or Thursday as hard copies. PMs should discuss the proposed plan with their state directors who have to give a 5 minute talk about the subregional plan.
- Recommend putting the subregional effort in context of the rangewide effort for the 5 minute briefing. State what percent of the population and habitat is within the subregion. Highlight the major threats in your state, and efforts with relationships (how USFWS has been involved locally). Also mention unique aspects about your effort (e.g., moratorium on planning in western UT).
- Matt will send the powerpoint with the regional context for each subregion.
- There will be a session on adaptive management, mitigation, monitoring and coordination with the states. Would like input from the state directors on how we will move forward with states collectively. There will be a regional meeting with the states after the federal family meeting. The Department, solicitors, Forest Service, and USFWS will also be there.
- Disturbance white paper will be released after the federal family meeting.

Outcomes from Last Week's Meeting

- Anticipate having one ROD for the Great Basin plans. May be signed by the Secretary. As a result, the proposed plans need to have a consistent format across the GBR and RMR. Proposed plans will be discussed separately in Chapter 2. There will be a consistent format that everyone must follow with consistent headings. Will require re-working and formatting. Template has yet to be determined.

- Ensure that all BMPs and RDFs from NTT are in the proposed plans. Matt will send a table tracking how RDFs are included. It is an internal check, but PMs should wait to fill it out until after the meeting next week. Not a problem if a subregion has added RDFs as long as they don't conflict with existing RDFs.
- Ongoing discussions on how to integrate Forest Service plan into Chapter 2. Will wait until after federal family meeting to talk about formatting.

Forest Service Plan Update

- Working to finish draft proposed planning language for ID/MT and UT. Working on NV/CA next.
- Reviewing the subregional revisions and comments and ensuring consistency across the region.

USFWS Data Call

- Data call letter from USFWS has been circulating. Data call for the conservation efforts database (CED) and threat information that will go to them. Steve Small and Vicki are working on the strategy for how BLM will respond. CED is in beta testing now. Would like to provide as much data as possible from national level datasets then determine what level of involvement will be needed from the field.
- Unsure how the threats data will be provided. Likely can be derived from the same data layers described in the monitoring framework for the broad and mid-scale.

Disturbance and Monitoring Team Update

- Working to develop consistency between local monitoring plans. Discussing what to include at fine/site-scale. Will be using same threats at broad/mid-scale in monitoring framework and additional threats to include at project level and biologically significant units. Taking a final vote on what to include on Thursday (e.g., underground pipelines, meteorological towers, hydropower plants, recreation areas). If PMs have concerns, talk to your disturbance and monitoring team liaisons.

Cumulative Effects Analysis

- Putting CEA on hold until after federal family meeting to ensure the data is ready, complete, and accurate. Moving forward with Buffalo CEA to use as a template. EMPSi will set up a workshop with PMs and lead biologists to review that plan so everyone can see what CEA includes/doesn't include and set expectations.

Other

- Joan sent out a paper regarding mitigation in Oregon and asked for feedback. Also sent revised adaptive management strategy.
- Randy will send out some of the materials they have worked on regarding mitigation.
- FIAT – hopefully the IM will be out this week.

Agenda - State Director RMP Critical Path Briefing – August 26, 2014

Call-in number: 406.896.5345 and Passcode: 1014#

Field Office Issues and Updates

Miles City:

HiLine:

Billings/PPNM:

South Dakota:

North Dakota:

Lewistown:

Dillon:

Issues	Discussion/Updates	Decision/Follow-up
Sage-grouse Reviews	<ul style="list-style-type: none"> • Update from John on the Great Basin FFM... • John and Jamie will attend the Rocky Mountain FFM week of September 9th. • EMSPi is working on MZ cumulative and will send John a draft report. • A white paper from the WO on disturbance cap is being delayed until after the FFM. • John has PDF of the spatial data for our plans to review. 	<ul style="list-style-type: none"> • Finalize BMP appendix with mitigation document – for revisions. • Finalize Adaptive Management Plan. • Insert MZ cumulative when done. • Incorporate any changes from FFM in September.
	<p>WO will update schedule after FFM in September.</p>	<ul style="list-style-type: none"> • Send Karan documents when they go to WO. • Amendments still need MSO review.

Items decided/sent to FOs for incorporation into FEIS:

- Oil and Gas Stipulations
- Predators: John C. drafted a section to drop into chapter 3 regarding predators.
- COT report threats table: North Dakota and Colorado examples provided to add to Chapter 4 of each plan.
- Future PH/GH delineation changes. No need to add text to the RMP - minor boundary adjustments can be done with plan maintenance. Large boundary adjustments would probably need an amendment.
- EMPSi recommendations on similar comment responses sent to Team Leads to review/incorporate changes.
- Allocations confirmed by WO – solar changed on many plans.

Dustin and Cally,

Last week the Great Basin efforts met with the federal agencies (BLM, Forest Service, FWS and DOI) to discuss plans.

We fared good and I've got a couple things I'd like to share with you soon. Do you have some time Tuesday or Wednesday that I could come down and chat with you?

Hi Madelyn,

Per the emails last week, here is the most recent ID/MT subregion comment response report for you to review. As an FYI to Brent and Rob, we thought it would be good to have Madelyn involved in these reviews since she has been looking at the reports from a national/consistency level with the FS perspective.

Subject: RE: Sage grouse

Jeff,

We are working to respond to the GIS needs and get those data sets to the NOC. We are having a little problem that we are trying to work through or around and have been trying to get in touch with someone at the NOC to resolve the issue. In a nutshell after we posted the data to the NOC server the NOC locked down the folder and the files so we cannot replace/delete/rename the files that are currently in the directory. We are trying to add new files (renamed) to that folder which may or may not work (it seems it is working for some files and not for others).

As for the call this afternoon – I will plan on sitting in on the call with you.

For Implementation we have been starting discussions on several topics that would be useful to discuss further. What we have discussed is starting to build and Implementation Guide (and we have included an action in the Proposed Plan to develop such a guide post-ROD which set FWS at ease about how we are moving forward) that would serve as a sort of handbook for implementation of the plan. There are several areas already identified that would need some further definition for implementation – our short list so far is:

1. Fire and Invasives Assessments – There is currently an IM on how to do these, and there could be more direction developed as to how to implement those and incorporate their findings into site specific projects.
2. Anthropogenic Disturbance – the NOC has described this process at the broad scale and there is a need to describe the specific process at the local scale – who (which office) is responsible for what component; who (which office) has the authority to evaluate and respond, etc.
3. Mitigation – the development of the strategy and the inter-workings of the coordinating body with federal and state partners.
4. Adaptive Management – similar to anthropogenic disturbance, with the additional coordination amongst stakeholders; what teams or boards do we need; who are the participants; how do they function – meeting, review, decision authority, etc.
5. Livestock Grazing permit renewals – describing how the decisions in the plan get translated down to the allotment level
6. Travel management planning – what is priority for completion in relation to other implementation efforts; how to step forward, etc.

There will undoubtedly be more but this is a beginning.

I will let Brent respond to both of your questions. I know that GIS has been working this week to get the data corrected and off to the NOC.

Thanks for agreeing to participate in the IAC Public Lands Committee meeting. Please find attached meeting materials for the meeting. As a reminder the meeting is scheduled for 3-5pm on Tuesday, September 16th at the University Inn in Moscow, ID. The meeting will take place in the Washington Room.

All the best,
Seth

**IDAHO ASSOCIATION OF COUNTIES
PUBLIC LANDS STEERING COMMITTEE**

Annual Conference ~ Moscow, ID
University Inn ~ Washington Room
September 16, 2014 ~ 3 pm to 5 pm

Tentative Agenda

- I. Call to Order: The Honorable Brenda Richards, Chair
 - A. Welcome and introduction of guests and committee members
 - B. Approval of February 2014 meeting minutes
- II. USFS Update: Andy Brunelle, USFS Capital City Coordinator
- III. Sage Grouse Management Plan Update: Brent Ralston, BLM Idaho
- IV. Congressional Update: Mike Hanna, Regional Director for Senator Jim Risch
- V. Clearwater Basin Collaborative Panel Discussion (why did the collaborative start, what are its current projects, why has it been successful, what can other counties do to adapt lessons learned to their communities): Don Ebert, Clearwater County Commissioner; Skip Brandt, Idaho County Commissioner; Robyn Miller, The Nature Conservancy; Bill Higgins, Idaho Forest Group
- VI. WIR/SRS/PILT Update: Gordon Cruickshank, Valley County Commissioner
- VII. Elko County Resolution on Sage Grouse/Grazing: Gordon Cruickshank, Valley Co Commissioner
- VIII. Discussion and Voting on Resolutions
 - A. IAC Resolution No. 2014-7: Designation of National Monuments - Gordon Cruickshank, Valley County Commissioner
- IX. Other business
- X. Adjourn

Committee Members:

Brenda Richards, Owyhee County Treasurer, Chair
John Allen, Clearwater County Commissioner, Vice Chair

Bill Brown, Adams Commissioner	Barbara Tierney, Custer Clerk
Mike Paradis, Adams Commissioner	Wes Wootan, Elmore Commissioner
Steve Hadley, Bannock Commissioner	LeRoy Miller, Fremont Commissioner
Jacob Greenberg, Blaine Commissioner	Jordan Stoddard, Fremont Commissioner
Angenie McCleary, Blaine Commissioner	Skip Brandt, Idaho Commissioner
Jamie Anderson, Boise Commissioner	Jim Chmelik, Idaho Commissioner
Dave Radford, Bonneville Commissioner	Jerald Raymond, Jefferson Commissioner
Dan Dinning Boundary Commissioner	Robert Cope, Lemhi Commissioner
Earl Somsen, Caribou Commissioner	Rick Snyder, Lemhi Commissioner
Dennis Crane, Cassia Commissioner	Doug Zenner, Nez Perce Commissioner
Bill Fredericksen, Clark Commissioner	Jerry Hoagland, Owyhee Commissioner
Greg Shenton, Clark Commissioner	Larry Church, Payette Commissioner
Tod Shenton, Clark Commissioner	Larry Yergler, Shoshone Commissioner
Don Ebert, Clearwater Commissioner	Gordon Cruickshank, Valley Commissioner
Wayne Butts, Custer Commissioner	Kirk Chandler, Washington Commissioner
Lin Hintze, Custer Commissioner	

IDAHO ASSOCIATION OF COUNTIES
PUBLIC LANDS COMMITTEE
IAC Midwinter Conference ~ Riverside Hotel ~ Boise, ID
February 4, 2014 ~ 1:15 Pm to 2:45 pm
MEETING MINUTES ~ DRAFT

ATTENDEES:

Brenda Richards, Owyhee County Treasurer, Chair
John Allen, Clearwater County Commissioner, Vice Chair

Committee Members:

Mike Paradis, Adams Commissioner
Jamie Anderson, Boise Commissioner
Dave Radford, Bonneville Commissioner
Dan Dinning Boundary Commissioner
Earl Somsen, Caribou Commissioner
Bill Fredericksen, Clark Commissioner
Greg Shenton, Clark Commissioner
Tod Shenton, Clark Commissioner
Don Ebert, Clearwater Commissioner
Wayne Butts, Custer Commissioner
Lin Hintze, Custer Commissioner
Barbara Tierney, Custer Clerk
Wes Wootan, Elmore Commissioner
LeRoy Miller, Fremont Commissioner
Skip Brandt, Idaho Commissioner
Jim Chmelik, Idaho Commissioner
Doug Zenner, Nez Perce Commissioner
Jerry Hoagland, Owyhee Commissioner
Larry Yergler, Shoshone Commissioner
Gordon Cruickshank, Valley Commissioner
Kirk Chandler, Washington Commissioner

IAC Members:

Stacy Dreyer, Adams Assessor
DeMar Romrell, Bear Lake Commissioner
Angenie McCleary, Blaine Commissioner
Daryl Wheeler, Bonner Commissioner
Seth Beal, Butte Commissioner
Bart May, Clark Sheriff
Doyle Lamb, Custer Commissioner
Deanna Hall, Idaho Treasurer

IAC Members (cont'd):

Lynn Bowerman, Lemhi Sheriff
Carroll Keith, Lewis Commissioner
Roy Hubert, Lincoln Commissioner
Ann Youts, Lincoln Treasurer
Kimber Ricks, Madison Commissioner
Kent McClellon, Minidoka Commissioner
Dale Tubbs, Oneida Commissioner
Kelly Aberasturi, Owyhee Commissioner
Joe Merrick, Owyhee Commissioner
Perry Grant, Owyhee Sheriff
Jerry White, Shoshone Assessor
Rod Plank, Shoshone Under Sheriff
Kelly Park, Teton Commissioner
Elt Hasbrouck, Valley Commissioner
Patti Bolen, Valley Sheriff

Guests:

Craig Glazier, USFS/IDL
Mike Roach, US Senator Risch
Jeff Foss, BLM
Brent Ralston, BLM
Kurt Wiederman, BLM
Layne Bangerter, US Senator Crapo
Mitch Silvers, US Senator Crapo
Jonathan Oppenheimer, ICL
Rob Mason, The Wilderness Society
Sam Eaton, OSC
David Thornton, Idaho Power

IAC Staff:

None

I. Call to Order and Introductions: Brenda Richards, Chair

Committee Chair Brenda Richards called the meeting to order and welcomed committee members and guests.

MOTION: Dave Radford, Bonneville County Commissioner moved to approve the September 2013 meeting minutes. Doug Zenner, Nez Perce County Commissioner seconded the motion. The motion carried unanimously on a voice vote.

II. BLM Sage Grouse Update: Brent Ralston, BLM

Brent Ralston updated the committee on the BLM's sage grouse resource management plan. The BLM has released its draft EIS with six alternatives. The BLM has identified two co-preferred alternatives, one developed by the BLM and one developed by the Governor's Sage Grouse Work Group. The 90 day public comment period ended in January and the BLM received over 15,000 individual comments. Many of the comments were form letters. Form letters came from five groups: Wild Earth Guardians (want strong protections), The American Bird Conservancy (want limited future development), Defenders of Wildlife (want wildlife preserves), the American Wild Horse Preservation Campaign (focus on BLM's mandate to protect wild horses), and the Idaho Cattlemens Association (advocating for Governor Otter's recommendations). In addition, there are 200-300 individual comments from government agencies, counties (Owyhee, Custer, Washington, Power, Gooding, Jefferson, and Beaverhead, MT), and legislators. The BLM is compiling and analyzing comments to develop a final EIS and make a final decision by the end of September.

III. BLM Grazing Permit Renewal Update: Kurt Wiederman, BLM

Kurt Wiederman updated the committee on grazing permit renewals in Owyhee County. Litigation on renewals dates back to the late 1990s. Western Watersheds is the main driver behind the lawsuits. The BLM was ordered in 2000 by courts to redo NEPA on the 68 permit renewals in question. It did not complete renewals by the court ordered deadline in 2006 and went back to court. The BLM was placed under a new court order in 2008 to complete NEPA on the remaining permit renewals by December 2013. The BLM has issued 56 final decisions and met conditions of 2008 court order. The BLM found that resource conditions on the ground were not up to BLM standards which led to a change in grazing policies on the allotments. As a result, there will be a 41% reduction of grazing on the allotments. The BLM has received 80 appeals and expects to receive up to 100 by the end of the appeals process. The appellants are primarily from the permittees, Western Watersheds, various cattlemen associations, and the Farm Bureau. The appeals will likely take up to two years to process. The status quo will be maintained until the appeals are finalized. The BLM is under a second court order to update the resources management plan for allotments in the Jarbidge area. The Jarbidge effort will start up this year.

IV. Gateway West Update: Jeff Foss, Deputy State Director for Resources, BLM

Jeff Foss provided an update of the Gateway West Transmission project to the committee. The project is a 500kv line by Idaho Power and Rocky Mountain Power from Wyoming to just outside of Boise. It crosses 47% BLM managed land, 44% private land, 7% state managed land, and 2% USFS managed land. The BLM published a final EIS in 2013 and a record of decision in December 2013. The decision applies to federally managed public lands only with the goal of mitigating the impacts of the project on federal land and recognizes that the authority is limited to federal jurisdiction and has no impact on county planning ordinances or the Idaho Public

Utilities Commission. Certain segments of the proposed corridor will undergo additional NEPA studies including in the Snake River Birds of Prey National Conservation Area. The path forward on private land has also yet to be determined. A couple of alternatives include closer spacing and piggybacking off of existing transmission lines.

V. Western Cohesive Strategy Update: Craig Glazier, USFS/IDL

Craig Glazier updated the committee on the Western Cohesive Wildfire Strategy. The three main tenets of the strategy are: maintaining and restoring resilient landscapes, creating fire adaptive communities, and strengthening wildfire response. The strategy goals are: increase management of vegetation and fuels, protect homes and communities at risk, managing human caused ignitions, and effectively responding to wildfire. There needs to be better resource allocation from all levels to meet the goals. Idaho ranks high for vegetation and fuels management, community planning, and effectively responding to large scale wildfires. Idaho ranked low for human caused ignitions. Community wildfire protection plans (CWPPs) will play a huge role in the implementation of the Western Cohesive Wildfire Strategy. Idaho's forest action plan will be greatly influenced by the cohesive strategy. Now is the time to provide feedback. Counties must make sure that their CWPPs are current. Counties without current CWPPs will not be eligible for grant funding. Counties will be better prepared to respond to wildfires if their plans are up to date.

VI. PILT/SRS/WIR Update: Gordon Cruickshank, Valley County Commissioner

Commissioner Cruickshank reported that the Farm Bill has passed the House and Senate and is on its way to the President Obama's desk for his signature. It contains a one year extension of full PILT funding. PILT payments for 2014 should be received in June 2014. Mr. Cruickshank also reported that SRS was reauthorized for one more year through the Helium ACT, payments should be released March 7th. The one year reauthorization expires on September 30th.

VII. Coordinating Natural Resource Litigation: Dan Dinning, Boundary County Commissioner

Commissioner Dinning discussed with the committee how counties can better coordinate litigation efforts with IAC. IAC has a litigation fund that can assist counties with litigation that impacts all counties. The Natural Resources Litigation Fund Committee needs to know when a county is contemplating litigation to better coordinate efforts, remove duplication, and prevent bad litigation.

VIII. Adjourn

Committee Chair Brenda Richards adjourned the meeting at 2:50pm. The next committee meeting will be held in Moscow, ID at the University Inn as part of the IAC Annual Conference in September.

IAC RESOLUTION NO. 2014-07

Resolution to urge the President to solicit and follow the advice of local stakeholders before using the Antiquities Act of 1906 to designate national monuments, such as the Boulder White Clouds, in the State of Idaho.

Sponsor: IACC (Gordon Cruickshank, Valley Co Commissioner) – Amended 6/12/14

Idaho Statute(s): None

Impacted County Office(s): Commissioner

Policy Issue: Use of the Antiquities Act to designate the national monuments, such as Boulder-White Clouds, in the State of Idaho.

Proposed Policy: The Idaho Association of Counties strongly **urges opposes** the President ~~to refrain from~~ using his powers under the Antiquities Act of 1906 to establish national monuments, such as the Boulder White Clouds, in the State of Idaho without seriously considering broad, local stakeholder input. National monuments should be designated upon agreement of local stakeholders and working groups **that live, work and recreate in the areas under consideration.**

Background Information: Interest groups are proposing that the Boulder-White Cloud National Monument be established by presidential proclamation using the Antiquities Act of 1906. The proposal encompasses 592,000 acres of federally administered public land in central Idaho, including 312,000 acres east of the East Fork of the Salmon River and 280,000 acres west of the East Fork that is in the Sawtooth National Recreation Area.

Establishing a monument without the active involvement of stakeholders would disrupt their way of life and undermine the good relationship that has existed for many years among most area users. The process for establishing a presidentially-declared National Monument should include broad, local input from people who live, work and recreate in the areas under consideration and should have the opportunity to fully participate in a land-use decision of critical importance to them.

Rather than relying upon a single act of presidential power, national monuments should be designated based on input from local elected officials, local working groups, public land users, and other local stakeholders. Local stakeholders are best positioned to understand local economies, cultures, and resources. Local stakeholders and working groups have been able to find agreement in the past in the designation of wilderness and national recreation areas. Often time's controversy is removed when public land use decisions are made with the input and recommendation of local stakeholders.

Fiscal Impact:

BLM and Forest Service National Greater Sage-Grouse Planning Strategy

BLM
Forest Service

Greater Sage-Grouse ESA Re-Cap

- 2005: FWS issued “not warranted” Finding
- 2007: District Court remanded 2005 Finding
- 2010: FWS issued “warranted but precluded” Finding
- Finding Identified Inadequate regulatory mechanisms as a major factor
- 2011: BLM initiated National Greater Sage Grouse Planning Strategy.
- FY 2015: GRSG final listing decision per settlement discussions

Purpose and Need

of all Great Basin Greater Sage-Grouse EISs

Purpose

Identify and incorporate appropriate conservation measures in LUPs to conserve, enhance, and restore Greater Sage-Grouse (GRSG) habitat by reducing, eliminating, or minimizing threats to that habitat.

Need

Respond to the US Fish and Wildlife Service's (FWS) March 2010 "warranted, but precluded" Endangered Species Act (ESA) listing petition decision, which identified inadequacy of regulatory mechanisms as a significant threat to GRSG.

The principal regulatory mechanism for BLM and FS is conservation measures in BLM's and FS's LUPs.

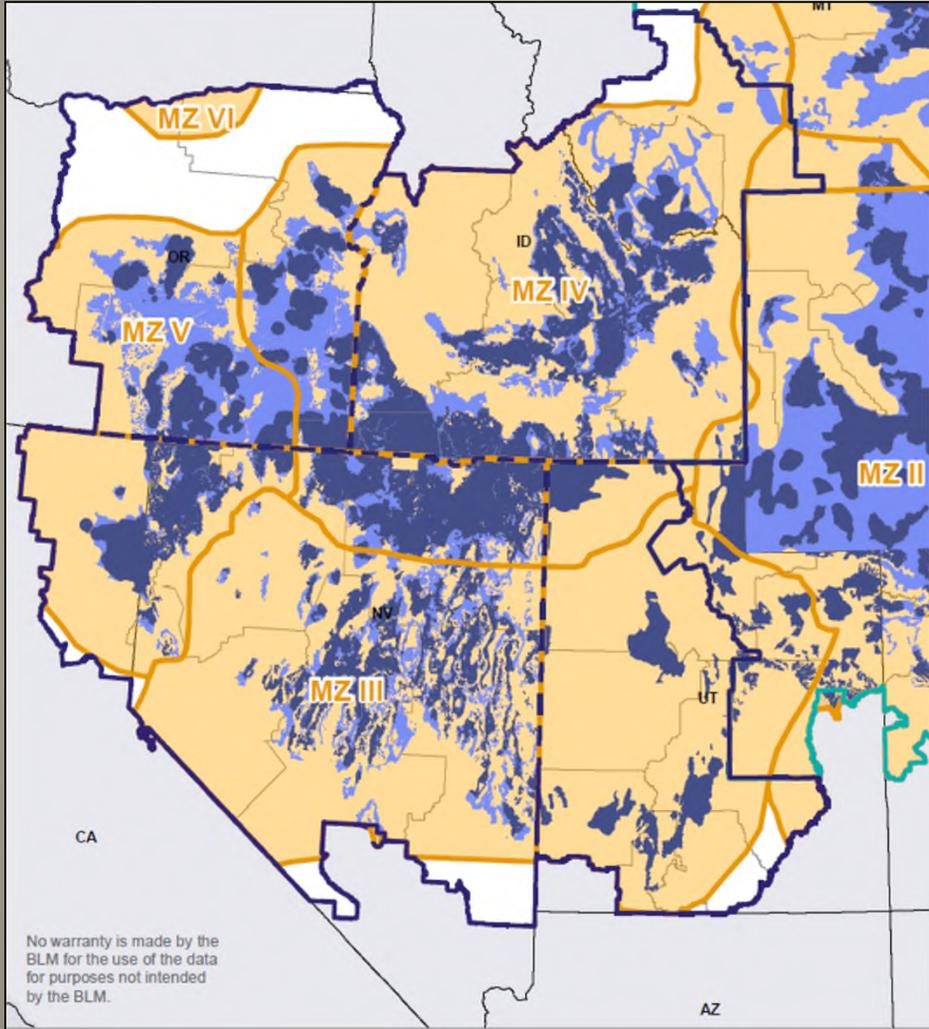

Major Threat – Great Basin Region

Major Threat – Rocky Mountain Region

Great Basin GRSB Habitat Overview

-  Great Basin
-  Rocky Mountain
-  Western Association of Fish and Wildlife Agencies' (WAFWA) Management Zone
-  Preliminary priority habitat
-  Preliminary general habitat

Great Basin GRSB Habitat Overview

- Total Great Basin Habitat Area: 61 million acres
- Subregions:
 - Idaho and southwestern Montana
 - Nevada and northeastern California
 - Oregon
 - Utah
- Land management:
 - BLM: 50% of habitat
 - FS: 7% of habitat
- Land Use Plan (LUP) Revisions:
 - 41 BLM Resource Management Plans (RMPs)
 - 12 Forest Service Forest Plans

Idaho and Southwestern Montana Sub-Region

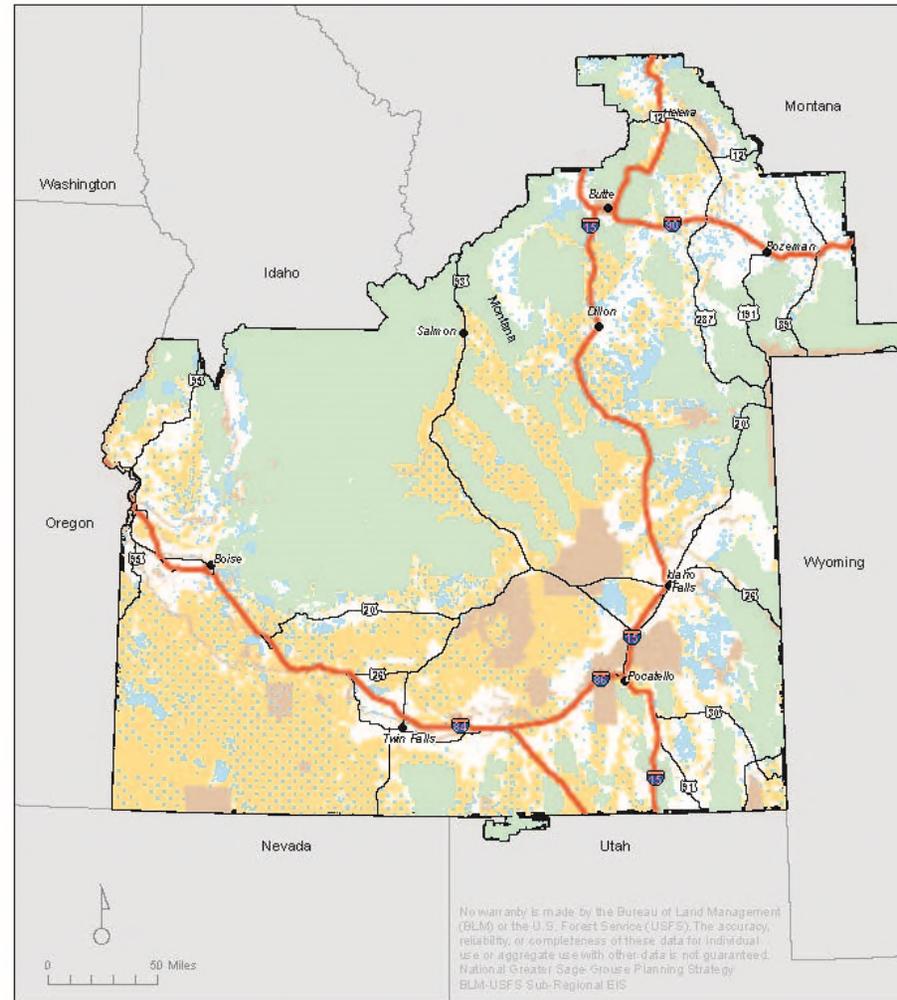

29 Plans Addressed:

Idaho – 20 BLM Resource Management Plans
 - 7 Forest Service Forest Plans

Montana – 1 BLM Resource Management Plan
 - 1 Forest Service Forest Plan

Subregion Includes
 18 million acres of habitat
 Addresses approximately
 11 million acres of habitat

Planning Area

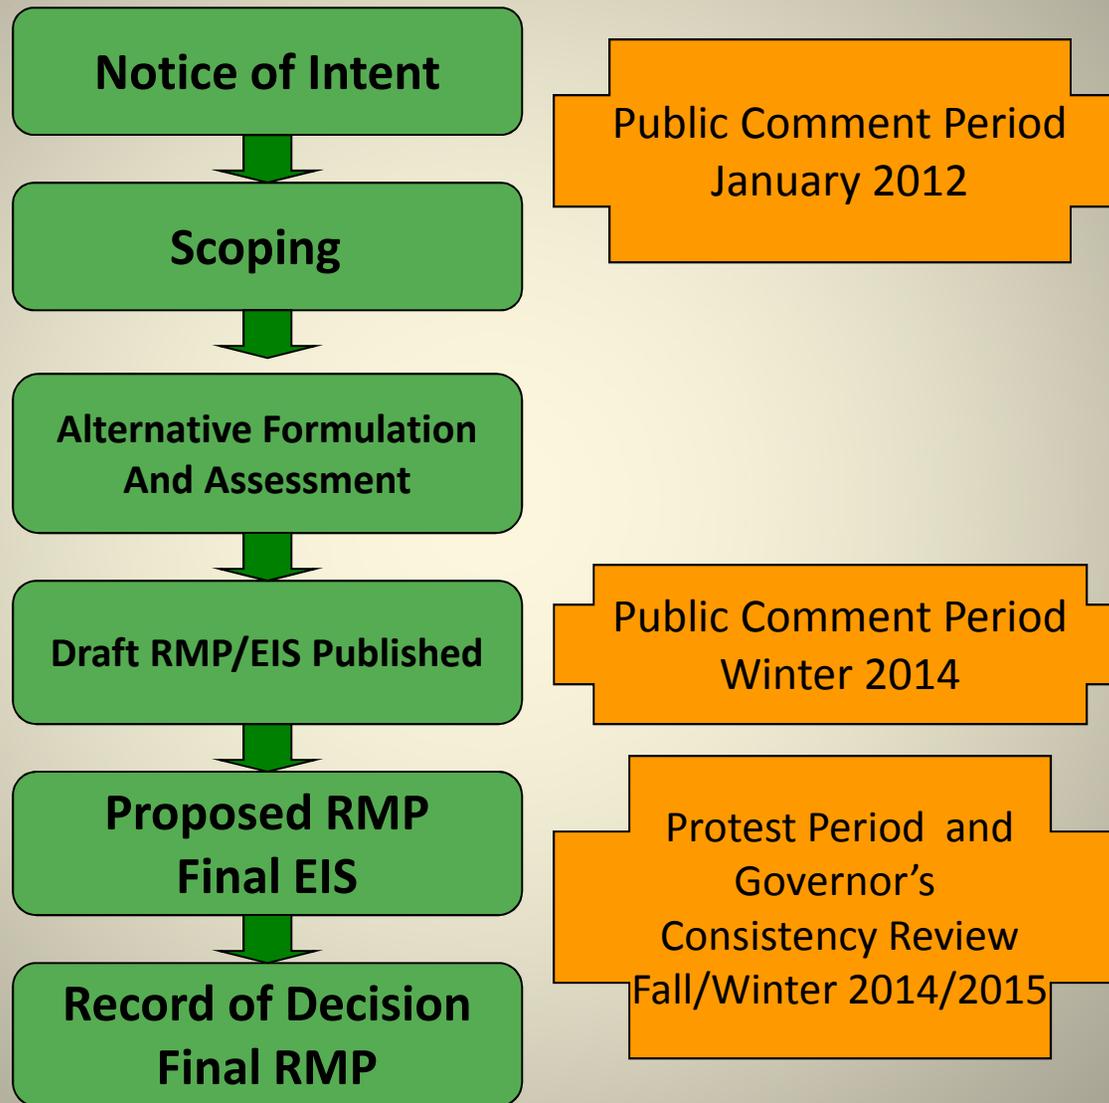

- | | |
|--------------------|------------------------------|
| Analysis Boundary | Bureau of Land Management |
| Interstate highway | United States Forest Service |
| US highway | Private |
| Major Cities | State |
| | Other |

BLM
Forest Service

Key Milestones

Proposed Plan Components

- Management Zones
- Habitat Management Objectives
- Adaptive Management Strategy
- Anthropogenic Disturbance Cap
- Mitigation Board and Strategy
- Wildfire and Invasive Species Assessments
- Program Direction
- Monitoring

Addressing the Wildfire Threat

- **Delineation of Management Zones to Prioritize Suppression and Restoration Activities to Protect the most Critical Areas**
- **Adaptive Management Strategy to Reduce Development Disturbances on Broader Areas and Prioritize Additional Acres for Suppression Activity if Habitat is Lost**
- **State Development and BLM/FS Support of Rural Fire Protection Associations to Increase Suppression Capacity**
- **Fuels Reduction Treatments Through Effective Measures**
- **Fuel Break Development to Compartmentalize Areas and Reduce Fire Spread**
- **Restoration and Rehabilitation of Sagebrush**
- **Development of Wildfire and Invasive Species Assessments to Prioritize Suppression and Other Activities and Identify Beneficial Project Activities**

<Jarbidge Standards and standards.docx>

On today's call we were discussing grazing in relation to the Jarbidge RMP and Greater Sage-Grouse Amendments, specifically in regards to the Forest Service approach and how they processes and implementation would play together.

BLM grazing activities are directed through federal rule by the state specific (Idaho in this case) Rangeland Health Standards and Guidelines. There are 8 Standards by which grazing activities are evaluated and adjustments made to ensure that conditions on the ground are meeting or are making progress toward meeting those Standards (capital S). The Forest Service does not have an analogous approach at this regulation or rule level.

At the land use planning level the GRSG Amendment is proposing the inclusion of vegetation management objectives into the development and implementation of project activities that would affect or impact vegetation – this includes grazing activities. Through the plan amendment BLM would incorporate these as objectives to screen potential activities to ensure that activities would result in meeting or making progress toward meeting these objectives. The Forest Service is proposing these be included in their plans as standards (lowercase s) that would be met before project activities could occur. The BLM objectives and Forest Service standards are very similar and in most cases are identical – they are based on the Greater Sage-Grouse Habitat Assessment Framework and tie to the indices that we will be monitoring through that process that reflect the condition of Greater Sage-Grouse habitat.

For BLM the amendments will add consideration of Greater Sage-Grouse vegetation objectives into site specific project implementation activities, including grazing, that builds on the foundation of the Rangeland Health Standards and Guidelines. The amendments are not proposing changes in the Standards (capital S) since that would require rulemaking. For Forest Service the amendments will incorporate land use plan standards (lowercase s) into the management and implementation of grazing activities on the Forest.

Hi Kurt, as per our meeting a couple weeks ago, I'm following up to send some additional detail on the Policy Forum we're planning for Sept 19th. See attached for additional details via the concept paper we discussed. Apologies this took a bit longer to get to you than I planned. Travel this week got things backed up.

After you have had a chance to review the document, let's touch base again soon. The panel and format are beginning to take shape and it would be good to connect again and discuss more.

Via this email, I'm also introducing you to Priscilla Salant, Director for the University of Idaho McClure Public Policy Center for Research, and lead organizer for the event.

Let me know if you have any immediate questions. Thanks again for your time and interest in this.

Building Trust in Science: Is Idaho Getting it Right with Sage-Grouse?

2014 McClure Forum on Science and Public Policy
Sponsored by the University of Idaho's
James A and Louise McClure Center and
National Science Foundation-IGERT¹ Project

September 19, 2014, 7:00 - 8:30 pm
Reception to Follow
Lincoln Auditorium, State Capitol
Boise, Idaho

The late Senator Jim McClure believed that sound policy depends on good science. He disparaged legislative bodies that made decisions on complicated issues without fully understanding the relevant science. Yet today's reality is that science is often used as ammunition to position interests rather than as objective analysis on which to base policy.

Many westerners today - Democrat and Republican, across a wide range of perspectives - see working collaboratively as the best hope for addressing tough issues related to rangeland and forest systems. Idaho's Owyhee Initiative and the Clearwater Basin Collaborative are two recent landscape-scale examples. In both cases, the participants are using science to help make decisions about managing resources - science about ecology, wildlife, and people who make their living on the land.

The 2014 McClure Forum on Science and Public Policy will explore the relationship between science and effective policy making through the lens of Idaho's sage-grouse conservation planning and a possible endangered species listing in 2015 by the US Fish and Wildlife Service. The forum's goal is to examine the role of science in the mix of considerations guiding the development of the state's conservation plan. Based on personal experiences, a panel of Idahoans will discuss how science has helped and also challenged their thinking about the land, its wildlife and surrounding communities.

On March 23, 2010, the U.S. Fish and Wildlife Service (FWS) determined that the greater sage-grouse warrants an endangered species listing over all of its range, including Idaho, but is precluded by higher-priority listing actions. Thus the sage-grouse is currently considered a "candidate" species under the ESA. The U. S. District

¹ Integrative Graduate Education and Research Traineeship, the National Science Foundation's flagship interdisciplinary training program, educating U.S. Ph.D. scientists and engineers by building on the foundations of their disciplinary knowledge with interdisciplinary training.

Court for the District of Idaho ruled that the FWS must re-evaluate the state of the species under the ESA by September 30, 2015.

A FWS decision to list the greater sage-grouse as endangered would likely have severe and widespread effects on energy, grazing and other land uses throughout Idaho and 10 other western states. To avoid a listing and its impacts, many of those western states have proactively developed voluntary conservation strategies. Idaho's response, technically referred to as the state's alternative for incorporation into the national planning strategy, is a promising example of how sound science grounded in local and state collaboration may inform policy making.

Format, panelists and working list of questions

After a brief update on Idaho's sage-grouse conservation plan, a moderator will facilitate discussion by a panel of people who have been involved in the planning process and/or scientific assessment. Time will be available at the end for audience discussion and for a reception where participants can continue their conversations.

Panelists will represent the wide range of stakeholders who have been involved in developing Idaho's plan from both local and state perspectives. We aim to have no more than six panelists, including:

- An elected representative (county commissioner and / or state legislator);
- A Local Working Group member;
- A rancher / landowner affected by the pending sage-grouse legislation;
- A staff person from an energy firm;
- A staff person from a conservation organization; and
- A scientist who has been involved with development of Idaho's alternative.

The overarching question to be addressed is whether Idaho has "gotten it right" in terms of using science in its response to the potential sage-grouse listing. Our working list of questions for the panelists includes:

- How has science informed planning in the case of the Idaho regulatory mechanism for sage-grouse management?
- What ecological, social, and economic science has been used successfully to help reach agreement on difficult issues and on the other hand, when has science made agreement hard to achieve?
- What have we learned and can we share with other states about the intersection of science and public policy?

Intended audiences for the forum

The intended audience includes several groups:

- Faculty and doctoral students attending the University of Idaho-CATIE NSF-IGERT meeting
- Appointed and elected policy makers and program managers involved in Idaho's proactive efforts to preclude the need to list the greater sage-grouse under the ESA
- Ranchers, energy stakeholders, conservationists, recreationists, sportsmen, and other groups who will be impacted by the expected decision in 2015 regarding an endangered species listing for the greater sage grouse
- Researchers from public agencies, private firms, and higher education whose analysis has the potential to impact policy
- Interested members of the public at large

National Science Foundation-IGERT Sagebrush Team

The 2014 McClure Forum is being held during the annual meeting of the University of Idaho-CATIE NSF-IGERT project. This IGERT meeting marks the culmination of a seven-year international project, Evaluating resilience of ecological and social systems in changing landscapes. The project has been conducted in partnership with CATIE (Centro Agronómico Tropical de Investigación y Enseñanza) in Turrialba, Costa Rica. Roughly 40 faculty and graduate students from the U.S. and Central America are gathering September 18-23 for interdisciplinary presentations and field trips in Idaho.

One of the student teams presenting at the annual IGERT meeting has been deeply involved in rangelands research with implications for the pending sage-grouse listing. The "Sagebrush Team" is made up of four University of Idaho doctoral students working collaboratively on an interdisciplinary research project in southwestern Idaho. Their findings are adding to the growing body of respected research that is improving our understanding of the sage-grouse species as well as the social, economic and ecological complexity of related management activities.

Earlier this year, the Sagebrush Team held a series of workshops in conjunction with a BLM process aimed at improving sage-grouse habitat through juniper management in the Owyhee region. From these workshops, the Sagebrush Team developed a unique dataset that incorporates the social-ecological perspectives of public land users, conservationists and managers about juniper and sage-grouse. The students' experiences in organizing the workshop series have been central to thinking behind this year's McClure Forum on Science and Public Policy.

Public Lands Foundation Annual Meeting Boise, Idaho Riverside Hotel September 9-12, 2014

Fuels/Fire Projects for Discussion at PLF Conference

Paradigm Project: The project, named for its aim to shift paradigms regarding land management, encompasses nearly 294,000 acres of federal, state and private land along the Interstate 84 corridor from Boise to Glens Ferry. The project entails planting non-native forage kochia in 300-foot-wide fuel breaks along both shoulders of 187 miles of road. The shift should result in fire priority management, fire strategy, vegetative management, use of science.

BOSH Project: Bruneau-Owyhee Sage-grouse Habitat project (BOSH)
Project is focused on conifer encroachment (western juniper) as it pertains to the maintenance of existing sage-grouse habitats. The proposal is to mechanically treat juniper in preliminary priority and preliminary general sage-grouse habitats (where it occurs) in a 10-km radius around occupied leks in the Owyhee and Bruneau Field Offices. The entire project area is approximately 1.75 million acres, however the actual treatment acres will be less as not all of the area is sage-grouse habitat. This EIS will be prepared over the next year with signing of final decision sometime in spring of 2015.

Tri-State Strategy: The southwest area of Idaho, northwest area of Nevada, and southeast corner of Oregon (tri-state area covers over 3 million acres) is extremely remote, and moving resources to fires in this area requires a long response times. This area also contains one of the largest areas of contiguous Preliminary Priority Habitat (PPH) and is a stronghold for sage-grouse in Idaho. Idaho, Nevada, and Oregon are cooperating to develop fuel breaks that would enhance the ability of the three states to protect this large area of sage-grouse habitat. Well planned and coordinated fuel breaks would compartmentalize the area and help contain large wildfires across the tri-state landscape and district boundaries. This would reduce the threat of wildfire to high value native plant communities and habitat. Fuel breaks would also provide firefighters areas where they can safely and more effectively engage in fire suppression operations. Maintenance of existing roads coupled with fuel breaks is critical to give fire suppression resources faster access to these remote areas.

Tri -State Strategy Objectives:

- Coordinate across 3 states and four Districts on large fire response
- Coordinate on mitigation/fuels treatments across state and district boundaries
- Identify priorities in tri-state area- life, property, resource
- Identify access routes into remote canyon country on each district
- Identify closest resources for quick response into remote country
- Develop resource advisor maps that will be common for the tri-state area- resource values, special designation areas that will present challenges to suppression resources.
- Identify and expand RFPA opportunities

Public Lands Foundation RFPA Panel Discussion

Wednesday, September 10, 2014

1:00 p.m. – 2:30 p.m.

Tim Murphy, Moderator

Opening Remarks (5-10 minutes)

Panel Discussion (5-10 minutes each)

- **Bert Brackett**, State Senator (RFPA legislation Sponsor)
“My role as sponsor of the current legislation”
- **Darcy Helmick**, Saylor Creek RFPA
“Logistics of setting up an RFPA”
- **Mike Guerry**, Three Creek RFPA
“Required training and challenges and successes with the training”
- **Charlie Lyons**, Mountain Home RPPA
“How it’s working on fires and some real life experiences”
- **Julia Sullens**, Idaho Department of Lands (Southwest Liaison)
“Current and planned RPFAs”
- **Chris Simonson**, Idaho BLM (Twin Falls Fire Management Officer)
“Benefits and challenges surrounding RFPAs from a BLM District FMO perspective”
- **Jim Fincher**, Idaho BLM (Boise District Manager)
“From a manager’s perspective”

Questions and Answers

Tim Murphy, Facilitator (15 minutes)

Closing Remarks

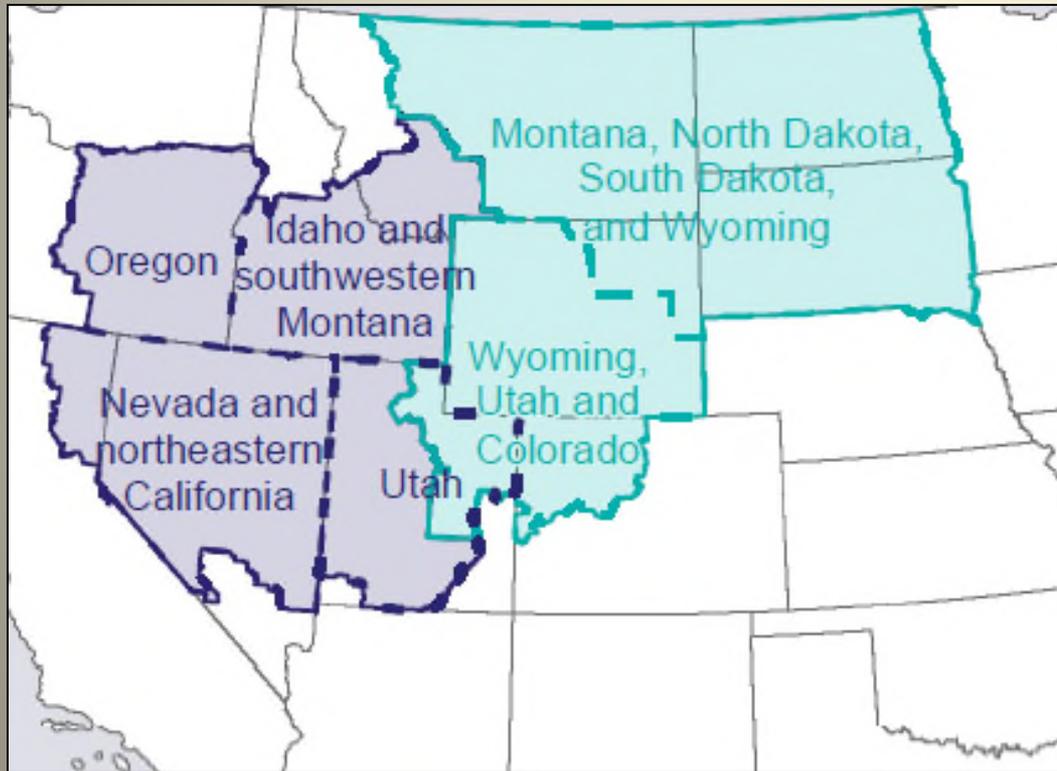

Tim Murphy (5 minutes)

BLM and Forest Service National Greater Sage-Grouse Planning Strategy

Greater Sage-Grouse ESA Re-Cap

- 2005: FWS issued “not warranted” Finding
- 2007: District Court remanded 2005 Finding
- 2010: FWS issued “warranted but precluded” Finding
- Finding Identified Inadequate regulatory mechanisms as a major factor
- 2011: BLM initiated National Greater Sage Grouse Planning Strategy.
- FY 2015: GRSG final listing decision per settlement discussions

Purpose and Need

of all Great Basin Greater Sage-Grouse EISs

Purpose

Identify and incorporate appropriate conservation measures in LUPs to conserve, enhance, and restore Greater Sage-Grouse (GRSG) habitat by reducing, eliminating, or minimizing threats to that habitat.

Need

Respond to the US Fish and Wildlife Service's (FWS) March 2010 "warranted, but precluded" Endangered Species Act (ESA) listing petition decision, which identified inadequacy of regulatory mechanisms as a significant threat to GRSG.

The principal regulatory mechanism for BLM and FS is conservation measures in BLM's and FS's LUPs.

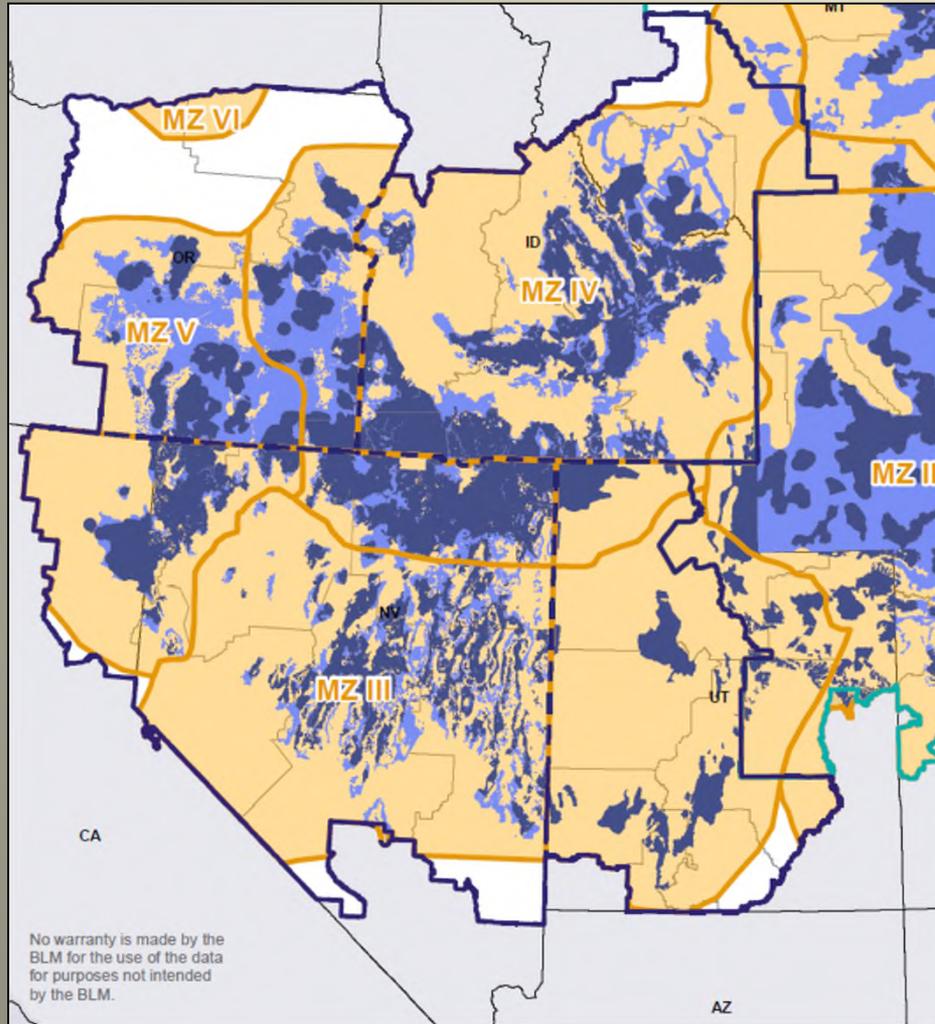

Major Threat – Great Basin Region

Major Threat – Rocky Mountain Region

Great Basin GRSG Habitat Overview

-  Great Basin
-  Rocky Mountain
-  Western Association of Fish and Wildlife Agencies' (WAFWA) Management Zone
-  Preliminary priority habitat
-  Preliminary general habitat

Great Basin GRSB Habitat Overview

- Total Great Basin Habitat Area: 61 million acres
- Subregions:
 - Idaho and southwestern Montana
 - Nevada and northeastern California
 - Oregon
 - Utah
- Land management:
 - BLM: 50% of habitat
 - FS: 7% of habitat
- Land Use Plan (LUP) Revisions:
 - 41 BLM Resource Management Plans (RMPs)
 - 12 Forest Service Forest Plans

Idaho and Southwestern Montana Sub-Region

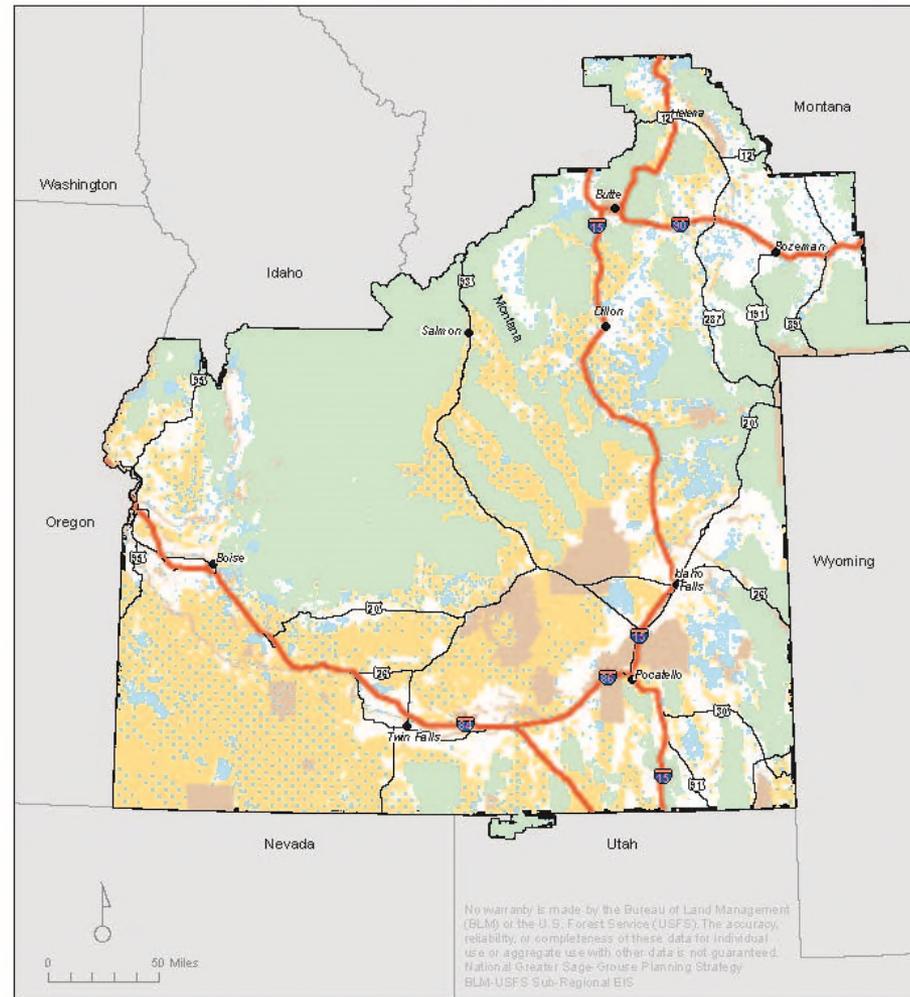

29 Plans Addressed:

Idaho – 20 BLM Resource Management Plans
 - 7 Forest Service Forest Plans

Montana – 1 BLM Resource Management Plan
 - 1 Forest Service Forest Plan

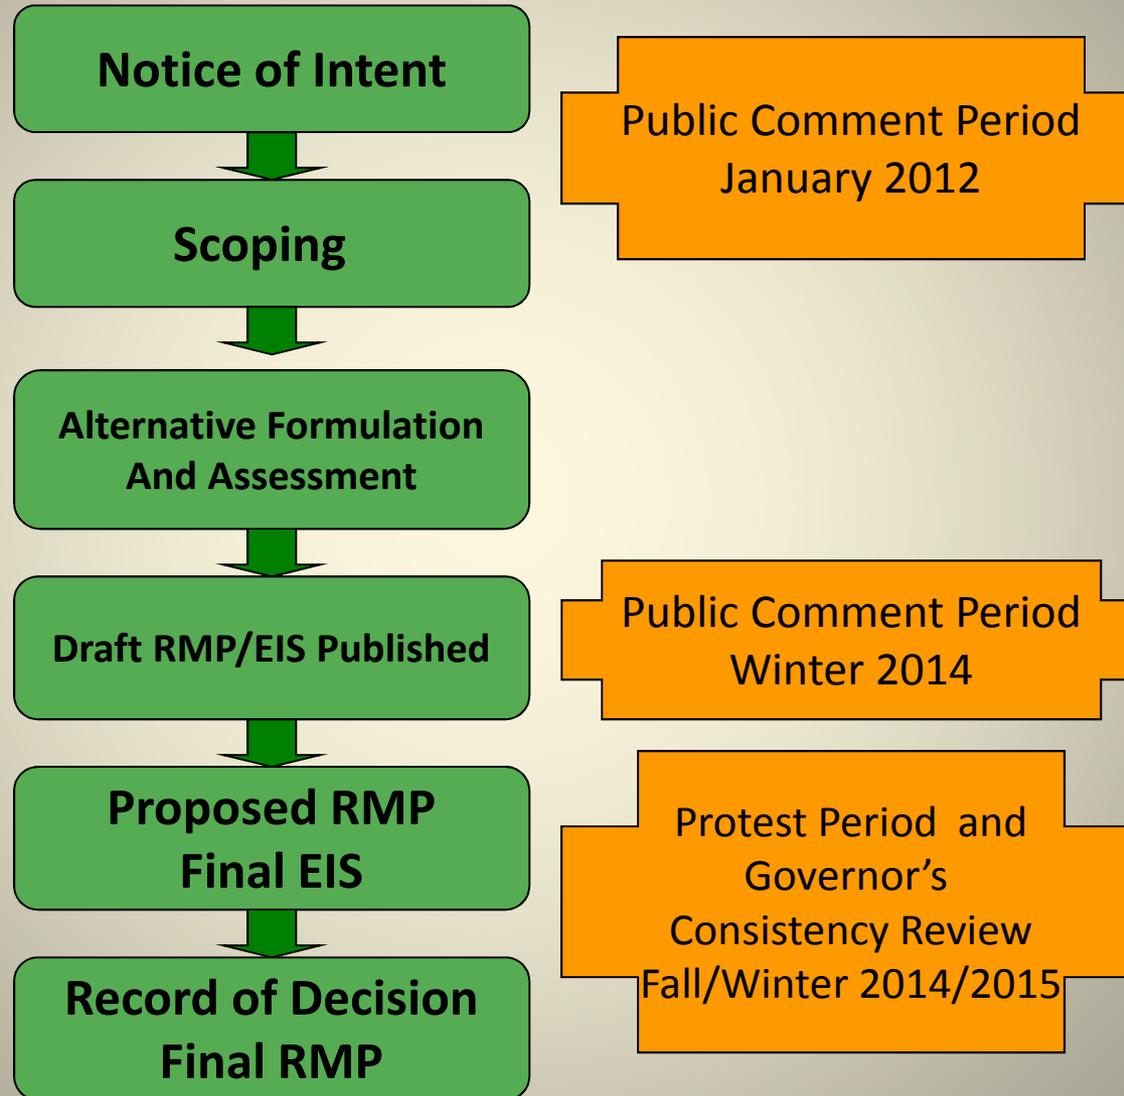

Subregion Includes
 18 million acres of habitat
 Addresses approximately
 11 million acres of habitat

Planning Area

- **Habitat Management Objectives**
- **Adaptive Management Strategy**
- **Anthropogenic Disturbance Cap**
- **Mitigation Board and Strategy**
- **Wildfire and Invasive Species Assessments**
- **Program Direction**
- **Monitoring**

Addressing the Wildfire Threat

- **Delineation of Management Zones to Prioritize Suppression and Restoration Activities to Protect the most Critical Areas**
- **Adaptive Management Strategy to Reduce Development Disturbances on Broader Areas and Prioritize Additional Acres for Suppression Activity if Habitat is Lost**
- **State Development and BLM/FS Support of Rural Fire Protection Associations to Increase Suppression Capacity**
- **Fuels Reduction Treatments Through Effective Measures**
- **Fuel Break Development to Compartmentalize Areas and Reduce Fire Spread**
- **Restoration and Rehabilitation of Sagebrush**
- **Development of Wildfire and Invasive Species Assessments to Prioritize Suppression and Other Activities and Identify Beneficial Project Activities**

Wildfire and Invasive Species Assessments

Each State is developing a **Wildfire and Invasive Species Assessment**

Wildfire and Invasive Species Assessments are interdisciplinary evaluations of the threats posed by wildfire and invasive species, as well as identification of priority areas.

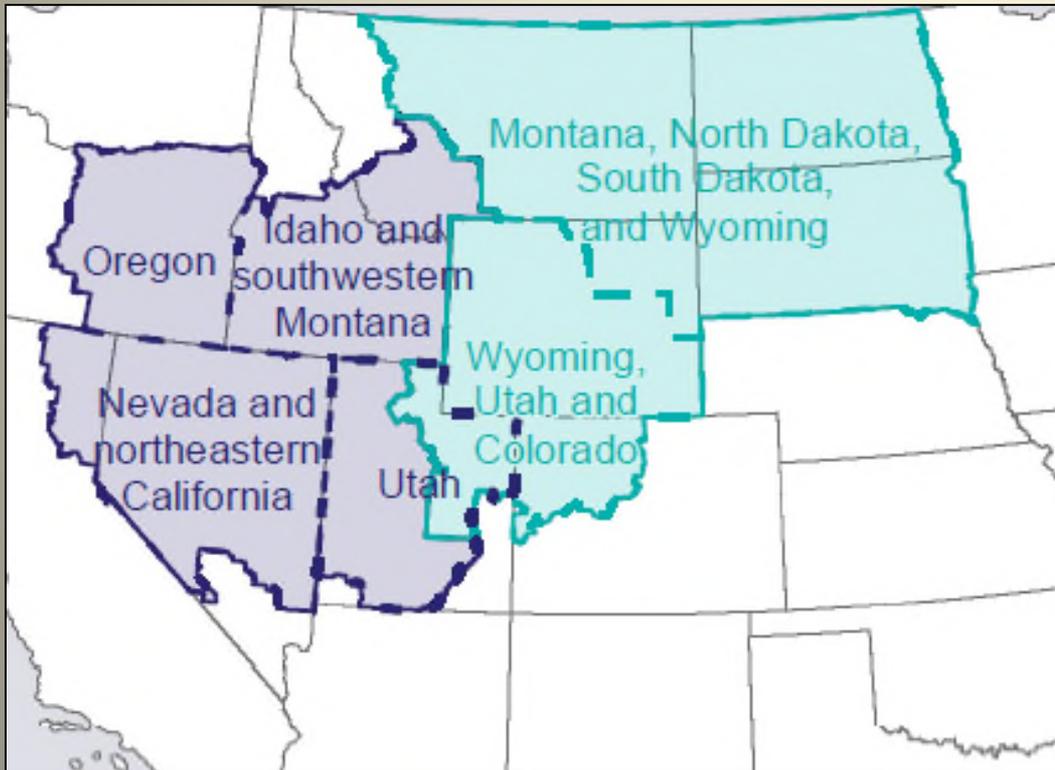

These assessments describe strategies and treatment opportunities for fuels management, suppression and restoration activities.

Subject: when will ID-E MT sage-grouse FEIS be released?
To: Kurt Wiedenmann <kwiedenmann@blm.gov>
Cc: Travis Bruner <travis@westernwatersheds.org>, Ken Cole <ken@westernwatersheds.org>

Hi Kurt,

Is there any word on the date for the release of the ID/SW MT sage-grouse FEIS?

And will the public have to Protest each FEIS separately?

We have heard there is supposed to be a CEQ review and two RODs - one for east and west portions of the range. Is this correct?

Also please include these Jarbidge RMP Protest submissions in the ID/SW MT GRSG EIS process record for consideration of the abject regulatory failure of the Jarbidge RMP in regards to sage-grouse needs.

Thanks,

Katie Fite
WWP

GRAZING AND RESTORATION ALTERNATIVE

Under this alternative, livestock would be removed from the most sensitive areas (pastures within allotments or allotments), to prevent degradation of critical habitats, and disturbance of wildlife during sensitive periods. This would also be done to preserve the values of the Proposed ACECs. BLM must conduct the basic biological surveys – for northern goshawk, flammulated, owl, sensitive and important migratory bird habitats, current status of redband trout and other rare species habitats and populations. Sage-grouse habitats would be protected and restored, with all grazing disturbance removed from them. Within those areas where livestock are removed, facilities will be removed and restoration (as described below) will occur. In areas of less risk, grazing at stocking that could achieve the use levels described below would be allowed. Large livestock-free reference areas would be established.

Ecological Recovery Alternative (ERA)

The Ecological Recovery Alternative will:

- 1) Protect remaining occupied sage-grouse habitats as well as other important areas to provide enclaves to protect rare, imperiled and sensitive species from chronic grazing disturbance and new development. It will significantly rollback and rehab many existing developments associated with livestock management. This will provide for secure habitats, and recovering natural ecological functions.
- 2) Allow for passive restoration of lands to recover natural processes, and minimize and prevent invasive species expansion and enable recovery of sage-grouse, migratory bird, and other species including big game.
- 3) Provide for active restoration of existing developments or disturbances that are harming habitats. Examples: Removal of harmful fences, stock ponds, spring developments, water pipelines, salt supplement feeding sites, and their associated roading, and selected other facilities and disturbance as well. This reduces invasive species risk– since these sites serve as epicenters for initial weed invasion and then subsequent outward spread. So it also reduces fire risk by reducing risk of invasive annual/exotic grasses.
- 4) Provide for active restoration of some sites most infested with the invasive exotics bulbous bluegrass through recovery of natural vegetation and microbotic crusts.
- 5) Ensure lands are in the best possible ecological condition both before and after wildfires to minimize risk of invasive species spread. This also maximizes post-fire recovery and effectiveness of taxpayer-funded actions such as reducing the need for seeding since understories will be in better ecological condition. Livestock disturbance will be removed from some landscapes, so sage-grouse and other wildlife populations impacted by wildfire will not suffer continued grazing disturbance in unburned lands of importance to the population - as is the current situation. Reductions in invasive exotic grass species will reduce risk of frequent fire and aberrant fire disturbance intervals.

- 6) Minimize adverse impacts of a broad range of disturbances on wildlife habitats and populations, and aquatic species watersheds that are impaired.

This will promote conservation and recovery of sage-grouse, migratory birds and other rare species while also protecting watersheds with native interior redband trout, Columbia spotted frog, and other aquatic species.

The ERA will remove livestock from lands found not to be suitable for continued use due to conflicts with aquatic and/or sagebrush species. A battery of harmful fences, water developments, salt/weed infestation sites, etc. will be removed from large portions of the landscape, and other important habitats wildlife and aquatic species conservation and protection of Wilderness and lands with Wilderness Characteristics. This will promote natural values, solitude, primitive and unconfined recreation, and untrammled wild lands.

Habitat will be conserved, enhanced and restored. The range and abundance of aquatic and terrestrial species populations will be increased. Current systematic surveys will be conducted at the start of this process, so a firm baseline of species occupancy abundance and viability of populations can be established.

In any areas where grazing might continue, BLM must significantly reduce grazing levels while applying much more conservative mandatory standards of livestock use. These conservative levels of use must include both riparian and upland trampling, utilization and other standards. Avoidance of disturbance during sensitive periods/seasons is mandatory.

For any grazed lands:

The use levels must leave 9 inches of residual grass cover across understory communities at all times. This must be based on the grass composition present –not merely on sites where larger statured grasses may remain in depleted landscapes.

That in reality means 10-15% upland utilization, or no utilization at all except by wildlife, must be put in place. It must be measured at sites that are actually used to a significant degree by livestock. BLM cannot apply 30% or 40% utilization –this is inadequate to prove necessary residual nesting cover (9 inches) and also to promote adequate recovery. Utilization is averaged across the grass plants that are grazed. So typically, when an area “averages” 40% utilization - this means that many grass plants are grazed to levels of 60%. Even one time grazing use so severe can harm or kill native bunchgrass plants by removing growing plant parts and depleting scarce root reserves, as well as by exposing the grass crown to winter freezing damage or summer heat-desiccation. Native bunchgrasses did not evolve with intensive grazing by herds of large hoofed ungulates. See USDI Technical Bulletin Anderson 1991, Mack and Thompson 1982.

BLM must also apply an upland trampling standard to limit disturbance to soils, microbiotic crusts and native understory plants, as well as to limit increased young trees that BLM is so obsessed with killing. Microbiotic crusts are a frontline defense against invasive species. BLM

must limit cattle trampling to less than 5% of the area of a square meter monitored at grazed sites across the pasture/land unit. No areas of the allotment, including those receiving the most intensive use, will be allowed to receive greater than 10% of the surface area trampling. Ranchers have horses and herders, and concentrations of livestock cannot be allowed to create epicenters of disturbance and weed invasion. Stocking must be properly applied so that these standards can be attained during every grazing disturbance episode and so that ranchers are grazing numbers of livestock they can control.

At least 6 inches of stubble height must remain on all riparian/meadow area herbaceous species at all times. This must be applied to all species – not just Nebraska sedge or species that grow right by, or in, water.

Riparian shrub browse and/or breakage must be limited to 5% of livestock-accessible new growth.

Livestock bank trampling (and spring-meadow trampling) standards must be applied that limit disturbance to less than 10% of livestock-accessible stream and all spring and meadow areas.

Areas extending back from the green line through the entire historic floodplain/meadow extent must be measured and monitored and these standards applied. Plants that are not right by the water's edge are much less likely to regrow. They are critical for protecting and conserving vital watershed values, protecting riparian/meadow areas linked to aquatic habitat health. These areas in some sites may provide sage-grouse brood rearing. This promotes recovery of habitat components for species ranging from migratory birds to beavers that use willow thickets. Agencies have long biased monitoring of impacts by measuring only the thin greenline and species likely to regrow there following heavy grazing – rather than mesic areas that provide suitable conditions for the forbs required by sage-grouse broods. See Belsky et al 1999.

BLM must also apply upland shrub structural integrity standards to all shrubs and mountain mahogany. No sagebrush plants, mountain shrubs, mountain mahogany, ceanothus or other shrubs anywhere in the pasture should receive more than 5% breakage or other livestock impacts.

All of these standards must be applied as triggers for removal of livestock from the pasture. If the use level is reached, the livestock must be moved out. Timely and adequate monitoring must be conducted – with random spot checks if funding is limited.

If any of these standards are exceeded in any year, livestock reductions in numbers will be put in place - with reductions of 25-50% in stocking for each violation along with more herding and shorter periods of use. If ranchers are unable to meet these standards, they are unable to control their livestock, so the herd size is too large.

If standards are exceeded in multiple years, livestock grazing must be ended in the pasture.

Salt and supplement will not be used. Livestock trailing to such sites, and the impacts of concentrated use at these sites, severely alters and reduces native vegetation. These disturbed sites provide centers for cheatgrass, medusahead, and other weeds to spread outward from. Responsible herding and a herd size that can be controlled are required.

Habitat Security: Seasons of Use

These livestock use standards must be coupled with avoidance of any grazing/trailing disturbance during sensitive periods of the year.

No grazing will be allowed in occupied sage-grouse habitat during lek and nesting periods. This must be applied to all occupied sagebrush habitats. A significant portion of sage-grouse populations may nest considerable distances from leks, and distant leks may have greater nest success. By focusing protections only near leks, agencies are sacrificing a significant part of the remaining sage-grouse population and its habitats.

No grazing will be allowed in sage-grouse habitat during winter periods. This must be applied to all sagebrush habitats to provide ample undisturbed winter habitat for sage-grouse including during hard winters.

In all instances, livestock use must not be shifted and intensified into other fragile sites or other vegetation communities. To meet standards, livestock must be reduced, not moved elsewhere to create further conflicts.

No livestock grazing will be allowed in important migratory bird or nesting raptor habitat during nesting periods. This period can range from February (some raptors, owls) to July.

Restoration Actions – Both Active and Passive

Passive restoration: Passive restoration focuses on removal of disturbance to aid natural healing processes in the sagebrush ecosystem. Removal of livestock grazing promotes short, mid and long term healing so that the composition, function and structure of the components of the sagebrush and ecosystems can recover (see Fleischner (1004, Belsky and Gelbard 2000) and sustain sage-grouse and other dependent species and their populations. It also includes road closures where natural recovery of facility-related or other road ruts and road verge areas could take place. This will help buffer from climate change effects.

Removal of livestock disturbance prevents livestock from disturbing nests and nesting birds. Disturbance of nests and nesting birds and habitat components promotes predation. Eggs can also be damaged by livestock trampling, or even eaten by cattle.

Removal of livestock disturbance also removes a source of abundant food or artificial water sources in uplands that serve to attract and subsidize mesopredators and nest predators like ravens. Dead livestock, carrion, livestock waste, livestock feed and supplements, sheep camps and other things that promote sage-grouse nest predators are reduced.

Sage-grouse, migratory birds, small mammals, pollinators of rare plants - all benefit from both recovering vegetation structure that helps screen nests from scent and visual predators, as well as a reduction in livestock-associated activity and substances that attract nest and egg predators.

This also eliminates pressure from livestock interests to kill coyotes and other predators that help to keep mesopredators in check. This helps restore a more natural predator-prey system and helps to limit mesopredators.

Active restoration to aid Passive restoration processes is also proposed: Active restoration aiding passive ecosystem recovery processes focuses on removal of fences, troughs and other livestock facilities to reduce sage-grouse mortality, reduce disturbance zones where weeds invade and thrive, reduce predator travel corridors, reduce nest predator perches, reduce habitat fragmentation, reduce structures that attract ravens and other nest predators.

Active restoration practices:

Remove cwg seedings and forage kochia in proximity to sage-grouse habitats.

Removal of livestock water troughs, pipelines and wells to reduce livestock disturbance to surrounding soils, microbiotic crusts, and native vegetation and to promote their health and passive recovery. This will also benefit sage-grouse and migratory birds through removal of sources for Mosquitoes that carry West Nile virus. West Nile virus also poses a threat to the health of human visitors.

Where possible, without further damage to springs/water sources, remove waterline piping and maximize water at spring/stream sources supporting diverse riparian and meadow vegetation. Natural flowing water reduces West Nile mosquito habitat. This will help to raise water tables, so larger areas of meadows provide for sage-grouse brood rearing.

Promote natural healing of headcuts to the maximum extent possible by limiting disturbance throughout the watershed. Do not merely dump rocks and boulders into headcut – as this often destroys the potential for any natural recovery of meadow systems, and leaves areas permanently cut off from former riparian/mesic zones. At times, a combination of methods may need to be used – but gabions and structural devices and boulder dumping should be limited, and restoration should strive for a functioning system – not leaving meadows high and dry as structural fixes typically do.

No livestock grazing will be allowed on any areas that are restored.

Seed local native ecotypes in areas of more intensive disturbance, and restore any crested wheatgrass or other areas where the agency has removed sagebrush, including any recent “treatments”.

Benefits: Recovery of composition, function and structure of the sagebrush ecosystem.
Reduction in elevated perches for nest and egg predators and other conditions that promote nest

and egg predators. Removal of centers of weed infestation and spread, removal of facilities and conditions promoting West Nile virus. Recovery of functioning watersheds. Potential retention and increase in flows and length of flows in currently ephemeral or intermittent drainages to promote brood rearing habitat and counter adverse impacts of climate change.

Other benefits: Prevent migratory bird, bat and small animal deaths from drowning. Promote recreational uses and human health (cleaner more abundant water, reduction in potential sites for disease-bearing mosquitoes and exposure to livestock pathogens). Promote persistence of perennial surface water flows and watershed conditions that retain and slowly release waters favoring sustained perennial flows.

Active restoration: Ripping/recontouring of roads and seeding with native local ecotypes of shrubs and grasses. This promotes habitat security.

Seeding

Conduct active restoration of areas disturbed by trough, fence or other project siting and/or removal operations, and provide targeted restoration planning to expand, reconnect or recover habitats required by native wildlife by:

- Inter-seeding sagebrush seed or seedlings.
- Active restoration of cheatgrass/invasive exotic grass infestation areas.
- Active restoration of all crested wheatgrass or other exotic seedings.

In all cases, local native plant ecotype seeds and seedlings must be used.

By far the cheapest and most cost-effective method to sustain, recover and restore plant communities is to remove livestock grazing and trampling disturbance.

Monitoring sites in any areas where grazing might continue must be established based on site visits with the Interested Public – not just ranchers. Monitoring must trigger specific mandatory required actions, and not just loose uncertain claimed BMPs as “adaptive management”.

This must all be applied as Interim measures to protect the values of the sagebrush and other ecosystem components. BLM frequently attributes problems with lands and waters to historic grazing – ignoring that the current chronic grazing disturbance incrementally eats away at the remnants. Grazing prevents or greatly slows “recovery”. And even if one were to believe that “historic” grazing caused all the problems one sees on public lands, there are now scientifically recognized new threats of invasive species, altered fire cycles fueled by annual grasses, climate change, diseases, and other threats. Continued grazing and trampling depletion and disturbance are threats to the health of the ecosystem. Grazing causes harms and/or exacerbates and acts synergistically with other threats.

BLM must conduct risk assessments. These must systematically examine damaged areas - such as springs, seeps, intermittent drainages, damaged headcutting streams, sagebrush uplands that

are vulnerable to cheatgrass spread, areas where microbiotic crusts are greatly trampled --- to determine if these sites can withstand any continued grazing disturbance, i.e. if they are suitable for any continued grazing.

Immediate action must be taken to remove livestock from the pastures or watersheds – not simply use fencing while allowing intensive grazing disturbance to deplete watersheds and sustainable flows. These must also systematically examine all local populations of rare and sensitive species, and determine the threats to these populations, and the degree of risk of extirpation the population is under.

Under this alternative, grazing would be removed from occupied habitats in ACECs, and all other lands with significant risk of cheatgrass/exotic invasion or other serious degradation with continued disturbance, as well as lands where populations are at risk of extirpation or significant declines if grazing disturbance continues.

The Preceding Discussion identifies measures to address livestock grazing and grazing removal components, and measures to address fire and to aid recovery following fire, and ensure secure, recovering, conserved, sustained habitats and populations.

BLM must fully and fairly analyze the No Grazing alternative, as well to provide a full and adequate baseline for understanding impacts of grazing in any areas where it may continue.

Mitigation

Mitigation by avoidance is the first option to be considered and must be rigorously examined. It will be required in ACECs and occupied habitats for sage-grouse, other rare species, and other imperiled biota like slickspot peppergrass.

Soils

Soils will be protected from wind and water erosion, Microbiotic crusts will help protect soils, and also sequester nutrients, and some species sequester Carbon dioxide. Minimizing soil erosion through limiting disturbance that makes soils prone to erosion also will help limit wind-blown soil transport that is exacerbating the impacts of climate change. Soils eroded as dust are deposited on snowpacks, causing earlier snowmelt. This will help mitigate climate change impacts to watersheds and habitats for native biota, and reduce dust in the air.

Vegetation

Composition, function and structure of native vegetation communities will be maximized to provide for healthy, resilient and recovering sage-grouse habitat components. See Mack and Thompson (1982), Fleischner (1994), Belsky et al. 1999.

See also integrated weed measures.

Cultural

The integrity of natural systems, plants and animals important to Native Americans will be maximized.

Integrity of cultural sites will be protected, and adverse impacts of disturbance to these sites will be minimized and often removed altogether.

ACECs

Large ACECs will be designated to preserve, protect, conserve watershed, pre-settlement and ancient trees and forest, and to restore and sustain sage-grouse populations and the sagebrush ecosystem on which the sage-grouse and pygmy rabbit rely, as well as balance and achieve aquatic species habitat protections and those of other communities and biota. See WWP ACEC proposals already submitted to Jarbidge BLM and found to meet relevance and importance criteria.

Livestock grazing disturbance will be ended and/or greatly controlled in ACECs.

Active and passive restoration will be conducted as described herein.

Other disturbances will be reduced and minimized to the maximum extent possible, as described herein and in WWP comments to address the particular risks posed to sage-grouse as identified in risk assessments conducted with this process.

Hazardous Materials

Use of herbicides will be minimized and used only with extreme care. Flash burning, mowing of weeds and selected hand cutting will be used as primary and preferred treatments to minimize use of and pollution by harmful substances. Only if no other alternative exists will selected ground-based application of herbicides be used.

Use of other hazardous substances with existing mining, oil and gas or other development will be examined in a risk assessment, and contamination or infiltration into the environment will be minimized.

Integrated Invasive Species Management

Integrated invasive species management will be practiced.

Use of herbicides will be minimized, and used only as a last resort to achieve clearly defined goals and objectives. Flash burners, mowing of weeds and selected hand cutting will be prioritized. Only if no other alternative exists will selected ground-based application of a limited range of herbicides be used.

Vectors of weed spread will be addressed. Livestock will not be moved from areas infested with invasive species into public lands. Livestock will be quarantined before entering public lands if noxious weeds are present in areas last grazed. Lands infested with noxious weeds will not be grazed until weed infestation is eradicated and restored with native vegetation.

Any project vehicles will be washed, and will not drive through infestations during access to site.

Full and complete analysis of the risk of cheatgrass or other annual grass expansion will be conducted, and livestock use prohibited in areas where such disturbance will expand invasive annual grasses that drastically alter the wildfire cycle.

Other Vegetation Measures

If there ever is any legitimate need to reduce “thatch” in meadows, grass mowers will be used. Thus, livestock manure, trampling damage to soils, weed spread will be minimized.

Mowing of grass in any fuelbreaks will be used in any fuelbreak fuels reduction project (roadsides or other areas). There will be no targeted grazing, and no seeding of exotics. Exotics will be a particular target for removal.

Lands will be managed to be in the good or better ecological condition to help minimize adverse impacts of fire. Having lands in best condition when a fire occurs maximizes recovery post-fire.

Any fuels treatments will focus on interfaces with habitation or significant existing disturbances, or be specific focused areas, not sprawling “block” or “mosaic” treatments that greatly fragment habitats.

Habitat Security

Noise pollution, light pollution, vibrations, motions, tall vertical objects all will be minimized. All future NEPA reviews starting immediately in sage-grouse occupied habitats, native raptor, and other disturbance-sensitive wildlife will include sensory conflicts and habitat security as an element of the environment.

The need for buffers surrounding habitats will be examined here, as well.

Sincerely,

Working to protect and restore Western Watersheds and Wildlife

September 18, 2014

Director (210)
Attn: Protest Coordinator. WO-210
20 M Streets SE, Room 2134LM
Washington. DC 20003

Sent Cert. U. S. Mail Return Receipt Requested
Also Sent by email to: protest@blm.gov

Dear BLM Director,

This is a Protest from Western Watersheds Project (WWP) regarding the Final Jarbidge Resource Management Plan and its associated Final Environmental Impact Statement.

WWP is alarmed that, as concerns and science related to climate change, livestock grazing impacts, impacts of extractive uses and disturbances on sage-grouse, bighorn sheep and other wildlife and aquatic species and water quality have increased, BLM proposed management actions have slid further backwards. Jarbidge BLM has produced a Proposed Action in this RMP that is a throwback to Dark Ages management. The BLM action has, unbelievably, substantially **worsened** from that proposed in the DEIS.

A Supplemental EIS with a full and valid range of alternatives based on current baseline information and science related to invasive species, climate change, grazing conflicts with native biota and recreational and other uses of the public lands watersheds, water scarcity, development and extractive use conflicts with wildlife and recreational uses and enjoyment, etc.

***** □

In this Protest, we highlight concerns raised in WWP's DEIS comments and the even worse livestock industry-driven Proposed Action.

□WWP commented that we were very troubled by the lack of reasonable alternatives in the Draft RMP/EIS and the failure of the BLM to address protection and restoration of sage grouse and other sensitive and listed species habitat in any of the draft alternatives. BLM ignored this concern, and instead of undertaking revised protective alternatives and selecting more protective actions for sage-grouse, slickspot peppergrass (LEPA) and other native biota, watersheds, clean water in the FEIS BLM has reverted to a severely livestock-industry-biased Proposed Action. We Protest this.

PRMP/FEIS Violates Stipulated Settlement Agreement

We Protest the failure of BLM to comply with the Stipulated settlement Agreement in WWP v. Bennett. BLM must redo this failed 2014 RMP Proposed Action that defies the Jarbidge Stipulated Settlement Agreement and the Federal Land Policy and Management Act.

A Supplemental EIS must be prepared that addresses the dire ecological circumstances and declining sensitive species populations and other resource losses occurring in the Jarbidge, and analyzes a truly suitable and reasonable range of alternatives.

The species downward slides, cheatgrass and other weed advances, and watershed declines, and trajectories of this all -had been already been abundantly documented in the Jarbidge AMS in early summer 2007. The AMS showed large-scale increases in cheatgrass in grazed areas, and the situation has dramatically worsened over the years. BLM ignores the pressing crisis from climate change, as well.

A greatly revised final Jarbidge RMP/EIS must reflect all the legal mandates under which the BLM must was required to prepare this Land Use Plan. Instead of complying with the SSA, FLPMA, NEPA, the CWA, the MBTA, legislation that protects cultural values - BLM first produced the confusing mishmash of this Draft Jarbidge RMP/EIS which now in 2014 has been morphed into a 1970s-style extractive-uses-trump-all management scheme under the livestock industry Alternative VI of the FEIS. BLM's promises of species and other resource protections are wildly untrue given the greatly conflicting Goals, Objectives and Management Actions (GOMAs) under the limited range of alternatives that BLM deigns to consider.

Review of FEIS Section 2.8 Alternative 6, section 2.8.2, which lays out the exceedingly harmful and highly uncertain agency actions proposed for Jarbidge public land resources. These actions are contradicted by broad range of current science, much of which WWP provided to BLM as scientific Literature and in the body of our comments on the DRMP. We are now providing updated scientific Literature on cd with this Protest. Current science shows the BLM actions here will fail to protect, and will result in irreversible harm to, the following public resources in the Jarbidge: Air and Atmospheric Values Geologic Features, Soil Resources, Water Resources, Vegetation Communities, Fish and Wildlife, Special Status Species, Noxious Weeds and Invasive Plants, Wildland Fire Ecology, Wild Horses, Paleontological Resources, Cultural Resources Visual Resources,

Lands with Wilderness Characteristics. The Proposed Action and limited alternatives would perpetuate very harmful levels and manner of Livestock grazing Resource Use (Sec 2.8.3.1), Land Use Authorizations (Section 2.8.3.4), Land Tenure (Section 2.8.3. 5, Transportation/Travel Section 2.8.3.3, Minerals (Section 2.8.3.6).

There is internal conflict between alternative actions. The RMP provides no coherent path forward. It provides pretty much an extractive industry free for all, lacking adequate required measurable standards of use, leaving in place a horrendous and inter-related road and livestock infrastructure system, and turning a blind eye to cheatgrass presence creeping into the livestock and seeding-treatment damaged understories across the Jarbidge.

We Protest all of these grave Jarbidge FEIS shortcomings:

Unclear Process Related to BLM Greater Sage-grouse EIS Process

We Protest the lack of clarity and certainty related to the Jarbidge RMP's interfacing with the GRSG DEIS Process. The State Director's letter included with the RMP adds to the confusion.

We Protest BLM relying on the GRSG EIS process to the extent that this may be occurring (and again that is unclear from the Director's letter – what, if any, concrete and effective actions may come out of the highly politicized exercise in largely perpetuating the status quo. Further, the RMP provides no rigorous science-based NEPA analysis of the flaws of GRSG EIS process (as shown in the various DEISs). These include:

- + the uncertain and limited actions and inadequacies of the Idaho state sage-grouse plan, the Nevada state sage-grouse plan, and other state plans affecting the local, regional and national populations of GRSG, including the northern Great Basin population.
- + the uncertain and limited actions and inadequacies and conflicts of the ID/SW MT GRSG EIS, the NV/NE CA EIS, and other sage-grouse EISs that attempt to balkanize/chop up the range into over a dozen management schemes, each and every one of them woefully deficient. See WWP comments on SW ID/MT and NV/NE CA, for example. The local Jarbidge population has undergone sharp decline, and it spans two states – Idaho and Nevada. The BLM GRSG EIS Proposed Actions are woefully deficient. Each EIS chops away and cuts out very important occupied habitat and habitat where agencies have previously committed to restoration from higher levels of habitat protection. For example, the ID/SW MT EIS and others fail to adequately protect all occupied habitats – let alone provide for sufficient restoration and recovery actions. They chop currently PPH into lesser habitat categories with minimal to no real measurable protections for livestock grazing and other uses, spurn **all** ACEC designations – guaranteeing no integrated management for sage-grouse on even a single area within these landscapes, etc. We are also alarmed at the level to the GRSG plans (and apparently this EIS as well) it would rely on the state proposals, which are greatly influenced by the livestock and other industries.

The BLM alternatives across the GRSG EIS process are weaker than and dumbed down

from the current PPH/PGH Interim protections. It cannot be used as a basis for providing adequate regulatory controls to conserve, enhance and restore GRSG habitats and populations, nor those of other wildlife species that agencies claim sage-grouse provide some kind of an umbrella for. See WWP Comments on the Idaho/SW Montana and Nevada/NE CA GRSG DEIS processes. From WWP inquiries to BLM about this process, it appears that little is intended to change from the Draft there – and the same greatly inadequate These GRSG shortcomings must also be fully considered in the analysis of the cumulative effects of the RMP/DEIS –as adjacent Burley, Bruneau, Elko BLM and Humboldt-Toiyabe Forest lands will be greatly affected at the local level. It is also necessary to assess adverse cumulative impacts of lack of sufficient regulatory controls to ensure sage-grouse conservation on the regional and West-wide populations of GRSG. Please consult the China Mountain wind sage-grouse and other wildlife studies, and the DEIS there to understand the regional importance of areas of the Jarbidge FO that will suffer continued high levels and harmful periods of livestock use, as well as where habitats will receive lesser protection that at present – under BOTH the GRSG DEIS process as well as this awful RMP which strips significant sage-grouse, bighorn sheep and other wildlife and natural resource protections that were present in the old Jarbidge RMP!

Sage-Grouse and Species Conservation Concerns Were Thwarted in RMP DEIS, and Now This is Made Even Worse in the FEIS

BLM's efforts to undermine the Stipulated Settlement Agreement (SSA) and bias the outcome of the RMP process strongly in favor of livestock and development interests were apparent from the start. RMP DEIS Volume 1, Executive Summary ES-2, Planning Issues and continue now in FEIS ES-1, The Draft, where the whole foundation of an RMP is laid down, did not even mention sage-grouse in this section. BLM vaguely referenced "resources", uses and special designations. The discussion of Alternatives (ES-2 to ES-3) did not even mention sage-grouse. BLM subverted the entire basis of the Agreement. Minimal mention continues in the FEIS, and mule deer, a generalist species, appears to receive greater emphasis.

BLM must promptly release a FEIS with a new series of ecological science-based alternatives that are honestly aimed at conserving sage-grouse, biodiversity and other very important values of the public lands here.

It is impossible to understand how this RMP process could have taken so long. BLM has tried to blame WWP and litigation that sought to protect sage-grouse in the aftermath of the Murphy Fire. But even before the Murphy Fire, it was becoming apparent that BLM was not going to develop a collaborative RMP.

It set up closed-door teams, excluding the public from that process. Then, Jarbidge BLM embarked on a highly controversial Wind Energy EIS where development of an industrial wind facility would destroy the best remaining sage-grouse habitat in the Jarbidge. Then there was a leadership vacuum in the Twin Falls District even more so following release of the DEIS, and range and extractive interests and range staff acting as their surrogates

then hijacked the RMP process – as shown in FEIS Proposed Action. The former Twin Falls District Manager went from BLM right into the arms of the livestock industry as a consultant. We also stress that there are only a small number of ranchers affected – primarily the various LLCs and sub-units of the Simplot Ag conglomerate, and various politicians and relatives of the Brackett family dominate the Jarbidge grazing.

After all of these years, BLM produced an unwieldy morass of confusion that would perpetuate - and now in the FEIS – would greatly worsen environmental conditions, loosen existing protections for habitats and populations like GRSG and Bighorn sheep, and perpetuate much of catastrophic management that has led to widespread losses of native species biodiversity, with sage-grouse and other sagebrush biota plummeting towards extinction.

It is a great concern that FEIS ES-1 (Purpose and Need) places minerals, food, timber and fiber as the first part of the purpose and need for this RMP. There is no timber produced here, hardly any minerals, limited fiber, and the “food” are a small number of taxpayer subsidized livestock operations run by various Simplot entities and the Brackett family and their relatives along with only a few other ranchers. The costs to all the public resources of this very harmful use are ignored. These are great – from loss of clean, clear and abundant water, to endless taxpayer funds sunk into trying to rehab the weed and exotic crested wheatgrass seedings these ranchers have forced upon BLM in the wake of fires that have been exacerbated by the livestock-caused flammable cheatgrass and dense livestock forage plantings of cwg and other grasses– through which wildfires rip across hundreds of thousands of acres – repeatedly -in less than a few days.

The EIS fails abysmally in providing a solid science-based analysis of the costs of livestock grazing to the public, including in destruction of land, air, water, wildlife and other resources (see Alt 6, Section 2.8, pps. 2-334 through 2-444. There is no valid analysis of the minimal role of public lands livestock grazing in producing food and fiber, as well as the minimal role of minerals. There is no valid analysis of the degree, severity and magnitude of conflicts of livestock grazing with clean and clear water, buffering climate change, reducing and destroying public lands recreational opportunities in many areas and ways through modification and destruction of habitats, etc.

We Protest this extractive interest-biased abuse of FLPMA - at the expense of all other public resources.

FLPMA was BLMs Organic Act. It was enacted for the purposes of establishing a coherent, comprehensive and systematic approach to management and protection of the public lands.

These lands are to be managed in a way that protects “*the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values.*” WHY isn’t THIS the Purpose and Need, and not the food, fiber, timber - i.e. public subsidies for private extractive interests? The FEIS resoundingly fails to protect these values, as required under FLPMA.

In fact, the inadequate near-status quo range of alternatives, the perpetuation and even increased gross overstocking of livestock, the FEIS's rejection and dismantling of ACECs, the proposal to round up and sterilize the entire wild horse herd, the near-non-existent protective GOMAs for environmental resources – all resoundingly demonstrate that the FEIS in its current form represents the de facto privatization of public resources in the Jarbidge for a few greedy public lands ranchers. THAT is what the P&N really represents.

Let's look for a minute at what the current grazing load is doing to the land, waters and watersheds:

A very significant contributor to the recent toxic algae bloom in Salmon Falls Reservoir is nonpoint source pollution, i.e. the the grossly overstocked and damaging grazing practices across the headwaters especially in the Salmon River allotment and other Elko BLM allotments, as well as the Humboldt-Toiyabe Forest allotments in Elk Mtn and the eastern Jarbidge. We have been complaining about the disgusting conditions on these public lands for decades.

See: <http://www.boiseweekly.com/CityDesk/archives/2014/09/13/toxic-algae-found-in-reservoir-near-twin-falls>

The Jarbidge BLM lands are located on the west side of the Reservoir itself, and the Burley BLM on the east side - with both using the Reservoir as a giant cow watering hole, with cattle defecating and urinating in the water in many areas, feasting on quasi-toxic cockleburrs, and other weeds, as the water recedes.

This is the situation at present – under the Proposed RMP, conditions would worsen in nearly all components of the environment – and there would be MORE cattle manure, urine, sediment, hormones in cattle excreta, etc. fouling and polluting surface waters.

BLM must establish a planning process for the management of public lands that accommodates multiple uses of the land and its resources and achieves sustained yields of natural resources. It is impossible to understand how there could be sustained yields of anything but weeds and livestock waste under the Proposed Action.

BLM must periodically inventory all public lands and the resources on those lands. Yet the RMP is based on now outdated and deficient baseline information on environmental conditions and public uses. It also presents information in a manner that misrepresents the severe cheatgrass problems and risk, native vegetation community depletion problems and other impairment of resources and habitats, and the the collapsing wildlife and other sensitive species populations, and otherwise is in violation of FLPMA.

FLPMA lays out a goal of preserving and protecting public lands in their natural condition to the extent possible. Instead – the RMP with its massive livestock grazing allocation load, uncapped TNR, vegetation manipulation schemes (the livestock forage

projects of the old RMP have been replaced with “fuels” projects in the new RMP –with the same outcomes), failure to greatly expand ACECs (only designating 5% of the ACEC-eligible lands – see FEIS 2-459), will further destroy natural values and public lands environmental conditions.

The RMP fails to adequately retain federal ownership of public lands in sage-grouse Priority habitats, and has not provided a reasonable analysis of why disposal could be in the national interest. In fact, the lands targeted for disposal would only benefit the various Brackett and other politically connected ranchers.

Conservation of biological, archeological, historical, and cultural resources simply will not occur under the massive grazing, treatment and other disturbance load, and development allocations and highly uncertain and ineffective GOMAs of the RMP.

BLM greatly ignores the need for protective withdrawals across Priority Habitats and other areas of vital importance to preservation of public resources.

FLPMA requires the BLM to develop land use plans to:

- implement principles of multiple use of public lands and sustained yields of resources;
- use a systematic, interdisciplinary approach that incorporates the consideration of the physical, biological, economic, and other sciences;
- **give priority to areas of critical environmental concern**;
- consider the present and potential uses of public lands. Yet here - while southern Idaho is rapidly urbanizing and the human population that uses public resources is increasing - the RMP increases extractive uses that conflict with public recreational uses, wildlife viewing and enjoyment, production of clean water and abundant water, etc.;
- consider the relative scarcity of the various values of public lands The RMP represents a tragic failure to conserve, enhance and restore the very scarce and vanishing sage-grouse, pygmy rabbit and other rare species habitats and populations of the Jarbidge; the very scarce surface waters and sustainable perennial flows, threatened bull trout and slickspot peppergrass and other rare plant species; high quality recreational experiences close to Idaho population centers; unique crossroads areas for regionally essential populations for survival of sage-grouse, crucial bighorn sheep habitats in the Bruneau-Jarbidge canyon complex, etc.
- weigh long-term and short-term public benefits, The RMP greatly fails to weigh long-term uses vs. short term gain for public lands “welfare ranching” operations – primarily Simplot entities, Brackett ranchers and their relatives, and a very small hand full of other ranchers;
- comply with pollution control laws (see 9/14 Salmon Falls Reservoir algae bloom article above). Under the RMP – the livestock waste load will worsen under the same or increased stocking and TNR – and these adverse effects will be amplified by climate change. Here we are nearly a decade after a TMDL on Salmon Falls and Cedar Creek and other Jarbidge areas, and conditions are worsening. Under the RMP, more manure and waste is likely to impair the surface waters. It is a VERY important public recreational use area. This pollution also jeopardizes the health and populations of wildlife species that may drink the water. Similarly, Cedar Creek reservoir is another greatly impaired

water body that RMP is likely to worsen conditions in. By maintaining the same or increasing AUMs, and issuing TNR, BLM will contribute substantial quantities of methane and other climate change gases, reduce the ability of the land to capture and sequester carbon, and reduce the ability of the lands to buffer the adverse effects of climate change.

These represent only some of the myriad deficiencies of the RMP FEIS regarding resources and sustainable uses of the public lands that are mandated under FLPMA.

The RMP and its limited range of industry-friendly alternatives greatly downplays the many conflicts with the tremendous livestock over-allocation load at present, and the continued downward trajectory of the sage-grouse, pygmy rabbit, slickspot peppergrass, Columbia spotted frog, redband trout and other native biota habitats and populations, along with native vegetation communities and watersheds and water resources. These conflicts are all amplified by climate change stress, BLM has failed to develop a suitable range of alternatives for a modern day land use plan that would comply with FLPMA. Thus a Supplemental EIS must be prepared.

We Protest all of these violations of FLPMA as shown in this Planning process that has been hijacked by the livestock and other extractive industry.

SSA Requirements Are Blatantly Violated by RMP/FEIS Proposed Action

Under the Stipulated Settlement Agreement (SSA):

BLM was required to re-visit and conduct studies on Ecological Site Inventory sites – which it did indeed do in 2006. This was to present a science-based comparative analysis between conditions in the 1980s vs. the baseline for the new RMP effort. It was to settle the debate over how much conditions had deteriorated, and determine how jeopardized habitats were. BLM then presented the bleak analysis of ecological conditions - up to the point just before the 2007 Murphy Fire - in the Analysis of the Management Situation (AMS).

Reading the 2014 worsened FEIS commodity and development-oriented RMP (worsened from the DEIS), it appears that BLM has forgotten how bad conditions were. Now, with large-scale additional habitat loss and degradation, conditions have only worsened since the AMS. This calls for sweeping and immediate conservation-based change –and not the increase in AUMs, stripping of ACEC protections and other radical backsliding of the FEIS.

Under the SSA, BLM was required to establish protocols and develop data necessary to evaluate current populations and habitats for BLM-designated sensitive species across the Jarbidge. BLM has not provided substantive current data in the RMP to base the RMP FEIS analysis on, and there are large gaps in data on current habitats and populations of sensitive species.

BLM's EIS lumps sensitive species into guilds/groups, and provides old, stale info and minimal to no analysis for many important sensitive species particular survival needs. For the few species that get a few sentences of specific mention, BLM provides only the most cursory, limited and often slanted analysis –fraught with omissions. Even sage-grouse conservation needs for habitats and populations are given short shrift, with no coherent analysis of the current status of habitats and populations, and no vision or science-based planning for conservation of viable populations. Thus, BLM cannot point to its greatly deficient FEIS sage-grouse analysis as some kind of “umbrella” for all the other rare species in the unraveling sagebrush habitats of the Jarbidge. It is not a suitable analysis, there is not adequate current baseline data, and the only protocols used appear to be to consult old databases, make species lists, and then gloss over the catastrophic effects continuing on an even worsened path would have. In fact, we wonder if BLM dragged this process out so long that the essential Ecosite and other information including the bleak ecological conditions and species summaries in the AMS would become old.

BLM was required by the SSA to consider utilization, trends, and other monitoring data. Yet the Affected Environment section of the EIS is minimal and presents information in a manner that favors the limited near-status quo or increased stocking/continued largely full throttle exploitation alternatives. It is particularly deficient, providing hardly any concrete analysis of any component of the environment. The Goals, Objectives and Management Actions (GOMAs) section (Chapter 2) dwarfs it. No Action receives a mere 30 pages (2-22 to 54 in FEIS). Yet the recidivist Proposed Action receives 100 pages. There is no rationale provided for how ecological conditions including the ESI data which already had shown large-scale increases in cheatgrass and loss of microbiotic crusts in unburned habitats, and ecological monitoring information, ecological needs of sensitive species for food, cover, space and the needs for sustainable populations have been assessed. There is no valid explanation and rationale for how this was used in developing a range of alternatives, or analyzing the conservation effectiveness and outcomes of alternatives.

BLM was to address desired outcomes, allowable uses, and management actions. In many cases, it is clear that based on the current science for the sagebrush ecosystem, the outcomes of the flawed FEIS alternatives will be more flammable weeds, a continued downward trajectory of sensitive species and sage-grouse populations until they reach the point of no possible recovery, and further environmental ruin. See Connelly et al. 2004, Braun 2006, Federal Court Findings in WWP. V. Bennett and showing need for avoidance of grazing disturbance to protect sage-grouse over substantial portions of the year, Reisner Dissertation 2010, Reisner et al. 2013, Beschta et al. 2012 and 2014, Manier et al. 2013 Baseline Ecological Report -for example. Current ecological science and necessary data is not used in assessing desired outcomes, there is no certainty what levels of allowable use will be, management actions are loose, uncertain, and often mere platitudes. BLM ties itself into knots with hollow and often not even rational claims in the FEIS Summary Tables 2.6 ad 2.7, particularly in trying to compare environmental consequences FEIS 2-445 to 2-459.

BLM was required to consider lands available and not available to livestock grazing,

considering factors including **other uses of the land, terrain characteristics, soil, vegetation, and watershed characteristics, the presence of undesirable vegetation including significant weed infestations, and the presence of other resources that may require special management or attention such as special status species, special recreation areas, or areas of critical environmental concern.** BLM has failed miserably. It has ignored conducting any kind of valid conflict analysis, capability, suitability or other similar analyses. It has downplayed the adverse effects of livestock grazing allocation/load, grazing disturbance adverse effects, the astonishing amount of roading and livestock infrastructure, energy development, minerals, that would be imposed to an extraordinary degree (FEIS 2-445 to 2-459), made nearly all grazable lands available to livestock, ignored the myriad competing public uses of the public land other than livestock, ignored grazing weed expansion risk – from the adverse effects to soils including causing cheatgrass by trampling crusts, creating hoof pocks in wet soils where weeds germinate and also tearing apart crusts, degradation of the proper composition, function and structure of native vegetation communities (Fleischner 1994, Connelly et al. 2004, Manier et al. 2013).

BLM takes giant steps backwards to pre-FLPMA days in gutting the B-J bighorn sheep ACEC (inexplicably shrinking it from 85,000 acres to 22,000 acres rather than expanding the land area. BLM cuts out the entire Jarbidge River area, and significant portions of the Bruneau area as a gift to Simplot and Brackett grazing interests. It reduces recreation protections, and would have broad sacrifice zone recreational designations that are essentially meaningless (ERMA) across much of the FO.

BLM was required to consider no grazing and other alternatives. BLM has failed to evaluate a No Grazing alternative in the FEIS, not even as a comparison with its severe grazing disturbance alternatives so the agency could properly gauge how harmful its grazing load really was. BLM shuns passive restoration, and purposefully rigs alternatives to try to discredit the role of passive restoration in conserving, enhancing and restoring native sagebrush habitats.

BLM did not consider an alternative that removed grazing and any portion of the infrastructure Footprint from lands of a proposed Sagebrush Sea landscape alternative to conserve sage-grouse –despite sage-grouse being a landscape species. It did not even consider an alternative that removed grazing from half or ¼ of the Sagebrush Sea alternative while significantly reducing the footprint of livestock grazing disturbance and infrastructure in areas of the Jarbidge. And that was in the Draft. In the FEIS, BLM would not even consider any additional ACECs, and instead guts the B-J bighorn sheep ACEC –which contains some of the only unseeded and intact Wyoming big sage and salt desert shrub inclusion communities remaining in the FO. Yet FLPMA requires that BLM give priority to ACECs.

BLM was to analyze in detail “at least one alternative in the EIS addressing significantly reduced grazing levels in those areas demonstrating livestock-related conflicts with other multiple uses”. BLM has not used current science to determine and assess conflicts. It has not conducted a capability and suitability analysis. It is impossible to tell from the RMP

what grazing levels will actually be. Use standards are uncertain. AUM changes are provided in broad ranges. The RMP Proposed Action heaps TNR, “targeted grazing” and all manner of additional possible uses on top of the ranges.

BLM was to establish reference areas. BLM consistently ignored WWP input that tiny little fenced off areas near fence corners were not sufficient reference areas and should not be considered viable alternatives, because they would add even more of a burden of fencing to the region and its antelope, sage-grouse and migratory birds that have serious problems with fences. Plus they would not be large enough for meaningful comparisons including for wildlife use.

BLM was to establish guidelines for drought. While there is a section on drought, there remains no clear and guaranteed actions to control grazing impacts during drought. Plus BLM used this as an excuse to sneak in consideration of more harmful “temporary” livestock facilities.

The SSA stated that “BLM acknowledges and agrees that protecting and restoring sage-grouse and their habitat on the JFO is a **high priority** and consistent with FLPMA and other laws”. Yet the BLM failed to analyze an adequate range of protective measures and mitigations in the FEIS alternatives, and now Alt. VI takes BLM back to the dark days of gross TNR damage, and even greater overstocking, plus more “forage” projects thinly disguised as fuels treatments or targeted grazing,. Plus this all is accompanied by rolling back ACEC and other habitat protections. It is shocking that in an RMP that was supposed to emphasize sage-grouse needs, BLM would designate only a mere 5% of the land area as ACECs that its own analyses found fulfilled ACEC Relevance and Importance Criteria.

In preparing the RMP, BLM was required to “follow its national Sage-Grouse Conservation Strategy, to identify and provide desired outcomes, strategies, restoration, opportunities, use restrictions, and management actions to conserve and restore sage grouse habitat”. The strategy has developed into the National Technical Team Report and its accompanying series of Implementing Memoranda. All the while over the past decade as BLM has been failing to produce a new RMP, the habitat conditions have been worsening and populations declining and occupied ranges contracting. So any logical person would assume that BLM needed to develop and adopt a much more protective management framework, greatly reduce allocations, and greatly commit to effective habitat and population restoration actions. Instead, the FEIS Proposed Action contains many of the worst elements of the existing RMP, and rolls back protections even more – in its jettisoning ACECs and other environmentally harmful measures such as gross overstocking “forage” allocations, lack of required protective measures to control livestock disturbance and environmental damage being caused, etc.

BLM is required to issue new permits that apply “the criteria adopted” in the new RMP. There are no solid and mandatory criteria in the RMP, and no clear direction forward to be found in the RMP FEIS to issue permits under. In fact, it is impossible to pin the RMP down on any measurable criteria –and the FEIS punts to the permit renewal process for

applying specifics.

The SSA refers to the Regulations at 43 CFR Part 4100. Management under the weak, uncertain and confusing industry-biased RMP Alternatives and GOMAs will not comply with the binding requirements of the Grazing regulations and will not ensure compliance with Rangeland Health requirements, including:

The following conditions **must exist** on BLM Lands (and it will be impossible to achieve this with the increased stocking, TNR, massive treatments, extensive energy and minerals and other development of the RMP):

§ 4180.1 Fundamentals of rangeland health.

Standards and guidelines developed or revised by a Bureau of Land Management State Director under § 4180.2(b) must be consistent with the following fundamentals of rangeland health:

(a) Watersheds are in, or are making significant progress toward, properly functioning physical condition, including their upland, riparian-wetland, and aquatic components; soil and plant conditions support infiltration, soil moisture storage, and the release of water that are in balance with climate and landform and maintain or improve water quality, water quantity, and timing and duration of flow.

(b) Ecological processes, including the hydrologic cycle, nutrient cycle, and energy flow, are maintained, or there is significant progress toward their attainment, in order to support healthy biotic populations and communities.

(c) Water quality complies with State water quality standards and achieves, or is making significant progress toward achieving, established BLM management objectives such as meeting wildlife needs.

(d) Habitats are, or are making significant progress toward being, restored or maintained for Federal threatened and endangered species, Federal proposed or candidate threatened and endangered species, and other special status species.

The Fundamentals of Rangeland Health regulations require BLM to use mandatory Terms and Conditions to “ensure compliance” with the duty to make significant progress. See 43 C.F.R. § 4130.3-1; *WWP v. U.S. Dep’t of Interior*, No. 08-CV-506, 2009 WL 5218020 (D.Idaho 2009), *WWP v. Salazar*, No. 4:08-cv-435 (D. Idaho 2012).

The SSA refers to permits with utilization levels, seasonal restrictions, and other management requirements. The RMP FEIS, with its lists of BMPs and loose, uncertain, non-binding industry wish lists of Management Actions (GOMAs), provides no clear plan to ensure sage-grouse and other rare species habitat and population protection, no certain standards, no required rest, no protective levels or methods of livestock use. Yet these are required for conservation of sage-grouse and sagebrush habitats, and those of any other rare and imperiled species, and sustaining a wealth of other very important values of the public lands. □ □

The SSA states that “reasonable and necessary measures” to conserve sage grouse as laid down in the new RMP are to be considered in the new permits. It is impossible to understand what is reasonable and necessary in the FEIS –other than maximize grazing at

all costs to every other value, and what BLM will actually act to do. The complicated, uncertain lists of BMPs, numerous Appendices, unclear battery of treatments, uncertain increased stocking rate ranges, stocking dependent on the scorched earth battery of “active” disturbance and “fuels” treatments, and often internally contradictory lists of uncertain actions and platitudes of the EIS GOMAs - all guarantee that significant changes for the better will not take place.

The newly added recidivist Proposed Action Alternative, which closely resembles the permittee comments, does not provide a basis for protection of any resource values under the new permits –but instead would result in serious, irreversible new adverse effects, potentially increased AUMs plus TNR use. It rejects clear measurable use standards shown by current sage-grouse, riparian and other science to be adequate to conserve, enhance and restore sage-grouse, other native biota, and watersheds across the Jarbidge. See FEIS Table ES-5, pps. ES-38-45, FEIS 2.10, Table 2.6 and 2.7.

The series of allocations often represent little change from the present/No Action – and in the case of the Proposed Action a Change for the Worse. There is no detailed science-based analysis that shows how allocations were determined, including those of the Proposed Action – and how factors such as livestock or development disturbance of habitat (food, cover and space) and recreational uses and enjoyment -were actually factored into and balanced with any allocations.

The allocations and near-status quo and even increased stocking is overlaid with unlimited TNR, targeted grazing, and a confusion of uncertain “fuels” actions and grazing imposition across much of the landscape. The Proposed Action (VI), and Alts I, II, III, IV, and the appalling Alt VI all focus overwhelmingly on “forage production” i.e. grass, ignoring everything from soil function to watershed health to shrubs to nesting, birthing or wintering habitat security for wildlife. BLM fails to provide clear management to address impacts like flammable weed-promoting soil trampling compaction and displacement to microbiotic crust recovery to passive recovery of native forbs to the need for long-term rest to provide passive restoration and aid in success and public investment in active restoration success. This is despite the severe degradation and loss documented in the AMS early in this process in 2007.

BLM failed to conduct valid carrying capacity and suitability analyses balance conflicts and competing uses, and then to allocate land and resource uses and ensure that they are sustainable. Forage is just one part of the analysis. The FEIS fails to provide any clarity at on how it arrived at the very high levels of allocations for livestock grazing and other extractive uses across these alternatives. See Table FEIS ES-5, pages 38 to 45. WWP submitted lengthy comments based on carrying capacity and suitability determinations, including a detailed paper during the Scoping process – and they have been ignored.

There are many habitat conflict, recreation conflict, and other factors that must be considered in current ecological science-based analyses to determine suitability. These analyses must take into account the failure of the use levels applied in the Jarbidge to protect critical native habitat components. This is compounded by the failure of Jarbidge

BLM to properly monitor use levels that have been occurring –often biasing the measured levels of use in favor of industry, and failing to adequately consider sage-grouse and other species needs for freedom from grazing disturbance during crucial periods of the year; the need for 7-9 inches of residual nesting cover; the need for avoidance of leks by a minimum of 4 miles (actually much greater in the wide open country fragmented Jarbidge) with any disturbance or energy development - and this must include gazing, oil and gas, geothermal, wind and other allocations or uses. Table ES-5 shows this was ignored. BLM ignored the necessity to have blocks of undisturbed habitat, and prevent disturbance of large areas of the landscape in order to conserve, enhance and restore sage-grouse and other native biota. There is no clear rationale for how any allocation or projected stocking rate or level of use was determined.

The necessary use of current ecological science to demonstrate that the loose, uncertain “GOMAs”, or a combination of the laundry lists of promises and BMPs in the morass of Appendices, will indeed preserve and protect, i. e. **conserve**, sage-grouse populations in the fragmented, tattered and unraveling habitats of the Jarbidge is profoundly **lacking** in the RMP. We believe that is because the RMP FEIS actions cannot be supported by current science on the ecology of the sagebrush biome and sage-grouse. See Braun 1998, Connelly et al. 2000, Connelly et al. 2004, Steinfeld et al. 2006, USDI BLM GRSG NTT Report, Knick and Connelly 2009/2011 Studies in Avian Biology, Reisner Dissertation, Reisner et al. 2013, Beschta et al. 2012 and 2014, Manier et al. 2013.

The SSA requires that new permits be issued in three years. In reality, this will be prior to significant restoration actually taking place. There is no clarity on how the RMP’s promises of restoration will factor into the grazing permit process - especially since under Alt VI and most other alternatives, where gross overstocking would continue or even expand. One of the fantastical assumptions on which BLM bases its rosy predictions in the EIS is that a very large amount of significant restoration will take place in five years following the RMP completion. BLM will never be able to act this quickly. Witness the restoration promises of the Craters of the Moon RMP and the Snake River Birds of Prey RMP. Here we are – nearly a decade after adoption of the Craters RMP, and 7 or so years after the SRBOPA RMP was finalized. BLM has undertaken only the most meager and minimal measures in a couple thousand acres. And meantime, as in the Big Desert Grazing Permit Renewal, BLM chose to dramatically intensify livestock damage to lands identified for restoration, and significantly expand and infrastructure while shirking any real restoration, continuing gross overstocking, and perpetuating harmful periods of livestock use that conflict with the needs of sage-grouse and other wildlife for habitat security. We Protest the failure of BLM to consider its own recent actions (and especially its own inaction and failed restoration promises). WWP is including information on Craters and Big Desert as part of this Protest. See cd Big Desert MSJ filings. The Jarbidge FEIS suppositions here are not based on economic and agency inertia inaction reality.

Unless sharp cuts in livestock numbers are made upfront, it is extremely unlikely any effective restoration will ever be able to take place. Witness the travesty of BLM spending hundreds of millions –or potentially billions – of dollars on post-fire rehab. Yet

recent studies such as Arkle et al. 2014 show they have not provided habitats necessary for sage-grouse. Of course, the failure of the post-fire rehab efforts and seedings to provide proper GRSG and other sensitive species habitat is highly foreseeable – as intensive pressure from public lands ranchers always prevented BLM from providing necessary rest to re-establish native vegetation components of grasses, forbs and shrubs and microbiotic crusts, Areas of the Jarbidge are featured (such as Poison Creek) as failures in the Arkle 2014 failed fire rehab Report.

Thus, we Protest all of these failures of the BLM in the RMP to comply with the SSA, and to properly assess and balance uses of the public lands.

Lack of Coherent Restoration Plan: AUM Cuts Needed to Undertake Effective Restoration Are Absent from the RMP FEIS

There is no coherent plan for restoration, in the RMP. BLM cannot dribble in bits and pieces of re-seeding here or there based on the crazy quilt pattern of the Jarbidge allotments in permit renewals. A greatly revised RMP must provide clear, unequivocal planning, guidance, and lay out a determined science-based path forward with required milestones (acres planted per year, passive restoration needs per year that have been applied, etc.) in order to conserve sage-grouse and other species. □ □ In the Snake River Birds of Prey RMP, Idaho BLM tied any significant reduction or removal of livestock to restoration. BLM never provided specifics on what restoration would occur where and when in that RMP. That landscape, like the Jarbidge, has also suffered large-scale habitat loss for sagebrush-dependent species, and similarly has large areas of lands in desperate need of true restoration.

The FEIS fails to provide a coherent and effective restoration plan for native vegetation communities and important habitats for native terrestrial and aquatic biota. In fact, it is impossible to understand how restoration could ever effectively take place with the RMP's extremely high livestock and development allocations, as well as minimal protective mitigation. It fails to show and describe how livestock impacts will be removed for sufficient time to allow any restoration or the battery of "fuels" or other projects to be established. The FEIS ignores the recent Arkle et al. 2014 report on the abject BLM fire rehab failure. BLM does not show that this has been taken into account in its alternatives, allocations, or other series of actions. This analysis and planning are critical as part of the RMP alternatives and fabric so that all the Alternatives measures can be examined to see if they are mutually achievable. It is needed to ensure that promised actions actually happen, the necessary degree of mitigation is applied, and that BLM can be held accountable if long lags or delays occur.

Thus, we Protest the lack of a coherent vegetation and habitat restoration path, given the overwhelming livestock disturbance load and other extractive uses and large-scale roading and other activities under the Proposed Action and Alts, 1-IV as well. This is arbitrary, and defies current science for sagebrush ecosystems.

If BLM ever would follow through with some meager AUM cuts (which we do not

believe would ever happen), will the public have to wait for the next round of permit renewals – i.e. 13 or more years – until any significant livestock reductions or removals occur? If so, the sage-grouse and other sensitive species populations will be past the point of no return.

What appears to be driving the looseness, uncertainty and lack of a coherent plan is that the livestock burden will be increased and intensified under the guise of TNR, Fuels “management”, undefined “targeted grazing”, and other schemes to ensure that no significant change or increased livestock use occurs. This is certain to doom the persistence of sage-grouse and other sensitive species populations. We commented on the Draft that *the RMP is written so that it is likely that livestock use in many areas could actually be increased - including through uncapped levels of TNR.* Now we see the FEIS newly contrived Proposed Action bringing this about.

We Protest that BLM has failed to provide a specific set of actions to ensure sage-grouse survival. It has failed to prioritize passive and active restoration actions in the face of near-certain federal budget cuts and limited funding for restoration projects. This part of the RMP process must be grounded in reality and lay out concrete actions that lead to conservation and recovery of sage-grouse, pygmy rabbit, slickspot peppergrass, Jarbidge bull trout, redband trout, and other rare and imperiled species. Specific actions that must occur if restoration does not happen (as is very likely given the BLM’s track record) must be laid out. Example: In areas where there is No significant progress in restoration of sagebrush habitats (both initiation of restoration and/or successful outcomes), the RMP must trigger removal of grazing and other very intrusive disturbances in still-occupied habitats so that they can be protected and passive restoration can be maximized.

Using the BLM’s Snake River Birds of Prey Analysis as an illustration, we stress that BLM did not specify with clarity where and how its promised restoration would occur, and how outcomes would be achieved to effectively preserve and recover sagebrush species. It provided no concrete plan for these actions - and linked removal of livestock to restoration. BLM now claims actions are: “in the Implementation Plan”. The SRBOPA Implementation Plan following the ROD was prepared behind closed doors without public involvement and NEPA. This Plan that we obtained long after RMP completion, was an excel spreadsheet, with lists of activities under broad categories. There were no specifics attached to any activity so there could be no understanding of what was to occur, how effective actions might be in addressing ecological threats, how various parts of the spreadsheet fit together, or if actions actually were accomplished. The lack of a certain, scientifically supported and expert vetted plan for a restoration path forward has been forsaken in the Jarbidge EIS process as well.

Unless a detailed and specific Plan for restoration and sage-grouse and other TES species conservation is laid out in the RMP, with specific actions to be accomplished and clear and measurable recovery goals, benchmarks for progress and time frames (such as acres of sagebrush re-established per year or acres of cheatgrass-vulnerable sage that receives passive restoration for sufficient periods to heal the understory). Thresholds of recovery must be gauged by BLM undertaking clear and specific effective actions – and without

this - promises of restoration are meaningless. There must be consequences triggered by BLM failure to undertake promised restoration actions or to meet goals. There has been no valid NEPA process related to understanding all direct, indirect, and cumulative impacts of the RMP claims concerning restoration, which is thrown loosely about, but never clearly defined and a path with specific actions laid down. There is no concrete Plan for conserving, enhancing and restoring remaining sage habitats, and re-connecting and restoring with native sagebrush vegetation areas of exotics, sterile post-fire seedings, etc.

There is no clear path for conserving sagebrush habitats and sage-grouse in the Jarbidge RMP DEIS. In fact the livestock and extractive use allocations under the Preferred Alternative ensure the bird's doom. Large-scale and profound changes will have to be made in a Supplemental EIS cutting through the RMP's morass of confusion for there to be any clear science-based plan for conserving sage-grouse and preventing any further habitat and population losses. A new range of real conservation-based alternatives must be analyzed as a first step. The range of unreasonable current Alternatives that continue to treat the Jarbidge like a feedlot must be scrapped.

The RMP under all Alternatives provides no certainty that the most pressing ecological issues will ever be dealt with, and that includes the habitats for all sensitive species. Here is an example using aquatic and riparian habitats. The public is faced with BLM's RMP – an agency that promised in 1997 (and prior) that riparian areas would be in PFC in five years – taking until 2021 to move 70% of degraded Jarbidge riparian areas even to the minimal PFC under the DEIS. Under the FEIS PA, 183 miles at claimed PFC (largely livestock-inaccessible canyons) and the rest – 42 miles “towards PFC”. This also appears to completely ignore springs and seeps. The 42 miles could be Non-functioning, but have some caving collapsed banks that BLM could claim were “moving toward” PFC – we have seen this kind of thing done before. PFC is a minimal level of riparian habitat quality, and often highly arbitrary health assessments are made. It does NOT ensure adequate aquatic species habitats, water quality, perennial water and flow sustainability, sustainable recreational uses and enjoyment, etc. It does not adequately provide for buffering riparian resources from adverse climate change impacts. The RMP has minimal riparian measures in its GOMAs. See Table ES-9 Riparian Vegetation ES-38, ES-39. There are no suitable alternatives to achieve needed recovery of riparian vegetation and watersheds, and to ensure compliance with rangeland health standards. As the Jarbidge ESI, microbiotic crust studies, biological studies, the plummeting sage-grouse and other wildlife populations all showed - and the AMS then compiled and affirmed - the Jarbidge has been turning into a biological desert and wasteland from intensive grazing and industrialization of the land from domestic livestock grazing, fire, post-fire wheatfield-like dense seedings comprised of exotics or large-sized coarse cultivars, lack of adequate rest from grazing so native components can recover. However, BLM has steadfastly refused to remove the coarse exotic dense seedings, intensive livestock grazing disturbance to vegetation, soils and microbiotic crusts that promote flammable cheatgrass, the synergistic effects of fire and grazing disturbance, and other severe ecological degradation. Please see WWP's Appeal of BLM Lone Butte fire ESR and Rehab Plan discussing the ecological disaster of BLM post-fire rehab and re-imposition of high

numbers of livestock on rehabbed land with minimal rest (submitted with DEIS comments and carried forward in this Protest).

BLM has now wasted a decade and many millions of taxpayer dollars in drawing up a range of near-status quo and increased exploitation alternatives mired in confusion and uncertainty. BLM's RMP DEIS, and its uncertain and largely status quo Preferred Alternative, and now the FEIS with its even worse Proposed Action, ensure further losses of sage-grouse, pygmy rabbit, migratory birds, aquatic species populations, and losses of public uses and enjoyment on the public lands. □ Restoration is desperately needed. Large-scale reductions in livestock grazing are necessary for any restoration to have any chance to succeed. It is necessary to protect the remnant native vegetation, and slickspot peppergrass potential habitat so that passive restoration can occur.

BLM has known the very significant problems with the tens if not hundreds of millions of dollars it has spent on post fire livestock forage rehab that used densely planted exotic or large cultivar grass fire rehab plantings. These seedings have promoted even more fires, and BLM perpetuated high cattle stocking rates that cause cheatgrass proliferation in understories, retard recovery of native species, and essentially convert lands to biological deserts where only a few deer mice can live. The RMP lacks adequate review of the past fire rehab and other failures of BLM and lack of cogent analysis of WHY this occurred. This is the least the agency can do – after taxpayers have lavished tens of millions of dollars on rehab on the Jarbidge – only to have it destroyed by Simplot, various Brackett family, and a hand full of other grazers.

BLM has allowed the livestock industry to drive post-fire actions – cattle to be turned out with minimal rest, and very large amounts of “temporary” infrastructure has enabled grazing of nearly every unburned acre –providing no havens for native wildlife suffering from habitat losses. The result has been non-existent to poor sagebrush recovery, limited native grass and forb recovery, reduced microbiotic crusts, intensively trampled soils creating an environment nearly devoid of native wildlife – where weeds thrive.

This continues up to the present – despite the AMS documenting cheatgrass expansion including in large acreages of lands seeded in post-fire species that were claimed to help exclude cheatgrass. The non-native perennial and coarse cultivar seedings did not exclude cheatgrass and instead exacerbated desertification processes and weed expansion. Chronic intensive grazing practices and limited post-seeding rest have spawned even worse problems – with rush skeletonweed and other weeds increasing as well.

It is clear that what BLM has been doing has not worked. BLM must critically examine the ecological wastelands that have resulted from its post-fire seedings and limited rest. The RMP does not do this. Instead, under the guise of “targeted grazing”, fuels, and other actions, on top of which TNR can be heaped, BLM plans to continue more of the same - minimal rest and then full-throttle grazing disturbance, and forage seedings under the guise of “fuels” projects.

BLM must reckon with its catastrophic past mistakes that have driven the unraveling of

the ecosystem. It must develop a plan with a range of alternatives to remove and minimize livestock grazing and other disturbances in remaining native sagebrush habitats. BLM must act to restore connectivity between habitats so that conservation of the sage-grouse and other populations can occur. This must include removing large areas of dense exotic or other coarse grass seedings. The RMP lacks any science-based effective controls on post-fire or post-treatment livestock disturbance.

Instead, what BLM has developed in the FEIS is a plan that is so wedded to continuing the livestock disturbance load (including through use of TNR to make up for any livestock cuts on paper), as well as a full battery of resource exploitation and industrialization, that it will be impossible to conserve sage-grouse under the Alternatives. Conservation is also unlikely under the loose and uncertain GOMAs and “poison pill” energy exploitation, VRM, mining and industrial use allocations that BLM bizarrely rolled into the only remotely conservation-minded Alternative, Alt V. BLM included several harmful provisions that appear to be thrown into Alternative V as “poison pill” components, to bias analysis of Alt. V conservation values. See Alt comparison FEIS Section 2.10.2, Table 6 and 7 for example. There are no suitably protective Alternatives, and BLM comparisons between the RMP’s limited alternatives and its evaluation of direct, indirect and cumulative effects of alternatives is greatly biased towards minimizing exposure of the harms the Proposed Actions will cause, and the high degree of risk with the confusing and often mutually incompatible management schemes and promises.

BLM wasted nearly ten years of time in this process – only to produce a document that often is more harmful to the environment and provides less certainty than the existing RMP. The Proposed RMP has several very similar intensive exploitation Alternatives (see Table ES-5) with loose, unclear, and uncertain Goals, Objectives and Management actions. See FEIS Chapter 2: Alt 1 Sect 2.3, Sect. 2.4, Sect 2.5, Sec. 2.6, Sec. 2.7, Sec. 2.8. Yet BLM had on hand information from the flawed Simplot and RCI permit renewal EA processes, its own ESI, its own AMS, IDFG Wildlife Progress Reports, lek surveys and databases and other reports of continued losses of sage-grouse and leks, and a large body of other scientific information to know without a shadow of a doubt that the FEIS fails to undertake actions essential to acting to conserving sage-grouse and all other sagebrush biota in the Jarbidge.

Alts 1-IV and VI are scientifically unreasonable Alternatives that violate FLPMA and NEPA in the ecological context of the Jarbidge in 2014. Alt V is laced with Poison Pills, and is also unfairly evaluated by BLM - through excluding any active restoration, for example.

BLM’s Alternatives Range, in the context of the Jarbidge in 2007 with its AMS data, then the Murphy Fire, and even more so now in 2014, is scientifically indefensible, and much of this continues in the FEIS. Some Alternatives were so bizarre that they would let fires to burn over much of the FO, and industrial-level visual despoliation could occur under VRM Class IV across vast areas of the FO. All manner of mineral and other development activity could occur across many sage habitats.

□BLM has developed an RMP plan that is a morass of confusion. Its Goals, Objectives and Management Actions (GOMAs) are filled with loose, non-binding, unspecific, and often contradictory wording. There is often little recognizable difference between many components of Alternatives. See Executive Summary (ES) Table ES-5 to ES-42, showing minor differences in many allocations, for example.

There is no certainty that any real significant change will ever occur in addressing the most significant issues facing the health of public lands and native species, and that actions needed for population persistence and conservation will happen. □□BLM must provide concrete and reality-based specific actions to address causes of habitat degradation and loss. It must require that specific and concrete actions be undertaken in specific time frames to remove and reduce livestock and other disturbances, and conduct restoration in sagebrush and other important habitats in the Planning process.

Actions must be immediate. Sagebrush and other native species are sliding to extirpation and extinction. Just look at the alarming paucity of small animals, and near-monocultures of a few deer deer mice, in the BLM mammal surveys of a few years ago. There is no indication that a proper baseline currently exists. Some areas of the Jarbidge have been so intensively disturbed by livestock and other uses that animal communities are greatly depauperate even in remnant unburned areas that are so trampled and intensively disturbed. The structure of the sagebrush structure is diminished and simplified from livestock breaking and browsing it. This has resulted in loss of structural diversity and “see-through” sagebrush that offers minimal nesting benefit to many species. The soil surface is extensively trampled, often lacking in microbial crusts. Which has caused cheatgrass expansion and risk. Understories are greatly depleted, lacking forbs and larger stature native grasses. The recovery of forbs and other species is impossible due to intensive livestock use and disturbance with little to no rest, and aggressive exotic or coarse large-statured cultivar dense seeding grasses and intensive stocking based on these grasses that promotes a profusion of cheatgrass or other weeds in interspaces. Since then - conditions have worsened. We Protest BLM failing to undertake the dramatic livestock reductions necessary to protect remnant better condition areas, and ensure rehab and FRH compliance across the landscape. BLM can’t control funding for vague promises of restoration – thus passive restoration is made even more imperative. The RMP lacks a clear Plan of what actions will occur - where, when and how, and costs - to fulfill any promises to conserve sage-grouse. A Restoration plan must be the foundation for alternatives and analysis - and must be based on viable sage-grouse populations, pygmy rabbit populations, LEPA, clean surface water, and other species survival needs and “goods and services (like clean abundant water in riparian areas) accompanied by detailed ecological analysis that looks at population viability under a range of alternatives.

Development of specific management changes and passive restoration actions that are not dependent on funding – such as removal of livestock from remaining native vegetation habitats in the highly fragmented Jarbidge would immediately save large amounts of admin. costs and would be a boon to wildlife, aquatic species, clean water, watershed processes, etc. It be considered with a hard look analysis under a range of reasonable alternatives in a SEIS process. Economically, de-stocking and long-term closures of

rehabbed areas to livestock disturbance, is the only certain path to some degree of effective rehab and restoration actions. See Moskowitz and Romaniello report.

MYRIAD RMP FLAWS

Vague and Ineffective Resource “Protection” Actions

Under the Riparian and the Upland Vegetation discussions, and indeed throughout the whole RMP with its platitudinous and vague Goals, Objectives, and non-binding Management Actions, BLM doesn't have to act to do anything.

When questioned about this, BLM RMP managers have claimed that the agency is not supposed to be specific in Land Use Plans – asserting that the Plan is for a large landscape over a long time – so BLM cannot be pinned down. This ignores the ecological crisis facing the Jarbidge, the large-scale losses of sage-grouse and other populations whose viability is threatened right now, like pygmy rabbit and bull trout; the many outdoor-oriented recreational uses of the lands that are threatened by continued exotic grass seedings, cheatgrass advances under the synergistic adverse effects of livestock grazing, or other development and disturbance. In other words, BLM is saying a Plan does not really need to be shown to be a coherent and effective document, and merely a list of often conflicting promises – where the extractive use burden under the status quo and Proposed Action makes the promises for natural resources values and native biota clearly unattainable.

The point of a Land Use Plan is to enable the agency to make needed changes and be current in effectively addressing the environmental and other issues and threats that the public lands face, while providing benefits to the public. In the case of the Jarbidge – the benefit is overwhelmingly thriving wildlife populations, clean water, clean air and recreational uses and enjoyment. As the population of southern Idaho grows, open space and wild lands become ever more precious and sought after for relaxation, photography, birdwatching, camping, hiking, fishing, etc. This plan has little capability of enabling good choices – since BLM doesn't have to do anything under it but allow the same and often even more livestock that have already so highly degraded all the other public uses of these lands. It is unclear how any potential action would occur. Instead of referencing vague lists of “tools in a toolbox”, BMPs, etc. – the BLM must methodically lie out effective actions and ensure that they are realistically able to occur.

Despite repeated comments by WWP and others throughout this process, and the BLM's own AMS showing the ecological crisis facing sage-grouse, and other values of the public lands like antelope that face the extremely high fence densities in the Jarbidge, BLM has structured all of its alternatives around the immense allotment and pasture fence footprint remaining. Even more would be built under the FEIS– including untold miles of “temporary” fence a massive forage projects occur. There is no specificity to hold the agency accountable for anything that is glibly promised in the EIS, or to base any uncertain “adaptive” management on.

BLM's Plan views the current maze of barbed wire as nearly immutable. BLM has explained to us that fence removal to benefit bighorns or grouse could not occur if it altered an allotment boundary fence. BLM also said that the plan's cutting off boundaries of lands in Alt IVA for removal of grazing from LEPA habitats was based on fencing layout. Slickspot peppergrass was a Threatened species, and is again Proposed by the USFWS as Threatened, yet BLM is holding fence lines that bisect critical habitats immutable for the convenience of greatly subsidized large-scale Brackett family public lands ranching operations. The entire RMP is structured to give far more protections to disturbance-tolerant mule deer than it gives to sage-grouse, the sensitive California bighorn sheep, the pygmy rabbit, sensitive migratory birds, golden eagles, imperiled rare plants like slickspot peppergrass, etc.

There is no specificity of management choices and outcomes. Providing lists of BMPs and describing RCA categories does not ensure that all of the actions will be followed, or if only some will, or perhaps none. Examples of the meaningless lists of BMPs and SOPs: Appendix B, A-5 to A-75 is a laundry list of the usual range of harmful actions (like fencing) and long known to be ineffective "mitigation" measures and excuses for allowing extractive and other uses and development to occur. There is no clarity – Ex: Veg Treatments Water Quality, Resources and Resource Uses (includes livestock recreation, Fire, Special status species/Sage-grouse, Rare aquatic species, Noxious weeds and invasive plants (RMP lacks any integrated weed management), Wildfire suppression, Livestock – General, and Upland. In fact most of these loose BMPs are aimed at enabling grazing seedings to dirt, likely using TNR and gross overstocking across sagebrush habitats, extreme range infrastructure loads, water developments, travel planning that would maintain the massive road footprint, high degrees of extractive land use, wind energy, unprotective Plans of Development and project operation that sacrifices wildlife and other ecological resources. Mere lists for visual resources, roads, transportation, noise, noxious weeds and pesticides, cultural/historical resources, paleontological, hazardous materials, storm water, human health and safety, construction impacts on wildlife, visual, roads, air emissions, noise health and safety, operations, monitoring, etc. do not ensure resource protection and do not ensure harm will be minimized.

The solar energy BMPs, wind energy BMPs, geothermal BMPs, mining and other development BMPs, all fail to provide effective conservation of public resources and mitigation of direct, indirect and cumulative adverse effects of facility development and operation on public land resources. There is also no clear path for requiring mitigation by avoidance, or to ensure that mitigation will effectively conserve species.

The same concerns apply to Appendix G – Cultural A-193-199, Appendix F Drought Measures A-191-192, and others.

Further, Appendix E Conservation Measures A-129-190 for LEPA, bull trout are insufficient to ensure conservation of the species and viable populations. There is no effective population analysis, triggers for action, thresholds, etc. Trampling and other severe disturbance is not effectively controlled, for example.

Under *Kleppe v New Mexico (1976)* the federal government has authority over wildlife on federal lands, because it owns them. BLM has authority to protect habitat. Yet for sage-grouse, BLM in the DEIS where the foundation of the flawed RMP was laid down - defaulted to the Idaho sage-grouse Plan and the industry-dominated "Local Working Group". BLM never bothers to show how these efforts would effectively conserve sage-grouse. Now in the FEIS that legacy continues and the GRSG DEIS is on a path (albeit voluminous and full of vague and hollow promises) to avoid solid habitat protections.

We Protest the failure of BLM to adequately respond to all of these serious environmental concerns and RMP flaws.

Water Development and Artificial Upland Livestock Water Harms - RMP Inaction Worsens

We Protest the following:

The Water Development Mapping DEIS 22 (M-23 and M-44), and FEIS Map 51 shows what is driving the Jarbidge RMP process – i.e. maintaining massive industrialization of the landscape for livestock at all costs. This is the very same massive industrialization that has so greatly harmed the landscape and sage-grouse habitats- allowing intensive livestock grazing which has promoted frequent and often very large fires - as a result of livestock industry pressures, past TNR, harmful dense exotic seedings with flammable cheatgrass in the interspaces from grazing loads, etc. BLM provides no mapping or any specificity showing it will ever remove a single pipeline or water trough to conserve and protect sage-grouse or other wildlife, or slickspot peppergrass.

In a 2011 meeting, BLM told us that the RMP Team didn't want to consider removing pipelines because of the damage to the land that this would cause! This is absurd, since so many of the Jarbidge pipelines have roads on top of/by them. Ranchers, at present, rip up the land all the time as the pipelines leak – and BLM turns a blind eye to that damage. Much of the roading is entirely unplanned, and was caused by the construction of the pipeline, and ranchers continuing to drive in routes following facilities. The greatly excessive road network has grown up alongside fences, and on or by pipelines. It has grown as ranchers try to maximize AUMs in a depleted landscape through placing salt – and now feeding supplement – over thousands of sites creating new zones of depletion and cheatgrass infestation that are completely unassessed in the RMP. Vast areas of the Jarbidge have now been crisscrossed with thousands of miles of unplanned roads that were spawned by industrialization of the land for intensive livestock use. Yet the RMP provides no adequate baseline numbers on road densities (the RMP Map M-71 is so pale as to be illegible but it shows a monstrous number of roads – ALL of which would remain under the woeful proposed action. There are no specific goals, objectives and management actions for removing miles of roads to ensure wildlife species habitat security or untrammled or quiet recreational uses. There is no binding requirement to reduce road densities in important habitat areas to conserve wildlife. BLM must overlay the road mapping with facilities and show what is really going on. See Road density mapping Map M-71 FEIS.

Ranchers have horses. Yet relying on herding and horse use has fallen by the wayside in the Jarbidge, as roads have been driven into virtually every area – resulting in a truly astounding road density especially in association with the livestock facilities and intensive grazing disturbance practices.

It isn't necessary for BLM to disturb the ground at all ripping up a pipeline. BLM could just remove and recycle the troughs, plug the pipe, and leave it buried. This is illustrative of how BLM arbitrarily seizes on any possible excuse to scuttle any meaningful change to grazing in the Jarbidge, without any science –based or common sense rationale.

Unless significant numbers of these developments are de-commissioned, BLM will continue to impose livestock use even in the very few areas (outside the small Reference sites) under its Alternatives. The RMP is laced with provisions that thwart grazing permit retirement, and ways to impose sacrifice area “grassbanks”, or the ruse of creating “Fuelbreaks” full of cow food, and targeted grazing dustbowls, and impose TNR over all but 300,000 or fewer acres of the Jarbidge (DEIS) and now in the worsened FEIS over virtually all the landscape. Under Alt VI it could include even the scarce non-canyon riparian areas, inflict severe livestock disturbance of “targeted grazing”, TNR, etc. The basis for the livestock grazing allocation is deeply flawed and greatly under-estimates the forage use of the heavy and often hormone livestock. BLM uses a long-outdated 800 lbs. per AUM (FEIS A-239 footnote) when in reality the cows/AUMs now weigh 1000 to 1200 lbs. Plus they typically have a large calf with them that gets to eat for free.

If BLM is so concerned about the impacts of pipeline excavation, then the RMP needs to clamp down on just letting Jarbidge ranchers go out with backhoes and work on pipelines without any oversight, as is common practice in this area especially in slickspot peppergrass and remaining sagebrush habitats. But of course this was just an excuse to perpetuate the extreme levels of grazing laid out in the RMP.

The issue of failing to clearly identify facilities (or at least a percentage of them) for removal is linked to BLM's ability to develop appropriate grazing alternatives and sideboards for Travel Planning. The RMP must lay a framework for reduction in the horrific road density in the RMP. FEIS ES-33 admits to **4300 miles of known roading, and that there could be twice that amount.** Thus, there was no adequate baseline of the road footprint, causes and impacts provided, with road miles ranging from 4300 to 8600 miles.

BLM must layout and identify in the RMP targeted pipelines, troughs, and fencing for removal so that unnecessary roading that can be removed and high road densities reduced to provide habitat security for wildlife and limit human intrusion in sensitive habitats, reduce or limit weed spread, decrease sage-grouse predator travel corridors, and provide many other habitat security benefits. See USFWS WBP Finding for GRSG. These unnecessary roads can then be closed in the Travel Plan and slated for de-commissioning/rehab. BLM must plan for re-connecting habitats and reducing rather than increasing habitat fragmentation.

Land Areas Available vs. Unavailable for Livestock Grazing

The only areas not available are cattle-inaccessible steep canyons, scattered tracts in the north, and the reference areas. It appears even exclosures are able to be grazed under the FEIS.

Reference Areas are identified as not available. The RMP DEIS would have created 75 reference areas paired with adjacent areas – now in the FEIS this area is even less (Map M-59). The RMP provides no monitoring requirements for reference areas, and no specific or clear actions that will occur if monitoring shows adverse impacts – or standards are exceeded.

BLM must close entire pastures or allotments for reference sites. Otherwise the burden of fencing in this tragically industrialized landscape becomes even greater. The SSA says that the Reference Areas are to be used to allow comparisons for future evaluations of livestock grazing. Thus, large areas based on existing fence lines, at a minimum, must be used.

Grazing Permit Retirement

Western Watersheds Project provided scoping comments requesting that the Jarbidge RMP include language that will enable relinquished or waived grazing permits to be held indefinitely for wildlife habitat and watershed health and not be reissued for livestock use. The Draft RMP/EIS did not include such a provision. WWP does not support using such allotment permits as grass banks. This language needs to be part of each alternative in the final RMP/EIS. The language WWP supports is as follows: ***Grazing privileges that are lost, retired, relinquished, canceled, or have base property sold without transfer would have attached AUMs held for watershed protection and wildlife habitat***. RMP direction provided by this language can enable collaborative and voluntary efforts to reduce conflicts between livestock grazing and native plant and animal communities as well as riparian and watershed health and should be adopted and encouraged by the BLM for the future management of the Jarbidge Field Office through the final RMP/EIS.

We Protest BLM failing to fairly consider this.

Jarbidge Fencing, Water Trough and Other Facility Nightmare Is Not Adequately Assessed, Mitigated and Minimized

Much of the horrendous footprint of fencing in the Jarbidge was imposed haphazardly following fires when fire fences were left in place. FEIS Map M-51 shows existing fence areas, and a plethora of water developments. Now, on top of this, BLM in the FEIS proposes to allow unchecked amounts of water hauling.

BLM made the reference areas as meager as possible and increase fencing in the process. BLM stratified allotments, and randomly selected points in an elaborate scheme based in

part on existing fences. However, this reference fencing scheme must be simplified and the tiny little areas abandoned—we can foresee BLM claiming that the exact configuration of fences must be maintained – because the reference areas are based on the current configuration. The burden of existing fencing hazards to sage-grouse, raptors, antelope and other big game must be much reduced. From the start, WWP asked BLM to consider large-scale rollbacks and removals in fencing, water developments and other livestock facilities as part of this analysis to allow for recovery and maintenance of wildlife and other sensitive species populations, reduce invasive species, improve watershed health, and to promote less trammled recreational activities. BLM ignored this in the DRMP and the Final is worse. BLM has developed a scheme for reference areas that would increase the footprint of harmful fencing hampering antelope and other animal movement, killing and injuring sage-grouse, raptors, owls and bats through providing a collision hazard and interfering with habitat use – increasing fragmentation.

How does the Jarbidge fence density compare to that recommended in the BLM National Technical Team Report? The RMP fails provide detailed analysis. We know of no other landscape that is so tragically industrialized for the sole benefit of livestock. See Jarbidge AMS 2007, the FEIS Map M-51, the Roding Map M-71, and Map of Remnant sagebrush habitats. Much of the FO is within a mile of water. Removal of half, two thirds or more of these water developments, including through expanding pastures and removal of fencing, and rolling back existing water hauling would assist in getting rid of some of the ecological blight, habitat fragmentation and degradation caused by water developments. Cattle in flat landscapes are readily able to travel two miles from water sources. Ranchers have horses, and can work to herd livestock. This must be considered in all grazing alternatives.

There is no alternative that shows fence or other project removal and reconfiguration based on a Plan to conserve sage-grouse, pygmy rabbit, LEPA or other rare species. We believe that is because livestock-industry constrained Twin Falls BLM had no intention of ever making significant changes in the livestock grazing intensity in the Jarbidge and has constructed this RMP morass of confusion to ensure that change does not occur in time to save sage-grouse and other rare native biota in the Jarbidge. Even if livestock were removed from significant areas, the lack of clarity in the EIS leaves the door open for efforts to be made to move them back in under the guise of “fuels”, TNR, forage reserves, or some other artifice.

The DEIS contained Map 22, the Water Development Map (now overlaid with fences in the RMP) which vividly portrayed what appears to be driving this tragically industrialized landscape RMP. i.e. the retention of all water developments. BLM never presents a single map or plan or required action to remove a single one of these harmful sage-grouse habitat impairing and fragmenting, predator sink, and potential West Nile virus source areas. These facilities promote West Nile mosquito virus, facilitate livestock depletion of sagebrush habitats, serve as infestations sites for weeds, and have many other adverse impacts. See Connelly et al. 2004, USFWS WBP Finding for GRSG 2010, Knick and Connelly 2009/2011, Declaration of Dr. David Dobkin, Stevens et al. 2012, Manier et al. 2013.

There is no analysis of the toll the existing infrastructure is taking on wildlife. The AMS showed there were serious conflicts – these are woefully unaddressed by the RMP failed to effectively rollback the horrendous livestock facility footprint.

We Protest all of these Jarbidge FEIS deficiencies.

We Protest the grassbanks/Reserve Common Areas – as they are another form of taxpayer welfare to reward ranchers including those who may have so abused the allotments where they hold permits that those areas must be rested/rehabbed. The fragmented and livestock-degraded Jarbidge desperately needs significant landscape areas free of livestock disturbance.

RMP S&G Compliance Failures and Monitoring Uncertainty

We Protest the following:

The RMP has no protocols and no binding requirements that forge a clear management path forward – but plenty of elaborate fuels, TNR, grassbank, water hauling and other schemes to maximize livestock numbers for the financial gain of a tiny hand full of private grazing interests. The RMP does not provide mandatory annual measurable use standards and other actions needed to comply with the FRH requirements. The RMP must also specify how monitoring results would then be applied, i.e. fed back into the system and used to trigger clear and specific changes – specific AUM cuts, closure of areas from grazing, etc. Instead, the RMP has loose, uncertain “adaptive management” as a cover for allowing uses to be minimally controlled and their harms minimally detected. Thus there is no certainty that the FRH will be attained.

There is no schedule for S&G analysis and re-analysis. BLM needs a schedule for compliance with S&G. Even though the SSA requires new permits in three years, BLM never met the schedule for the RMP, and may also fail to meet the permit renewal schedule. Actions must be prioritized on the basis of the importance habitats in affected lands for rare and imperiled species like sage grouse. S&Gs must be scheduled for re-assessment, as well.

Under BLM’s 1997 National Riparian Goal - **within five years, all streams were supposed to be in PFC. Yet here is BLM 17 years later, taking baby steps towards attaining PFC** with no clear path to achieve even this minimal and arbitrary condition on some Jarbidge streams. See the pathetic meager measures in the Alts in Table ES-5, FEIS 2.8.2.4, 2.8.2. 5, 2.8.2.6, 2.8.3.1. There are no mandatory annual grazing use requirements (6 inch stubble triggers, less than 10% bank alteration triggers, less than 10% woody browse standards) and specified timely monitoring in the RMP, so there is no certainty any progress will be made.

PFC is the wrong goal, and does not ensure water quality compliance, or progress under

the FRH for water quality. FEIS at 4-1119 wrongly claims that the rate of improvement in water-quality and habitat impaired streams would depend on the rate of improvement of PFC and HC ratings and that HC is expected to improve more slowly. This must be why Alt VI GOMAs seems to be primarily focused on just trying to keep exotic fish species present – rather than native fisheries and aquatic species restoration. Exotics tolerate wretched water quality and habitat quality better than natives. Species like brook trout thrive in more degraded waters, and prey on natives. The poor water quality and poor habitat conditions under the new RMP will provide exotic fish with a strong competitive advantage.

WWP commented that BLM should use **a desired natural condition** and a natural rate of recovery that far exceeds PFC. This is required to comply with INFISH. PFC is an arbitrary non-scientific basis for assessment. PFC does not address instream habitat conditions for riparian areas. BLM efforts to claim PFC can be “cross-walked” and translate into instream conditions are not valid. This has been ignored, as the severe pollution and impairment footprint of the EIS Alts and the Proposed Action will not provide for natural conditions and a near natural rate of recovery.

BLM’s discusses its very infrequent riparian MIM monitoring in the riparian section. MIM monitoring can be as infrequent as one year in six – or longer given the degree to which BLM falls behind in commitments. This introduces a great deal of uncertainty. Over the life of the RMP, BLM is also likely to change monitoring schemes many times – MIM is just the latest system by BLM. None ever lasts very long.

BLM provides no analysis of the effectiveness of the MIM monitoring – especially under the rudderless GOMAs and the limited range of high extractive use alternatives in the RMP. Under the BLM methodology of the MIM method, the agency claims that it is not necessary to meet particular use levels every year. There is little to no grazing accountability with MIM. Under the infrequent and minimal number of sites monitored under MIM, harms cannot be properly mitigated and minimized before irreversible damage occurs.

MIM measurements for riparian vegetation are taken right by the water’s edge – the first line of vegetation where even the thinnest of green spikerush (*Eleocharis*) or other shallow-rooted poor bank stabilizers would be measured and considered towards meeting goals. MIM sets no standards of use. It is just a technique/set of limited measurements that are taken. Worse, BLM often arbitrarily selects better condition sites as its very limited monitoring areas. Thus only a small subset of riparian systems get monitored at all – and typically in better condition cherry-picked sites.

The RMP must set clear measurable triggers to gauge progress towards the FRH and ensure standards are met -for stubble height bank, trampling of livestock-accessible areas of streambanks, and riparian browse triggers for livestock removal under a range of alternatives to be measured by the MIM system in all riparian areas – not just a select few.

BLM must analyze a range of alternatives that rely on 6 inches stubble height, analyzing

5% and 10% annual bank trampling requirements, and less than 10% woody browse. Livestock use reaching any of these levels must serve as a trigger for their removal from the pasture. Excesses must have specific actions taken in the following grazing year to correct them –including substantial reductions in livestock numbers. This must be analyzed in a SEIS. See Alternative submitted on cd which expands on, and updates WWP’s initial alternative submission that was submitted under strict BLM constraints and then rejected.

We Protest all of these RMP Deficiencies as described above.

FEIS Fisheries (Section 2.3.6 Fish and Wildlife) and other Sections

The over-arching Goal for Fisheries is nearly identical in all alternatives. Reference in the DEIS was made to the “ARMS” document, Appendix D. The even more harmful FEIS 2-345 refers to ARMS Appendix D under Alt VI. Appendix D contains many numbers, acronyms, and categories applied to streams. Yet it fails to provide essential baseline information on the causes of loss of flows, reaches now lacking sustainable perennial flows and the causes, reductions/absence in native fish species and other aquatic biota like amphibians, or impairment or loss of habitat components, and specified actions taken to recover flows, fish, water quality, etc. It does not provide required actions to make positive change happen. It does not address and develop a range of measures to minimize adverse foreseeable effects of climate change on aquatic resources and biota (less winter snowpack= reduced perennial flows, more precip falling as rain, violent runoff events, etc.) See Comer et al. 2012, Great Basin Rapid ecological Assessment, for example.

The RMP RCAs have four categories – with bias towards less protection if the waters currently do not have fish. Thus, there is no guarantee that these areas will ever be improved. If the fish fauna is wiped out at present, BLM places the stream in a lower category and dooms it to poorer management and especially severe losses under the maximized stocking and TNR alternative VI. Plus, it is unclear if native dace and other species are considered expendable. This sacrificing of whole drainages and watersheds is highly likely to doom many native aquatic species, including amphibians, prevent survival and recovery of Columbia spotted frog, a federal candidate species and other rare species. This is not a Plan for recovery - it is a Plan for Triage, extirpation/extinction, loss of crucial brood rearing habitat, further headcutting and permanent loss of springs and meadow areas and a range of further ecological losses - all to enable high and unsustainable levels of grazing disturbance to continue, and the footprint of various energy, minerals, oil and gas or other development and disturbance to expand.

“Management for RCAs” (Table A-64 to A-70 in DEIS, Table D-8 in FEIS) is supposed to show what actions will occur. This contains many statements, but no mandatory measurable standards for livestock use that are vital to ensure protections and the FRH. There is no required grazing seasonal avoidance period – when redband trout are spawning, when CSF egg masses present, etc. See in contrast BLM Owyhee 68 permit various alternatives claiming to avoid conflicts. The lack is found in FEIS Table D-8, and FEIS A-111 with grazing impacts uncontrolled - so highly destructive impacts can occur.

This results in uncertainty over any claimed protections or mitigation measures. The FEIS's RCA and riparian system way of viewing streams comes from PACFish, InFish, and ICBEMP. Much of the background science was conducted on much larger more interconnected waters than the desert systems of the Jarbidge. Logging and roads were often primary threats in those systems and studies – and not grazing as in the Jarbidge. BLM must provide much more specific required guidance and annually measurable livestock grazing standards as triggers for livestock removal to limit chronic and cumulative livestock grazing degradation of riparian areas and aquatic species habitat quality and quantity. BLM must employ this and other measures to address and help buffer climate stress on aquatic systems and biota. Climate change stress is amplified by the adverse effects of livestock grazing See Steinfeld et al. 2006, Beschta et al. 20-12, 2014.

The inadequate Fisheries Objectives of the RMP under all alternatives rely on meager and arbitrary PFC, which lacks any standardized measurements. See Table ES-5 summarizing minimal baby steps towards PFC Yet the RCA Table stated in regards to PFC (DEIS at A-65 “Fish and Wildlife Restoration”) under FW-1 that “Management activities and land uses in RCAs shall be implemented to attain proper functioning condition as an initial step to move habitat conditions of streams, riparian areas and wetlands toward achieving aquatic and riparian management objectives”. BLM proposes 20 years - or even longer - just for its initial baby step.

The RMP's Fish Objective in Alt IV is “maintain or improve streams” referring to “70% of the miles of fish-bearing streams and their perennial tributaries are properly functioning”. DEIS at 2-62. Table ES5 of the FEIS claims Alt VI is the same as Alts III through VI for riparian veg objectives. So over 20 years of the RMP, it is ok with BLM if 30% of the streams remain highly degraded (not even in the minimal PFC), and nothing ever had to get better than the low bar PFC category. Does this also mean that some streams could actually decline? There was no requirement for the many miles of intermittent tributaries that characterize large areas of the redband trout and bull trout tributaries in southern Idaho and northern Nevada.

In the FEIS, this is worsened under Alt VI – because of the higher livestock disturbance load and even more lax management of extractive and other harmful uses. This will result in increased sedimentation, reduced sustainable perennial flows, accelerated watershed degradation, increased manure and livestock waste contamination, and the adverse cumulative impacts of all of this – such as the toxic algae blooms in Salmon Falls Reservoir.

Furthermore, BLM provides no commitment to improve or address the intermittent and ephemeral tributaries – many of which are suffering extensive headcutting destroying sage-grouse brood rearing habitats and delivering copious amounts of sediment downstream, reduced flows, deliver large volumes of sediment to downstream flowing waters during runoff, and are in these conditions specifically because of livestock degradation and associated desertification processes across the watersheds including upland areas and the tributary arteries. BLM must gauge how much potential has been

lost and the causes – to provide a baseline of understanding actions needed to recover and sustain perennial flows. BLM knows full well the critical importance of taking care of the tributaries in desert systems. In ESA watersheds, FWS in past consultations we have reviewed has often in the past provided detailed comments on sediment delivery, manure, and other pollutants delivered from these arteries and watershed slopes, as well as the effects of livestock, roading or other degradation in disrupting, reducing or even killing perennial flows. This appears to have been forgotten by BLM in the flawed FEIS. A SEIS must be prepared to address these serious concerns.

Water diversions and impacts of private land practices and degradation must also be fully analyzed. The degree and severity of threats to water flows, water quality, aquatic biota, impairment of recreational uses, and other info must be examined.

Areas that continue to be degraded might under some stretch of the imagination be permissible in an RMP in an environment with many very big streams with much higher typical perennial flow – i.e. better-watered landscapes. But this is unacceptable in the low flow, high runoff pulse Bruneau-Jarbidge and Salmon Falls systems of the high desert. These systems now face the added stress of climate change in affecting the livestock, roading and otherwise de-stabilized the severely grazed watersheds – spanning Humboldt-Toiyabe, Elko BLM and Jarbidge BLM managed lands.

The FEIS GOMAs actually allow many watershed conditions to worsen – especially across the tributaries – many of which become intermittent in summer due to chronic livestock degradation. This same kind of uncertain and unclear wording is used repeatedly in relation to the other public lands Values considered in the RMP. It is designed to ensure that only very limited change would occur – and in fact allows conditions to worsen. BLM cannot hope for slow, plodding change. Adverse change (such as erosion, downcutting, loss of flow potential and the ability to sustain fisheries) in degraded systems is not linear - major irreversible erosion and loss of sustainable perennial flows can occur very quickly in headcutting eroding systems.

Sage-grouse use water or rear broods in areas of streams in less steep canyons or more open reaches –which are precisely the areas that are livestock-accessible in the Jarbidge. The flawed FEIS GOMAs actually would allow sage-grouse brood rearing habitat to continue to be degraded and even decline and suffer further irreparable erosion, loss of areal extent of brood rearing habitats, and desiccated flows under the riparian management strategy.

There is nothing that ties together coherent and effective actions needed to stave off further declines (the highly uncertain references to adaptive management make matters even worse), and to promote large-scale restoration to conserve and recover species. This also appears to violate the promises of the agencies to rely on current and coherent ecological science under ICBEMP – and not just parrot ICBEMP terms or insert them in appendices with no clear path of forward action.

The non-perennial stream segments and springs, seeps and meadows largely forsaken by

the RMP are likely to be particularly important to sage-grouse, since many of these areas are not in steep canyons, and so they are used by sage-grouse for brood rearing and water. Recovery here would also better provide habitat for rare and declining nesting migratory birds, as well.

The limited and inadequate Alternatives Range fails to address the degree of threats facing the current highly fragmented habitats, degraded habitats, and very reduced fish and wildlife populations in the Jarbidge. See for example the similarity of the Rip Veg and several other Objectives in Table ES-5.

Some population information is provided on bull trout. Yet there is not an adequate current analysis that reveals how few bull trout currently are present in the entire DPS; the problems with connectivity between occupied reaches and ways to fix this including enhancing sustainable flows and water quality. BLM does not effectively examine the causes of low numbers such as excessive sedimentation from grazed and roaded watersheds or other factors, or losses of sustainable perennial flows, elevated water temperatures, etc. BLM must examine the degree and severity of the direct indirect and cumulative threats the DPS faces - from climate change to livestock and road-produced sediment. This is needed to present a coherent and coordinated set of actions to restore and recover populations and habitats, including critical habitats (which are much too limited in area for the DPS persistence and we believe must be expanded). A valid analysis of the cumulative impacts of roads, grazing, water developments, trailing, recent fire effects including Slide Rock and others etc. must be undertaken. Population viability and persistence must be examined under a range of alternatives. Large-scale changes must be made in the entire RMP before BLM can prepare a proper Biological Assessment, and FWS can adequately consult over this loose and uncertain RMP. The promises of Appendix FEIS Appendix D are not backed up by sufficient current baseline data and analysis. So their sufficiency cannot be gauged.

Actions to restore bull trout and quality habitat and connectivity with USFS lands in the upper Jarbidge and Bruneau systems should be a high priority of this RMP. This is necessary to recover populations, and must be fully examined in a range of alternatives.

The FEIS 3-52 states there are six populations of fluvial, migratory bull trout, yet there is no valid analysis of the current status of the habitats and populations, and the threats to the local populations and the DPS as a whole. Data is largely from 2005 and 2006 –prior to the large BLM and Forest lands fires that impacted headwater and downstream habitat, That data had already shown exceedances of temperature, and abundant sediment where agencies even bothered to look, and other significant problems. These are very likely much worse for bull trout as well as Columbia Basin redband trout (FEIS 3-54 to 55). That data is old, limited and from much the same era as the bull trout information, despite large-scale losses of shading vegetation, and watershed de-stabilization from fires, roading, and a high grazing disturbance load and continued harmful hot season grazing and other known deleterious grazing management methods, There is no analysis of whether any annual measurable standards have been made in a timely manner, and if they have - what the results may be. Thus, there is no basis for a proper current understanding

of the populations and the DPS habitats and viability.

DEIS 3-39 described Columbia River Basin bull trout – what happened to consideration of the **unique** DPS living at the southern periphery of the species' range? This does not appear to have been corrected in the FEIS.

The DEIS at 3-40 showed little movement of bull trout between the Jarbidge River and the East Fork. This amplifies concerns about the small and very vulnerable population in the East Fork, Dave Creek and Slide Creek – as well as the adverse effects of the Brackett Jim Bob pipeline de-watering and other water development concerns, especially now that large areas in the Wilderness in the Forest on the East Fork Jarbidge watershed burned.

Did BLM place any thermometers in the currently unoccupied reaches? It appears not. So BLM has no idea how high the temperatures are in the streams that are currently unfit for trout to live in. (DEIS 3-40). The FEIS lacks substantial analysis of the cumulative impacts of resuming grazing in burned watersheds, or of activities on the Forest Service lands that threaten the upstream portion of all these bull trout watersheds. The FEIS is silent on which sections of streams have lost beaver dams, and how has this impacted hydrology, perennial flows, and aquatic species persistence?

Various parts of the RMP, even covering the same topics, appear to be inconsistent and conflicting. FEIS Table D-1 provides bull trout habitat indicators. Table D-3 provides “HC Ratings and Indicators in a degraded Condition for Stream Reaches Containing Special Status Fish”. This table shows little degradation in some areas (date of data is not provided). Yet other Tables – using minimal PFC as a goal, showed problems in the DEIS – Example Table A-58 (East Fork Jarbidge segment a high priority for improvement). Yet the D-3 “netweavered” (Netweaver is some kind of model) Table showed fewer problems. It is really impossible to understand what the situation is, and how positive change will occur. It appears that BLM modeled and re-categorized until problems went away. In fact, in the FEIS, Table D-5 Riparian PFC Ratings does not have the PFC data provided for each reach. Neither does FEIS Table D-3. So they are useless for understanding the current degradation – a full understanding of which must be the basis for development a suitable range of alternatives.

BLM is paralyzed and unable to control grazing impacts caused by politically powerful permittees that it even refuses under Alt IV and now VI to prevent destructive sediment-producing cattle trailing and hillslope erosion caused by Brackett trailing across the East Fork Jarbidge River through bull trout critical habitat, redband trout habitats, and a campground/recreation site– when in fact **there is a road and bridge** that the cattle could readily be herded across. Significant loss of the unstable, cattle-trampled banks apparently will continue for the next 20 years. Specific Alt MAs allow such herding to occur for the next 20 years!

The ARMs section discusses Watershed Analysis, and Monitoring and Adaptive Management. No information on the results of any watershed analysis is provided. No valid watershed NEPA analysis can be conducted until BLM provides much more

information on soils, soil erosion, microbiotic crusts, intermittent and ephemeral drainages, sideslope stability and cover, and vegetative conditions in watersheds. This is necessary so that the degree and severity of risks associated with continued grazing or other allocations under the FEIS RMP can be understood.

The monitoring section provides no basis for any required protective or corrective actions to occur, required timely scheduled monitoring to understand thresholds/adverse changes or prevent further losses, or specific triggered actions such as removal of livestock, five years or more of rest, etc. Understanding what kind of “adaptive” action will occur is impossible in the morass of the RMP. Essentially – nothing, really, is required to occur.

BLM in the DEIS referred to a 1997 (now 16 year old Watershed Analysis) that the BLM couldn't be bothered to update (see now FEIS A-118 to A-119). This analysis pre-dated Bull Trout ESA listing for the Jarbidge DPS. The reference to this document highlights the need for the BLM to analyze cumulative impacts of livestock grazing – caused by the same BLM lands permittee herds that also graze on the shared Forest watershed. These herds, and this same very small number of permittees has a large-scale disturbance and degradation footprint that affects populations of bull trout, redband trout, as well as sage-grouse, pygmy rabbit and other wildlife over a huge land area in this region.

Affected important, sensitive and ESA-listed populations on the Forest are inter-connected and shared with BLM lands. BLM must examine the impacts and use levels of Forest grazing, livestock facilities such as the many pipelines, fence densities in grazed sagebrush lands, fire effects, inter-connected roading and use and other activities. It must address all direct, indirect and cumulative impacts. No modern day NEPA analysis of grazing impacts has occurred on the Forest. The Forest prepared a general programmatic “Rangeland EIS”. It was based on a grazing pamphlet and other industry-centered management paradigms (Dietz and others). It collected ecological information, and tried to set up an uncertain “adaptive management” monitoring scheme on top of the gray literature range claims. That EIS has been withdrawn for many years - due to serious flaws in analysis.

The Forest has also pursued piecemeal livestock facilities, with further industrialization of sagebrush habitats, and shifting of impacts onto already degraded intermittent stream areas and critical sage-grouse habitats. Piecemeal water developments have occurred in bull trout and redband trout watersheds under DNAs and CEs. Eight miles of new fence sliced through many sagebrush habitats under a CE—despite the Forest grazed areas and sage-grouse habitats already having a heavy load and high density of fencing just like the BLM lands do. A large-scale fire occurred in the Forest in 2008, the Slide Rock fire. This also altered the Baseline for what had been thought to be a secure bull trout population in the Wilderness. However, now this bull trout population is exposed to significant bank erosion sedimentation, and long stretches with little shading of waters. Thus, the Baseline changed - including the Baseline in upstream watersheds of the BLM RMP area. The very same cattle herds that move back and forth - and where exceedance of Forest standards, if the Forest actually applies management is to trigger livestock removal – which means movement onto or through the BLM lands. The BLM failed to consider and

update its analysis in the FEIS.

DEIS Volume 3, A-47 showed that the Time Frame for change or actions (like maintain or improve 70% to PFC ...) was the life of plan --- **20 years!** There are no milestones to be met at five years (BLM used to say that PFC would be attained in five years in most instances), ten years, etc. There is no analysis to show that this slow pace will sustain viable populations of native biota, or if this relatively low goal of improvement is even attainable under a series of near-status quo disturbance alternatives, especially with the added stressor of climate change. There is no real analysis of the adverse impacts of climate change, the timing and severity of grazing disturbances on BLM and Forest lands, roading impacts and other direct, indirect or cumulative impacts that may impede progress or attainment. Nor of climate change (higher temperatures, less perennial flow more violent runoff, increased cheatgrass, etc.), including taking into account the abject failure of the FEIS to address and buffer climate change effects on watersheds and native biota and other uses of the public lands.

DEIS Volume 2, 4-95 showed that there is no real difference in impacts on aquatic species between Alternatives 1, 4 and 5 - without any scientific analysis and real basis for understanding why these alternatives were structured in this manner. This now continues with the FEIS. See FEIS 2-399-402, with effects of Alt VI being indecipherable but largely allowing even worse conditions based on minimal PFC than the other Alts.

In efforts to downplay any removal/reduction of livestock - BLM falsely claimed that “the increased emphasis on passive restoration could result in fewer short-term impacts to water quality and slower rates of recovery for 303d listed streams of the other alternatives”. BLM used its own ridiculous and purposeful construction of ALT V that omits any active restoration so that the claim can be made that Alt V would be worse than Alt IV! It is a set-up to bias outcomes towards the Preferred Alternative, and these type of schemes continue in the FEIS.

So, the BLM essentially claims that recovery - if livestock were removed – would be slower than if BLM took bulldozers in a stream and bulldozed some rocks on to a portion of a bank (active restoration) - while at the same time continuing to allow cattle to trample banks and fish redds without mandatory measurable standards of use. BLM minimizing fair analysis of the effectiveness of passive recovery is typical of the extreme livestock industry bias that pervades all aspects of the analysis in the FEIS RMP. All of these analyses must be redone – and based on ecological science and industry accountability, not the desires of ranchers and range staff to maintain status quo or higher amounts of degradation so that a tiny number of ranchers are not inconvenienced.

Appendix D describes pool frequency, width, depth, temperatures, and conditions for functioning. Yet there is no clear management path in the FEIS to attain or make real progress on these desired conditions.

Thus, the FEIS and its alternatives are not sufficient to provide effective conservation and recovery for the Jarbidge bull trout DPS. We Protest the RMP failings as described above.

Herbicide/Pesticide Use Concerns – SEIS Is Required

We Protest the inadequate baseline, analysis and alternatives related to herbicide and pesticide use – including amounts and types of herbicides under the FEIS alternatives, and their direct indirect and cumulative effects –including drift, degradates, breakdown products, residues, contamination of soils and water, effects on human health and TES species, etc.

Since BLM proposes extreme levels of use of grazing disturbance (fuels, TNR, gross overstocking in the proposed Livestock AUM allocation) and herbicide “tools”, there must be a detailed analysis of potential serious effects to aquatic species, and non-target upland species as well, and certain, clear and effective minimization and mitigation measures. This includes cumulative effects.

The very high level of livestock use and harmful allocations are likely to greatly increase herbicide use, drift, contamination, and adverse impacts to non-target species. Where and when has BLM sprayed herbicides in the past? Please provide mapping and science-based analysis of impacts to native biota and effectiveness (or lack thereof). Please do the same for post-fire “treatments”. There has been very little success in preventing cheatgrass, despite Oust, Plateau and their ilk having doused Jarbidge lands. Rabbitbrush has been eliminated in many areas, as well – and prevented from resprouting. We have repeatedly observed non-target perennials and even shrubs killed or weakened by BLM herbicide use including in the Jarbidge. We are very concerned that BLM’s industry-biased FEIS alternatives and massive treatments over-emphasize and rely extensively on unassessed and unquantified chemical use – with likely very significant adverse impacts not just to upland species but also aquatic species as runoff occurs. A Supplemental EIS must be prepared on the issue of the amount of herbicide use the Proposed Action will spawn, and the adverse effects to the environment this will cause. How much herbicide will be used? Where? Which herbicide or combination? What are the potential effects – including based on all the new science since the long-outdated 2007 assessments (which themselves were based on older data). For example, how will LEPA or other rare plant pollinators be harmed? Sagebrush recovery? Bird eggs and nests? Water quality and native amphibians and fish? Given the extreme amount of weed-promoting disturbance that the FEIS Proposed Action would inflict, BLM must prepare an update to its Weed/Veg Treatment EIS.

BLM has failed to provide reasoned and detailed analysis of the success of any of its post-fire or other herbiciding in controlling cheatgrass or other weeds in the Jarbidge, and failed to map and analyze effectiveness and outcomes.

In addition, where and when has APHIS sprayed grasshoppers and Mormon crickets? Which watersheds? How has this increased? How do current degraded land conditions in the JFO contribute to expanded rancher claims of native insect “problems”? What chemicals are used and what are the effects – not only to aquatic biota including through drift, but also to the critical insect supply for sage-grouse, Columbia sharp-tailed grouse,

migratory birds, etc.?

Much more detailed information is necessary to understand impacts on all upland species, as well as aquatic species – including Snake River white sturgeon, Shoshone sculpin, and rare aquatic invertebrates?

We Protest the lack of much more detailed analysis of direct indirect and cumulative impacts.

Alternatives, Planning Actions, and Restoration Flaws

BLM never provides a clear plan for conservation, and application of both passive and active restoration under a range of science-based alternatives that comply with FLPMA, the ESA, its own special status species policies, and its own Conservation Plans for sagebrush species. BLM must balance both in ecologically sensitive alternatives to conserve and restore sage-grouse, LEPA and other critical habitats. A careful and coherent combination of both forms of restoration must be used to recover sage-grouse or to protect any of the important Values/Resources of the public lands in the RMP. A SEIS is essential.

In Scoping, WWP submitted an Alternative in a format/template style that BLM required at the time. We submitted many comments that relied on both active and passive restoration and a conservation-centered management paradigm. Yet our concerns were not fully considered in the limited and industry-centered near-status quo alternatives of the flawed and inadequate DEIS. We had wrongly believed that BLM understood the severe conflicts with sage-grouse and other native species persistence, watershed health, etc. that current land uses posed, and the inability of the Jarbidge lands to withstand new threats from more development and intensive use, and would act to properly protect resources, **We were wrong**. The AMS showed clearly that there were severe problems, and wildlife, native plant communities, etc. faced a crisis in the Jarbidge. The ink was scarcely dry on the AMS when BLM began back-pedaling. The data on which the AMS was based pre-dated the Murphy Fire. Now we have a FEIS that is a throwback to a grazing-take-all mindset, and worse in many ways than the existing 1980s RMP.

At the time we tried to submit an Alternative, BLM made us follow the sparse Alternative framework that Jarbidge BLM had provided. BLM then sent one request for clarification that seemed designed to further limit and whittle down an already exceedingly sparse framework. Then, BLM did not even deign to analyze WWP's Alternative as an Alternative, and asked for no further clarification. We were not allowed not even attend the various Team meetings. BLM provided no requests for any expansion of the alternative, or development of the MAs or other components that it went on to use in the DEIS. During this time period, WWP repeatedly sought to meet with BLM staff to discuss ACECs and other components of this Alternative, but BLM would not allow this. Thus, BLM violated the Settlement as well as slammed the door on a reasonable range of alternatives to address the threats facing sage-grouse and other native biota across the Jarbidge lands and waters.

The interaction with BLM related to the RMP were as follows:

A general Scoping Meeting; Several meetings with Attorneys and the livestock industry present where BLM told us some of what was occurring with the RMP. During and following these meetings, WWP expressed concerns about the direction the RMP appeared to be going, its lack of effectiveness and a cohesive strategy and alternative for sage-grouse perpetuation, the confusion of the vegetation info and FRCC, and many other issues. We expressed these concerns both in the meetings and in follow-up e-mails. The RMP process continued to change for the worse.

BLM's version of collaboration was to shutter itself and an anonymous Team behind closed doors, and develop an RMP with a range of alternatives that appear based on a mindset /false assumptions that there is endless time to waste before any meaningful conservation measures for sage-grouse and other imperiled or depleted Jarbidge public lands values and resources occur.

The range and nature of the alternatives appear to be largely a throwback to some rosy 1980s period when sagebrush was abundant, sage-grouse and other wildlife populations were much more numerous, cheatgrass was very limited, recreational use was minimal, and grazing conflicts were of little concern.

Throughout the FEIS process, BLM never showed if it met any objectives of its old plan. BLM must clearly explain and map all the allocations and GOMAs (or their equivalent) of its old RMP, and show the public what has been met, and what has not been met. It must explain what occurred in a SEIS. This is necessary to take a hard look at the No Action alternative, as well. BLM must include a detailed analysis of fish, wildlife, habitat and population, soils, vegetation, watershed, water quality, recreation and all other goals, objectives, MAs or the equivalent of the old Plan and demonstrate how they were or were not met, and provide causal factors for these failures.

The FEIS has a greatly inadequate evaluation of the No Action alternative. The Old Plan in some elements related to sage-grouse and some other wildlife species actually provides more conservation requirements than the very harmful uncertain and loose FEIS Proposed Action.

There is no adequate analysis of the shortcomings of the No Action Alternative, and since many parts of most of the "new" alternatives are very similar to what is occurring now - or even more harmful - this must be revealed and analyzed in detail.

BLM must provide data on the actual use and utilization that has been occurring in each pasture under various stocking levels and the timeliness and methods for any utilization monitoring, effects of TNR use, native residual grass height that has remained under grazing schemes, the degree of cheatgrass and other weed advance under the level and manner of livestock use, how minimal the rest for fire rehabs has been and the minimal recovery standards applied before grazing was again imposed, microbotic crust losses or

degradation, forb recovery or losses, failed or poorly recovered fire and other rehab efforts and their locations, etc. The degree and severity of impacts of existing uses on habitats and species suffering declines must be clearly laid out – so a reader can understand how the new RMP would change matters – if at all. A SEIS must be prepared to do this.

We Protest the FEIS failure to address all of these serious concerns.

FEIS Monitoring, Implementation, Mitigation Deficiencies

The FEIS Monitoring and Implementation strategy (and woefully deficient mitigation) are inadequate to ensure compliance with the FRH, conservation, enhancement and restoration of GRSG and other rare and important species habitats, etc. See FEIS Sect 2.92-392-395. LUPs are supposed to establish intervals for monitoring. This relies on PFC, and that it will use MIM to support this. Actions will occur “as available”. There is no certainty of actions occurring, or progress being made. There is no certainty that further extirpation and loss will be prevented.

There is no clear effective Plan with clear monitoring requirements and milestones laid out for conserving sage-grouse, pygmy rabbit, redband trout, LEPA, and monitoring to ensure this occurs. There are no annual, periodic or other milestones for moving toward goals/objectives/MAs.

We Protest these FEIS deficiencies.

Additional FEIS Water Quality Problems

Under this Plan, BLM has no obligation to do water quality monitoring. This runs counter to the Fundamentals of Rangeland Health (FRH). A full evaluation of shortcomings and limitations of MIM methods must be provided. BLM must monitor for *E. coli* and other bacteria on a required and specific schedule associated with livestock and other use impacts.

BLM must identify all causes of exceedances, and examine all direct, indirect and cumulative impacts - including activities on private lands.

Specific measurable annual standards of grazing, browse, and trampling use must be applied to all riparian areas. If at any time during period of grazing use, these standards are met, livestock must be removed from the area.

The RMP refers to the Idaho Pollution Abatement plan – and does not explain that this is entirely voluntary. It lists BMPs. But a list of BMPs does not show how management would occur, and how BLM would achieve significant positive change. BLM must explain how it is going to meet these standards and lay out a clear plan to do so.

The DEIS stated that it would “Consider new water developments and water development

projects” where impacts could be mitigated, and this continues in the FEIS. Where does data ever show impacts of water developments can be mitigated? Where and how has this ever been done in the Jarbidge? How does BLM make up for reduced natural spring flows from developments? Or the impacts of the severe compaction and plant community degradation associated with placing troughs in upland habitats?

Please provide a full and detailed analysis of how effective BLM has been in mitigating water development effects on ecological processes, sage-grouse habitats and populations, pygmy rabbit habitats and populations, and other important biota in the JFO. BLM can’t even act to make the ranchers remove unlawful water developments that have sprung up across the landscape – let alone somehow “mitigate”. How does BLM take cumulative impacts of developments into account when “mitigating”? There has never yet been a full and detailed analysis of the gigantic Footprint of the water developments - and all direct, indirect and cumulative impacts in the Jarbidge. The RMP lacks information on flows and changes inflows over time – despite extensive WWP comments on the need of for this essential information.

Even under the somewhat less destructive alternative, BLM’s analysis DEIS Chapter 4, 4-197 states “estimated use levels in the Sagebrush Sea ACEC would be 10% to 20%, less than in other alternatives”. Yet BLM provides no information on the levels of use that have been occurring in riparian areas at present. BLM proposes to continue livestock grazing in large areas of the ACEC. BLM plans on applying no mandatory annual measurable standards of use to riparian areas – why else would it use some vague reference to upland utilization as the linchpin of its riparian impacts analysis? How does BLM plan to live up to the claims of 10 to 20% utilization – including for riparian areas? There is no certain and clear path laid out in the RMP, and no mandatory measurable standards of use. We fear that BLM will apply no mandatory requirements – and will instead rely on even more barbed wire fence mazes that are damaging to native wildlife – and that serve only to shift and intensify livestock damage in other areas.

There is no commitment to significantly recover degraded ecological conditions and ensure water quality compliance with the Clean Water Act and FRH.

We Protest these deficiencies.

Worse Environmental Conditions Will Result from the FEIS – No Hard Look At Environmental Consequences of FEIS

The limited range of Alternatives takes a degraded status quo and perpetuates it, or lets it become worse, over time. What management actions are being taken now? The same laundry list of Best Management Practices (BMPs) – are what is occurring now, and is actually contributing to the ecological degradation? For example, salting/and the proliferation of supplement feeding that BLM has allowed now result in zones of intensive livestock trailing and slope disturbance in watersheds including in and near intermittent drainages. Each of the now several hundred or likely thousands of supplement sites are severely trampled and a site for weed infestation - especially

flammable cheatgrass- followed by outward spread and transport by livestock. Livestock industry trucks drive back and forth filling large tubs of the supplement that is now used in large amounts because of the depleted plant communities. Simplot and some other allotments on a near daily basis place substances in big plastic buckets – so this is tantamount to feeding and a symptom of lack of sustainable perennial forage to support livestock use. This equates to supplemental feeding. Ravens, and other nest predators, are attracted to the supplements and zones of severe livestock disturbance. Soil erosion and loss into drainages occurs. BLM has allowed the ranchers to incrementally convert the public lands into an intensive farm-like setting –with predictable flammable cheatgrass spread, and loss of critical habitat components through uncontrolled use of supplements that largely continues under the FEIS – with unassessed direct, indirect and cumulative adverse impacts.

We Protest this.

Visual Resource Index (VRI) and Visual Resource Management (VRM) Biases

DEIS at 3-61 described three steps in Ratings. A, B, C. From BLM’s verbal description of this in an RMP meeting, WWP learned that the Jarbidge BLM used an analysis method that interjected a strong bias against shrubsteppe habitats as having many visual values. The methodology that BLM described using has inherent bias against sage-steppe as a visually pleasant landscape, where visual intrusions are very evident over long distances. This nonsense continues in the FEIS. Since much of the JFO has no water and no “unusual” landforms – it was written off. BLM claims it relied on adjacent scenery, and Scarcity, and looked at modification. BLM ignores the fact it can use VRM to limit any further intrusions, and to aid in restoration and sage-grouse conservation efforts. BLM must use appropriate VRM standards to conserve, enhance and restore visually sensitive sage-grouse, too. We believe this must be done, and a greatly revised Visual analysis occur in a SEIS. See FEIS M-149 absurdly claiming Low sensitivity for visual resources, and M-148 claiming Low scenic quality for nearly every site outside the old WSA lands and the Jarbidge foothills – and this appears primarily based on the old RMP.

The first sentence in the DEIS RMP Visual discussion stated: “the Jarbidge ...is known for its unique geology of broad, gently rolling plateau lands with deeply incised rivers, which provide a variety of scenic values”. Yet in the flawed VRM process, BLM discarded the visual qualities of the vast rolling plateau areas. This of course was so that the visual categories in the range of deficient alternatives would allow all manner of harmful livestock facility, energy and other development to continue to occur.

BLM has a responsibility that scenic values are fully and fairly considered, before allowing uses that may have negative impacts. So BLM got around this by just writing off the scenic values over vast areas under ALL alternatives so that it wouldn’t have to protect the lands from existing and increased grazing industrialization, dustbowl-like scenes created by its proposed TNR and Fuels grazing, energy developments, and other intrusions. This is a throwback to pre-FLPMA days.

Since the broad rolling plateau over such a vast area is part of the unique landscape of the JFO – how can BLM then turn around and claim it has no visual appeal, and proceed to impose VRM III and IV over vast areas? The whole visual analysis must be redone, and the context must be taken into account, as well as the high sensitivity of wide open sagebrush landscapes and species like sage-grouse as well as recreational visitors -to visual intrusions. Cattle troughs stick out for vast distances, for example – a combination of the metal trough and broad weed zones typically surrounding them are blights on the landscape. The Air force Emitter and No Drop sites are visible for vast distances, intruding into scenic wild land settings.

There is a significant public concern for pleasing scenic quality and a growing appreciation for sweeping sagebrush landscapes, vast vistas with blue skies and clouds that appear to be almost touching the horizon, and cloud shadows moving across the rolling sagebrush plateau lands.

Visual intrusions in sagebrush habitats are increasingly known to adversely affect sensitive bird species. These include sage-grouse that may avoid tall objects or other visual intrusions. Plus ravens and other nest predators may visually key in on disruptions and contrasts/developments in the landscape as an aid in finding bird nests, for example. Visually disruptive structures in sagebrush habitats may also provide elevated perches for avian predators. See USFWS GRSG WBP Finding 2010, Knick and Connelly 2009/2011.

In order to sustain recreational uses, sage-grouse and other wildlife, it is essential that nearly all lands be managed as VRM I. But BLM assigned VRM 1 only to lands where a “management decision has been made” (whatever that means). There could be really degraded lands – but because a decision had been made – it receives high priority, even though the visual quality is not different from immediately adjacent lands? This makes no sense. How does a management decision per se change the Visual Quality – say from I to IV? This just proves the point that VRM is used by BLM to manage to protect lands – or in the case of this EIS – to allow all manner of industrial development to occur over vast areas (as in Alt IV and VI, even in Alt V with vast areas Zoned III and IV in that Alt as a poison pill). See Maps FEIS M-41 through 48.

DEIS at 3-62 stated that scenic quality, sensitivity, and distance zone maps are used. Well, the sagebrush landscape is highly sensitive to disturbance. Disturbance would be visible over a significant distance – so rolling back the disturbance must be a priority for management. We refer BLM to the Lemhi LUP amendment, the Owyhee RMP, and other visual analyses that acted to protect lands, including some areas in a disturbed condition like the Silver City region, or all lands in two miles of main roads in the case of the Lemhi to prevent further intrusions in viewsheds for Lewis and Clark visitors – and not because of any particular “purity” or scenery in that spot. BLM certainly can use VRM to “Zone” lands to protect values from further degradation.

Plus, when BLM greatly revises the range of alternatives in a SEIS, and develops an actual science-based Plan to conserve sage-grouse in this RMP process, it will have to remove and reduce the existing visual disturbances of fences, pipelines and other

livestock infrastructure. This must be factored in to understand the proper visual designation under all alternatives.

BLM's shortchanging of the Visual Setting of the Jarbidge enables widespread continued destruction of visual settings, and thus further severe habitat intrusions and reductions in recreational activities. There is no analysis of how far transmission line, water tanks, etc. may be seen – to serve as a baseline for understanding effects, and the density of visual intrusions at present.

BLM will not be able to conserve and recover sage-grouse habitat under VRM III and VRM IV designations/allocations.

BLM can use VRM to “manage” lands. BLM has not even provided the public with its obviously flawed and biased Visual Report. It continues to be absent in the RMP FEIS appendices. We requested that BLM redo its entire Visual analysis with staff from the DC office and credible retired agency recreation personnel. The excuses in writing off large areas of the landscape here remind us of how BLM's old Idaho Wilderness Inventories cast aside nearly all sagebrush lands – through BLM slapping labels of “monotony” or “no visitor group screening” on sagebrush landscapes - millions of acres of desert wild lands were discarded from WSA consideration. The FEIS is a throwback to those days.

WWP provided BLM with an Alternative fit into BLM's limited spreadsheet framework. We proposed VRM 1. This was ignored. Some of the alternatives would even allow large ACEC areas to be managed under VRM III - as in Alt. V, as poison pills to bias the agency's rigged alternatives comparisons.

The bottom line is that BLM's range of alternatives, and the VRM Categories applied to vast land areas, show that BLM applies little value to sagebrush steppe – either in daylight or for darkness of night skies.

We Protest BLM forsaking necessary sound visual studies, analysis suitable for sagebrush landscapes, and forsaking more protective designations in the flawed FEIS, as described above.

Noise Measures, Dark Night Skies Measures Are Insufficient to Protect Recreational Values and Uses, Wildlife Habitats and Populations, and Other Resources

Science related to sage-grouse and other native wildlife increasingly show sensitivity to noise and other disturbances. BLM ignored Scoping and other information we submitted on the need to fully consider these concerns, and also the recreational value of quiet and darkness of night skies free of light pollution on public lands. BLM must include much more protective measures in the RMP to address these issues, conserve sage-grouse, migrating birds (see for example information on lights causing communication tower collisions by migrating birds) and provide for habitat security needs of many important and sensitive species – as well as enjoyable wild land recreation. The loose uncertain

measures of the FEIS are greatly insufficient.

We Protest these deficiencies.

FEIS Grazing Flaws - RMP's Over-Allocation and Broad AUM Range Uncertainty Promote Continued Conflict

BLM artificially constrained analysis of grazing effects and alternatives development. FEIS 4-661 shows that BLM only considered two factors as “Indicators” in its analysis of livestock grazing effects: Availability of Forage and Restrictions on infrastructure. This ignores the serious habitat **disturbance** and chronic degradation caused by grazing in sage-grouse and other sensitive species habitats (nest and egg disturbance, increasing mesopredators due to carrion, artificial upland water, etc.). It ignores the adverse impacts of livestock grazing and the RMP allocation on the quality and composition of the habitat for sage-grouse, pygmy rabbit, riparian species, migratory birds, bighorn sheep, and a host of other values of the public lands. See Braun 1998, Connelly et al. 2000, Connelly et al. 2004, Braun 2006, Knick and Connelly 2009/2011, Manier et al. 2013.

FEIS Table 4-322 is labeled Acres and Forage Available for Livestock by Alt. This is based on conjecture - with a wide uncertain bloated AUM range. It is related to forage only (no matter how low quality and how much supplement may need to be fed to keep the cows alive or how many weeds and sensitive species losses eking out this “forage” causes), ignoring the many serious conflicts of grazing disturbance with TES species needs, recreational uses and enjoyment including in Wilderness, and general hiking and camping as well. This approach is the RCI and Simplot EAs, *déjà vu*.

DEIS Table 4-282 at 4-595, “Forage Available for Livestock Grazing Due to Veg Treatments by Alternatives” showed how the Fuels treatments were really forage treatments in disguise. The AUM potential ranges are great. This Table also serves to show that three of the alternatives would potentially increase grazing (I II, III). It provides a basis for understanding that the complicated and obtuse Fuels discussions and “tools in the toolbox” for Fuels are aimed at very significantly INCREASING stocking rates. Alt VI is based on this flawed scheme.

In fact, what the RMP trumpets as an Alternative to address Fuels concerns, Alternative III (much of the worst parts again show up in Alt VI) would make a bad situation even worse – by increasing the very type of communities that burn with great frequency in the Jarbidge – the densely planted perennial exotic grass and other coarse grasses devoid of shrubs. III would greatly increase grazing using Fuels as an excuse. Example: Long Butte fire 2010, followed by a similar huge fire in 2012 which a mere two years later burned the same lands in the opposite direction –through vast areas of BLM’s so-called “fuelbreak” dense cwg and fire rehab seedings.

This Table also provides broad AUM ranges that will promote conflict, constant rancher pushes for TNR, and more facilities and vast acreages of dense coarse grass seedings.

BLM must set a specific number.

DEIS at 2-139, Alt IV. Allocates forage in broad and unspecific ways under no clear method and this is continued in the FEIS, as discussed below. LG-IV-A-2 allocates 75% to 85% native perennial grass to watershed and wildlife; 70 to 80% non-native perennial grass to watershed and wildlife. In having a broad range, BLM is maximizing uncertainty and enabling a certain outcome and relentless conflict.

BLM allows spring grazing – where utilization measurements that the whole forage estimation is based on do not properly track the amount of use because grass is continuously growing and being r-grazed. Spring grazing poses severe conflicts with nesting sage-grouse (see Braun 2006), pygmy rabbits with kits in shallow natal burrows, nesting migratory birds, and other concerns. Such serious species need conflicts are not taken into account in this paper allocation of “forage” for the long gone 800 lb. calf-less cow. Spring grazing also poses severe threats to the health of native plants, and is one of the reasons that native species are so depleted in Jarbidge understories. See Anderson 1991, BLM Tech. Bull., Manier et al. 2013. Would removal of spring grazing reduce livestock stocking by 25% or much more?

BLM cannot properly allocate vegetation production unless it incorporates ALL of the necessary information into determining carrying capacity and suitability, including conflicts with sustainability of native vegetation composition, function, and structure and sage-grouse and other rare species needs. BLM’s Table doesn’t take into account the range of actions needed to provide for sage-grouse and other rare species - habitat security, space, timing, removal of harmful fences/water developments, etc. Or to protect bull trout, redband trout and other watersheds.

Under these simplistic forage-only analyses, will there be double, triple livestock numbers in the fall – if spring and winter grazing are limited? If so, how will this impact resources?

BLM must manage the habitats – not chop up its sage-grouse analysis based on existing barbed wire. But this is exactly what it will do if Planning is left to allotment-level actions.

FEIS Table 4-323 shows 125,000 annual acres, 60,000 non-native understory – but is this based on the old 2006 ESI? If so, the non-native understory has expanded. What is the baseline, and the amount of cheatgrass that triggers its detection here? BLM must provide current and adequate mapping of cheatgrass, which is known to be expanding greatly in the Owyhee uplands. See Peterson 2006, for example, also across arid sagebrush lands see Comer et al. 2012, Reisner Diss. 2010, Reisner et al. 2013. The percentage composition BLM used is also not provided. We Protest the lack of current valid baseline info on cheatgrass and other exotic understory species. We are very concerned BLM may have reverted back to the old RCI or Simplot “forage” estimates and flawed methodologies.

Under Alt 6, the non-native understory would INCREASE. See Table 4-329. It is impossible to understand how BLM arrives at the claimed changes in non-native grasses, and the range of assumptions that were used it is also not revealed of highly flawed NRCS Ecosites with often wildly inflated production levels in idealized or modeled communities were used. The Idaho NRCS Ecosite models are fraught with scientific flaws – including use of woefully short unsupportable fire and disturbance intervals used to develop models.

Further it appears that the forage allocations are based on ZERO rest from grazing disturbance. Under these assumptions, would every pasture be grazed every year and stocked to the gills?

BLM rigs alternatives comparisons. BLM artificially manipulates suppression acres to make Alt VI seem better than Alts 1-IV. See FEIS Table 4-680. There is no reason on earth that full suppression would not be maximized in Alt IV, for example. A SEIS must be prepared that does not attempt to artificially rig alternatives so BLM can twist analyses to try to claim that a high and harmful grazing stocking alternative (VI) is “better” for grouse or wildlife than Alt IV for example. We Protest the FEIS forage data and analysis flaws, and Protest the failure of BLM to present a reasonable range of science-based alternatives, rather than sneaking around trying to set things up so it can warp analysis to favor the livestock industry and extractive interests.

Please review WWP comments on GRSB ID-SW MT GRSB DEIS and NE NV-CA GRSB DEIS as support for these concerns. Also Manier et al, 2013.

We Protest the harmful FEIS actions as described above.

Sage Grouse Needs Must Be Basis for any Grazing or Other Allocations and Alternatives - and The FEIS Fails to Do This

BLM must prepare a coherent Plan to conserve habitats and populations. It must prioritize areas and clearly identify what must be done to preserve and restore habitats. This must then be incorporated into determining carrying capacity, capability, conflicts and suitability for any continued livestock use. This then must form the basis of any allocation. The RMP fails to do this. We Protest this.

Slickspot Peppergrass Needs Must Be Basis for Any Grazing Allocations and Alternatives – and the FEIS Fails to do This

Alt IV was supposed to address slickspot peppergrass concerns. We asked why BLM chose Alternative IV A over IV B. BLM stated that it chose 4-A (the smaller size)--- because BLM didn't want to change pasture fences! This has nothing to do with conserving species (now listed as Threatened) - and everything to do with maximizing the status quo for politically powerful ranchers. BLM must remove grazing and trampling disturbance from all slickspot peppergrass habitats – the species was not listed at the time this effort to slice away habitats occurred and will be in the near future. We incorporate

our comments on the 2014 FWS Proposed Listing Rule and the Proposed rule into this Protest.

BLM has not conducted a necessary Habitat and Population analysis to ensure viability of slickspot peppergrass through preservation of habitats and restoration of degraded or fragmented areas of potential habitat.

BLM must provide detailed mapping of all potential habitat, as well as concrete plans for habitat conservation and effective and certain restoration – and this includes grazing removal and livestock facility de-commissioning and some road removals in the affected slickspot and other TES species areas.

BLM must tie existing occupied habitat areas together and re-connect habitats. It must provide for expansive pollinator habitat as well, and constrain livestock grazing, herbicide impacts and other adverse pollinator plant actions. How can BLM maximize continued existence and recovery? An expanded range of alternatives must be provided in a SEIS. We Protest BLMs failure to use current science and make reasonable changes and cuts in livestock use. For example, since this RMP began long ago, the issue of harvester ant LEPA seed predation has arisen. Harvester ants thrive in livestock-disturbed landscapes, and these impacts are unassessed in the FEIS, and will be exacerbated under Alt VI.

We Protest the great failure of the FEIS analysis and alternatives to effectively conserve LEPA habitats.

ADDITIONAL JARBIDGE RMP/FEIS PROTEST POINTS

More Serious Livestock Grazing FEIS Deficiencies and Conflicts

In its meager range of grazing and resource extraction maximization Alternatives, BLM appears to have forgotten the degraded conditions, severe adverse Footprint of livestock facilities and associated roading, increased cheatgrass, loss of microbiotic crusts, depletion of understories, simplified and limited sagebrush habitats as described in the 2007 Jarbidge AMS. The Murphy Fire then followed the AMS and now Long Butte and others have continued to destroy vast areas of habitats.

The old JRMP's use of a range of high AUMs (160,000 to 260,000) has been disastrous. It has resulted in constant tension with ranchers always pushing for more intensive grazing and more facilities, BLM placating the rancher grass greed with post-fire seeding rehab of dense large coarse grasses that have caused even more fires, as well as the TNR boondoggle.

The RMP Management Common to All Alternatives section (DEIS 2-125-2-126, now FEIS 2.8.3.1 and other similar sections across alternatives of the FEIS) contains numerous extremely harmful provisions, including:

The RMP fails to require that any required annual measurable standards of livestock use

be applied. The wording of LC-CA-MA-1 is “Implement **adaptive management** grazing use indicators to meet resource and special designation area objectives”. The, “grazing indicators include” – under which utilization, bank and soil surface alteration, and “other indicators” of unknown type. There is no binding requirement that any indicator be applied. We have been through the ever-shifting use of various terms (here in the Jarbidge it is now GICs) to avoid ever applying required standards. In the Owyhee there have been “AICs” and other acronyms. Plus, in its response to DEIS comments, BLM tries to backpedal from adaptive management. So it is impossible to understand just how lands would be managed in this inconsistent analysis.

There is no adequate framework applied for applying scientifically defensible adaptive management. Specific triggers, sideboards and required actions must be laid down, and concrete actions based on science that are certain to be effective must be required and applied – for example, 10 year closure of degraded riparian areas to bring about some recovery. Nothing in the RMP is specified as required. Ranchers will claim riparian trampling, conservative levels of upland use that provide 9 inches of nesting cover, and other controls on livestock use are “not feasible” – and under this flawed RMP, BLM will not be required to apply this. Under all Alternatives, standards in GOMAs must be mandatory, measurable and based on current ecological science. Specific actions must be laid out to be taken if use or other standards are not met.

BLM refers to GICS “grazing use indicators” and but these are not specified and are left up in the air. There is no certainty that any proper criteria will be applied and will be required to be met.

FEIS 2-363 provides a laundry list of an uncertain “toolbox”. The toolbox is really just typical elements of having cows and sheep on public lands - – with no certainty of what will be applied or required. See Manier et al. 2013 BER review of failed grazing systems in relation sage-grouse expose this list and the foreseeable use levels that will result for what they are – very harmful and demonstrated failing actions that will never effectively protect sage-grouse, watersheds, resource sustainability of the public lands in the Jarbidge.

There is no evidence that grazing in spring on shrubs improves browse. It destroys spring nesting habitat for sage-grouse by reducing sage cover. In the “common to alternatives” section –mule deer appear to be given more importance than sage-grouse. Mule deer can subsist in more degraded habitats than sage-grouse.

Big game habitat and restoration receive attention in FEIS Maps M-17 “Big Game Winter Range and Restoration Areas”. How was this defined?

There is only one map for sage-grouse, i.e. FEIS Map 25. This mapping omits considerable areas where the public has been promised sagebrush habitat restoration and large sums have been spent on it – but livestock grazing was rapidly re-imposed, thus ruining recovery chances. Millions of dollars in rehab have been ground to dust and wasted by the failure of BLM to control livestock use levels and provide adequate rest.

Despite the SSA, BLM has provided no mapping and coherent planning for conserving sage-grouse – yet has laid out mapping identifying habitats for both winter range and restoration for mule deer. BLM then uses this planning to overlay more restrictive mineral leasing, geothermal and other actions on mule deer habitats than for grouse.

BLM doesn't even provide mapping that identifies crucial seasonal habitats - such as winter habitats for sage-grouse –such as in the 71 Desert Brackett-grazed area where BLM has long sought to pretend that sage-grouse are not a very significant concern.

The objective for riparian areas is to “move toward objectives”- not even to ensure significant progress and to achieve goals and objectives. Even controls on trailing are qualified with an anything-goes “out”- using the terminology “**where practical**”. Such loose terms which make any promise optional pervade the entire FEIS and its BMPs and Appendices.

Range infrastructure: 2.8.3.1 continues the same harmful actions as at present. There is no limitation on salting and the thousands of supplement feeding sites that are accelerating habitat declines and weed invasions. Nothing here guarantees a single livestock facility will ever be removed.

In Alt III 2-135 under Fuels, in the DEIS BLM would modify pasture and allotment boundaries to concentrate livestock for fuels reductions – i.e. inflict extreme grazing disturbance that will promote flammable weeds and contribute to a further downward spiral and ecosystem unraveling in the JFO. Yet BLM staff told us that it relied on existing fence lines in its LEPA Proposals. So altering fences for a Threatened plant species is given lower priority than accommodating cattle for dust bowl fuels projects that are likely to result in even worse cheatgrass and flammable weed problems. This whole Alternative is a hopeless jumble of damaging actions, and like Alts II and VI is not a reasonable alternative.

FEIS ES-17-20 shows, in reality, little difference between land area allocations for grazing. See also FEIS ES-19.

Under the Preferred Alt IV and now VI, the canyons are closed because the cows can't access them. A small Inside Desert ACEC is closed. The Sagebrush Sea ACEC is NOT closed, and must be. No matter how high the degree of wildlife habitat and population sensitivity may be to livestock grazing disturbance, BLM imposes this disturbance almost everywhere – only avoiding the areas livestock cannot access like the deep canyons, the ineffective reference areas and some wildlife tracts.

Under the forage BLM has allocated vegetation without any reasoned consideration of impacts to soils and microbiotic crusts, and a specified plan and actions needed for maintenance and recovery. BLM has not shown that lands can recover when faced with continued grazing use in the face of cheatgrass and other weed expansion, or that restoration can be successful with high stocking rates. This must be demonstrated to ensure conservation of sage-grouse, bull trout watersheds, redband trout watersheds, and

other critical habitats and populations. There is no science-based analysis supporting the allocation acreage numbers.

BLM supposedly allocates fairly similar ranges of vegetation to watershed and wildlife in Alts. Yet these allocations do not ensure 9 inches residual nesting cover, protection of sage-grouse from nesting disturbance by livestock and management activity – i.e. habitat security, or recovery of understory forbs that produce essential insects for sage-grouse chicks, etc.

Our experience with BLM utilization measurements at cherry-picked sites and then only on some species shows that these levels are not typically reached – and in fact the measured utilization has often been lower. This is due to: Flaws and bias in how and where BLM measures utilization, the limited species that utilization is measured on, (see Catlin utilization critique), the failure of BLM to measure repeat utilization on species like small native Poas, the failure of BLM to adequately and timely measure utilization during periods when grasses are growing (fall green-up, early spring, spring). The result is that livestock eating green up typically consume much more than BLM ever measures. We are greatly concerned that BLM is setting up a system to allow what it has been allowing in Interim grazing – not accurately monitoring, ignoring the more depleted areas, and leaving the cows on the land until levels are nearly achieved – no matter how long that means they may remain. This is being done in part through artificial supplement feeding to maximize intense use and disturbance - thus promoting cheatgrass, bur buttercup and other weeds and destroying sage-grouse nesting shrub and grass cover characteristics -over large areas, as in the Brackett Antelope Springs allotment. The bottom line: BLM has been conducting the equivalent of **forage mining as the forage has become less and less palatable**. See WWP comments on recent year AGPs (on cd), and imposing maximizing grazing harm and disturbance on sensitive species and watersheds. BLM has also been allowing twice over grazing, and grazing during spring, so the utilization –on an additive and cumulative level – is actually MUCH greater than the amount BLM measures.

BLM provides a different level for exotic species – but fails to clarify if these levels will apply to entire pastures. Will this be based on a certain percentage of the pasture being exotics, or what basis will be used for determining non-native vs. native pasture? Or is BLM even planning to split use within the already tiny pastures? All sagebrush and restoration habitats including smaller areas must be protected – and not be sacrificed if the majority of the pasture is a seeding.

It's hard to understand how 100% of annual grass production could be allocated to watershed and wildlife – yet BLM claims it will be doing grazing to reduce fuels. And how does BLM plan to keep cows and sheep from eating forbs? Or browsing and breaking sagebrush – especially since trampling, eating and battering sage has contributed to the lack of fire recovery and the loss of necessary structural components for GRSG, pygmy rabbit and other species.

BLM claims it will do this all during the permit allocation process. But the way it would

be done must be specified in detail and with clarity here in the Land Use Plan, and not just scattershot BMPs and empty promises made. The more murky and uncertain the RMP, the more each permit process will be subject to even more political meddling – which has long been rife in the Jarbidge.

These allocations do not adequately provide for significantly reduced allocations through removal of exotic grass seedings, greatly increased sagebrush cover, and other measures essential to conserve sage-grouse.

BLM also allocates 100% of shrub and forb production to wildlife and watershed – yet cows consume significant amounts of shrubs as well as forbs in the JFO. How will BLM prevent cattle from consuming/breaking these - other than by removing use entirely?

BLM may never even reduce AUMs in association with restoration, or for conservation of grouse and other values of the public lands. LG-IV-A-3 “forage available for livestock use would likely change as the RMP is implemented, although allocation percentages would remain the same” FEIS 2-363. The RMP punts to changes in AUMs in the future that would be determined after monitoring (which is inadequate, spotty and uses cherry-picked lower impact sites) and site-specific NEPA analysis through future permit renewal processes”. It also appears that the AUM cuts seen in DEIS Table 4-282 would only occur if vegetation treatments are conducted. If there is no money for veg treatments – will there be no cuts? Is this also the case with the FEIS? This is the strategy the SRBOPA RMP relied on to avoid cutting AUMs in the RMP or allocations. The RMP pretended to be doing something, and in reality on the ground nothing has changed, See for example, Fossil Butte grazing permit renewal. With TNR, it is highly likely use will be intensified in the areas not treated.

Where in the RMP FEIS are stocking rate reductions specified if no or limited restoration occurs? We Commented on the DEIS as follows, and these concerns are even greater under the worse actions of the FEIS (see Section 2.8.3, 2.8.3.1 Livestock Grazing FEIS 2-362 through 2-366):

LG-IV-MA-1. “Utilization would be determined on a case by case basis” to meet Riparian, Fish and Wildlife, other Objectives. Since these other objectives are highly uncertain and unclear, it is impossible to understand what levels would be applied.

LG-IV-MA-2 DEIS, FEIS LG-VI-MA-3 referred to Reserve Common Allotments. Instead of retiring livestock grazing permits so any sound investment in habitat and restoration can occur, BLM would sacrifice lands to continued grazing abuse. We strongly oppose these –and they take taxpayer welfare for public lands ranchers to a whole new level. The RMP even allows this harmful practice in intact native vegetation communities, on top of sage-grouse leks, across PPH, etc.

LG-VI-MA-7 FEIS would allow TNR nearly everywhere. In the extremely fragmented and burned JFO, all remnant sagebrush is critical –yet BLM bases imposition of large herds of livestock and even potential repeated grazing bouts in the same year – on barbed

wire configurations of its tiny pastures.

BLM has not provided detailed analysis of the impacts of previous TNR use in promoting cheatgrass, depletion of native communities, and cheatgrass-fueled fires with resultant dense coarse grass and cheatgrass interspace seedings. Again here – the pasture and barbed wire form the entire basis of how these terribly depleted habitats would be managed. Under this bizarre scheme, even occupied bull trout habitat, or LEPA habitat, might be subjected to TNR. BLM makes a complete mockery of the Settlement and all the efforts conservation groups have put into the Jarbidge. No Action is more protective than this travesty. Where has the most TNR been issued – and how does it relate to areas of most frequent fires? Please provide detailed mapping and analysis.

BLM allows TNR to be issued so that use can be taken up to the maximum amount allowed. We believe BLM will interpret allowable TNR use the same way it has been conducting “interim” grazing - by allowing livestock to make near-maximum use on one area of a pasture, then allowing them to remain and trying to lure them into any less grazed areas through supplement feeding, or water in troughs until that area, too, suffers high use. Thus there is no refugia or areas of better cover or habitat conditions for native species remaining.

The RCA, TNR, targeted grazing, etc. appear to be a reason BLM refuses to identify a real plan for restoration – such as fence removal, or water development removal. The more fences and water – the more exploitation for livestock can be maximized. The end result is no minimally grazed or less trampled soils and habitats. This intensive exploitation, as currently being conducted, explains the severe depletion of small animal communities – even in lands that still have some shrubs remaining. BLM clearly means to perpetuate this - and large areas of virtual biological wastelands that have resulted. The FEIS worsens and expands this.

DEIS LG-IV-MA-10 stated BLM will manage “for a variety of cover heights” for ground-nesting birds. It does not meet sage-grouse conservation requirements. BLM staff said they just couldn’t be tied down to any specifics – because – after all – different birds had different requirements. BLM will resort to any artifice to avoid applying necessary protections to conserve sage-grouse. This should be compared to FEIS 2-364, which makes only vague reference to tweaking utilization levels in an unknown and uncertain manner.

This is followed by LG-IV-MA-11. “Follow BLM guidelines for managing greater sage-grouse habitats - BLM then refers to the state plan and local working group plans. This is a ticket for further ecological disaster, The LWGs are rancher and industry-dominated entities fraught with politics, self-serving financial interests, and do not provide sound management for public lands. A *Times-News* article stated the LWG couldn’t even agree on comments on the RMP –yet somehow BLM is supposed to default to the LWG in conserving its crashing population of sage grouse? In the FEIS Alt. VI, sage-grouse needs are scarcely mentioned and considered at all. See Sec 2.8.3.1.

The LWG (ranchers) have built even more livestock /cattle water sources stock ponds – West Nile breeding sites – under a claim that sage-grouse would benefit. The LWG has acted to extend harmful facilities on private and state lands as well as more sage destruction, and not grouse conservation.

BLM must apply mandatory measurable standards of use to provide 9 inch herbaceous nesting cover for sage-grouse across occupied habitats to all permits as a provision of the RMP. It must reduce livestock impacts to understory diversity and shrub canopy complexity. For many native bunchgrasses, essentially no grazing use can be made and this standard achieved until long-term rest has occurred.

Other provisions of this DEIS Preferred Alternative and now the FEIS Proposed Action in section 2.8.3 section allow livestock grazing to occur in mule deer winter habitats (including burned lands where deer may face maximum stress), provide no limit on winter grazing in SG habitats, don't even identify sage-grouse seasonal habitats, provide no limit on spring grazing in sage-grouse lekking and nesting habitats – and generally make a mockery of management to conserve sage-grouse, as was required under the SSA. Other species fare just as poorly.

There is no evidence that “targeted grazing” could effectively control flammable conditions during the situations when wildfirs burn, and not spawn even more cheatgrass and worse noxious weeds invasion. There is serious unaddressed risk that this is likely to cause a downward spiraling ecological degradation. Flammable cheatgrass increase, and further loss of biodiversity, would be the foreseeable consequences of this scheme. See Hempy-Mayer and Pyke for example. This would even allow the imposition of more “temporary” fencing and water hauling and harmful supplements that would promote forage mining – with no clear limits or bounds of damage to be inflicted soils, crust, desirable vegetation and the wildlife that inhabits portions of these lands, including migratory birds and raptors. “Targeted grazing” is more range jargon - highly uncertain, poorly defined, and there is no evidence that it is effective at anything other than further subsidizing a tiny number of politically connected livestock grazing operations.

Despite the extreme industrialization of the landscape Alt. VI allows even more temporary and permanent livestock infrastructure and habitat loss and fragmentation from in FEIS Section 2.8.3.1, and this is linked in part to the severe disturbances of forage treatments, fuels treatments, targeted grazing, TNR and all the other excuses for intensifying livestock degradation for financial gain of permittees.

WWP asked BLM Managers: Where is the “prescription” for livestock grazing in key and restored sage-grouse habitats? We were referred to this section, with its lists of loose and uncertain BMPs or occasional alternatives components strewn across the three volumes. Bottom line: There is no plan to conserve sage-grouse. Yet there is elaborate scheming – as shown in the Alt IV and the even worse Alt VI -Livestock grazing section – to conserve all and even increase- AUMs - impose more use through TNR, targeted grazing, or by classifying areas as grasslands following rehab or “restoration”.

This corresponds to the response WWP's Fite was provided with in the stilted formal blm RMP briefing meetings when this question was asked – How are you conserving sage grouse? In response, scattershot weak piecemeal provisions were pulled by BLM from across the bulky and confusing RMP. Nothing has been provided that laid out a clear and coherent Plan for sage-grouse conservation.

Alternative IV and the even worse alt VI will not clearly and effectively conserve sage-grouse habitats and populations.

Alternative V (2-143 to 2-145) is only somewhat better. It does not provide a grazing allocation that comports with the Alternative that WWP submitted, or that will do all that is necessary to conserve sage-grouse and pygmy rabbit, restore LEPA, and protect bull trout, redband trout and other rare and imperiled species, watersheds, and many diverse recreational uses and enjoyment of the public lands. Alternative V is not the Alternative that WWP submitted. Only 303,000 acres ES -19 -and this was reduced by 6000 acres from the Draft – why?) would not have chronic grazing disturbance. We do not trust BLM not to allow TNR or other use to occur even in the unallocated areas. It is unclear if that could occur using trumped up “fuels” or other subterfuges.

The range of “allocation” shows that 80 to 90% of “forage” would be allocated to wildlife. There is much more than forage “production” to be considered in making an allocation – like space and sagebrush complex structural cover. Animals need habitat security and space- freedom from disturbance to provide nesting, winter and other habitat security, the ability to move across the landscape and fulfill all a species habitat needs over the course of the year, providing a thriving diversity of native understory components, providing necessary shrub canopy and structural complexity, etc. There is no evidence provided that obsessing over “perennial forage” alone will achieve conservation of sage-grouse.

BLM must analyze an expanded range of alternatives in a SEIS, including removal of livestock from all lands in the Sagebrush Sea ACEC, and in areas identified as ACECs in the 2007 WWP Alternative that BLM did not adequately address.

All lands where restoration is undertaken must have livestock removed – to protect the public's very costly investment needed to conserve the species. This has not been done in the past, and weed proliferation, desertification and biodiversity losses have been the result. See Dobkin and Sauder 2004, Jarbidge AMS, BLM's small mammal studies, Jarbidge Bartels and other Pygmy Rabbit studies, and now the 2014 Arkle et al. study on failed rehab across BLM grazed lands.

BLM must also analyze a No Grazing Alternative for the entire Jarbidge FO – especially since it chose to analyze several near-status quo now more increased livestock grazing alternatives. The RMP alternatives fail to take into account and “allocate” based on removal of non-native perennial grasses to reduce coarse dense unpalatable fuel hazards, and to provide for recovery of the full component of native vegetation and healthy microbial crusts required to support sagebrush ecosystems, and sage-grouse.

Alternatives should also not “allocate” any annual grass to “watershed and wildlife” – it should act to restore these weedlands. Further, as the Catlin report critique demonstrates, BLM use measurement techniques fail to effectively detect the often severe degree of use that is occurring.

Again, we have no idea how BLM plans to keep cows from eating sagebrush, and breaking off shrubs - in its fantastical 100% non use level. Recent studies from the Bi-state Mono Basin region highlight the need for complex screening shrub cover in areas with deficient understories. Other recent studies across the GRSG range show this too. Yet the Jarbidge has some of the most simplified livestock-battered and reduced “see-through” big sagebrush communities we have ever seen – as in Poison Butte and Inside Desert southern areas including south of the Murphy-Rogerson road. This is due to livestock browse and breakage. It also slows recovery following fire as well, since growth is less, and seed stalks are eaten or broken – reducing reproductive potential.

BLM stated in the DEIS at 2-143: “the purpose of allocating vegetation is to determine the total AUMs available for livestock grazing”. We again stress that the huge livestock disturbance footprint and conflicts with TES species, recreation, etc, and the need for recovery of native components must be factored into any RMP grazing allocation – and it has not been. This is also necessary to comply with the SSA. BLM claimed that Allocation percentages are not the same as utilization, as the allocation is used to identify the total number of AUMs for livestock, while utilization identifies the amount of vegetation used by livestock in a specific area”. This is gibberish. It also divorces “forage” from all the other elements of “habitat” that sage-grouse and other species require.

The use of “forage” as the basis for allocating lands for grazing use shows that BLM has ignored a primary component of the RMP –i.e. to conserve sage-grouse. Grouse do not eat grass. They have complex habitat requirements, and enhancing and preserving those, and restoring large areas, must be the basis of making any cattle “forage” allocation. See Connelly et al. 2004, Knick and Connelly 2009 USGS *Studies in Avian Biology Sage-Grouse Monograph*.

In order to allocate lands or AUMs, or have any basis for understanding impacts of actions or alternatives, BLM must tie AUMs to mandatory annual measurable utilization caps, avoidance of spring grazing on top of nesting sage-grouse and other birds and wildlife during sensitive periods (see Braun 2006). BLM must have all of this info laid out to tie together all the components of an alternative.

BLM claims forage allocated would remain the same, though vegetation would change. What does this mean – that cows are always constant? There is great unassessed risk in this scheme.

This DEIS Pref Alt contained untenable MAs: 1, 4, 5, 6. While it is nice that mule deer might not have to deal with cows in the winter in highly degraded areas under Alt IV–sage-grouse would have to deal with them under this RMP. In MA 7 –bighorn sheep needs must be analyzed beyond the pasture confinements, 8 has no requirement for

“diversity”, etc. This must be clarified as referring to native species diversity. MA 10 – the nebulous “targeted grazing” - is a wide open category for any and all kinds of extreme grazing disturbance and loss of native vegetation components, forbs, microbotic crusts, and soil health and function. In the FEIS Alt VI, even many of these meager measures are lacking.

Range Infrastructure: BLM still continues all manner of projects, allows the weed-proliferation supplemental feeding to continue and enables expanded new temporary and other water and fencing sites.

While the RMP mentions “remove fences that are not needed”, it appears that hardly any fences would be removed since grazing would continue over > 4/5 of the FO under the most protective Alt (V), and much of the land area would be wide open to additional “temporary” or other fencing under the murky fuels proposals.

BLM fails to even consider the fundamental principles of an actual science-based carrying capacity and suitability analysis in its obsession with its never-explained and complicated “forage” machinations and allocation.

BLM must specify that areas are closed. They must be Unavailable under all circumstances. Sage-grouse need 9 inches of residual cover and abundant structurally complex sagebrush, and an absence of cheatgrass.

The FEIS Livestock facility MAs will only exacerbate sage-grouse and other wildlife declines. BLM must focus on removing spring developments, and other facilities – not on building even more. How many springs remain undeveloped? What restoration actions are needed?

Reference to a 6 inch residual cover was buried in the midst of BMPs at A-81 in the DEIS, and there is no requirement that even this inadequate measure be applied to all sage-grouse habitats and to recover seeded areas. We cannot find it in the FEIS. BLM makes reference to trivial 4 inches in the FEIS when discussing its useless and ineffective sagebrush Zone which is used in part as an excuse to not designate ACECs.

Throughout the RMP, it is unclear if “sagebrush” habitats or communities would be suddenly removed from that category with a fire, or if many of the recently burned areas are now considered by BLM to no longer be sagebrush habitats and thus not managed for sage-grouse or other sagebrush-dependent species. This indeed appears to be the case. BLM must recover and manage as sagebrush habitats all lands where sagebrush was present at the time of the 1987 RMP. In the laundry list of BMPs -“Upland” does not even ban supplements in sagebrush habitat.

We Protest this welter of FEIS deficiencies.

More RMP Alternatives Deficiencies and Concerns

Jarbidge lands are highly altered, degraded and fragmented. Wildlife populations are reduced, and in many instances appear to be below the level of viability already. BLM after years of delay has issued a cookie cutter EIS that makes a sham of addressing a range of reasonable alternatives in the context of the Jarbidge's ecological setting and the stressors on the public lands and biota that inhabit these lands.

To be reasonable and science-based, all the Actions related to components of the environment within an Alternative should be **achievable, compatible with one another, and designed to meet the threats to, demands on, and challenges facing the public lands in the context of the current dire state of the collapsing sagebrush ecosystem of the Jarbidge**. The EIS has failed miserably.

WWP and other commentors provided BLM with extensive comments and scientific literature to demonstrate that ecological processes and native biota of the Jarbidge require extraordinary action to stop further losses. We provided extensive verbal comments, too - in the context of Settlement Group RMP Update meetings and other contacts over the past several years. WWP specifically requested to meet with resources specialists over the past several years to discuss our concerns about the RMP Alternatives and components. BLM did not allow this outside the industry-Attorney meetings. BLM's closed door blindered agency process - and it appears political pressure - produced a document that does not have a reasonable range of alternatives to address the greatly altered ecosystem. BLM continued on a rigid path, and produced an RMP where several Alternatives are deeply flawed, do not provide for the long-term benefit of the American people. These alternatives are fraught with internal conflict.

We Protest this.

BLM Never Used Its Own Past Failures to Develop a Reality and Science-Based RMP

The promises made to the public to protect wildlife habitats and populations, native vegetation communities, watersheds, recreational uses, etc. in the 1987 RMP were never met. Land conditions and populations of native biota spiraled downward over the past 25 years. BLM's own AMS showed that. Since the AMS, the situation has only worsened.

BLM must honestly address why this occurred, and employ a range of alternatives that forge a new direction in this current effort. It has not. The RMP fails to take a hard look at causal factors, and analyze the likelihood of being able to achieve the goals and outcomes to protect public lands and resources with current science and these stresses in mind.

There is great internal conflict Between Allocations, Goals, Objectives, and Promises of Restoration both within and between Alternatives. Doesn't an RMP have to "make sense" under NEPA? So that one part is not impossible to achieve with the others? Honest analysis of the feasibility and effectiveness of each alternative has not been provided. A SEIS must be prepared.

We Protest these deficiencies.

Artificial FRCC Categories, Models and Confusion Provide Little Basis for Managing Wild Sagebrush Lands – Fire/Disturbance Interval Science Is Changing

BLM's use of the FRCC 1,2,3 categories as a basis for credible land use planning in the context of the Jarbidge landscape imposes idealized models with highly uncertain and questionable inputs as the basis for long-term land management. With models, if garbage is put into the model, the output will be garbage. BLM never lays out the assumptions made in the FRCC, Fuels, and Vegetation Community modeling.

FRCC was first developed for forested large tree areas (like Ponderosa pine forests). Inputs/supposed science on which disturbance intervals are based are ever-changing, and they depend on whose research one believes. This is part of the input that is factored into FRCC. This is then used to claim that lands need to be further disturbed, or they will be outside a historical range of disturbance. Plus, lands in FRCC 1 or often FRCC 2, as BLM applies this loose, uncertain and ever-changing Fuel description system to sagebrush landscapes - typically have few shrubs and provide unsuitable habitat for nearly all native wildlife. As FRCC is typically applied by BLM, it is used to justify any and all manner of major disturbance to native plant communities. The models basically discriminate against the type of habitats in shortest supply for sage-grouse, pygmy rabbit, etc. – i.e. mature and relatively dense canopy sagebrush communities with complex shrub structure and understories – because these communities take a long time to recover, and grazing often retards or precludes their full development.

For example, many “range” scientists, and the NRCS Ecosite and other unvetted models used by Idaho BLM, cling to erroneous short fire return/disturbance intervals, and ignore or underplay the role and importance of microbiotic crusts in healthy vegetation communities and full ecological function. Papers that short-cut ecology are produced to support the livestock industry and unsustainable grazing levels. Outcomes of these papers get plugged into the vegetation condition and disturbance “boxes” of the FRCC scheme *du jour*. It is quite likely that the fire disturbance interval used in preparation of this RMP is now already outdated. Please review Knick and Connelly *Studies in Avian Biology* (2009/2011), article by William Baker, and other Chapters where fire is discussed. See also Baker and Bukowski 2013. What fire disturbance intervals is the RMP FRCC analysis based on? Will BLM update this and provide detailed analysis of how it arrived at claimed disturbance intervals in analysis of an expanded range of alternatives.

Idaho BLM signed a ROD for an eastern Idaho Vegetation and Fuels EIS that includes Jarbidge lands that has woefully outdated and erroneous fire/disturbance intervals as its basis. BLM cannot rely on that greatly flawed document for “treatments” under this RMP. ALL inputs and assumptions into the models used must be clearly explained so the validity of the entire mammoth EIS Fuels and Veg sections - which of course feed into the bloated AUM allocations – can be determined.

BLM, while spending dozens of pages on FRCC, greatly ignores assessment of the on the ground predicted effects of Climate Change stress on Jarbidge lands, and fails to develop alternatives to buffer and minimize adverse impacts of climate change effects, including buffer disturbances to remaining sagebrush habitats and lands necessary for restoration for conservation and enhancement of sage-grouse and other TES species habitats and populations.

BLM must provide detailed analysis of how fire/disturbance and vegetation characteristics have changed since the FRCC analysis and alternatives development. BLM must provide a detailed Appendix that lays this all out, and mapping that shows the current 2014 FRCC Categories for the FO and explains in great detail how they were derived. We have seen agency-accepted fire/disturbance intervals be lengthened by 100% or more - just in the time this RMP has been in preparation. The dire status of sage-grouse and the sagebrush ecosystem with which its fate is so closely intertwined has resulted in much more critical examination of range scientists who BLM has relied on in the past - who wrongly claimed fires in ARTRWY and other sage communities known known to have very long fire return intervals were frequent – 50-75 years, or so in many sagebrush communities. See Knick

BLM does not adequately explain how FRCC applies to all the exotic crested wheatgrass or coarse cultivar and cheatgrass lands. BLM has not provided necessary info and analysis on how sparse and little-vegetated, as well as how structurally simplified and desertified lands would be if managed under FRCC 1 and 2. Lands would be nearly devoid of all species of sagebrush-dependent wildlife. What species would thrive under each FRCC Class? What species would face further habitat contraction and loss?

BLM points to its ever-changing planning handbook. Nothing in FLPMA, which should provide the over-arching basis for understanding Land Use Planning - refers to artificial, often arbitrary and ever-changing FRCC categories layered with complicated modeling as the basis for managing this landscape. Best available science must be used. But first, the public needs to be told WHAT science and assumptions BLM has used.

We have seen FRCC used even in highly fragmented and degraded areas to promote disturbance of remnant mature and old growth vegetation – through claiming the remnant veg is unhealthy, outside the “historic range of variability”, or otherwise in need of being radically disturbed by human intervention that kills or alters native vegetation to reach a “desired” state.

WWP Attached Comments on Pocatello RMP, and the WWP Appeal of Jarbidge BLM’s 2010 Long Butte Fire ESR and Rehab Plan to the DEIS comments. These were ignored. A SEIS is essential to address these serious ecological concerns.

We Protest the use of FRCC and other models with unknown and unexplained assumptions and inputs as the basis for the limited range of RMP alternatives.

We Protest the inadequate actions and analysis of the FEIS as described above.

Additional FRCC, Fuels, Modeling Concerns

In the FEIS, BLM has rigged various Alt. suppression allocations among alternatives to make alternatives with a bit less grazing seem bad for sage-grouse and other wildlife. See FEIS ES-5 and maps M-30 through 36. Questions abound. Why does Alt 2 show suppression primarily only in the WUI? This is not realistic in an RMP that is to conserve sage-grouse – and BLM knows it. This is an example of BLM drawing up fantasyland alternative components so it can claim it analyzed a range of alternatives – no matter how far removed from the current reality and the need for providing for sustainable and viable wildlife populations and habitats that they may be. Alt 2 is unreasonable in its entirety.

FEIS Alt V suppression must be applied to all alternatives (see Map M-35). If this is feasible in V it is feasible under all Alts. It is alarming that BLM would allow the greatly intermingled grass areas to not be suppressed –because those fires will take out the sage that still is present – and this is just what has happened time after time in the Jarbidge.

At some point as this RMP process dragged on and on without a EIS being produced, it appears that the RMP agency planning process became pretty much an exercise in “modeling” idealized alternatives tied to bulky lists of BMPs, with little foundation in reality. Planning appears to have become a game of sorts, unmoored from the need to conserve, enhance, restore, sustain and protect the public land values including GRSG and other TES species habitats and populations, and the wide range of public recreational uses of this landscape.

Why does BLM even bother relying on the FRCC in this way in such a drastically altered landscape? Since FRCC requires a certain percentage of vegetation communities to be in the arbitrary and ever-changing Ideal “disturbed” states, to develop a range of Alternatives based on FRCC results in BLM considering many actions that everyone knows it will never adopt, and that are not realistic in the Jarbidge over the next 20 years.

How can BLM conserve sage-grouse with such limited suppression in the Proposed Alternative? Major efforts are right now under No Action made to suppress fires – yet the FEIS pretends otherwise. Please be honest. BLM needs to provide info based on what really is occurring now and what actually would occur in the next 20 years. We strongly object to BLM relying on the added layer of “VMAs” that chop the Jarbidge lands into sections from north to south - rather than on protection of all native communities in this planning effort. The artificial VMA break-down is then used to sacrifice areas to different levels of destructive management under the artificial FRCC classes and the other components of the RMP.

BLM needs to protect and restore sagebrush habitats – not lump remaining sagebrush, rabbitbrush or native Poa grassland areas into various contrived categories, throw some jargon about resiliency on top of them, and then use this to degrade them through “intensive” Fuels or “targeted” grazing or other actions. See Connelly 2013.

We suggested that the entire FRCC section be removed, and BLM under vegetation, wildlife, etc. have a goal of suppression across all alternatives, with protection of all existing and recovering native communities, surrounded by a five mile buffer, being the highest priority to conserve and enhance sage-grouse habitats. This is a reasonable plan to serve as the basis for conservation efforts and compliance with the SSA and FLPMA.

Just how feasible is it to suppress fire with water in wild lands? This makes little sense. This appears to be an effort for ranchers to expand pipe systems and intensify grazing use even further under cover of fire/fuels suppression.

Fuel treatments have not been shown to be effective in the Jarbidge in the past. All fuels treatments that reduce or simplify native vegetation should be greatly restricted. Fuels concerns have been used to excuse/justify manipulation of native shrubs and trees to promote livestock forage – and often weedy flammable annual grasses thrive in the aftermath – thus exacerbating wildfire concerns.

We strongly oppose use of exotic weedy species like forage kochia, or crested wheat grass, or any others - in fuelbreaks.

There are large irrigated meadows/pasture by Three Creek, as well as large irrigated areas near Rogerson – which form fuelbreaks much more substantial and effective than anything BLM could do. Mapping and analysis must factor in what is actually present on these lands - so the public can understand how limited risk is here in many of these areas. Why isn't the first thing – and the overwhelming emphasis of the RMP - maximizing the retention of all components of native vegetation communities”?

Under any component of the discussion of Fuels, a full and science-based analysis of the impacts of livestock grazing in spreading flammable cheatgrass must be incorporated, and actions taken to significantly reduce livestock disturbances and promote microbial crusts.

“NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. . . . Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA.” 40 C.F.R. § 1500.1(b) (emphasis added). NEPA’s emphasis on “the importance of coherent and comprehensive up-front environmental analysis [] ensure[s] informed decision making to the end that the agency will not act on incomplete information, only to regret its decision after it is too late to correct.” Blue Mtns. Biodiversity Project v. Blackwood, 161 F.3d 1208, 1216 (9th Cir. 1998) (emphasis added).

Please provide full and detailed analysis of the effects of using small statured native plants such as Poa and yarrow vs. use of exotics, and place management emphasis on healing and recovering microbial crusts in interspaces to prevent cheatgrass and other annual weed invasions.

BLM under all alternatives must consider large-scale removal of cwg/swg and other large statured coarse and unpalatable flammable grasses. These should be replaced with small native Poa, yarrow and the like. The livestock grazing, facility, and all other components of the RMP must mesh with this essential removal of disastrous post-fire and other livestock forage-based seedings. Rather than weed and methane-promoting grazing, any fuelbreaks can be mowed in this immensely roaded and often flat landscape.

BLM has not shown that any Fuelbreaks it has planted or constructed over all the years in the Jarbidge have been effective. Before BLM disturbs and destroys native plants, or plants even more exotics as fuelbreaks, detailed analysis of the effectiveness of past fuel and seeding projects must be provided. There is no action alternative that would not result in massive habitat disturbance from Fuelbreaks and a battery of other “treatments”.

Alt V allows Fuelbreaks along designated roads and primitive roads. This means that there could be hundreds or even thousands of miles of fuelbreaks of unknown width—drastically adding to the negative Footprint and habitat fragmentation of the road network in the Jarbidge. See Map 56, FEIS at 57 that shows the appalling number and density of roads in the JFO. The other alternatives appear to virtually turn the entire landscape into a giant fuelbreak – sacrificing all other values.

BLM has planted several hundred thousand acres of crested wheatgrass in the Jarbidge – which it has repeatedly claimed served as a fuelbreak. That was and is not true, and the public was misled. The more cwg, and artificially dense grass in general – the more frequent the fires have been. Lands become more desertified, and dry out earlier because there is nothing to shade the ground, there is no wind break of any kind near ground level, and the fire season is prolonged. BLM has seeded its hundreds of thousands of acres of “fuelbreaks” much too densely. See WWP Long Butte fire appeal, and RMP mapping of areas of frequent recent fires.

The fuelbreak action that we support is replacement of large-statured coarse exotic and cultivar grasses with small native Poas and yarrow, while disturbing no native shrub communities. This must be considered in an expanded range of alternatives that rely on REMOVAL of the vast coarse over-sized densely planted grasslands as a Fuels and habitat action. Simply replace flammable and other exotics with small statured natives. This was, after all, the recommendation of former BLM Managers on a tour at the outset of the RMP process. BLM conveniently buried that finding, and refuses to provide alternatives that significantly reduce the coarse tall dense grass seedings and weedlands.

We Protest BLM’s failure to fully analyze these serious concerns, provide a proper baseline of information, and learn from its past mistakes – such as the vast existing cwg fuelbreak seeding – that is reality is the CAUSE of many frequent fires. We Protest all of these FEIS analysis and alternatives deficiencies.

More RMP FEIS Vegetation Concerns

BLM complicates the vegetation section (FEIS ES-6 to ES-7.and “Vegetation

Communities” and “Wildland Fire Ecology and Management” portions of the RMP across all Alts.). The vegetation totals became different due to the Long Butte fire. Have they been updated?

BLM must consider an alternative that removes livestock to improve lands across the Field Office through natural plant succession in native community areas. It must reduce non-native perennial communities so that they comprise less than 1/3 of their present area. Fuelbreak actions would replace seeded coarse dense exotic or coarse cultivars grasses with small-statured native Poas and yarrow or other short forbs. Seeded Fuelbreak areas would receive no grazing use, to maximize microbiotic crust recovery, and prevent cheatgrass and other weed expansion. Fuelbreaks will be based on - at a minimum - existing pasture fences. The FEIS fails to do this.

Native shrub recovery must be allowed in these areas to help further moderate recovery. Over the life of the Plan, with the high livestock disturbance burden, and livestock trampling, injuring and retarding any rehab actions, high densities of recovering shrubs in these fuelbreak areas are not likely. Braun 2006, Knick and Connelly 2009/2011.

BLM includes unproven and unscientific rancher grazing schemes as the basis of its Vegetation and Fuels in Alternative II, III and now VI.

The RMP would allow a greater burden of fencing to be imposed following fires. In the already densely fenced JFO, there is no valid reason for this. BLM has failed to provide detailed mapping and analysis of all existing fences that were placed in piecemeal fashion following fires since the 1987 RMP. Carving off unburned lands for continued intensive use is precisely what BLM has done in the past post-fire. It has only served to lead to further degradation of remaining unburned lands.

There is no clarity provided on what will comprise a native plant community. Will cwg with some sagebrush be treated as non-native? Cwg and rabbitbrush? Mottled and mixed communities currently abound here. That is one of the flaws with past veg studies – LM selected more “pure” areas – leaving the weedier sites out of monitoring and baseline data collection, including the ESI at times. We are alarmed that the RMP treats Poa communities as expendable for TNR and other severe cheatgrass-causing grazing disturbances.

The EIS’s Alt V – which is supposed to be an environmentally “friendly” alternative – would retain vast areas of exotic seedings, and annuals and non-native understory. See FEIS Table Table ES-1, ES-6 and 7. BLM purposefully rigs this by claiming there would be no active restoration – such as seeding sage or ripping out cwg under that Alt. It is done to make the seriously flawed other Alts seem more desirable, and rig the sage-gorse benefit comparison by alternative. See Table ES-1, pages ES-6 through 9.

We strongly oppose the use of VMA segregation schemes to sacrifice habitats.

Why in the world would BLM want to manage for a “native grassland” – of 130,000

acres in VMA B- unless it was giving overwhelming weight to ranchers over sage-grouse and other imperiled species habitat needs? This is not a reasonable alternative. Or for other vast grassland acreages elsewhere in the other VMAs across the flawed Alts.? The goal should be to **recover native shrubs in as many areas as possible** – so if a fire does occur, relative losses will not be as great. This is NOT a prairie –it is supposed to be shrubsteppe and some salt desert shrub. This rigged Alternative scheme and artificial segregation into VMAs and then breaking that down into a miscellany of percentages treated vs. retained - all appears to be part of BLM’s trying to impose an artificial FRCC to benefit ranchers and fit veg into various confusing acronym categories so it can continue to act in every possible way except that which would effectively conserve sage-grouse and other TES species.

This elaborate focus on Veg acres is also part of covering up the immense and damaging continued livestock disturbance footprint and series of harmful actions that would continue.

We fear the reason **BLM is proposing to manage for grasslands** is because - as shrub cover increases in grazed landscapes - lands may have less cattle forage grass productivity. We note this is not the case in ungrazed areas where both shrubs and grass increase– as studies at INEL (Anderson and Holte, Anderson and Inouye) found. But it has been shown in past RCI and other heavily grazed Jarbidge landscape studies to be so.

With its elaborate veg percentages BLM tries to impose a “farm” mentality on public wild lands. The problem is – wild land systems subject to drought, flood, fire, insects including sage defoliators and army cutworms that may kill grass, and all manner of human degradation do not respond like an irrigated plowed field. This also ignores that communities in greatly manipulated landscapes like this are often mottled and mixed, too.

BLM has not provided clarity on how it categorized lands into VSGs. What specific data inputs were used? Detailed mapping and analysis must be provided so that this process can be understood. This still has not been done in the FEIS, and a SEIS must be prepared.

One or two fires could greatly change acreages. **It is far simpler to set a goal of managing for native species and expanding native habitats and connectivity - and maximizing native shrubs while minimizing invasive species.** The confusing range of Veg allocations seems designed to cause continuing conflict over the next 20 years.

We Protest all of these deficiencies.

VMA Segregation Adds to Confusion and Fails to Meet Requirements to Conserve Sage-Grouse

BLM fails to provide adequate detailed mapping, analysis and ecological science for understanding the complexities of its segregation of areas of the FO into yet another category – the VMA. This segregation appears to have very little to do with conserving and recovering sagebrush dependent species with viable and thriving populations. It

appears to have everything to do with maintaining chronic livestock grazing disturbance and high stocking rates over 4/5 or more of the FO. BLM overlays FRCC and other actions on top of this in its series of industry-centered alternatives.

BLM appears to be clinging to some hope that it can “conserve” sage-grouse by focusing its efforts in large part on only some portions of the land area, primarily VMA D – 20% or less of the FO. Why else would BLM propose GOMAs as it does? Why else would BLM propose under its DEIS Preferred Alternative to only designate a small sagebrush ACEC area and now in the FEIS gut even the existing bighorn alternative, and to allow all manner of development and extractive use and destruction of natural resources to occur over the great majority of the FO under all alternatives – in defiance of all current ecological science? See USFWS WBP Finding for GRSG, Knick and Connelly (2009/2011).

Sage-grouse and other sagebrush wildlife need to be able to fully occupy and thrive across much larger areas of the JFO to sustain viable populations. What part of “sage-grouse are a landscape species” does the BLM not understand? Under its Proposed Action, BLM would even be able to further manipulate and destroy remaining native sagebrush communities. This, of course it to benefit ranchers – and even recent Wyoming research and other shows no real positive effects for sage-grouse of sagebrush removal.

Yet is well-documented, and has been well-known for the past several years, that the removal of livestock grazing from Hart Mountain and the Steens in Oregon promoted rapid passive recovery of sagebrush habitats and thriving populations of dependent species.

BLM refers to monitoring microbiotic crusts – but this appears to be in relation to reference areas. BLM establishes no annual required monitoring protocol for livestock trampling impacts to microbiotic crusts – so that further damage to these depleted crucial elements of sagebrush ecosystems can be protected and recovered.

At DEIS at 4-145 (and this continues in the FEIS), we learned than BLM’s definitions and predictions of “mid-seral” are based on categorizing mid-seral as **5-25%** sagebrush canopy cover. Yet sage-grouse require at a minimum 15% cover, and it is increasingly known that especially in depleted areas - much higher canopy cover is required – as shown by Mono Lake/Bi-state and other recent sage-grouse research. Sage-grouse typically nest in the densest sage in an area – so why would BLM impose such a limited canopy cover? It appears to be so BLM could thin lands to levels as low as 5% for livestock forage.

There is a huge difference between 5% and 25% sagebrush cover. In the past, BLM refused to consider 5% sagebrush canopy cover as the basis for management as sagebrush habitats. Now, when it is to BLM’s advantage to paint it’s deeply flawed and limited range of alternatives in a favorable light – we are suddenly told y BLM that 5% is “mid-seral” sagebrush habitat. BLM Must fully assess the prolonged time periods it may take for sage to achieve these levels of cover, and how grazing hinders or precludes recovery.

This prediction is also wildly optimistic – as BLM provides no mandatory measurable standards of sagebrush breakage or trampling of seedlings, and no required mandatory measurable standards of use to prevent continued advances of cheatgrass in understories. Cheatgrass chokes the ground surface and prevents sagebrush seedling establishment. BLM allows near-non-stop grazing for the Simplot and various Brackett and Guerry operations that dominate nearly the entire JFO south of Saylor Creek. Since many areas are so depleted, and winter grazing occurs, too, livestock are often forced to eat whatever is sticking up above the snow. Witness the severe depletion of the four-wing saltbush and sagebrush wildlife and rehab plantings in portions of Poison Creek, 71 Desert, and Inside Desert.

BLM makes no commitment to remove livestock grazing from areas it would restore—either permanently or for 10 years so that natural recovery can be jump-started and taxpayer investments in restoration actions be protected.

Over the years, we have documented the high levels of use to sagebrush in Brackett and other allotments – where seedlings and young plants following fires remain broken and browsed by livestock for many years – slowing growth, recolonization, and recovery. Domestic sheep devour sagebrush, as well – and cattle in depleted chronically grazed lands –especially the vast coarse seeding areas of the JFO seek any relief from the coarse unpalatable large grasses BLM insists in continuing to use. In many areas including remaining sagebrush habitats, domestic sheep are run on top of cattle – grazing the same lands.

It is impossible to understand how these percent ranges were derived – as there is no supporting science or research to understand where this extremely broad 5-25% mid-seral range came from.

At a minimum, all burned areas where BLM in the past has promised in fire rehab efforts that sagebrush must recover or be restored, and should be identified for recovery here. These must be delineated in a SEIS, and a clear plan developed.

VMA A actions continue to promote grass seedings and this is not a reasonable alternative. VMA B and VMA C Actions continue intensive livestock grazing in native shrub and grass areas. This fails to recover vast areas of native and perennial “grasslands”.

In the DEIS, 4-146 VMA C proposed “assisted succession” – i.e. further fragmentation and destruction of shrubs in sagebrush communities in order to attempt to get some forb or grass growth. This appears to still be in the FEIS under 2-118 UV-II-MA-8 – allowing treatment of native shrub lands. “to increase late seral grasses”. Alt VI – FEIS 2-3339, also allows this invasive disturbance treatment to produce “late seral grasses” aka cattle forage. These flawed actions are arbitrary and are repeated across the VMAs and alternatives. Many research projects have shown this is a waste – and will only lead to further losses. This includes pygmy rabbit studies in Utah, and a very large study of various methods of sagebrush destruction in Wyoming. See Hess and Beck 2010, Beck et al. 2012, Jones et al. 2013. BLM must replace any part of the RMP where it would use “assisted succession” to destroy or alter native shrub communities (including rabbitbrush

which is successional to sagebrush and serves to moderate site conditions and provide at least some structural complexity and site moderation in the vast burned and intensively grazed and trampled areas especially of the central and south-central Jarbidge) with “removal of livestock grazing disturbance to promote forb, microbial crusts, and understory recovery”. It is unclear if this has been done in the FEIS, as the discussion of seral stages is so sprawling and nonsensical. In any one pasture, there could be numerous seral stages, weedlands, etc. – a legacy of the severe past grazing, harmful methods of fire rehab, purposeful past treatment and extreme grazing, facility and roading footprint.

It is not possible to understand what is supposed to occur under various alternatives – given statements like VMA C for Alt II, UV-III-MA-9. Actions refer to whole other confusing sections of the RMP – the confusing noxious weeds and invasive plants section, and wildland fire ecology model scheme sections. There is no clarity what many of the various Alt provisions actually mean- example IV-II-MA-10 means. Would BLM “treat” one part of 50 % of all pastures – or the entire land area referred to with 50%?

UV-II-G-1 is incompatible with sage-grouse conservation. UV-II-MA-2 and MA-VI in occupied sage-grouse habitat are not reasonable, given the overwhelming amount of cwg already present. Nor is UV-II-MA-3. BLM might as well just call Alt II the Feedlot Alt in the FEIS. Many of the goals are meaningless – like not treating canyon walls, as the FEIS essentially does here (2.4.2.5, for example).

Under Alt II it seems protecting forage and interfaces from burning up is the priority –as it focuses a lot on VMA A. Isn't that the case? This alternative and others over-emphasize herbicide use without analyzing adverse effects, drift, harm to non-target species, soil contamination, etc.– while continuing to inflict severe livestock grazing disturbances on public lands, including damaging “targeted grazing”, and even “prescribed fire”. The degree and severity of risks with the herbicide use are not adequately examined in the EIS. BLM cannot rely on the now-dated and deficient 17 States Veg Treatment Weed EIS. The Oust herbicide drift disaster in Idaho and its outcomes, and much other new information, have demonstrated serious deficiencies with that complicated document. This is especially the case because of wind, wind-blown soil, and other drift in the vast depleted lands of the JFO that currently lack many natural windbreaks, and the dust bowl-like conditions that the Proposed Action would generate under targeted grazing, fuels treatments, etc. and the higher grazing allocation.

BLM cannot rely on the PER report that accompanied the Veg/Weed EIS to coer analysis of herbicide use in combination with the massive treatment scheme of the FEIS. No NEPA was ever conducted on that document. What NEPA coverage does BLM believe it will have for its welter of fuels and veg treatments? The RMP in its present form certainly is not adequate. A SEIS must be prepared.

Alt III does not conserve sage-grouse and instead primarily conserves cattle and sheep grazing, and it is not a viable alternative.

Management of lands, and the discussion under Alt IV, is also a morass of uncertainty.

Here, VMA A: Only 25% of the vast exotic grass seedings (many of these post-fire rehab where cwg was supposed to be a placeholder” for sagebrush establishment) would be restored. This same problem plagues the other alternatives. It is important to restore native seedings in areas **across** the sagebrush habitats of the north to whatever degree is necessary to recover the recently occupied leks for sage-grouse and other sagebrush dependent species – like loggerhead shrike, Brewer’s sparrow, sage sparrow, sage thrasher) use here. BLM forsakes removal of the coarse unpalatable grasses in UV-IV-MA-3, and others across Alternatives.

UV-IV-MA-5 allows further destruction of sagebrush, even though abundant studies now show this is ineffective. See Hess and Beck 2010, Jones et al. 2013.

Removal of livestock and allowing required mandatory measurable standards of use, significant rest or passive recovery is not even a fundamental part (MA) of Alternative IV and certainly not of the FEIS Proposed Action, either.

How can BLM hope to “restore the resiliency of ecosystem structure and function, and reduce fragmentation of habitat for sage-grouse and other native species” – if it will not admit the very significant - and in the case of the Jarbidge severe – adverse effects of grazing on ecosystem structure, function, and resiliency? See Fleischner 1994. There is no emphasis on recovery of microbiotic crusts, as there are no measurable standards to limit chronic grazing disturbance, no goals for percent recovery, no goals to protect remnant better conditions areas. etc. These concerns apply to all of the VMAs and alternatives in the FEIS.

VMA B is nearly 2/5 of the land area of the FO, and it is a large portion of the land area essential to recover for a viable and inter-connected population of sage-grouse to thrive and be conserved. There is no current accurate baseline identifying areas of annuals, non-native perennials, etc. It is impossible to understand where the percentages came from, how they may relate to existing infrastructure, etc. Promises of restoration will never occur unless there is a large-scale and systematic planned rollback of livestock facilities, livestock use, and intensity of use.

Alt IV and VI might even allow native shrub lands to be “treated” – and sagebrush or rabbitbrush killed to promote grass and forbs –even though 20% or less of the lands in this VMA now are native shrubs. What is the basis for defining shrub lands? What canopy cover or other values? Are whole pastures to be managed on the basis of the “majority” species?

There is no certainty that these actions would conserve, enhance and restore sage-grouse habitats and populations. Plus BLM refers to “additional vegetation treatments” in Noxious Weeds and Fire sections. This means vast areas could be “treated” with fuelbreaks – and more coarse unpalatable or non-native species seeded. There is no adequate mapping and analysis that shows what all of this treatment would really look like, where it could occur, if it would be meaningful or effective at recovering sage-grouse – or how soon it might in reality harm or even extirpate native species in the

various artificial “VMAs”.

There is no valid economic analysis factored into these uncertain and highly risky alternatives - to show the cost of active vs. passive restoration (removal of livestock, closure of jeep trails, etc) here. There is no valid economic analysis to show the cost of cheatgrass herbiciding, fencing, etc. if treatments are subjected to continued livestock grazing – or how much grazing use will slow or retard any recovery or rehab. This is on top of the abject failure of the EIS to assess the alternative uses forgone from imposing large-scale grazing disturbance under the limited FEIS alternatives.

An overlay of native vegetation, Critical and Key sage-grouse and other wildlife habitats, and restoration-focused lands should also be provided as a basis for BLM developing a set of alternatives that remove developments and restore habitats on an orderly and scheduled basis where removal is important to achieve wild lands and wildlife habitat restoration goals.

BLM must face the reality that funding is going to be a significant problem. How much does it cost BLM just to administer the grazing permits? To deal with damage caused by livestock? How much do taxpayers lose on this annually? Over the life of the Plan?

How much do taxpayers spend on routine weed control, livestock facility road maintenance, herbicides, post-fire seedings of livestock-depleted lands? How much less would taxpayers spend if livestock use on the southern 2/3 of the Jarbidge FO were phased out over the life of the Plan? What is the economic value of the uses and values of public lands that are lost or foregone due to the severe existing depletion of much of the FO? What are the losses expected to be over the life of the Plan? BLM has failed to address these pertinent economic issues we raised in comments.

BLM uses endless artifices to avoid livestock removal or long-term rest to promote recovery and retention of all vegetative growth of native forbs so that seeds can develop and mature. Allowing natural processes to occur without grazing impacts maximizes native local ecotype seed production, and natural no-cost passive recovery and restoration.

In order to allow a reader to even begin to understand what any of the VMA veg/treatment planning means, BLM must provide **current** Baseline mapping showing where and how it categorizes the underlying communities on top of which the VMA is imposed. At present – where are all exotic annual grasslands? Perennial exotic grasslands? Native “grasslands” (early seral communities)? How many of these areas had BLM seeded with sagebrush in the past? Promised the public that crested wheatgrass would be a “place holder” for shrub recovery? Promised the public that sagebrush would be recovered? Review of Map M-9 FEIS Existing Veg shows it over-emphasizes “non-native understories” in some areas – like Antelope Springs to benefit Brackett grazers there, while minimizing “non-native” in other areas. WWP repeatedly commented on how BLM used cwg having been seeded long ago (even though many areas now have relatively little cwg present – like in Antelope Springs) in some allotments to sacrifice pastures of high importance to sage-grouse in the AGPs. The RMP continues this. There

appears to be no valid mapping of just what constitutes a non-native understory, and where these areas are located.

Where in FEIS Map M-9 has sagebrush been seeded in the past 12 years? Where are there now sagebrush seedlings? How will BLM effectively recover all the areas where sagebrush has been re-seeded? BLM must provide monitoring and analysis of the success (or failure) of the Murphy Fire rehab, and other rehabs,\.

In viewing Maps 9 and 10 (Vol. 3) we are greatly concerned that BLM categorizes lands on Browns Bench as non-native understory – with an apparently different criteria being used than in other areas. We cannot understand how BLM actually decided what was and was not a “non-native understory” for management purposes, and setting up its whole elaborate VMA Veg, FRCC, Forage and other schemes. This must be clearly defined, as so much of the FO has been herbicided, disced, railed, burned and seeded with exotics in some composition. It is hard to understand how BLM has separated out these often blended communities.

WE had specifically commented on this regarding the DEIS. There is much more non-native understory than BLM admits to in Map 9 of the FEIS – including cwg and iwg. Plus BLM places coarse cultivars in with Natives. BLM also appears to not have mapped important mixed rabbitbrush and sage communities as native shrubland. In M-9, as in Brackett Juniper Butte, portions of Inside desert and other areas.

BLM in seedings continues to use large coarse exotics in many seedings with some native species thrown in. But with minimal post-fire rest, it is often the exotics that thrive, dominate and out-compete natives, especially local ecotype natives. Native species are often destroyed in the plowing-style seeding techniques. BLM must clarify whether seedings where sagebrush and some other natives were seeded are located. Where in these sagebrush seedings is the plant community now dominated by large exotic grasses – if these are considered native or non-native seedings? How are plant communities on the ground really delineated and defined –and how are they then fed into the morass of VMA, FRCC, Fuelbreaks, Forage allocations, and the rest of the confusion of the livestock-industry centered RMP FEIS?

Why is there no mapping and science-based analysis that shows where and how vegetation will be managed and restored to conserve sage-grouse habitats and populations and other sagebrush-dependent species? Why isn't this the foremost part, and the basis of all alternatives, in the RMP?

The NTT Report describes careful delineation of environmental risk and use of current science:

The National Greater Sage- Grouse Planning

Strategy Charter charged the NTT to serve as a scientific and technical forum to:

- Understand current scientific knowledge related to the greater sage- grouse.*
- Provide specialized sources of expertise not otherwise available.*

- *Provide innovative scientific perspectives concerning management approaches for the greater sage- grouse.*
- **Provide assurance that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.**
- *Provide science and technical assistance to the Regional Management Team (RMT) and Regional Interdisciplinary Team (RIDT), on request.*
- **Articulate conservation objectives for the greater sage- grouse in measurable terms to guide overall planning.**
Identify science- based management considerations for the greater sage- grouse (e.g., conservation measures) that are necessary to promote sustainable sage- grouse populations, and which focus on the threats (75 FR 13910) in each of the management zones. While BLM will claim its mish mash and scattershot confusion of fuels projects, various treatments dealing with fire are based on high science of some kind– BLM greatly ignores the role of grazing disturbance in causing flammable cheatgrass which promotes fires as well as retards post-fire recovery. Billings 1994, Reisner et al. 2013. The very high grazing allocations, uncapped and unknown amounts of TNR use, and energy, roading, infrastructure and development impacts of the FEIS, and BLM’s abject abandonment of ACECs ad integrated management in Alt VI defy current science, BLM planning requirements, guidance and legal mandates.

The FEIS analysis woefully fails to comply with the requirements of a valid current sage-grouse and sagebrush ecosystem analysis. A SEIS must be prepared to rectify this, and turn around the manner in which BLM has ignored the full range of management concerns and the paradigms of the NTT and IMs. Jarbidge BLM cannot continue to live in past and sacrifice lands to such a high degree to the livestock industry and other harmful uses.

Why is there no mapping of sage-grouse seasonal habitats in the RMP? Or of PPH/PGH? Or all occupied habitats? Why has PPH and PGH mapping been ignored, and full consideration of the provisions for these habitats in a reasonable range of alternatives? How can a Plan to conserve sage-grouse be developed without this? This mapping and analysis must include adjacent Burley and Bruneau lands, as well as the Forest Service and Elko BLM lands to the south affecting the local and regional populations. What are the cumulative impacts of fire, fences, water developments, treatments, energy developments, etc. on this landscape that is used by the Jarbidge grouse?

Plus, the twisted and contorted justifications for BLM’s severely flawed Alt VI and other livestock and pro-development alternatives in Tables like the “Comparison of Alternatives” FEIS shows the lack of BLM concern about sage-grouse and current sage-grouse science. BLM goes to great lengths to try to rig the alternatives and comparisons. See 2.10.1, Table 2.6 and Table 2.7 Comparison of Environmental Consequences. Reality

is contorted and current science such as the NTT ignored - as BLM tries to make its abysmal Proposed Action look less catastrophic for sage-grouse (and riparian/wetland fish, wildlife, sensitive species, etc.) and other all natural resources.

Alt IV MA-21 (applies to all VMAs and now Alt VI too) states “the first priority to improve would be VMA D” is not defined. Since the preceding MAs for Alt IV under the VMA category NEVER mention removal of livestock, but do indeed specify “treating” shrublands (MA 23) in grouse habitat, it is clear that “improve” may mean thin and/or destroy more sagebrush - even though current ecological science shows this will not help sage-grouse. This would mean even more habitat fragmentation in the only less fragmented landscape. See Braun 1998, Knick and Connelly 2009/2011, Hess and Beck 2010, Neck et al. 2012, Bukowski and Baker 2013, Jones et al. 2013. There is no analysis of the cumulative impacts of grazing and further sagebrush habitat loss under this so-called “restoration”. Then after more sagebrush is destroyed, BLM would consider treatments to expand and connect habitats in VMA C.

BLM is likely to have limited funding, for any of the claimed restoration so how much will actually change across the Jarbidge FO? It may even further fragment VMA D (even though are many seedings that need to be restored. There are also severely depleted sagebrush communities that are in dire need of rest in Browns Bench and elsewhere. BLM might dabble in some seeding in unidentified parts of VMA C.

UV-IV-MA-28 of FEIS states that BLM will assess microbiotic crusts and manage to move them towards potential by modifying grazing. It already is required to do this under the FRH. The sad fact that several alternatives do not even require this shows that these alternatives do not have any legal validity, and appear to have been developed to set a “low bar” to better enable selection of a very poor Preferred Alternative that will hasten sage-grouse extirpation and extinction. There is no mandatory trampling or other standard to limit grazing disturbance, no milestones, and no concrete information provided on how this would be achieved. There is no comparison provided on predicted recovery with or without grazing, or mapping of the conditions of the crusts from the information BLM already has on hand.

How depleted are crusts? Where? What season of use may cause more significant harm to crusts? Since fire kills or reduces crusts, and they can take many years to recover, BLM in the much-burned Jarbidge landscape must apply annual measurable standards for trampling in upland habitats. This can be done with transects. The desirable crust communities and percent cover must be defined, and measurable standards put in place to achieve this, BLM has Technical and other references that address crusts. BLM can and must competently establish monitoring frameworks/methods and required standards.

BLM must establish a real plan for this now – since it is allocating lands for grazing use and grazing disturbance loads. If crust recovery would be only minimal with grazing – isn’t now the time to close the lands – or plan for significant rest to jump start recovery? If BLM is going to keep cattle and sheep out of lekking and nesting habitat, that means that drier summer-early fall periods are likely to have maximum cattle numbers. Crusts

suffer very severe harm if trampled when very dry – and also high impacts occur when they are very wet once fall rains and freeze-thaw winter conditions occur, and throughout spring. To meet a goal of recovery, all of these impacts must be examined in detail and a clear plan, measurable standards, and required monitoring laid out.

Since the RMP was unfortunately developed to a significant part on the grazing desires of the local Working Group, which is dominated by ranchers, the threat of destructive mowing, chopping, hacking, rotobeating, crushing, herbiciding and other “treatments” and even more livestock facility development to try to futilely promote grass and forbs in lands that continue to be grazed will likely be pre-eminent.

This is made clear, where the “restoration toolbox” is chemical, seeding and planting, an unknown and scientifically unsubstantiated category called “targeted grazing”, and prescribed fire”.

There is not even a requirement to use only native species in restoration. We have communicated with BLM many times with concern about their continued use of exotics mixed in with large-sized coarse native cultivars. BLM refuses to use small statured native species to quell fire spread naturally. We have raised serious concerns about local native ecotypes being harmed by use of these large coarse grass cultivars - that sometimes are not even the same species as the natives they are substituted for. Recent pollinator studies in the Great Basin show there may be significant impacts from use of aberrant and non-local plant material. Instead, the FEIS provides all kinds of excuses for BLM to never have to use native species. There is no emphasis on local native ecotypes.

We do not support the construction of all the new fences with the scattered reference areas – and any reference areas, at a minimum, must use existing fencing. In all of Alt IV and VI, there is no MA for removal of grazing from currently grazed areas anywhere other than reference areas. The “Toolbox” to restore or “treat” does not include removal of grazing.

Alt V appears to rely on the FRCC’s contrived “historic” vegetation communities. Just what BLM believes this to be in 2014 is not defined. There is no assurance that anything will be achieved, or significant progress be made. BLM is only required to “move toward” *“historic veg communities by sustaining, improving, or increasing native plant communities that provide habitat for sage-grouse or other special status species”*. The word “or” means all that BLM needs to do is pretty much continue the current level of loss/degradation.

Under all VMAS, BLM must specify that removal of grazing through passive restoration to be applied to areas of native shrublands to allow healing of understories, as well as native grasslands and all treated or restored areas where there is risk of cheatgrass increases and/or dominance. Active restoration in native grasslands should involve planting locally adapted ecotypes of native shrubs, and other native species ecotypes.

The limited MAs are designed to not significantly alter the vast wastelands of exotic

seedlings very much. BLM often would not even try to restore all “native grasslands” - whatever these are, and often coarse pseudo-native cultivars are claimed to be native such as Secar bbwg. BLM must rely on local ecotypes only.

We support DEIS Alt V, VMA B, Goal IV which is to “restore 50% of sagebrush sea annual communities”. In DEIS Alt V MAs BLM would “treat 67% of non-native perennials to introduce shrubs - we requested that BLM add the following: “remove significant acreages of large non-native perennials and re-seed with natives to produce natural composition, function, and structure”. The FEIS does not appear to provide an alternative to effectively do so. Alt VI does not do so. Why wouldn't BLM aim to restore all native grassland – as it is the easiest grass community to try to recover native biodiversity.

We support native shrubland not being a target of active restoration except for inter-seeding shrubs. BLM's disturbance-oriented “toolbox” maximizes risk of disturbance-related weeds. We are concerned that there is no specific mention of removing or greatly reducing livestock grazing **to promote passive restoration**. Full consideration of additional stress placed on grazed communities with predicted climate change effects must be presented. Passive restoration, i.e. reducing disturbance, aids in buffering sagebrush vegetation communities from the many stress of climate change. These include increased cheatgrass risk, hotter temperatures, more rapid and erosive runoff events, less precip falling as snow, more erratic weather and weather extremes, etc. Sec. Order 3289A1 requires BLM address actions to prevent and mitigate climate change effects, But instead of developing a suitable range of alternatives to mitigate these effects, BLM increases the likelihood of adverse effects of climate change by increasing livestock disturbance, gutting ACECs which enable integrated and priority management to prevent natural resources from environmental harm, provides minimal actions to recover damaged riparian areas, forsakes protective annual measurable use standards to limit annual grazing harms and ensure progress is being made under the FRH, etc. See Steinfeld et al. 2006, Beschta et al. 2012, 2014, Comer et al. 2012, Manier et al. 2013. BLM has failed to describe in detail how its actions will reverse the depletion and desertification trajectory in the JFO that feed into and worsen climate change effects. For example, cheatgrass is known to be advancing in hotter, drier sites. See Peterson (2007), Great Basin Ecoregional analysis, now the Comer et al. 2012 REA.

BLM must specify in detail what “managed treatments” means in WSAs/Wilderness. What would be a “Minimum” of treatment? The FEIS Alt VI greatly lacks measures to protect wilderness and wild land values from the adverse effects of grazing disturbance, and combined treatment effects on natural and biological values and impairment of recreational uses and enjoyment.

BLM should focus on restoring shrubs to ALL “native grassland” communities. The intense livestock grazing in the Jarbidge is retarding and hindering recovery through loss of shrub seedlings, battering and breakage of both young and mature shrubs. It is reducing seed production and shrub recovery rates, and now promoting cheatgrass in interspaces.

BLM must clarify what it means by unvegetated areas – as mapping shows lands burned in the aftermath of Murphy Fire were classified by BLM as unvegetated. Does this mean that following future fires, sagebrush and local native ecotype perennials will not be seeded?

It is unclear how BLM's reference to weed and fire ecology sections will play into/be overlaid with actions related to Vegetation. Since these RMP sections lack adequate consideration of buffering and mitigation measures for climate change adverse effects and grazing-caused desertification effects. Even more uncertainty is added. See also Protest discussions of the uncertainty, confusion and changing nature of FRCC and agency inputs in modeling of historical disturbance intervals.

At times, the EIS limits treatments in non-native vegetation communities to ensure that the crested wheatgrass/swg or forage kochia weed can't be removed! Why is care being taken in non-native communities - compared to less care under the RMP in native grass areas?

FEIS 2-286, MA-21 actually makes sense – and should be the foundation of all alternatives, phrased as **“focus restoration treatments [DELETE “for each VMA”] on habitat for sage-grouse or other special status species”**. BLM must revise this VMA segregation of the FO - and get rid of the artificial VMA categories that draw arbitrary lines across the FO. This is meaningless to sage-grouse and other wildlife in the Jarbidge – where research has long shown that birds move all over the landscape especially the more fragmented that the landscape is. See Commons-Kemner (circa 2003), recent USAF research, and other studies up to the present – including recent IDFG Progress Reports.

There is no analysis of management actions that will be taken for microbiotic crusts. BLM must apply a concrete plan and direction with mandatory measurable use standard. We remind BLM that healthy microbiotic crusts in the sagebrush matrix as well as on the surface of slickspots help prevent weed invasion into the matrix and slickspots.

There is no adequate analysis of the effectiveness of various “tools” – and the direct, indirect and cumulative effects of one form of “treatment” or “Tool” vs. the other. This is more indication that under Alt IV removal of grazing is not going to be a BLM “tool”.

We Protest all of these deficiencies and unresolved conflicts.

More Grazing Section Concerns

FEIS “Impacts” analysis for various Resources is greatly inadequate to address the broad range of adverse ecological impacts to sage-grouse, pygmy rabbit, loggerhead shrike, and many other important and sensitive species – across all alternatives. BLM provides only limited citations to support its various vegetation, fuels, fire and other FEIS sections in Alt VI and elsewhere.

BLM resorted to a study on raptors in the Great Plains (an entirely different ecosystem that evolved with large herds of hoofed animals – bison) to try to claim that the small mammal prey base for the ferruginous hawk is not affected by grazing. BLM forgot about its own series of Klott and others small mammal and small animal surveys/inventories where BLM itself found that vast areas were devoid of nearly all wildlife except weedy deer mice. This kind of incomplete, biased presentation of information must be greatly revised and a new range of alternatives developed that are based on ecological reality.

The FEIS Section 4.3.7.3 sage-grouse and other TES species discussions and alternatives analysis fails to provide sufficient detailed current scientific information and analysis, including in the specific context of the Jarbidge, so that a reasoned understanding of the degree and severity of threats and causal factors can be obtained by a reader. It is impossible to properly analyze direct, indirect and cumulative effects of BLM actions under the limited and industry-subservient alternatives.

We are greatly concerned that BLM relies on “transplants” of rare species – rather than protection of functioning systems and native species populations that are viable. FEIS 4-423.

FEIS 4-423 shows BLM relied on the 2007 Jarbidge LWG GRSG mapping – that selectively cut out habitat for important permittees.

BLM ignores PPH and PGH, and instead describes 988,000 acres of sage-grouse “management area” with no legally binding protections of any kind, and with a mere 305,000 acres of key habitat, This appears to deviate sharply from the ID GRSG conservation plan of 2006.

FEIS table 4-164 contains observations of species in habitats that no longer exist (example, pygmy rabbit, sage-grouse lek sites in several areas). It is unclear what the time frame of the info is for sage-grouse and several other wildlife species. BLM must assess, and has failed to do so, the dramatic range contractions that have occurred since the 1980s RMP.

BLM even tries to make excuses for inflicting very harmful spring grazing on native bunchgrasses during the active and critical growing periods (4-402). This practice has long known to result in significant depletion to native grasses and forbs,

In DEIS at 4-403, and FEIS 4-436 under No action, BLM states “**at 20% use, residual herbaceous heights of the same grasses are near or exceed the nesting cover requirements**”. But this was nonsense – because Sandberg bluegrass, Stipa, Idaho fescue, etc at 20% use do not meet or exceed the 9 inch residual cover requirements. Plus chronically grazed grasses - no matter the species – tend to grow to less than optimum height. It is also uncertain what BLM is using as a “required” height here – is it 6 inches (listed in laundry BMP list), is it 5 inches? 7 inches? Is it 9 inches, as is required? Or is it the 4” vaguely referenced in relation to the ineffective sage-grouse management zone?

Will BLM apply this on an allotment by allotment, pasture by pasture, or within pasture basis? What if the pasture has a blend of grasses – as so many in the JFO do? It is impossible to tell, or predict outcomes.

However, what is certain in the FEIS is that the extremely high 800 lbs/AUM stocking allocations are based on much greater use.

FEIS 4-436 presents a confusing discussion of utilization and residual cover heights. This is confounded even more by FEIS 4-440 reference to this section. It is unclear what is occurring. We also note that in earlier discussions of grazing, BLM ignores Mack and Thompson 1982, and the Anderson 1991 BLM Tech Bulletin describing how harmful grazing during active and critical growing periods is. BLM proposes to select Alt VI, which “Overall” ranks as only 4th most beneficial of 6 Alts. - among an appallingly deficient range of alternatives for wildlife habitats and populations.

In DEIS 4-403 and FEIS 4-436 to 4-437: What does BLM mean that “the No Action alternative does not have specific utilization levels”? BLM claims that use ranges from less than 20% to more than 50% “in pastures” – Native? Exotic? Blended? It then claims that native grasses at 20% use somehow meet requirements. This provides less than a single page of analysis of livestock grazing impacts. It ignores the fact that BLM regulations allow it to change harmful management – including prohibiting trailing through rare species habitat – immediately. BLM does not need fencing to do this. It can require that herding avoid the area.

EIS Alt II would only apply sage-grouse standards to “allotments with greater than 50% native plant communities”. This is a non-starter (because of the highly fragmented Jarbidge landscape, and the history of the Jarbidge range staff in rigging pasture categories to benefit ranchers having fewer constraints). This is not a valid alternative for an RMP in the context of the woefully altered Jarbidge. BLM has not analyzed a reasonable range of alternatives.

BLM claims that April-June grass growth will result in acceptable nesting conditions, Connelly said **residual cover** – not hypothetical new growth. Grouse are gray and brown --- not green. Residual dried grass cover conceals nesting birds. There will not be adequate early nesting cover, and grazing while birds are nesting heightens nest and egg damage, predation and even includes egg eating by cows. USFWS WBP GRSG Finding, recent Curlew Coates et al. USGS Report.

The FEIS Proposed Action would issue massive amounts of TNR, uncertain targeted grazing, and increase range infrastructure – all these are also non-starters for any alternative in an RMP that must conserve, enhance and restore sagebrush habitats and biota.

In DEIS 4-405. Alt. 3. BLM claimed Alt III (based on fire and resource objectives) impacts would be the same as Alternative 1. High stocking under No Action, similar to Alt 1, has been a complete disaster in preventing fires, In fact, under Alt 1 –and chronic

grazing disturbance promoting flammable cheatgrass, relentless BLM post-fire “rehab” of coarse palatable densely planted grasses, minimal rest and overstocking - the Jarbidge has been conflagration central. This also is not a viable alternative for an RMP that is to conserve sage-grouse. This predicts 30-40% utilization. The discussion of these generalized utilization percentages is highly uncertain and even more muddled in the FEIS. See Catlin critique of BLM utilization. Also, just how does utilization NOW compare to that predicted? And WHAT level of utilization does BLM believe will prevent fires?

Reducing livestock utilization levels doesn't reduce other types of livestock impacts – as we described in comments on the DEIS: Utilization does not address trailing impacts on top of rare species.

This analysis of impacts is a disappointment, and violates BLM Conservation Plans for sage-grouse and other sagebrush species, the NTT IMs, is a violation of FLPMA, and a violation of the SSA.

We Protest these inadequacies as described above.

FEIS Lumps Rare and Other Species Into Guilds/Groups for Generic Analysis and Minimization of Consideration of Direct, Indirect and Cumulative Impacts to Important and Rare Biota

It is inappropriate for BLM to rely on lumping so many important species, often with specific and differing habitat needs, into “guilds”. BLM cannot comply with its sensitive species policy, the Migratory Bird Treaty Act with such cursory analysis.

BLM never analyzes an alternative that would not inflict very high amounts of grazing disturbance. BLM just lumps the whole Field Office together and conducts minimal analysis of the grazing impacts on sensitive plant and animal species (FEIS 4.3.7), and other fish and wildlife (FEIS 4.3.6). Many disturbance and habitat impairment direct, indirect and cumulative harms are swept under the rug.

There is no vegetation-specific, pasture specific, “targeted grazing” impacts, “fuels” impacts or allotment-specific analysis for the various alternative impacts to individual species habitats and populations - or how treatments combined with continued grazing disturbance and potential developments – may affect population viability. This must be undertaken in a SEIS - including across a reasonable range of alternatives.

BLM FEIS rare plants 4-335 devotes a mere vague paragraph to livestock disturbance and other impacts to rare plants. This serves as no basis for making comparisons between the various defective alternatives – where 97% 94%, 96%, 96%, 90% 79% and 96% (FEIS 4-336 to 340) of the land area would be “available” for livestock grazing. The same concerns apply to all elements of the environment and uses analyzed in relation to sensitive plant and animal species in FEIS Section 4.3.7. This includes 4.3.7.2 Special Status Fish and Invertebrates, with flawed assumptions based in significant part on

arbitrary – see for example FEIS 4-235 where BLM continues to insist that improving PFC would improve HC. This section also shows that bull trout habitat surveys did not even include the entire reach, and habitat was approximated over large areas. It is crazy for BLM to apply arbitrary and minimal PFC to Snake River snails and rare amphibian populations as well. PFC says nothing about whether any water flows are actually still present, losses in flows, and the full extent of degradation and risk of continued disturbance to the persistence and stability of the riparian and aquatic system and its ability to support aquatic and other biota. FEIS 4-355 also shows there is no firm commitment to do anything - as “*any stream in an impaired condition would be identified for restoration or improvement within the limits of BLM discretion*”. This allows BLM a huge out.

The FEIS is particularly deficient in relation to limiting adverse grazing disturbance and other impacts to springs, seeps and stream systems including their ability to support sustainable perennial flows in the face of climate change, throughout Section 4.3.7.2. This threatens crucial sage-grouse brood rearing habitats.

Special Status Wildlife throughout FEIS 4.3.7.3 fare similarly to rare plants and aquatic species. The Indicators ignore disturbance effects of grazing and other harmful activities, lumping species into “wildlife groups”. With the limited range of alternatives, parameters like ‘changes in upland acres’ and one Alt vs. the other are largely meaningless. Since the EIS rejects nearly all ACECs, there is no guarantee that species needs will ever be addressed in any coordinate manner, or that they will not suffer irreparable harm.

Despite FEIS alternatives imposing a massive livestock and facility footprint, the limited analysis of livestock grazing in the FEIS (example 4-434 and 4-435), BLM relies on a hand full of cherry-picked old references – ignoring even information it had assembled in the Jarbidge AMS baseline analyses of adverse effects and scientific literature of grazing and other land use activities and disturbances to wildlife across the Jarbidge.

There is no explanation for how the extremely limited information in the FEIS was arrived at – for example, FEIS Table 4-168 “Selected Special Status Wildlife Habitat Components ...” 91 occupied leks, 91 “other” leks – WHAT is this category???, 26 unoccupied. This does not appear to accurately reflect the current state of sage-grouse or other wildlife in the Jarbidge. Also – is BLM claiming it plans to build a very long stringer fence to fence a mere 22,000 acres for bighorn sheep – what is meant by this comparison? This Table reflects the presentation of information throughout all parts of the EIS – much of it is old, or based on presentation of only cherry-picked info presented in a biased light, or has no underlying basis for understanding data origins and analysis leading to rosy predictions.

BLM cannot arbitrarily segregate endangered Bruneau dunes tiger beetles into a “different” sensitive species category. This is another attempt at segregation to avoid addressing impacts of commodity and industrial uses on species. It is counter to requirements for conserving native wildlife violates FLPMA, and the FRH. Several recent papers by Fothergill and others demonstrate the extreme rarity and imperilment of

this species. In fact, BLM's whole strategy in the RMP – as clearly illustrated with the tiger beetle - is designed to push species to the brink of extinction or drive them extinct altogether– not proactively work to conserve them.

BLM elevates big game to special mention –but does not do the same for sage-grouse. Ex: 4-287-4-295. Why do big game receive more analysis than sage-grouse?

The use of Indicators, Guilds, etc.to lump species serve to masks and omit key concerns, threats, species-specific needs critical to conserving habitats and viable populations, and ensuring the species thrive and recover.

4-247 admits that restored habitat may take more than two decades function similarly to intact habitat – shrubsteppe, mountain mahogany mountain, aspen.

BLM in the DEIS claimed “for analysis purpose, all treatments would be implemented in five years”. It is very difficult to believe BLM will act with anything like this much speed. Very significant grazing cuts must be made under a new and expanded range of alternatives. Yet it appears that BLM is going to try to tie cuts to treatments/restoration. See DEIS Chapter 4, Table 4-282. It is unclear if this same assumption is carried forward in the FEIS.

Why does BLM admit that human disturbance can cause displacement and temporal or spatial habitat fragmentation or abandonment – but not list and describe livestock grazing disturbance, displacement, etc.? BLM cannot rely on claims that “all species within a guild react similarly to disturbances or habitat changes” – especially with the broad range of species with quite variable habitat needs it lumps in its guilds.

It is impossible to conduct analysis when BLM heaps an entire other list of assumptions (which we believe are deeply flawed as they relate to vegetation) into the same list. See DEIS at 4-247. This all results in a situation so confusing no clear understanding or analysis can occur.

Even with the big game “guild” – different species have different critical seasonal habitats and biological needs. BLM must analyze all of this. For example, the Jarbidge AMS emphasized the serious adverse effects of the extreme fence density in the Jarbidge on antelope. Research in the Owyhee has shown that bighorn sheep move out of areas when cattle are moved in – yet BLM fails to address this serious adverse impact of the very high levels of Simplot and Brackett grazing that occur in the Jarbidge bighorn sheep habitats, including the ACEC that BLM proposes to gut in its severely flawed Alt VI.

The No action Alt for wildlife has more certainty than the morass of a Preferred Alt in the DEIS and now the appalling FEIS Proposed Action would. No Action directs BLM to establish shrubs on winter range - if shrubs comprise less than 30% weight.

BLM's various Wildlife Trends Tables are not based on adequate baseline and supporting info and analysis for anyone to understand if the directions and predicted changes are

accurate. For example –the fuels actions in Alt II, III and VI could well result in a large-scale loss of habitat.

The broad guild/group categories lumping species that often have very specific needs are inappropriate in the Jarbidge – where such vast areas have very few native species present due to the severe ecological degradation, and protection of remaining native biodiversity is critical.

Mountain lions are native predators – lumping them in with big game (FEIS 3-28) masks their biological role, life history requirements and relegates them to a “commodity” rather than an animal that serves a critical role in predator-prey relations. There is great public concern over the anti-predator attitude and censorship of biologists in state game agencies under the current Commissions of both IDFG and NDOW. BLM must not parrot the current anti-predator attitudes.

3-23. It is impossible to believe that IDFG has no data on mule deer. BLM forgets how dire the situation is for pronghorn – as shown in the AMS. Now with more fires, and alternatives that would impose even more fencing, and maintain near-status quo use (allocations and TNR) there is no clear path for protection of big game species and their habitats.

How specifically is BLM reducing livestock competition with elk? Deer? Pronghorn Antelope? Sage-grouse? This includes fawning and wintering habitats.

BLM constantly downplays the importance of rabbitbrush because the Jarbidge ranchers do not like it– ignoring that this species provides functions of moderating micro-site climate, produces blooms that are alive with native insects that are a critical part of biodiversity, and it provides winter and other food in a greatly depleted environment. The desire of the Brackett and a few other ranchers to destroy through herbicide the rabbitbrush of the Jarbidge must be prohibited in the RMP, but the FEIS fails to do so.

Aspen communities comprise so little of the JFO. Across the west they are now recognized to be greatly threatened by new diseases and climate change. Grazing exacerbates aspen health problems and understory condition. Mechanical browsing or trampling injury wounds trees and promotes fungal infections. Given all the stresses on aspen, and the importance of the avian and other wildlife associated with them, removal of livestock grazing stress from all aspen communities is critical to ensure they are conserved and sustained in the Jarbidge.

DEIS 3-26 to 3-27. BLM’s simplistic Table of a sagebrush guild/group greatly obscures the differences in sagebrush habitat characteristics that various species rely on. Example: mountain big sagebrush vs. Wyoming big sagebrush –and differences between green-tailed towhee and loggerhead shrike habitats. Now in FEIS 3-63, BLM merely presents a Table showing large declines in Brewer’s sparrow and sage thrasher, and sampling at only a single area. Loggerhead shrike require tall complex shrub structure, sage sparrow continuous sagebrush cover, and each of these species has different specific requirements.

See Rich 1977, Vaner Haegen WA State sage-steppe species habitat needs summaries, Dobkin and Sauder 2004. This fails to reflect the status of yellow-billed cuckoo. Why isn't willow flycatcher in the riparian group? Given the woefully deficient riparian measures of the RMP, the native amphibians including western toad, Woodhouse toad, northern leopard frog and Columbia spotted frog, among others, are in serious trouble.

It also appears that the sensitive animal species list in the RMP at 3-57 and 3-58 is not current. Sage thrasher, Brewer's sparrow and sage sparrow are current Idaho BLM sensitive species, for example. It has many species listed as NV only, and this is just not correct. What about Idaho especially since BLM seeks to shunt the important Nevada-managed lands to Elko, for equally poor and deficient, plus inefficient, management oversight.

What similarities do mourning dove and nightsnake have? Lists do not even have white-tailed jackrabbit, pygmy rabbit or other declining or imperiled species on it. In the Draft which formed the framework of the RMP effort, BLM appears to give the same deference to deer mouse, and place this extremely weedy species on a par with other much more scarce animals. BLM lumps sandhill crane (meadow/wetland/marsh vegetation) and yellow-breasted chat (requires dense and expansive riparian shrubs and trees), ignoring the very specific habitat differences of these 2 - and all the other species - in FEIS 3-65. This provides no basis for informed analysis and development of alternatives.

This appears to be being done to bias the BLM analyses based on guilds/lumped species lists - even though the species in any list often have very different and specific needs from one another. BLM's small mammal and other animal inventories found large-scale absence of nearly all native species over large areas, representing large-scale losses in biodiversity. So by BLM placing the one species that was abundant - the disturbance-related deer mouse, which is a species that thrives in a devastated landscape - in its Sagebrush guild in the draft, BLM biased RMP alternatives, analyses, and predicted outcomes about impacts of the industry-centered alternatives to more rosy outcomes. The FEIS guilds/lists have been tweaked somewhat, and species like badger are nowhere to be found - especially missing are sagebrush species.

Burrowing owls occupy sagebrush communities, too - they are not only grassland species. Why is Brewer's blackbird in the grassland guild? Who in the world prepared these lists? It looks like BLM was trying to make it appear that the vast grass and weedlands provided for a range of native species - and bias analysis in favor of its deficient alternative.

These lists fail to take into account elevational changes, and vegetation change with elevation.

Why are golden eagles in a canyonland guild, but not a sagebrush guild? Yes, they nest in canyons -but require vast areas of sagebrush inhabited by jackrabbits to flourish. These lists of guilds are supposed to form the basis for analysis - but they suffer severe omissions and problems. The RMP is woefully lacking in honest detail and analysis of

the loss of many of these species across vast areas of the JFO.

BLM cannot claim just because a couple species in a guild might be present, that lands are meeting requirements for biodiversity and species habitats.

BLM's guilds are so broad that they lump species with greatly different habitat together – and generalists with specialists - spotted sandpipers and long-tailed vole. Like all the other laundry lists of the RMP, these seem designed to mask valid analysis of impacts.

FEIS at 3-31 admits that **less than 1% of the FO should be grassland, where shrub cover is less than 2%, yet 33% was mapped as grassland**. It appears that this percentage of **33% does not reflect the current reality** – and does not adequately take into account the aftermath of the Murphy Fire. If it does not, then the percentage is **likely 60-70% or more???** Map 10 shows around 33% non-native perennial, and perennial and annual grassland. This map has nearly one-third of the FO shown as Unvegetated – i.e. the Murphy Complex. If a reader closely scrutinizes the following Map, Map 10 (Page M-11), the Projected 2012 Vegetation, it appears that 60-70% of the FO is grassland.

Mountain mahogany avian species would be much at risk for wind farm development – since so much of the remaining mahogany habitat is in the Foothills area. BLM in all instances must analyze impacts to species of its allocations/alternatives.

So the question is: WHAT was the entire RMP development of alternatives and analysis of impacts throughout the RMP based on in regards to vegetation and wildlife/sensitive species? Was it based percentage on DEIS Grassland – Map 9 (Page M-10), or Map 10 (Page M-11), the projected 2012 cover that reflects grass and vast shrubless expanses? On 33% grassland cover – or 60-70% grassland cover? Is it based on deer mice being key components of sagebrush guilds? How was this all then carried forward in the glib assumptions of the FEIS that the massive disturbance burden of Alt VI could somehow result in sustainable wildlife habitats and populations?

Why were deer mice in sagebrush guilds only – when they are the primary species that thrives in grass monocultures? These flaws in EIS development are so fundamental that they must be purposeful – to water down recognition of adverse outcomes from the RMP's DEIS preferred and FEIS proposed action and other commodity and industry-oriented alternatives.

BLM's DEIS lumped sagebrush species together that were not combined in Wisdom ICBEMP analyses. In fact, salt desert and lower elevation sagebrush species were analyzed separately from other sagebrush species. BLM erroneously claimed that "limited information is available" for special status wildlife (including sage-grouse that are lumped in with the guild). This is not true, and has not been corrected in the FEIS. There are many studies available especially for some species (sage-grouse, pygmy rabbit), and numerous studies on loggerhead shrike and other migratory bird species, as well as raptors. Further, the whole reason that BLM is supposed to be conducting an EIS is to determine how to conserve species. A SEIS must be prepared.

The statement in the DEIS was that 1,277,000 acres historically contained sagebrush, and “currently 463,000 acres of sagebrush steppe remain”. How much less is that now – following more fires? Some of the areas that BLM has mapped as Native shrubland in M-11 in the DEIS have very little sagebrush or other shrubs.

BLM uses old and outdated information on sage-grouse nesting in relation to leks - it is known that grouse including in the Jarbidge – may move considerable distances to nest, and roam over vast distances in the course of the year –such as up to higher elevations on the HT Forest in summer and for brood rearing, and exhibit a degree of nest site fidelity.

DEIS 3-44 underplayed the crisis facing sage-grouse and sagebrush species. **“Between 1983 and 2006, active leks ... declined from 152 to 39 due to habitat change”**. What are the numbers of birds on the remaining leks? What has been the fate and trend of those 39 leks? How are they dispersed spatially? Please provide mapping. This is now followed by the FEIS minimal information in 3-60 to 3-61. BLM refers to the WAFWA management zone, but fails to address the local and regional populations. How can there have been 463,000 acres of sagebrush steppe in 2006-2007, and now the FEIS states key habitat is approximately 311,000 acres? BLM does not even consider all leks to be in key habitat. Why?

BLM references briefly the Garton et al. analysis, but has failed to conduct its own analysis up to the present using the same techniques to understand the plight of the local and regional populations. Garton et al. was based on 2007 and prior lek counts, so do not reflect the large-scale recent changes post-Murphy and as very heavy extensive grazing disturbance has continued. See WWP comments on recent AGPs to understand the severity of grazing disturbance, repeated grazing, additive and cumulative grazing the totality of which is never measured especially with spring grazing, etc.

How can the habitat security of lekking, nesting, brood rearing and wintering sage-grouse be maximized? This is a question that the EIS and its alternatives have not adequately assessed. This cannot be answered until BLM does what the SSA requires it to do - conduct a detailed site-specific analysis of the current habitat conditions and population status of sage-grouse across the JFO – taking into full account the degree and severity of losses and degradation across the FO and surrounding lands – as well as severe losses in other portions of the biome. Then it must develop effective conservation measures under a greatly reduced livestock stocking, infrastructure and roading load and footprint.

BLM in this section devotes a single paragraph to sage-grouse. This serves as no basis for conducting a valid analysis of any of the alternatives, or for understanding threats, developing a viable plan to conserve the species, etc. The section on Habitat fragmentation (3-48) is minimal. There is no current science applied on the severity of losses to persistence of a viable population. It provides no overlay of all the threats tied to the land areas of the JFO so that proper sage-grouse conservation planning and alternative development can occur

BLM must radically revise its analysis of sage-grouse and all rare and declining species, and develop a range of alternatives that would honestly act to conserve sage-grouse and other wildlife, rare plants, aquatic species, recreational uses, clean air and clean water, and other values of the public lands.

FEIS 4-167 Table is not based on a hard look or critical analysis of the serious adverse effects and risks of fuelbreak and all the other proposed cattle forage treatment weed infestation under the massive grazing and other disturbance loads the Proposed Action would impose. FEIS 4-430 claims there will magically be increased suitable habitat due to “restoration”. But this ignores the devastating impact of the livestock grazing disturbance load to be imposed, along with the livestock infrastructure, vast livestock-linked road network, and the whole range of other development and disturbance that could be inflicted – including in these very same “treated” areas under the flawed RMP.

The FEIS analyses are divorced from the grim reality that BLM cannot maintain the massive livestock grazing load and many ways to intensify grazing even more, plus impose all the direct, indirect and cumulative impacts of development and energy intrusions - and provide for sustainable wildlife, sensitive species, watershed, clean perennial water flow, or a host of other sustainable uses in the Jarbidge.

FEIS admits 4-461 that ACECs “can help reduce human disturbance, reduce route density, and seasonally restrict land use authorizations” and that “these actions influence wildlife habitat, habitat use and populations”. Yet Alt VI casts aside any sage-grouse and LEPA ACECs, and guts the bighorn sheep ACEC. There is no solid protection whatsoever provided by the so-called “sage-grouse management area” (see FEIS 4-470). Alt VI is in most instances WORSE than status quo management across this landscape. The so-called grouse “management area” would suffer from an immense disturbance footprint due to: extremely high and uncertain levels of grazing based on “forage” and not the welter of other grazing disturbance impacts; greatly inadequate loose and minimal vegetation non-binding criteria. 4 inches is mentioned and is not sufficient to provide necessary residual cover for sage-grouse. It would not allow recovery of the severely damaged forbs and native understory. It would not prevent the major disturbances of imposing extensive spring and other periods of grazing in sage-grouse and other sensitive species crucial habitats. There is no basis (other than rigged analysis and alternatives with poison pills) for the BLM claim that “overall Alt VI would provide the second most benefit to special status species at the landscape scale”. This statement demonstrates the inadequate range of alternatives, too!

Jarbidge BLM has purposefully developed a series of near-status quo – or worse – harmful alternatives, and has purposefully structured alternatives that would reduce livestock or designate ACECs that have “poison pill” components. BLM rigs the structure of the alternatives and its analysis to make its flawed “comparisons” favor the agency industry-centered alternative *du jour*. Gregg et al. 1994, Fleischner 1994,

Connelly et al. 2000, Belsky and Gelbard 2000, Connelly et al. 2004, Braun 2006, Knick and Connelly 2009/2011, Manier et al. 2013, Beschta et al. 2012, 2014.

BLM lays out very low bars – like Alts. II and III – to try to make an ecologically terrible outcome under Alt IV (DEIS) and now Alt VI (FEIS)– a close relative of Alt II, III seem meagerly beneficial. In comparing effects, BLM repeatedly ranks Alternatives (and the alternatives with somewhat more favorable provisions are also rigged with poison pills). So if an alternative is rated third most beneficial for one factor or another – and the range of alternatives is very similar and all continue to impose very high burdens of grazing almost everywhere, high levels of extractive uses, and massive fuels/forage “treatments”, then the comparison becomes largely meaningless. BLM has violated NEPA and the SSA, and failed to consider a reasonable range of alternatives. Alternatives are the heart of the NEPA process.

Again, sage-grouse need significant grass and shrub cover for protection from predators, particularly during nesting season, and females will preferentially choose nesting sites based on these qualities (Hagen et al. 2007, p. 46). The reduction of grass heights due to livestock grazing in sage-grouse nesting and brood-rearing areas has been shown to negatively affect nesting success when cover is reduced below the 18 cm (7 in.) needed for predation avoidance (Gregg *et al.* 1994, p. 165). In heavily fragmented and intensively grazed landscapes like the Jarbidge with its very small pastures and heavy fence densities, mesopredators and nest and egg predators are abundant –due to the attraction and subsidies of dead livestock and carrion, afterbirth, artificial upland water developments, supplement that is required to keep the cows alive in the depleted ranges, frequent human disturbance, etc. See Boarman and other papers discussing the need to reduce and minimize raven and other subsidies, The FEIS has ignore all of this – yet at the same time the greedy local livestock interests promote predator killing and/or poisoning. See also USFWS Gunnison grouse Finding describing how livestock grazing and infrastructure promote predation.

BLM’s FEIS and alternatives lack any adequate plan to control predation through regulation of livestock use and subsidies associated with the immense footprint of grazing in the Jarbidge.

BLM’s Special Status Species Policy, BLM Manual, Section 6840, requires that BLM managers “**obtain and use the best available information deemed necessary to evaluate the status of special status species in areas affected by land use plans . . .**” Policy at 6840.22A. BLM has a 2004 National Sage-grouse Habitat Conservation Strategy, which BLM adopted “to guide future actions for conserving sage-grouse and associated sage-brush habitats,” and “help BLM ensure that it successfully incorporates sage-grouse conservation measures into all of its ongoing programs and activities.”

We Protest the FEIS inadequacies and harmful actions as described above.

Recent BLM Sage-Grouse and Sagebrush Habitat Guidance Ignored in RMP FEIS and Alternatives

Under the National Sage-grouse Planning Strategy initiated in 2011, designed to avoid sage-grouse being listed under the ESA, BLM is in the process of amending its Resource Management Plans across the sage-grouse range to include additional conservation measures for sage-grouse. *See* 76 Fed. Reg. 77009 (Dec. 7, 2011) (Notice of Intent to Prepare EISs). *See* WWP comments in inadequacy of this BLM EIS Planning to date.

As part of this process, the Dept. of Interior convened its “Sage-grouse National Technical Team” of experts to review the best available science and make recommendations for sage-grouse conservation measures. On December 21, 2011, BLM’s National Technical Team released its “Report on National Greater Sage-grouse Conservation Measures.” (“NTT Report”). The NTT Report established the following overriding “goal”: “**Maintain and/or increase sage-grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.**” *Id.*

To serve this goal, the NTT Report stated that BLM “will strive to maintain or increase current distribution and abundance of sage-grouse on BLM administered lands in support of the range-wide goals.” *Id.* According to the NTT Report, BLM has also adopted a “new paradigm” for sage-grouse management:

*Through the establishment of the National Sage-grouse Planning Strategy, BLM has committed to a **new paradigm** in managing the sagebrush landscape. . . . Land uses, habitat treatments, and anthropogenic disturbances will need to be managed below thresholds necessary to conserve not only local sage-grouse populations, but sagebrush communities and landscapes as well. Management priorities will need to be shifted and balanced to **maximize benefits to sage-grouse habitats and populations in priority habitats.** *Id.* at 6-7 (emphases added).*

The NTT Report contains specific management recommendations on Range Management and Monitoring of Sage-grouse and Sagebrush Habitats, among other things. NTT report at 14, 28.

BLM subsequently issued IM 2012-043 on Dec. 27, 2011 in order to implement the NTT report in “**ongoing proposed authorizations and activities that affect the Greater Sage-grouse . . . and its habitat**” while the national sage-grouse planning process is underway. The report explains that BLM new paradigm will emphasize: *1) Protection of unfragmented habitats; 2) Minimization of habitat loss and fragmentation; and 3) Management of habitats to maintain, enhance, or restore conditions that meet Greater Sage-Grouse life history needs.* *Id.* at 1. It identifies two categories of habitat, “preliminary priority habitats” (PPH) and “preliminary general habitat” (PGH). *Id.* PPH “comprises areas that have been identified as having the highest conservation value to maintaining sustainable Greater Sage-Grouse populations,” including “breeding, late brood-rearing, and winter concentration areas.” *Id.* PGH includes “areas of occupied seasonal or year-round habitat outside of priority habitat.” *Id.*

Because sage-grouse is now a candidate species for ESA listing, that Policy directs BLM to

“ensure that actions requiring authorization or approval by [BLM] are consistent with the conservation needs of special status species and do not contribute to the need to list any special status species . . . under the provisions of the ESA.” *Id.*, § 6840.02 (emphasis added). Likewise, among the “guiding principles” of BLM’s 2004 National Sage-grouse Habitat Conservation Strategy is that “**BLM use the best available science and other relevant information to develop conservation efforts for sage-grouse and sagebrush habitats.**” (emphasis added).

The NTT report contains sections on Range Management and Monitoring. And the specific provisions counsel against the exact type of actions authorized here.

For grazing, the NTT report states:

- “Implement management actions ([including] grazing decisions . . .) to **modify grazing management to meet seasonal sage-grouse habitat requirements** (Connelly et al. 2011c). Consider singly, or in combination, changes in: 1) Season of timing of use; 2) Numbers of livestock (includes temporary **non-use** or livestock removal); 3) Distribution of livestock use; 4) Intensity of use; and 5) Type of livestock . . .” NTT report at 15 (emphasis added).

The RMP has no real analysis range and controls on harmful seasons and manner of livestock use, as required by the NTT and IMs. It increases stocking even potentially above above actual use, lacks any rest or non-use except in tiny or inaccessible areas, and would impose massive and unknown amounts of concentrated TNR and other harmful use without mandatory measurable controls.

It would increase use in inadequately assessed and mitigated ways in important seasonal habitats by relying on livestock “forage” as the overwhelming basis for allocations, the same and even more of a facility burden, harmful and/or ineffective rotation and other schemes (see Manier et al. 2013), and no plan for removal of livestock and significant rest periods so any taxpayer investment in claimed “restoration” actions could take place, not be destroyed. See Arkle 2014 report on failed fire rehab.

BLM is to: Evaluate **existing** structural range improvements . . . to make sure they **conserve, enhance or restore sage-grouse habitat.**” *Id.* at 17 (emphasis added).

BLM has not done this. It did not carefully assess the impacts of the existing battery of projects on important seasonal habitats, on extending predation, West Nile, depletion of forbs, bunchgrasses, sagebrush cover, and in promoting disturbance of grouse habitats by cattle – thus promoting predation of nests, eggs and adult birds. See Jarbidge AMS, USFWS GRSG WBP Finding.

The GRSG WBP Finding repeatedly noted the risk and threat posed by habitat fragmentation, and a series of overlapping threats affecting populations. BLM in the FEIS certainly never adequately addressed this –including the cumulative impacts of all the disturbances under the high habitat disturbance load of the alternative allocations, plus the severe degradation on surrounding BLM Elko, Burley and HT Forest, state, and private lands. Small maps don't adequately show roads. Fragmentation for grouse use and seasonal habitats is not addressed in any detail that allows understanding of the actual

impacts to sage-grouse seasonal habitats and crucial habitat components. BLM also never examined how the battery of activities and projects on neighboring allotments may impact the important seasonal habitats there, and thus the population.

BLM rigged alternatives with poison pills, and often used red herrings to minimize the benefits of any reduced grazing, and rejected analysis of No Grazing with a flawed and minimal analysis.

The IM 2012-043 carries through the NTT concerns. *See, e.g.*, IM 2012-043 at p. 5 (Grazing Permit/Leases Issuance/Grazing Management) (“Evaluate the potential risk to Greater Sage-Grouse and its habitats from **existing structural range improvements**. Address those structural range improvements identified as posing a risk **during the renewal process**.”)

BLM did not adequately evaluate the overall and cumulative risk posed by the EIS alternative actions to important seasonal habitats. It did not evaluate risk of construction disturbance and impacts. It did not evaluate the depletion and disturbance risks posed by the projects, These include:

Risk of habitat declines in quality (from chronic depletion of native vegetation -grass, forbs, sage cover) and soils and microbiotic crusts (including the extreme livestock disturbance load promoting weeds) that will extend 1-2 miles outward from upland artificial water sources for example. And these water sources may proliferate -both temporarily and permanently under the RMP’s intensive grazing, targeted grazing, fuels grazing, TNR, sacrifice area “Reserve Common Allotments”, etc.

Risk posed by elevated predator perches in the midst of treeless sage expanses;

Risk of significant increases in avian predators, and mesopredators from existing facilities and potential expansion, and poor an uncontrolled management practices that promote nest and egg predation, along with inadequate protective residual grass and structurally intact sagebrush cover.

Risk of additional habitat fragmentation under the RMP’s grazing, incessant “treatment”, TNR, targeted grazing and fuelbreaks, plus infrastructure, energy development, transmission, mining, ROWs (including the many Air Force ROWs), immense road footprint, etc. would cause.

Risk posed by cumulative effects of grazing schemes, plus facilities in disturbing sage-grouse during sensitive nesting and brood rearing periods (and also adversely affecting many other sensitive species migratory birds, big game, etc.) while facilities extend chronic depletion degrading their habitats.

Since BLM did not do this, it cannot have carefully examined risk to the local population (undergoing serious decline with area of occupied leks shrinking/range contraction in the local area and across the region, and declining neighboring populations as well. There are

few leks left over vast land areas, many of the leks have very low numbers of birds, lek routes with few birds have been abandoned thus artificially inflating the numbers counted in some more recent surveys.

The FEIS lacks a careful, hard look at the conflicts posed by existing facilities to leks, nesting areas, wintering habitats, or other areas. Like all parts of the RMP, the various Tables in the FEIS related to sage-grouse and other wildlife often do not provide sufficient environmental context to understand how numbers were arrived at, or if much of the area examined was actually used or usable by sage-grouse. Thus, BLM never really examines risks posed by existing or expanded facilities and management, or both combined.

In the case of West Nile, BLM never takes a hard look at the areas where the massive load of leaking pipelines, stagnant water troughs, vile stagnant stock ponds and other livestock facilities, plus 1000 plus pound cattle trampling disturbance causing deep stagnant water hoof depressions - will promote conditions suitable for mosquitoes and/or place waters in the midst of areas that currently do not have any surface water. It never examines the role of facilities and grazing during nesting periods coupled with lack of necessary residual cover in sagebrush habitats in dramatically increasing nest and egg predation, with predated eggs observed by WWP during site visits.

BLM refuses to consider large blocks of livestock-free nesting habitats across allotments in spring to provide habitat security. There are no real controls on carrion, supplements, artificial water sources, etc. luring nest and egg predators into the areas where sage-grouse are attempting to nest. WWP Jarbidge overflights observe only small numbers of ravens in areas of land where cattle were not present, but large numbers in areas being grazed. BLM has refused to require reasonable limitations on livestock use and management practices - as the abusive ranchers clamor for ecosystem disruptive predator killing rather than cleaning up their act.

Timely and pertinent monitoring methods are necessary to understand impacts of RMP actions on sagebrush habitats, and the need for significant change and mitigation measures. Yet the RMP proposes only spotty, meager and minimal monitoring at cherry-picked sites. As the NNT describes: "Sage-grouse select habitats at multiple scales across large landscapes . . . , which monitoring strategies for sage-grouse habitats must reflect. . . . At the project level, a truly effective monitoring strategy will include measures as to how plant communities respond, how that relates to structural and other sage-grouse habitat requirements, and how sage-grouse populations respond demographically. Quantitative data for habitat measurements should be collected that are sensitive to the land use change being proposed, [and] monitoring must occur over the proper time frames to evaluate temporal variation of important components of sage-grouse habitats". *Id.* at 29 (citing literature).

"Furthermore, the **BLM National Technical Team report (USDI-BLM, 2012)** recommends, "*Managing livestock grazing to maintain residual cover of herbaceous vegetation so as to reduce predation during nesting may be the most beneficial for sage-grouse populations ...*" and "*Within priority sage-grouse habitat, incorporate sage-grouse habitat objectives and management considerations into all BLM grazing allotments through AMPs or permit renewals.*" EA at 22. The RMP must lay a clear plan and

effective foundation for this all by clear, required management actions in the RMP to efficiently guide permit renewals.

The FEIS and limited near-status quo alternatives including the appalling Alt VI certainly do not follow the BLM's own sage-grouse guidance. Indeed, they do the opposite. Instead of modifying grazing to meet seasonal habitat requirements, BLM maintains and/or worsens status quo grazing practices, including spring grazing in lek and nesting habitat, twice-over grazing, with no discussion of why the guidance is being ignored. BLM under the loose and uncertain TNR and other provisions may radically increase the number of livestock actually being grazed and/or increase concentrated use. BLM may authorize multiple new livestock projects such as fences and troughs in sage-grouse habitat, despite the blatant lack of benefit to sage-grouse habitat. No analysis is given to whether modifications are needed to preserve the continuity of riparian areas. There is no current science-based discussion of how the FEIS alternatives will “conserve, enhance, and restore” sage-grouse habitat. Of course, they will not do so. Nor does BLM evaluate the risks to sage-grouse or their habitat from **existing** range projects so it can plan to alter and remove harmful facilities and minimize habitat fragmentation while reducing the heavy grazing disturbance caused by facilities.

The FEIS violates NEPA, the SSA and BLM's own often-repeated conservation promises for sage-grouse including the NTT, and the sensitive species policy by failing to assess a reasonable range of alternatives, and by failing to take a hard look at all the serious adverse direct indirect and cumulative effects (based on current science) of the meager range of alternatives it does consider. Braun 2006, Knick and Connelly 2009/2011, USFWS GRSW WBP Finding, Resiner et al. 2013, Beschta et al. 2012, 2014, Manier et al. 2013. NEPA requires accurate scientific analysis, and that the agency disclose and discuss responsible opposing views and take a hard look at all environmental consequences of the proposed action.

The FEIS cumulative impacts analyses are greatly deficient. Example FEIS pages 4-471-4-486 series of Tables and paragraphs, and throughout the RMP. BLM merely presents lists of leks in some areas in Tables, uses 2011 and prior info, fails to actually assess and take a hard look at threats to the local, regional and other populations, and rate and severity of population declines and predicted further losses.

As WWP described in our comments on the ID and NV BLM GRSW DEIS, BLM must analyze population trends and trajectories by transparently updating analysis similar to that of Garton et al. in Knick and Connelly 2009/2011. The Garton analysis only used 2007 and prior data – and thus did not reflect the massive effects of the Murphy and other recent fires including across Nevada (see Espinosa and Phenix 2008, for example) and continued high levels of grazing in the Jarbidge and across much of the region. See WWP GRSW Comments on cd.

There is also an alarming recent trend by state agencies, and then BLM is pressured to follow suit, to minimize habitat protections and reduce high priority/key/crucial habitat areas – at the same time as threats are mounting. This of course makes no sense – but in

reality habitat is being mapped away. BLM must fully assess the threat that the regional and range-wide mapping efforts pose.

BLM ignores full assessment of the population implications of contraction of land area with occupied leks, the losses of leks, the much more intensive agency counting efforts resulting in much higher percentage of birds being counted thus inflating population estimates for relative comparisons over time, etc.

The BLM fails to analyze the proposed grazing burden and heavy burden of other energy, minerals, ROWs, transportation, etc. burden on all aspects of breeding, winter and summer and other important seasonal habitats.

BLM analyzed no alternatives that require measurable levels of livestock use as Terms and Conditions of Permits, i.e. there is no alternative that ensures that any riparian and upland livestock use levels are actually met, and not chronically exceeded - thus causing further irreparable harm and loss to sage-grouse seasonal habitats.

BLM analyzed no alternatives that removed grazing disturbance (and all the problems it brings – from cows eating eggs, flushing birds from nest resulting in increased predation, stripping nesting cover, impairing quality and health of native vegetation during active and critical growing period use, etc.) during the spring sage-grouse and other sensitive species nesting/birthing/young bearing and early brood rearing/young rearing periods.

BLM did not analyze a reasonable range of alternatives for removal of livestock from areas of considerable conflict with sage-grouse or other sensitive species or resource depletion/damage needs, while continuing use on others - to provide for passive restoration while grazing continued with conservative and effective measurable standards in others.

Similarly, there is no analysis of the bighorn population and habitats - merely land ownership and some infrastructure figures –without relating the latter to habitat conditions. If BLM is so concerned about infrastructure and bighorns, then why is cogent analysis of the effects of infrastructure – say on sage-grouse as well not provided – such as the extreme water development, road and fence network? Why is there no real analysis of the degree of habitat loss, lack of connectivity, the quality and quantity of habitats, the extent and percent of cheatgrass in understories or dominating the landscape across the affected local and regional GRSG and other wildlife populations spanning Elko BLM, HT Forest, Burley BLM lands?

FEIS Table 4-97. This Table highlights out the failure and refusal of BLM to develop any real conservation alternatives for effective conservation of rare species and minimizing risks to their survival. Because of subterfuges in claiming that Alt V would have less shrub recovery because BLM purposefully structure Alt V to have no shrub planting (active restoration) and just passive restoration. If BLM were to just include a “plant shrubs” provision in Alt V, and the direction of the change arrow would change! BLM has purposefully constructed Alternatives to bias the outcome towards the abysmal Alt.

IV that will not conserve sage-grouse.

BLM has provided no substantial science-based analysis to show that it will be able to effectively control wildfire – especially with high numbers of livestock continuing to promote flammable cheatgrass.

We vainly turned to the Impacts from Livestock grazing section, referred to here, to understand the referenced “targeted grazing”. We found minimal analysis. See Manier et al. 2013 debunking range rosy claims of various grazing systems.

We Protest all of these deficiencies for the reasons described above.

Special Status Plants

FEIS 3.3.7.1. omits critical baseline information and analysis of the actual status of habitats and populations of these species. How degraded are habitats? How much of the habitat for all of these species is at risk to cheatgrass invasion under the grazing disturbance and other allocations of the RMP? With no controls on trampling which promotes invasive annuals? How will the range of alternatives and each alternative aggravate conditions – and increase risk? BLM must provide greatly updated mapping and analysis to properly depict potential and occupied habitat, habitats critical for restoration, and clear and effective recovery planning in a greatly revised alternative range.

The RMP, in its basically ignoring ecological conditions related to understanding soil integrity and health provides no basis for valid understanding of impacts to alternatives and the GOMAs to rare plants. See FEIS Table 3-29, for the large number of rare plants “potentially” occurring. Table 3-30 shows how limited BLM data actually is, FEIS 3-47 shows that data is not current and that BLM fails to provide a proper baseline for the RMP analysis.

There is no adequate basis for understanding the impacts of the severe grazing pressures under many parts of the range of alternatives on pollinators for native plants – including life stages in soils, and their dispersion across the landscape. In such a forb-depleted area, native pollinators become a significant concern. Why does BLM put out an RMP in late 2010 that has 2008 plant status? BLM could have readily revised this information, too.

Why is there no mapping that shows the location and dispersion of these rare plant species in the FO? The location of potential vs. occupied habitat? The presence of cheatgrass in understories at various percentages? What percentage of habitats for each species are currently occupied?

We Protest these the above deficiencies for the reasons described above.

Slickspot Peppergrass Minimal Analysis

Despite all the efforts made to try to conserve slickspot peppergrass by WWP and others, BLM merely lists this species and the VMAs in Table 3-31, and does not identify the various HIP/Habitat Integrity ratings applied to the Element Occurrences. It does not even discuss population vigor, habitat quality, causes of degradation - see FEIS Table 3-30. claims population vigor “fair” and habitat quality Fair. This, of course, is counter to all the information habitat degradation affecting specific Element Occurrences. Greatly revised and detailed analysis of LEPA Habitats and threats to EOs and populations must be provided in a greatly revised RMP so that proper threat analysis, development of a valid range of science-based alternative mitigation measures, and full transparent analysis of the livestock, roading, treatment, fuels, targeted grazing and other proposals on slickspot peppergrass and its habitats can be undertaken. See WWP Comments on Proposed Listing Rule on cd.

We Protest the failure to properly assess slickspot habitats and populations and undertake necessary conservation planning and protections.

Noxious Weeds and Invasive Plants

BLM ignores the large advance of cheatgrass that was documented including into understories of sagebrush communities based on the ESI before the Murphy Fire. This is evidence that the levels and manner of grazing use, and the extremely high facility footprint was having a significant negative impact to ecological processes. BLM Ignores the comprehensive studies by Reisner showing that livestock grazing disturbance causes cheatgrass. Reisner dissertation 2010, Reisner et al. 2013.

BLM must provide detailed mapping and analysis fully examining cheatgrass composition in understories, and areas “at risk” of cheatgrass increase or dominance under a new range of much more conservation-oriented alternatives. Under the situation as shown in the AMS, now followed by massive wildfire, proposing several commodity-oriented alternatives is ecological madness. A SEIS must be prepared that properly presents cheatgrass expansion and risk data and analysis.

The RMP provides a shallow and greatly inadequate analysis of the vectors and causes of weeds. In the JFO where cows outnumber wild horses by much over a thousand or more to one, mentioning horses and livestock to an equal degree is just not informative. But this is typical of BLM analysis that is overwhelmingly blind to livestock impacts. See <http://www.peer.org/news/news-releases/2014/09/16/blm-weighs-wild-horse-impact-much-more-heavily-than-cattle/> .

This section doesn't even mention the severe impacts of livestock trampling in damaging microbiotic crusts, and priming lands for weed invasion. It ignores the now immense footprint of supplement feeding in livestock-depleted lands - that creates thousands of new disturbance zones and weed infestation sites.

There is no commitment to practicing Integrated Weed Management, which must be a cornerstone of conserving native species – especially in the face of climate change and

increased weed risk. Instead, BLM's "tools" are overwhelmingly herbicides. BLM will never be able to control weed spread and battle cheatgrass or other weeds until it:

- Removes or seriously curtails livestock trampling disturbance;
- Prevents movement of livestock from infested areas (pastures, allotments, private lands) into uninfested sites;
 - Removes grazing or other disturbance in "at risk" areas until native understories recover - which is still possible in the middle to higher elevation areas);
 - Protects the public's tremendous investment in rehab actions by preventing livestock damage and resting lands until much more adequate recovery of composition, function and structure occurs
- Prohibits livestock use of infested areas until invasive species/noxious weeds have been controlled and eliminated.

BLM has failed to develop alternatives and allocations based on Integrated Weed Principles to protect sage-grouse and other habitats from grave weed threats. This must be done in a SEIS. Instead of doing this – BLM seeks to impose even more extreme levels of targeted grazing, TNR, and other disturbance that will only serve to exacerbate ecological problems, promote more weeds, and result in likely intensified herbicide use, drift, and harm plus increased frequent fire danger in many areas.

Threats analysis must provide much more information on the impacts of livestock grazing and trampling and limit upland trampling, and the full range of threats so that all direct, indirect and cumulative impacts of alternatives and management actions can be understood.

We Protest the FEIS due to the deficiencies described above.

EIS Fire/Fuels Background, Confusion, Lack of Science and Risk Analysis Remains

The foundation of the RMP, as shown in DEIS 3-52, shows that in the whole RMP development of alternatives and RMP structure, BLM still obsessed over "fire fulfilling its role in the ecosystem and accomplishing resource objectives". The presentation of information appeared designed to minimize the severe effects of the fires (except when useful to BLM to impose massive grazing and fuels treatments to promote forage grass) – and cover over the disaster that BLM's post-fire seedings have caused by promoting large and repetitive fires. (See DEIS Table 3-31, VMA A and B), WWP Lone Butte Fire Appeal. These are the areas where many of the harmful dense fire-promoting cwg and other seedings are found - and such seedings we have been repeatedly told are essentially huge fuelbreaks. Of course, they are not, but BLM has justified planting more dense seedings and planting dense over-sized pseudo-native cultivars by saying they are.

Detailed and honest ecological analysis of the ineffectiveness of the existing fuelbreaks, and the crested wheatgrass billed as fuelbreaks and the failure of coarse large grasses to control fires must be understood. Please describe in detail just what FRCC existed in the lands of the Lone Butte fire, and where pre-fire. The Clover Fire? Seeding areas of the

Murphy fire?

We have discussed the biases of applying FRCC in the Jarbidge in the Fire Appeal submitted with comments on the DEIS. We highlighted 3-53 stating that “FRCC is delineated as the departure from the historic fire regime”. Then, “Departure from HFR is based on comparison of current fire return interval and fire severity to the historical fire return interval and fire severity”. So – in the case of the Jarbidge where credible science would show fire may have burned on the average every 200 years or longer – BLM must specify what the interval is that it used in the models underlying the EIS. If we super-impose “fire severity” on this – based on what is actually on the ground – we get lower fire severity than in grass than sagebrush communities. However, the model appears to imply that the severity is based on PNC - and whatever in the world a “VSG” is. Then, “HFR in the planning area was determined based on potential vegetation. HFR is further defined in the LANDFIRE models used to describe the planning area’s HFR. Table 3-34 assigns the potential natural vegetation groups ... from the LANDFIRE model to an HFR, PNC (based on information from SSURGO) and a VSG. This is even further complicated by BLM reference to “HFT definitions defined in the cohesive strategy. This is even crazier in 2014, as all of this FRCC modeling was done many years ago now, is likely based on incorrect fire return intervals, idealized super-grassy Ecosites and other confusion. The whole FRCC process was designed to model timber country - not greatly altered coarse seedings, mottled landscapes that are a mix of some exotics in the understory and some sage and rabbitbrush, sagebrush communities, annual grasslands. BLM has not clarified the underlying data inputs for this elaborate modeling relied upon in the FEIS for massive veg treatments, underlying targeted grazing, TNR, ancillary herbicide use, and a host of linked adverse impacts associated with these activities.

Complex FRCC and other veg models of the RMP EIS with ever-changing inputs do not promote sagebrush and sage-grouse conservation. In the FEIS, BLM in using the model, plugs in idealized inputs - to promote livestock grazing in the name of “fuels”, TNR, etc. – so instead of the process being aimed at any fire protection it really is aimed at protecting livestock use.

There is little evidence that the arbitrary categories of the FEIS, models and diagrams have real relevance to understanding fires, controlling fires, or protecting sage-grouse habitat in the Jarbidge. These figures are based on uninterrupted idealized succession processes – something that just does not occur anymore in the JFO with coarse grass seedings combined with livestock disturbance and other “treatments” that retard succession. BLM’s artificial division of the FO into the VMAs adds yet another arbitrary and artificial category to this all.

S-Class must be clarified– “which had more influence” in the JFO? Does this mean that the coarse woody grasses have burned more frequently - time after time? That is the reality of what has occurred. Does BLM consider cwg and swg “successional”?

DEIS 3-55 stated that fuel models do not account for fire return intervals, changes in landscape patterns, or length of fire season. BLM has failed to specify what does in the

FEIS. It appears that the Lone Butte Fire burned a great big hole in the FRCC and Fuels modeling in Table 3-36, page 3-56? There, the VMAs (northernmost Jarbidge), had 0 acres with an extreme rate of spread rating. Yet the Lone Butte fire burned at extreme spread - nearly 300,000 acres in primarily just two days. This exposes the serious flaws in the models the entire FEIS is based upon. VMA A and VMA B had very large acreages in very high, and high categories. Yet these are the very areas with vast expanses of cwg and recent dense BLM fire seedings. So what the retired BLM Managers, WWP and others have been saying is true- the dense seedings in the JFO are a disaster. The Murphy Fire was a singular extreme event. Such events will likely be impossible to stop -unless square miles are bladed off.

BLM never explains what the complicated system actually means. In DEIS Fire 4-470, crucial information was omitted. For example, why doesn't BLM have "number of fires" (not just human-caused) as an Indicator? Perhaps because it would highlight the frequent, repeated and large fires in the northern FO.

On top of the jumble for the fire discussion from DEIS and FEIS Chapter 3, BLM in Chapter 4 imposes the jumble of uncertainty from livestock grazing, rec, travel, and claims "impacts from management in the Veg Communities and noxious weeds and invasive plants sections were captured in wildland fire ecology". BLM then proceeds to conduct its flawed alternative analyses based in part on the artificial VMA categories.

DEIS 4-472 stated that "estimated utilization levels of non-native veg were compared between the alternatives". What is the basis for understanding utilization levels under any alternative? We asked that BLM provide details and these were not provided in the FEIS.

Plus, the FEIS Response to Comments (A-479) adds even more confusion to how utilization and production was factored into the grazing allocation (at 800 lbs. per AUM). BLM states that percentages were for allocations of forage and not annual use. BLM stated: "it was assumed that higher utilization levels in non-native vegetation would have an immediate effect in decreasing fire size" - and cited the Murphy Fire Report (Launchbaugh et al. 2008). Unfortunately, **that is not what the Murphy report said.** That report - and Steve Bunting in the BLM Press Conference - admitted that **only under the cool, calm prescribed fire conditions does his MODELING of grazing use levels show any effect on fire behavior.** These are not the conditions when wildfires naturally burn. Thus, BLM's use of the Murphy Fire Report, in support of its massive fuels/forage treatment and grazing disturbance intensification scheme, is not valid.

Throughout the RMP process, BLM has never identified the degree and severity of grazing, fuelbreak and other disturbance that it believes would be required to effectively stop fires under the actual, real world conditions when wildfires burn. How much land? Where? What would be growing on it? What wildlife could survive in it? How might this massive series of often overlaid and additive and cumulative disturbances increase habitat fragmentation? Thus, it has no basis for the elaborate modeling schemes it has concocted to justify status quo, increased and TNR grazing.

It appears that BLM's entire basis for analyzing fuels, the high levels of grazing and extreme number of treatments of Alt III and targeted grazing in Alts IV and FEIS VI is based in large part on the assumption that wildfires in the Jarbidge burn under the cool, calm spring or fall temperatures and moisture conditions of prescribed fires!

BLM's misleading and incorrect use of the Murphy Fire report is inexcusable. It is being done to promote very high and harmful levels of grazing use continue in the JFO, to the detriment of all other uses of the public lands.

In the development of the limited range of Alts, BLM assumed that recreational use won't increase over the next 20 years. DEIS 4-472 – this further illustrates the flawed foundation of the entire RMP, and the need for a SEIS.

BLM cannot simplistically claim that limiting travel to roads alone is going to reduce fires. Very little OHV off-road use occurs except the hill outcrops, Yahoo area, etc. in small sections of the north. There are so many roads over much of the area (many thousands of miles)– there is no need. What is most important here, and BLM refuses to deal with it, is limiting flammable cheatgrass and other weeds that invade road and roadside disturbances, and the infestations that spread cross country due to grazing impacts.

We Protest all of these RMP EIS deficiencies for the reasons described above.

FEIS Land Use Allocations/Authorizations

BLM has still failed to provide the basis for coming up with and then analyzing the Land Use Authorizations. These include ROWS, oil and gas, geothermal, military activity, etc.? Wouldn't large-scale oil and gas development increase flammable cheatgrass and likelihood of explosions and other lightning-cheatgrass and/or human-caused fires? So shouldn't BLM prohibit oil and gas development in all remaining sagebrush habitats and recovery/restoration habitats to protect the habitat? Likewise for geothermal, military activity, etc.

In fact, BLM's own NTT report found universally NEGATIVE effects of Oil and Gas, and also:

The primary potential risks to sage grouse from energy and mineral development are:

- 1) Direct disturbance, displacement, or mortality of grouse.*
- 2) Direct loss of habitat, or loss of effective habitat through fragmentation and reduced habitat patch size and quality.*
- 3) Cumulative landscape-level impacts (Bergquist et al. 2007, Walston et al. 2009, Naugle et al. 2011). There is strong evidence from the literature to support that surface disturbing energy or mineral development within priority sage grouse habitats is not consistent with a goal to maintain or increase populations or distribution. None of the published science reports a positive influence of development on sage grouse populations or habitats. Breeding populations are*

severely reduced at well pad densities commonly permitted (Holloran 2005, Walker et al. 2007a). Magnitude of losses varies from one field to another, but findings suggest that impacts are universally negative and typically severe.

The NTT also recommended “**Disturbance Thresholds**”. Note in the highly fragmented Jarbidge we do not believe these thresholds are sufficient. The habitats and populations are at the point where they can withstand no additional disturbance. However, we stress that BLM rejects its own science in its greatly deficient Alternatives, BMPs, SOPs, etc. The thresholds are as follows:

Disturbance thresholds recommended by the NTT include:

- *3% surface disturbance cap*
- *one well per section cap*
- *4-mile no surface occupancy buffers*
- *noise limited to less than 10 decibels above 20-24 dBA.*

The NTT and IM were released in late 2011-early 2012. Now, there is even more evidence from the disastrous BLM land oil and gas development in WY, MT, UT, CO to show that more protective measures are needed, in fact, the BLMs own China mountain DEIS for wind recommended a five mile minimum buffer from development disturbance.

There is no way to examine the direct, indirect and cumulative effects of RMP FEIS actions and understand outcomes of any alternative until BLM develops an RMP based on current ecological and conservation science, and presents all of this forthrightly, plainly. BLM must develop an RMP based on conserving sagebrush and sage-grouse habitats and populations, using current grazing, energy and other science. For example, see WWP’s comments on ID/SW MT and NV/E CA GRSG EIS processes, Manier et al. 2013, Knick and Connelly 2009/2011 *Studies in Avian Biology*.

Artificially segregating habitat and analysis into VMAs meaningless to sage-grouse serves no purpose other than to complicate matters – and provide a basis for inflicting large-scale TNR and destructive grazing levels in the “sacrifice” areas –like A, B, most of C and some of D areas.

Direct, Indirect, Cumulative impacts analyses and Alts comparisons in a series of EIS Tables are just not based on valid assumptions BLM’s misinterpretation of the Murphy Fire report claims that grazing could somehow stop fires. How effective would any of this be at stopping the “perfect storm” of the Murphy Fire? DEIS 4-473 to 4-478, same assumptions carried forward in the FEIS.

How severe would grazing use have to be, and at what level of utilization, across all vegetation communities to achieve the outcomes predicted by BLM? 80% or 90% use of cwg? Or of Cheatgrass? How much soil erosion in wind and water would occur? How might this actually increase fire risk in following years? How might this turn the lands into a weed wasteland? Where specifically would these acts occur, and how much would this cause fragmentation, impairment and loss of sage-grouse and other sensitive

species habitats? What will the effects be on rare and sensitive species?

BLM somehow came up with 916,000 acres "Improved" – and claimed it is more than any alternative. This type of analysis – with unknown inputs underlying the RMP data and analysis, continues in the FEIS. BLM must provide all acreages, livestock stocking rates, use levels, treatments, changes in cheatgrass predicted over 20 years under all the complicated morass of Alt IV and now the FEIS Alt VI and others. What does "improved" mean? Rosy outcomes are not based on a serious assessment of ecological risk of imposing the combined massive treatment and massive grazing and infrastructure scheme.

What are the climate conditions (humidity, wind speed, fuel moisture, etc.) that are used in the predicted "rate of spread"? What percent cheatgrass is in all the communities here? What is the vegetation that BLM assumes is in the Fuelbreak? Regarding the EIS "S-Class similarity" – that is partially related to whether shrubs are present – in a "successional stage". BLM artificially cuts out any shrub planting/active restoration from Alt V to elevate Alt IV over V (and now VI in the FEIS). So it is the artificial and industry-serving constraints that BLM throws in to various alternatives for no apparent reason that allows BLM to manipulate numbers and Alternatives Comparisons any way it wants. This represents another example of arbitrary rigging of the EIS to make industry alternatives appear better for the environment.

How does BLM factor in the important effects of passive restoration in inhibiting cheatgrass spread and dominance? What would be the impacts of a No Grazing Alternative? Or no Grazing of the WWP-proposed Sagebrush Sea Alternative? A SEIS must be prepared to take a hard look at these issues, and assess this in a fair, balanced and science-based manner. It is also necessary to balance competing uses, and minimize harm and conflicts between competing uses of the public lands.

We Protest the failure to address these FEIS concerns for the reasons described above.

FEIS Transportation/Recreation

We Protest the following:

DEIS 4-639 phrasing indicates BLM foresees increased recreational use. Yet BLM elsewhere claimed in some of the most important wild recreation areas there would not be an increase. 4-643, Table 4-302.

BLM knows it will never adopt a route density change increase as shown for Alt II – an increase over 1,161,000 acres. This is just done to make Alt. IV look better (through having other a really wretched alternatives, and represents rigging of alternatives. How does BLM factor Oil and Gas, Geothermal, wind and other ROWs and industrial uses into the massive road network under the industry-friendly range of expanded development alternatives of the RMP?

BLM has failed to adequately restrict snowmobile use in sage-grouse, big game and other

habitats. These areas should be closed to snowmobile use. Snowmobiles must be restricted to roads. Not only is wildlife disturbed, shrubs may be broken off and crushed. Pygmy rabbit snow burrows may be collapsed

BLM must limit rancher use of motorized vehicles to ensure habitat security and limit disturbance and weed spread, plus to allow roading to be properly rehabbed and removed. Ranchers have horses. A large-scale reduction in road density could readily be achieved – with roads closed and rehabbed to limit weed spread.

In Alt V, BLM does not adequately lay out a plan to close roads associated with livestock facilities, supplement artificial feeding, etc in lands where grazing would not occur. Plus, it does not identify a protocol for terminating unnecessary roads in grazed areas if ranchers were required to rely more on horses and herding to distribute livestock rather than fences and supplements.

Alt VI FEIS is greatly flawed, imposes continued large-scale roading disturbance across sensitive species habitats and fragile eroding watersheds. BLM has failed to properly:

Evaluate and disclose motorized and non-motorized recreational resource and opportunity information to the public. BLM does not even know the number of miles of routes – and in fact admits that it may be twice that shown in the impossible to see clearly RMP mapping.

- Miles of roads, routes, and trails. BLM admits that at present it does not even know - and in fact it may be double the number that the agency has inventoried.
- The different uses allowed on roads, routes, and trails.
- The current and expected future use by motorized and non-motorized users on roads, routes, and trails.
- Amount of cross-country opportunity available to motorized and non-motorized users.
- Scientific Basis for the analysis.

Until BLM openly admits the full-scale adverse impacts of the massive livestock facility system and the battery of unnecessary roading in use (often two tracks running on BOTH sides of a fence, for example) and develops a range of alternatives to greatly rollback the facility footprint on sage-grouse, big game and other species habitats, it cannot develop a modern day travel plan that sufficiently protects Jarbidge natural resources. See FWS WBP Finding for GRSG.

We Protest the FEIS for the reasons described above.

FEIS Actions Will Trammel and Impair Wilderness and Wild Lands Natural and Other Values

Lands “released” in the Owyhee Initiative should be managed as roadless, and incorporated into ACECs or other protections, and the FEIS fails to do this. There is so little wild land left in the Jarbidge that this is essential. Much more detailed analysis of adverse effects of all RMP Alternatives and actions on the thin and narrow Wilderness areas must be provided.

We Protest the failure to analyze the adverse footprint of the immense livestock load and other disturbances under Alt VI and all FEIS alternatives on Wilderness values and integrity – including natural and biological values, primitive and unconfined recreation, solitude and other vital values. The degree to which the RMP allocations and lax and uncertain management threatens these values must be fully assessed in a SEIS.

Additional RMP Concerns – Based on Mapping and Other Components of the RMP, and More Cumulative Impacts

We use the visual information portrayed in the RMP Maps to highlight concerns in this portion of our comments. We also discuss areas of the RMP where much more detailed analysis is essential.

Military Noise, Habitat Degradation, Fragmentation. It is necessary to understand the footprint of the military here, and all direct, indirect and cumulative disturbances. Please provide analysis of the US, Singapore, Saudi and other existing or foreseeable military noise, ground activity, use of military apparatus on ground and air, use of flammable and dangerous white phosphorus at Saylor Creek, and other activities here.

How has military activity caused fires – on both BLM and AF lands? How has the risk of military-associated fires increased? If BLM is going to develop any fuelbreaks, the key place this should be done is working with the AF on Air Force lands –since many fires start there. This is also likely to expand with increased use, use of white phosphorus, etc.

The FEIS failed to assess the full adverse footprint of the Gateway Transmission line on the area –including the Burley FO lands and wild lands, scenic, recreational, wildlife habitat, and other values.

The FEIS failed to provide detailed analysis of the current military disturbances and stresses on ecosystems and wildlife populations including sage-grouse, bighorn sheep, migratory birds and others. This must include direct, indirect and cumulative effects. For example, sage grouse in the Jarbidge are subject to extreme plane noise disturbance for several hours a day, and at night-time too during periods of intensive training.

How do the sounds from these activities affect sage-grouse? Bighorn sheep? Other wildlife? Recreational users? Please provide analysis of risk of military flare-caused fires. Has BLM, since expansion of the AF Bombing Range, ever required the Air force to stop using flares during periods of very hot and dry conditions? How many fires have

occurred on Air Force lands from 1987 to the present? Where? This includes at least one fire in LEPA habitat on Juniper Butte. Many of the emitter roads and portions of accessing routes would go for many days or weeks and receive no human motorized use – except for the Air Force. So what is the manner of use and disturbance to wild lands and wildlife that is actually occurring, and is foreseeable, over the life of this Plan? How do military lights interfere with dark night skies?

There is a very large and unexamined Footprint of military actions that have direct (vehicle-caused mortality of migratory birds, reptiles, and other wildlife, for example), indirect and cumulative impacts on habitats and populations of wildlife species.

Please examine the failed rehab actions on AF access roads grazed by BLM-managed livestock. What was seeded? What is now present, and in what condition, after several years of grazing? This must be factored into any predictions of treatment outcomes in the RMP EIS. This is crucial to inform BLM of how the severe livestock grazing footprint will ruin any rehab, fuels or other seedings it may try to put in place. The level and severity of grazing, and lack of adequate measurable use standard controls and required prolonged periods of rest will doom seedings.

BLM inaction (lax management of grazing disturbance) have resulted in failures of rehab efforts on Air Force road rights-of-way. We have watched as Brackett cows have devoured shrubs and other vegetation that were planted, including some like fourwing saltbush that were supposed to be “mitigation” for wildlife. Basically, the “mitigation” for the AF road expansion has been eaten up. Air Force seedings, just like the fire rehabs as documented in Arkle et al. 2014, often failed due to BLM overstocking and harmful seasons of use for politically powerful livestock industry permittees.

What actions can BLM take at some level to mitigate the severe adverse impacts of near non-stop noise and visual disturbances from low-flying aircraft on sage-grouse, bighorn sheep, and other wildlife? When the military does its own NEPA analyses, it claims that such things as road closures or vegetation condition are the purview of the BLM. So now BLM is doing a new RMP with new management. So how can all of the many disturbances/stressors on native wildlife, wild land ecosystems, i.e. the military Footprint in this landscape, be better mitigated by BLM? The FEIS fails to address this, and fails to provide a proper noise, traffic, habitat fragmentation, or other baseline. What has been the fate of the leks near Juniper Butte? Aren't they in freefall? The severely flawed EIS Visual analysis and allocation and several other parts of the EIS impose severe allowable disturbance to habitats.

BLM must also examine the footprint of military-permitted grazing levels, and the disturbance and conflicts with wildlife, promotion of weeds, polluted skies cloaked in contrail clouds, losses and disturbance to LEPA- and other impacts that the AF is causing. Regular and repeated use of roads by military vehicles accessing remote sites poses a very significant threat for weed expansion – as livestock crisscross all over the road verges and then disturb soils crosscountry.

Air Force Saylor Creek lands are choked with rush skeletonweed and other aggressive invasive species. Military vehicles can readily transport these weeds into LEPA and other habitats. We have watched in alarm as MHAFB puts out press releases about bringing in military tanker aircraft to disperse herbicide to try to address the severe weed problems on its Saylor Creek site. There is strong risk of aerial drift of herbicide, with mortality of non-target vegetation and other adverse impacts. Repeated spraying has occurred – so it must not be effective at control. Indirect and cumulative effects of herbicide use on military, state, private and other lands are not adequately assessed.

We have watched as the AF destroyed sagebrush, replacing it with crested wheatgrass as a so-called” Fuelbreak” along the Bruneau Desert road. Then, some shrubs grew into the seeding – and the Air Force mowed them – and intensive grazing continued. This resulted in cheatgrass expansion, and wildfires have repeatedly burned right over the fuelbreak.

BLM must provide much more detailed analysis of these activities as a real Baseline for understanding past, present and foreseeable effects in a greatly expanded analysis here in a SEIS. BLM must then act to significantly reduce the disturbance Footprint on species, lands and public lands activities that are impacted by military ground and air based disturbances.

We Protest the failure to properly assess all direct indirect and cumulative effects and minimize these disturbances and harms as described above.

Livestock Operation Disturbance Footprint, Indirect and Cumulative Impacts – Other BLM State, Private, HTNF Lands

The same very small number of permittee cattle and sheep herds impact the headwater areas too. The full watershed/ecosystem/wildlife disturbance Footprint of these operations must be examined. The Forest has in most instances never conducted ANY site-specific NEPA on livestock grazing operations of Jarbidge permittees. It withdrew, following Appeals, a Rangeland EIS, which did not provide necessary site-specific analysis of the disturbance Footprint of livestock grazing on the Forest. Understanding this all is necessary for BLM to fully take into account all direct, indirect and cumulative impacts to ecological systems and native biota of its FEIS actions.

We Protest this as described above.

Erosion, Wind, Climate Concerns Continue

Wind erosion potential and mapping. BLM has failed to provide full analysis of the synergistic effects of loss of shrubs that has altered winds near the ground surface in the Jarbidge at the micro-site scale. How has this affected fire spread? Could an increase in taller shrubs actually serve to reduce fire risk – not only through providing wind breaks - but also through shading the ground surface and slowing snow melt and runoff, as well as retention of rain water moisture on site? Full analysis of how significant native shrub cover may ameliorate micro-site/local climate must be provided. If sites dry out one, two,

three or even more weeks later if shrub cover has helped retain moisture on-site, how might that help to reduce the time period of fire risk? We stress that many devastating fires have occurred in July, and with climate change, sites are predicted to dry out faster. So sound management must include providing taller shrub composition to retain moisture on-site and limit early-onset of fire season.

BLM must also examine how livestock grazing may reduce the period of moisture availability and green vegetation. This includes: Removing standing cover; creating bare dirt instead of soils covered with microbiotic crusts; drastically simplifying sagebrush and other shrub structure so that there is much less shade; by promoting dense growth of cheatgrass that “cheats” by germinating in fall and then growing rapidly in spring - using up moisture from the site and exacerbating early site drying- and many other factors; plants using up moisture as they attempt to regrow following repeated spring grazing, etc.

The presence of taller shrubs also traps wind-blown soils. Wind-blown soils are also of concern to LEPA habitats and populations. Soil deposited on slickspots and the surrounding sagebrush matrix would adversely alter site hydrology, increase nutrient composition that may foster weed proliferation, and have many other adverse impacts. The disturbance from livestock grazing generates dust that erodes and is then deposited in slickspots – so minimizing trampling disturbance to soils and microbiotic crusts during

While mapping of soil “potential” is fine - how is the potential for wind erosion affected by the presence of vegetative cover? By livestock trampling disturbance including the extreme burdens of the RMP FEIS Proposed Action? By both? How much soil potential has been lost? BLM must provide mapping and analysis that examines these factors, and a set of alternative actions that addresses this.

It is increasingly known that dust deposition accelerates snow melt, and exacerbates change processes. More cows= more dust. Please provide detailed analysis and mapping of a range of alternatives that serve to minimize dust production from these lands. This must include specific measurement of trampling impacts, and establishment of upland and riparian standards of livestock trampling disturbance use for any lands that continued to be grazed. An emphasis on restoration of microbiotic crusts to minimize wind-caused soil erosion is critical.

Water erosion potential and mapping. It is alarming to see that significant areas of occupied and potential LEPA habitat have “high” water erosion potential. Thus any continued livestock trampling and trailing may expose the sagebrush matrix soils to erosion – and slickspots to much deposition of matrix soils that result, in combination with other effects of livestock grazing, in conditions that favor weed infestations of slickspots and long-term loss of the slickspots and their natric soil surfaces.

Bull trout habitat in the Jarbidge system is also at risk from water-eroded soils –with erosion exacerbated by livestock grazing and trailing on BLM and HTNF lands, disturbance related with livestock facilities, as well as from the significant road network,

recent fires, etc. The FEIS RMP and BLM rangeland health (as BLM in Idaho assesses watershed standards) do not adequately address the role of intermittent and ephemeral drainages in a high desert ecosystem in transporting large volumes of sediment choked water into canyon and other stream systems during a very brief period of intensive late winter-spring flows, or summer thunderstorm events. Full understanding of the local climate regime, watershed condition and stressors, and the manner of runoff in these systems must be provided to understand grazing, roading and other disturbance effects, and to properly mitigate and minimize these.

The FEIS has failed to provide an understanding of baseline conditions, ecological degradation (how much topsoil has been lost, and is the “potential” in fact lost?) and management shortcomings on BLM Lands as well as in the adjacent headwater areas in the Forest must be provided - to understand what the total sediment load may be – and all direct, indirect and cumulative effects. There is a shocking lack of information and analysis of soil conditions. BLM cannot develop a reasonable range of alternatives until provides much more substantial information and analysis of the current degree and severity of soil degradation, losses and desertification processes.

Soil is the foundation for all the “forage” that BLM allocates. It is the foundation for sage-grouse habitats. It’s stability in the sagebrush matrix preserves slickspot integrity. The soils of slickspots are greatly vulnerable to livestock trampling, and the FEIS alternatives and analysis fails to control or even reliably measure this during grazing periods. See Appendix E. Large amounts of topsoil have eroded and been lost from many areas of the FO. Soils in upland and riparian areas receive very high amounts of trampling disturbance and displacement from 1000-1200 pound cattle – leading to compaction, erosion in wind and water, hydrological process disruption, loss of microbotic crusts, and promotion of weed invasion. Large areas of the soils are covered with vast quantities of livestock waste on an annual basis, upsetting the nutrient balance and providing excessive nutrients that weeds thrive on. Small mammals, and many insects that form the basis of bird and mammal diets (including for sage-grouse and migratory bird chicks), and critical pollinators of native plants all rely on functioning soils that provide diverse habitats – not heavily trampled, degraded soils as is the case at present. Soils form the basis for ecological processes, and native biodiversity.

These impacts and the degree and severity of loss at present are not adequately examined. Until this is done, no adequate range of alternatives can be developed and sustainable allocations made. BLM continues to ignore the current degradation – and develops its management schemes based on idealized conditions that do not exist. (Example: BLM’s Fuels modeling).

BLM provides minimal information on this critical component, or the adverse effects of land uses on soils. How will summer grazing disturbance impact soils of various types and condition –compared to winter, or grazing when soils are saturated? How long-lasting are heavy to severe trampling impacts during these times on soils of varying types? How much of the FO currently receives heavy trampling? Where? Where have soil horizons been lost due to erosion? Are depleted soils and monoculture coarse grasses

responsible in part for the need to feed so much supplement to livestock? What is the current soil formation rate? How has past erosion exceeded that rate, and where? How will the various alternatives affect this rate? How will depleted or degraded soils hinder rehab actions?

In scoping, BLM sought to minimize consideration of the critical role of soils as a foundation for ecosystem processes. In 2007, when WWP sought to submit an alternative, we were told to follow the minimalist box format that BLM was using at that time – and among its many flaws were how the framework prevented meaningful consideration of soil and other resource conditions. BLM never moved forward with any real analysis of soils all of this time.

BLM fails to provide mapping and analysis of the soil health, microbiotic crust condition and composition, erosion rates from current activities, predicted erosion rates under all alternatives, measures of soil compaction, and a host of other info and analysis necessary to develop and analyze a suitable range of alternatives.

While the DEIS finds time to point to fire erosion- the Affected Environment section of the DEIS provides no analysis or information on livestock trampling disturbance promoting erosion, pedestaling, loss of fertility, destruction of stabilizing microbiotic crusts, etc. – or of degradation of soils and microbiotic crusts promoting flammable weeds that exacerbate fire erosion.

Won't livestock-friendly BLM GOMAs in the high livestock disturbance alternatives that aim to maintain large areas in exotic and perennial grasslands and intensify grazing under various guises - lead to unhealthy accelerated wind and water erosion? Aren't shrubs keystone species that anchor and moderate microclimatic conditions including important soils processes – and should be present to protect from erosion, and moderate micro-climate features?

The analysis of Effects to soils under the limited alternatives is minimal. BLM basically points to other EIS Sections heaping the confusion and uncertainty of the Veg, Fire, Treatments, and other sections on top of the vague soils section. This is not analysis – yet this method is repeated across the Sections of the EIS. BLM points away, distracting from the gross deficiencies of the Soils or other sections at hand, to get the reader to look at other confusing and near-substanceless EIS sections.

Retaining soils in situ is dependent on the degree and severity of livestock impacts – both vegetation removal and tramping:

Runoff containing sediment and associated pollutants generally occurs as a result of two environmental factors. One is winter/spring snow melt and heavy rainfall periods occurring on saturated or frozen soils and in areas with rangeland soil surfaces lacking adequate vegetative ground cover to prevent excess erosion and sediment delivery off site. The other can occur after wildfire events on exposed rangelands during the summer months where

intense summer cloudbursts impact large areas of unprotected soil resources due to a lack of plant and litter cover. Activities including, but not limited to, livestock grazing, OHV use, and fire suppression can affect sediment and other pollutants in the water (Jarbidge AMS).

Even if we were to accept that BLM limits on utilization alone (without also having measurable trampling limits) would provide protective vegetation and protect soils – a reader of the EIS has no clear understanding of what these may be. It is impossible to understand how proper analysis of alternatives effects can be undertaken, or allocations made.

BLM ignores adequate analysis and alternatives development to address the predicted impacts of climate change on soils and vegetation – for example: Climate change may cause the region to become drier and less vegetated in the foreseeable future, leaving soils more exposed to wind erosion and resulting in an increase in particulate matter (Jarbidge AMS), see also Comer et al. 2012.

There is no real analysis of the current loss of soil potential and horizons, widespread pedestaling, depletion of essential nutrients, loss of microbiotic crusts, ecological conditions of soils in slickspots and surrounding habitats, soil conditions in all vegetation communities that are still native in composition, etc. This is all necessary to make science-based decisions to ensure sustainable uses and significant progress towards functioning ecosystem processes that provide the foundation for habitats for native biota.

BLM must overlay for LEPA and other sensitive and vulnerable species habitats, baseline data on the impacts of both moderately to high soil erosion in wind and water to affected values of the public lands. If slickspot habitat occurs in lands with both high wind and water erosion, then how does livestock trampling disturbance act cumulatively to worsen conditions?

We Protest these deficiencies as described above.

We also Protest the following:

Paging throughout the ES Summary Charts, a reader quickly sees that there is very little difference between many of the alternatives and their components.

There is no valid reason to allocate different amounts of “forage” percentages – especially taking into account adverse impacts that come along with the “forage” use – i.e. – severe livestock trampling –and compaction of soils, accelerated erosion of soils.

While BLM uses the phrase “resiliency”, and other current jargon, meaningful definitions and the basis for this is not provided.

303d Listed Streams/Water Quality/TMDLs and Continued WQ Violations

We are greatly concerned that BLM has been conducting limited monitoring, and does not have an adequate Baseline of the severity of sedimentation, turbidity algal growth, temperature and bacterial contamination of waters due to livestock grazing impacts, and in some cases the combined impacts of grazing and roads. The FEIS fails to provide this information, and adequately address how BLM post-fire grazing and other activities heighten water quality problems.

The RMP fails to provide required mandatory monitoring of bacterial contamination sediment, temperature, and other water quality concerns during periods of livestock use, when runoff occurs, and other critical time periods. It fails to provide thresholds/triggers for rectifying exceedances by minimizing disturbance such as livestock degradation of uplands and riparian areas. There is not a reasonable range of alternatives to address water quality issues. This must be corrected in a SEIS.

Chapter 4, 4-196 to 197 appears to allow TNR grazing in RCAs – Under Alts 1, 2, 3, 6 – and apparently IV as well. The analysis for riparian areas found throughout Chapter 4, draws sweeping rosy conclusions based on uncertain lists of BMPs and Appendices, without providing any understanding of how positive change, even to the greatly inadequate per cent of PFC, will ever be achieved.

We Protest all of these shortcomings and deficiencies that were not corrected in the FEIS.

Potential Veg Communities and VMAs

The EIS Veg map is much too general to provide understanding of complexity of interspersed soils, veg communities that “forage”, treatments, and all manner of RMP actions are based on.

The very small gray VMA inset Maps in the RMP are also greatly inadequate, as is using Potential Vegetation and modeled and artificial Ecosites. The FEIS has failed to describe how the Jarbidge Ecosites greatly over-inflate forage production, and downplay shrub cover, and describe how this was used in generating stocking levels/allocations.

We Protest this.

Desertification and Climate Hard Look Is Necessary to Evaluate Change Effects and Stress

Climate Change in the RMP DEIS was discussed in 3-4 to 3-6, 4-40 to 4-44. BLM provided little meaningful information, sidesteps analysis, fails to look at the overall Footprint of livestock operations and other activities, and fails to look at the overall Footprint of alternatives. It fails to address a suitable range of alternatives to address the threats and risks posed by climate change – i.e. likely increased temperatures, earlier snow melt, more spring rain, and more extreme weather scenarios. BLM’s own scientists have testified to Congress concerning the likely increase in cheatgrass due to higher temperatures and more spring rains. Thus, the sensitivity of lands to grazing disturbance

resulting in weeds is likely to be greater. This call into question BLM relies on large-scale TNR, increases significantly the risk of weed invasion following intrusive “active” treatments, and “targeted” grazing (whatever this is), as well as decreases the natural resilience of native vegetation communities and soil processes to livestock grazing disturbance. This continues in FEIS 4.3.1.2, 4-41 to 54. Erroneous assumptions abound in BLM initially addressing air quality – this includes the often very poor air quality in the northern part of the FO from the massive ag burning, ag feedlots (including linked to Jarbidge permittees, dairies and other sources of air pollution in south-central Idaho.

BLM’s climate assessment overwhelmingly focuses on gas emissions (even while ignoring manure), and uses 800lbs/AUM when cattle weights are much greater and typically large calves are present with cattle - in its calculations, and otherwise greatly under-estimates effects. BLM merely recites adverse effects of climate change and does not analyze them or develop any suitable alternatives to ameliorate and buffer these effects.

It ignores the information on desertification that we provided and analysis that is required – including of the degree to which lands are desertified feeds into climate change. See Sheridan CEQ Report, Steinfeld et al. 2006.

BLM fails to provide analysis of how all of the actions under all of the alternatives will be affected by predicted or foreseeable climate change effects. There are predicted major stresses on waters, watersheds, accelerated and early runoff, more violent rainfall events, more spring rains that are likely to favor cheatgrass and other weeds, and many other serious adverse effects of climate change that will directly, indirectly and cumulatively affect the outcomes of management actions under alternatives.

Doesn’t the predicted increase in cheatgrass due to climate change show a need for taking much better care of existing uninfested vegetation communities? For significant removal of livestock facilities, fences and ending salting-supplement disturbances in susceptible lands that are not yet invaded? Isn’t there significantly less risk of cheatgrass or other weed invasion, if treatments focus on passive restoration (removal if disturbance) rather than active restoration?

This must be taken into consideration in all aspects of the RMP, including the suitability of lands for Oil and Gas, Geothermal, granting ROWs, mineral withdrawals, or other actions that result in significant surface disturbance. It must also be fully considered in travel processes and identifying road closures to limit weed spread along rights of-way or as a result of road upgrades.

As the NTT describes:

Roads have multiple impacts on wildlife in terrestrial ecosystems, including:

- 1) Increased mortality from collision with vehicles;*
- 2) Changes in behavior;*
- 3) Loss, fragmentation, and alteration of habitat;*

4) *Spread of exotic species; and*
5) *Increased human access, resulting in facilitation of additional alteration and use of habitats by humans (Formann and Alexander 1998, Jackson 2000, Trombulak and Frissel 2000). The effect of roads can be expressed directly through changes in habitat and sage-grouse populations and indirectly through avoidance behavior because of noise created by vehicle traffic (Lyon and Anderson 2003, 75 FR 13910).*

The huge road footprint is caused by grazing infrastructure.

GHG emissions would be increased from No Action. BLM must analyze alternatives that reduce GHG emissions significantly – such as an alternative that removes grazing from the entire sagebrush Sea ACEC. How much would that alternative reduce emissions? How has BLM taken into account the role of grazing in damaging microbiotic crusts? See Wohlfahrt et al 2012, describing carbon sequestration. How would sagebrush lands being converted to cheatgrass reduce the ability of the lands to absorb CO₂, for example?

BLM analysis should be much more specific so that the real grazing and treatment GHG Footprint can be understood. This includes the livestock and livestock operator emissions, as well as the impacts of the livestock disturbance (and other disturbances) in adversely impacting the ability of the land to absorb CO₂. What is the combined footprint with private lands activities involving these livestock as well – for example, the Simplot Grand View feedlot?

BLM must analyze how to buffer lands, native biota, sage-grouse, pygmy rabbit and other critical habitats, from climate change effects.

For bull trout, redband trout, spotted frog, California floater and other aquatic species, BLM must analyze the degree of predicted impacts to watersheds, drainage networks, stream flows, pattern of runoff, etc. It is critical that BLM focus attention too on drainages that currently lack perennial flow to buffer runoff and other effects, take better care of the whole watershed so precipitation can be absorbed rather than run off, and otherwise do all that it can to maintain flows. BLM must provide baseline information on water flows over all seasons of the year. How have flows changed since 1987? Since BLM did a water rights inventory in the 1990s? How have they been altered from “developments”? How can perennial flows be increased – we do not believe that stringer riparian fencing will provide all the necessary actions to buffer species from climate change effects. Here, as with all aspects of the RMP, a hard look at trends in resources relative scarcity of resources, and magnitude of loss is not taken.

If BLM were interested in controlling GHG emissions, why would it propose Alts with near-status quo actions, TNR, targeted grazing, and all manner of increased disturbances – including Alt VI?

BLM fails to answer key questions: How much are current uses currently impairing the ecosystem response to climate change? How will that impairment be affected by

alternatives and actions? Until BLM addresses the desertification concerns that we raised in Scoping, there will be no valid baseline for assessment.

How will all of the predicted adverse impacts of climate change affect sage-grouse and other sensitive and important species and migratory bird habitats and populations – and place greater stress on them? Bull trout habitats and populations? The tiny and disconnected redband trout populations in the Elk Mountain and Jarbidge Front area – that span BLM and Forest managed lands? BLM cannot summarily dismiss analysis. This is critical in applying some measure of precautionary management to the public lands.

Estimating at least some degree of temperature increase is essential to understanding if water quality criteria can be met with continued commodity uses or management stresses on systems. Since shading vegetation is critical to maintaining cool water temperatures, BLM must have much stronger recovery goals than PFC over the next 20 years to sustain flows in the face of climate change effects – especially in degraded and depleted watershed systems.

The combined effects of livestock grazing and trampling in watersheds, existing flow reductions for diversions and developments, etc. must also be examined along with the additional stresses posed by climate change on ecosystems.

In a hotter, drier, longer summer scenario – is it acceptable or sustainable to have any continued livestock disturbance (soil compaction, grazing, weed spread) to meadow-spring, intermittent, or ephemeral waters?

BLM also ignores assessment of dust produced from grazing, roading, and developments under the RMP Alternatives. Dust has been implicated in early snowmelt, and loss of glaciers.

We Protest the FEIS deficiencies in addressing these significant issues as described above.

Monitoring, MIM and Other Deficiencies

The RMP EIS is deficient in providing certainty of use limitations, and timely annual monitoring. We illustrate this with a discussion of riparian monitoring. According to BLM's 2010 MIM document:

Elzinga et al. (1998) defined monitoring as “the collection and analysis of repeated observations or measurements to evaluate changes in condition and progress toward meeting a management objective.” In contrast, inventory is “the systematic acquisition and analysis of information needed to stratify, describe, characterize, or quantify resources for land-use planning and management of the public lands” (USDI, BLM 1996a).

This protocol includes procedures for monitoring 10 indicators. Three indicators provide

data from which short-term livestock (or other herbivore) use information can be derived:

1. Stubble height (adapted from USDI, BLM 1996b) and Challis Resource Area (1999)
2. Streambank alteration (Cowley 2004)
3. Woody species use (adapted from USDI, BLM 1996b)

Short-term indicators provide information necessary to help determine whether the current season's livestock grazing is meeting grazing use criteria. They can be used as early warning indicators that current grazing impacts may prevent the achievement of management objectives and can also be used to help explain changes in riparian vegetation and channel conditions over time.

MIM requires no standards to be met. It does not establish any specific measurable standard. Establishing standards and system for accountability and decisionmaking is the job of the RMP – which the RMP fails miserably to do.

MIM monitors livestock impacts to riparian areas only – not roading, energy development, chemical pollution, etc.

MIM measurements are based on measuring livestock use along the thinnest of greenlines right by the water's edge – and serve to minimize understanding of the degree and severity of loss or degradation that has occurred, impacts to floodplains and meadow habitats critical to sage-grouse, and other essential data needed to understand the degree and severity of degradation so that prompt action can be taken to limit or end the livestock disturbance. Only 25% of veg must be perennial. And this can be ANY perennial Veg – weeds like perennial pepperweed, or anything else.

MIM Indictors include:

1. Stubble Height

a. Purpose: Stubble height is a measure of the residual height of key herbaceous vegetation species remaining after grazing. The amount of foliar cover remaining is important for keeping plants healthy, maintaining or promoting strong root systems, protecting streambanks from erosion, slowing water during high streamflows, and building floodplains (Clary and Webster 1989). The measurement may be used in at least two ways: first, to determine when livestock should be moved from the riparian area, often called trigger monitoring, and second, at the end of the grazing season and growing season to help determine cause-and-effect relationships between livestock grazing and stream-riparian conditions and whether livestock grazing management changes may be needed the following year.

Note use of word “may” with MIM. Nothing is required.

MIM Procedures also measure streambank trampling disturbance, and woody browse use.

The RMP FEIS has failed to lay out clear and required mandatory standards of use that serve as annual triggers for livestock removal from grazed riparian areas.

The MIM procedure discusses: Relationship to Other Indicators: Stubble height data can

be enhanced when analyzed with percent of livestock use (not in the MIM protocol), woody species use, and streambank alteration to estimate levels of grazing intensity during the current grazing season. Coupled with other short-term and long-term monitoring indicators, stubble height may be used to develop relationships between condition and trend and livestock grazing management. Stubble height alone does not provide adequate information to develop a relationship between livestock grazing and vegetation conditions on the streambank. Commonly, streambank disturbance, measured by the streambank alteration procedure, **is the most important factor relating to streambank stability conditions.**

Streambank disturbance brings us back to livestock trampling of soils, and the compaction and bank eroding impacts of 1000 pound cattle use. There are no required annual measurable use standards under the RMP. WWP provided a standard in the Alternative that we submitted, and it was ignored. We are now submitting an updated Alternative standards with this Protest. Full consideration in a SEIS is necessary.

Fire, Vegetation and Projected Vegetation

The DEIS Fire Vegetation mapping was already outdated due to the Lone Butte, China Mountain, and other fires. Clear mapping and analysis is needed of all sagebrush seeding and rehab actions and success (or failure) following Clover, Murphy and subsequent fires that have occurred, and some measure and reporting of rehab and other planting success based on monitoring of recent rehab efforts must be provided.

Map 10 Projected Vegetation is biased towards the livestock industry desire to keep these lands as grasslands, rather than native shrublands. Why did the public pay for BLM to buy and seed sagebrush – the critical Keystone species in the sagebrush ecosystem – if BLM then maps away any projected recovery? There is no projection beyond 2016 – when all the millions of dollars of seeded sagebrush may not yet be present at a level that would show up in BLM’s broad vegetation mapping.

BLM must provide mapping showing changes necessary to understand what areas sagebrush, rabbitbrush or other shrubs will have to be replanted, and how and where restoration can best be accomplished.

This brings up a critical issue: For some enigmatic reason, sagebrush seedings in the Jarbidge have often, but not always, met with little success. Why is this? How can post-fire actions, grazing, any use of herbicide, the methods of obtaining seed, etc be changed to improve this and provide much more certainty in any sagebrush recovery?

Please provide detailed mapping showing all lands where sagebrush has been aerially or otherwise reseeded following wildfire, and measurements of the success if any seeding. A key part of the RM must be to recover sagebrush over this vast landscape, and BLM must live up to the commitments it made to the public over the years as it poured tens of millions of dollars into “rehab”, provided minimal and grossly inadequate rest from

livestock grazing,

It is critical to understand these post-fire measures. Like the limited and divorced-from-reality alternatives in this DEIS, BLM ignored the severe impacts of livestock grazing disturbance and the need for protection of lands for sites to recover. It made promises that wildlife could thrive, yet vast herds of livestock could again be inflicted on burned lands with 1 or 2 years rest. Of course that did not happen – livestock were turned back out in high numbers with only a year or two rest, and cheatgrass thrived in the degraded interspaces, sensitive native species did not recover, and seedlings were lost, trampled, destroyed. Plus, BLM aurally and otherwise has applied herbicide to kill weeds at times right on top of lands seeded with sagebrush.

We have watched in dismay as promises of fire rehab and wildlife habitat recovery are set aside in management actions to favor livestock. BLM to this day, and in this RMP refuses to focus on removing the biological wasteland densely planted crested wheatgrass seedlings. All fences or facilities that were built following fires and rehab must be identified, and a range of alternatives must be developed that target these for removal.

In order to understand the ecological conditions and fragmentation related to animal communities in the Jarvis, BLM must provide detailed mapping and analysis of ALL seedlings, sagebrush or other shrub removal including rabbitbrush or other herbiciding, that has occurred over all time periods, since FLPMA.

The same must be done for livestock facilities. A reasonable way to do this with mapping would be to provide “snapshots” at five year intervals. This will aid in identifying projects for removal under expanded alternatives of a SEIS. For projects/actions, BLM must provide an Appendix Listing all past projects tied to a land area on a map, and a brief analysis of the actions taken – seeding, species, facilities, if facilities were supposed to be temporary or permanent, etc.

BLM must similarly provide a detailed accounting of all post-fire rehab actions it has taken. Seedlings, species, location, etc. and show where it has told the public it would recover sagebrush. Any areas currently lacking sagebrush where BLM committed to the public in the past that sagebrush would be recovered must under all alternatives be restored for sagebrush ecosystems. Rabbitbrush is an important native shrub that sprouts back from its roots and would serve to provide for some wildlife habitat needs, moderate site aridity, and must be mapped and encouraged under all alternatives. It is a successional species to sagebrush. In areas prone to frequent fires, planting a native species like rabbitbrush that reprints from roots along with planting sagebrush in all circumstances, should be a management emphasis.

RMP mapping is at a scale where necessary understanding of allocation of “forage”, habitat, allotment, and other specifics is just not possible. Where is mapping that shows how much forage was allocated/or used in analysis in the RMP – tied to each land area (pasture, allotment). Wouldn't the allocation change based on the configuration of facilities – as the position of water and fencing may serve to limit or reduce livestock use

in some areas? So if that changed – allocations may be different?

We Protest the RMP uncertainty and the deficiencies above.

Reference Areas for the RMP

Where are all reference areas located that BLM used in the ESI analysis? Why isn't there much more detailed info and mapping of the ESI in the RMP? It is impossible to understand how the livestock allocations, fuels models, sensitive species habitat outcome analyses, etc. were arrived at.

BLM must not use the battery of existing fences as the “baseline” in all alternatives. It is clear that BLM does not even show the nightmare of pasture fences here. It only shows the crazy jigsaw puzzle allotment pattern.

Existing pasture fences form the basis of this reference area mapping. We strongly oppose more fencing, and believe goals and objectives of the RMP must be large-scale reduction in pasture fencing based on a specific time schedule. Due to the large amount of evidence of adverse impacts of fences to sage-grouse, BLM must set aside existing pastures as reference areas. It has not done this. It would just fence off crazily positioned little blocks – creating even more of a hazard for sage-grouse, migratory birds, antelope and other wildlife.

Where are all lands that BLM currently considers “reference areas”? All lands in good or better or “reference” conditions? These must be identified.

The existing pastures in Map 14, page M-15 should be the basis for the most extractive alternative – with all others including much larger areas thus reducing the facility footprint – and analyzed in a SEIS.

We Protest the above deficiencies.

PFC Ratings, RCAs, Priority Streams

PFC is subjective, and a minimal habitat descriptor. Waters at PFC are not assured of meeting the actual habitat requirements for aquatic biota. BLM must fully examine aquatic habitat quality and quantity. This includes sediment, temperature, cobble embeddedness, aquatic biota, bacterial pollution, turbidity, algae, dissolved oxygen and many other attributes.

BLM must provide detailed mapping and analysis of springs, seeps, ephemeral and intermittent drainages. An examination of their condition inside and outside enclosures must be provided. Measurable standards of grazing and trampling use must be applied to all such areas as objectives of the RMP. These must be applied as triggers of livestock removal from the area. BLM must rely on non-structural methods to ensure functioning riparian areas and watershed processes. This includes closures, reduced stocking coupled

with requirements for active herding of livestock.

How are these areas classified in the upstream Forest lands? How does degradation of private lands in all watersheds (such as in the China Mtn area, Jarbdige Foothills, Three Creek, Murphy, Diamond A) impair habitats? Alter ecological conditions? What is the degradation Footprint of the private lands on aquatic and riparian systems? How does BLM take thing into account in taking stronger measures to ensure species viability and water quality attainment?

In many areas of the Jarbidge, there is little perennial surface water. In areas that still retain native vegetation, all springs, seeps, intermittent, ephemeral drainages are very important and must be delineated and protected.

Please identify all critical bull trout habitat tribs, all redband trout tris, all potential spotted frog, all sage-grouse brood rearing, and all tribs including intermittent and ephemeral streams – as Priority waters.

What segments of all the drainage networks on these maps have perennial flows? Intermittent flows? How can the perennial flows in streams be increased by taking better care of the whole watershed? Removal or reduction of grazing impacts (including trampling) will promote retention of waters and slow release of waters from watersheds – increasing perennial flows, and reducing erosive forces of runoff events. These watershed, riparian and hydrological issues really gets to our significant concerns about increasing desertification processes caused by livestock grazing, and now amplified by fires and grazing, in the JFO. Climate change is expected to put even greater stresses on these systems.

All of this must serve as the basis for developing a greatly revised range of Alternatives that serve to sustain flows and native biota in systems greatly stressed by 150 years of livestock disturbance, now amplified by large-scale fires related to livestock disturbance and/or climate change.

When were redband trout lost from so many drainages near Elk Mountain? Near Three Creek? What set of actions are needed to restore these populations? What is their distribution on the Forest? What does BLM's livestock monitoring data show related to degree and severity of livestock impacts to these systems? BLM must set a time table a establish a set of specific actions focused on livestock grazing removal and large-scale reductions in numbers of livestock in any remaining degraded watersheds in order to sustain what are clearly increasingly isolated and threatened rare native fish species.

Aren't these apparently isolated populations in danger of extinction?

We Protest the failure of the FEIS to address these serious concerns.

Big Game Winter Range, Restoration Areas

Much better and more detailed mapping and overlays of conflict areas must be provided. A detailed mapping and analysis of conflicts between land uses/disturbances and bighorn sheep, mule deer, pronghorn antelope, elk, and all aspects of livestock grazing must be provided. This includes loss of structural complexity of hiding and thermal cover, loss of fawning/birthing habitats, fence hazards and barriers, disturbance from livestock during periods when young animals are present – and all aspects of conflicts.

BLM then must develop a specific **avoidance protocol** that includes livestock grazing during critical and important periods of use.

Why has BLM written off so much of the JFO as important big game habitats, (with this has worsened with the FEIS gutting the bighorn ACEC)? Hasn't BLM been promising all along that it would restore many lands in the northern and central FO for wildlife – including these big game species? Why has this been swept aside? These were obviously considered important habitats, yet they are not identified or acknowledged here.

What exactly does BLM mean when it labels maps for big game “restoration”? Is it including destruction or further alteration of native vegetation communities – as is promoted by some hunting groups tied to ranching interests?

Key Sage-Grouse Habitat – PPH and PGH Ignored

The Key Habitat mapping the DEIS alternatives were developed under was inaccurate and omitted important occupied habitats and leks. WWP repeatedly brought this to BLM's attention, and BLM refused to provide mapping of all Key sage-grouse habitat in important land areas grazed by permittees Simplot and Brackett. (71 Desert and Poison Creek area). – showing the stranglehold that livestock interests - and efforts by the agency's own range cons - maintain on the FO. habitat

BLM must clearly define what Key Habitat means, and how this relates to PPH/PGH. When WWP brings up the matter, BLM spins off false responses: “It's used for fire suppression purposes”. Which is of course not it's only use. We relate this to indicate the lengths to which BLM will cover up when pressed on issues of failing to protect lands from livestock grazing disturbance during critical nesting, brood rearing and other periods. Where is a Map of identified Restoration Habitats?

BLM must develop a broad range of new alternatives, and project the outcomes of Key and identified IDFG Restoration sage grouse habitat under all of them. A full set of actions to minimize disturbance, and conserve and enhance habitats for sustainable populations must be provided. A time frame of efforts made to achieve restoration and disturbance-minimization goals must be provided.

Why isn't BLM developing Alternatives based on the following: In Key and Restoration Habitat: **In 2 years, BLM will reduce fencing and water developments in all areas with sagebrush habitat by 50%. In 5 years, reductions will be 75%. In restoration habitat, BLM will reduce the amount of fencing and water developments by 50% in 5 years. This is the kind of specific alternative action that is needed to save the**

vanishing wildlife of the JFO.

It is clear that viable populations of sage-grouse cannot be sustained in the Jarbidge with the tremendous amount of habitat loss and fragmentation – coupled with ongoing chronic livestock grazing disturbance in the remaining native habitats.

BLM must provide detailed mapping and analysis that shows the current sagebrush and other vegetation communities, and depict key habitat.

Please provide mapping and analysis of the land area that must be recovered to provide viable populations, disturbance reduced, and protection measures taken to comply with BLM conservation plan for sage-grouse in a SEIS.

We Protest the above FEIS deficiencies.

Water Developments

We have previously discussed the severe adverse ecological effects of water developments. So did the BLM's own AMS. BLM must also identify all areas where it has allowed water hauling, and act to end this disturbance – we are aware of no NEPA analysis of its direct, indirect and cumulative adverse impacts.

Under all alternatives, BLM must develop a series of time-scheduled steps to significantly remove livestock infrastructure, as we describe above for fencing. The same actions and schedule should be applied to water developments.

Bottom line: There is no sense of urgency for addressing the myriad ecological crises or even the dire status of sage-grouse in the FO in the Jarbidge. BLM has produced a document that in many areas is near-status quo, in areas where there is some change, only minor differences often would occur. There is also no time frame, milestones or other actions that would be required to occur in a timely manner. It is also devoid of a broad range of necessary measurable use standards.

We Protest the concerns discussed above.

Wildlife Tracts

What toll is wind development on private lands in the area of these wildlife tracts taking on wildlife? Aren't these tracts now more important than ever? The Wildlife Tracts must be expanded, not reduced or lost in land disposals. This also in some ways is an Open Space issue. BLM just doesn't seem to comprehend the value that undeveloped land has to the public for Open Space, and a wide variety of recreational activity.

We Protest the lack of protective actions in the RMP.

Wildland Fire Frequency

As previously discussed, full and detailed mapping and analysis of all post-fire “rehab” and grazing actions must be provided. Infrastructure “creep” must also be mapped and examined. Please apply all concerns related to FRCC forward to this issues section, as well.

New and updated mapping that shows the Long Butte and other recent Fires must be provided. Please provide detailed mapping of all “fuelbreaks” or greenstrips BLM has planted since the 1987 RMP, or prior. These Fuelbreaks are in the same areas that have suffered several repeated fires – and do not appear to be effective. BLM must map them – and show fires so that an understanding of how fuelbreaks have not worked can be obtained. A full analysis of the location, species seeded, year seeded, and current composition of all Fuelbreaks must be identified here.

BLM has a proposal to drastically alter lands in the vicinity of the Saylor Creek wild horse herd area - and appears to be holding return of the horses to the HMA hostage so that it can leverage planting vast areas to the weedy aggressive exotic forage kochia. Once introduced in the northern part of the JFO, it will very likely be spread by BLM vehicles south in to LEPA habitats. This has not been adequately assessed.

We Protest this.

Hazard Rating for WUI

On what basis does BLM consider a seldom-occupied ranch, such as at Clover Creek, a WUI? Is the public supposed to spend millions of dollars “treating” the WUI at Clover Creek?

We Protest this.

Fire Suppression Mapping

We note that Map M-26 shows sagebrush-shrub habitats in areas where BLM purposefully left them off the preceding Key Habitat map for sage-grouse.

There is no reason for BLM to depict something it will never do – i.e. only conditionally suppress fire in a very few areas. A reasonable range of alternatives is required – not playing around with alternatives that will be out of the question to adopt.

Alternative V is the minimum of suppression that should be done here. This should just be a part of all Alternatives – instead of BLM trying to puff up “differences” between what in reality are a limited and greatly deficient set of alternatives.

We Protest the FEIS’s failures here.

Range Infrastructure in HMA, Alt VI Assault on Wild Horse Herd

BLM must consider a full range of alternatives that remove fencing in the wild horse HMA in a specific time frame. There is no need for endless little allotment fences here. This will also help the horses in the event of a fire.

The BLM in Alt VI imposes a drastic alternative to round up, and sterilize the wild horse herd. This is unacceptable to wild horse advocates, and is an action that livestock industry has long wanted.

We Protest BM abjectly disregarding public comment and participation and providing yet another gift to the livestock industry.

Serious RMP VRM, VRI Flaws

There is no possible rationale for BLM in 2011 designating VRM IV (maximum disturbance allowed) over such a vast area. This is one of many examples of BLM developing unreasonable and unrealistic alternatives - just apparently – to make it look like it considered more alternatives – and essentially lower the bar for a “mid-range” alternative.

Indeed all of the alternatives (and V is “poison-pilled”/contrived by BLM to be worse than IV, for example) would greatly sacrifice the public lands to all manner of development. The VRM actions would allow industrial development, mining, energy or other development to occur across nearly the FO – including the very lands that elsewhere are supposed to be “restored” for conservation of rare and declining species.

We again Protest the failure of BLM to properly protect visual resources of the sagebrush and other landscapes.

BLM Biased Rejection and Analysis of ACECS

We are dismayed that BLM refused to adopt the proposed Sagebrush Sea ACEC as its proposed action. BLM must reconsider its entire alternative structure, as all relevant and important values are now much greater for sage-grouse. This is shown by the USFWS’s recent Warranted But Precluded Finding that sage-grouse deserve ESA listing. BLM Has both worsened the Proposed action and aborted ACECs in the FEIS – guaranteeing irreparable harm will be done. See FEIS 4-822 through 828 (despite vast areas being found to meet relevant and important values – nearly all ACEC-suitable were inexplicably and arbitrarily discarded), FEIS Table 2.10.1, and Appendix M A-261 to 3-244.

Designation of an ACEC of sufficient size to conserve sage-grouse is fully supported by new scientific information – from the Knick and Connelly (2009/2011) Monograph *Studies in Avian Biology* to the recent Wyoming, Idaho and other studies on fence collisions and impacts to recent Ecoregional Assessments all highlight the grave threats that sage-grouse, pygmy rabbit and other sagebrush-dependent species are under.

Removal and/or large-scale changes in grazing are fully supported, as well. See Manier et al. 2013.

BLM must adopt the ACECs that it admitted meet the Relevant and Importance Criteria so it can provide integrated and cohesive management to prevent further irreparable harm and loss to habitats and populations of sage-grouse, bighorn sheep, slickspot peppergrass, and other native biota. The current RMP Alternatives all allow death-by-thousand cuts near-status quo actions to continue across the landscape that is essential to sage-grouse – a landscape species.

We request that ecologists from outside the BLM, and free from political pressures, be brought in to address the Relevance and Importance of the area we have identified and develop a suitable modern day range of ACEC alternatives.

The Sagebrush Sea ACEC also must be designated to protect large areas of potential LEPA habitat – both occupied and recovery habitats.

Management under the morass of confusion of the RMP will not conserve sage-grouse. VMAs slice through and arbitrarily segregate the habitats and ACEC-suitable lands. FRCC and other complicated modeling are imposed on this land to justify all manner of unclear treatments in uncertain locations without a cohesive plan. The extremely high 800 lbs per AUM livestock “forage” allocations overlie this land. Critical habitat areas are open to ROWs, have anything-goes VRM classifications relegating the great majority of the supposed sage-grouse zone to a sacrifice, visual intrusion and visual blight landscape status (FEIS Map M-48), unclear ROW categories (Map M-92), significant land disposal shown in Map 113 amid some of the most crucial habitats, includes much of the area of Oil and Gas Potential in the FO and where the RMP would enable development with minimal and scientifically indefensible “avoidance” areas, even though currently thought to have Low Geothermal potential, the RMP fails to limit development and provides minimal protective measures, wide open mineral leasing with minimal restrictions (MapM-122). The FEIS Alt VI and nearly all alternatives provide minimal, uncertain and known to be ineffective BMPs and SOPs for these activities, near-unfettered salable Mineral destruction is also allowed – Map M-129. With its minimal constraints and maximum loopholes and loose wording, high levels of irreversible further habitat loss is certain to occur. All manner of confusion is imposed and nearly anything is allowed to occur under the lax management of the RMP. Both directly, indirectly and cumulatively - the grazing, extractive use and development footprint will doom, rather than conserve, sage-grouse.

While not designating a large ACEC may benefit commodity interests whose side BLM has so strongly taken in this RMP, BLM cannot allow these interests to trump those of crashing wildlife and rare plant populations. It is a violation of FLPMA. BLM’s analysis considers only small groups of local interests hostile to public lands protections –while ignoring a wide range of wildlife and other groups. See Tables 2.10.1, 2.10.2.

As it stands in its present form, the RMP and Preferred Alternative are really a Plan for

gradual extirpation of native vegetation and animal species, not the strong measures and prompt actions required for conservation. BLM spent over five years developing this cumbersome document. During the whole time - the plight of sagebrush species has gotten worse and worse, and the Relevance and Importance of the proposed ACEC lands have only increased. A SEIS must be prepared to correct the disastrous FEIS scheme.

We Protest all of the above serious FEIS actions and flaws.

SRMA/ERMA Concerns

We are very concerned that BLM considered a broad range of OHV “SRMAs” and not more non-motorized use SRMAs or non-OHV focused SRMAs such as our suggested Wild Horse-Oregon Trail-Fossil Beds region SRMA.

We are greatly concerned that expanded OHV torn-up areas will adversely impact native reptiles. Bare soil areas and some semblance of native shrubs are found in areas of hillier terrain and specific soils where OHV use is now being greatly imposed.

Aren't there also larger SRMA areas near Salmon Falls Creek as well? Why not all of Antelope Pocket?

Now, in the FEIS, an even less protective measure – an ERMA – is proposed That like the SMZ (meaningless sage management zone) will do nothing to protect natural resources.

We Protest BLM's lack of commitment to management of recreation and conflicts with other uses, as well as non-motorized uses of the public lands.

Areas Available and Unavailable for Livestock Grazing

BLM has woefully failed to grapple with the dire ecological concerns that are related directly, indirectly and cumulatively to livestock grazing disturbance in the Jarbidge.

Map 50 **does not** reflect the information provided by WWP to BLM during the Scoping period and other public comments. It greatly reduces the land area that would be closed to grazing compared to WWP's comments and communications with BLM. Our ACEC proposal would result in a greatly expanded area where livestock grazing would be removed in an orderly fashion. So would the need for sage-grouse habitat and population protection and enhancement and restoration to be a primary focus and outcome of the RMP.

Alt. V plus all LEPA habitats should be the minimum ungrazed area even in the most commodity-oriented alternative– and a series of alternatives that greatly expand ungrazed lands in remaining sagebrush habitat, and reconnect and restore habitats must be considered.

BLM must consider a No Grazing Alternative, and a series of significantly reduced

grazing alternatives with large areas closed to grazing, with a systematic de-stocking and de-industrialization plan that applies both passive and active restoration. It must consider closing of significantly more lands to livestock use than Map 50, Alternative V shows. This is essential to undertaking restoration and protecting the public's investment in restoration.

Travel Routes and Inventoried Ways

BLM must provide detailed analysis of the role of livestock infrastructure and management actions in expanding this road network. How does this road network compare with that present in 1987? How many roads were planned? How many roads just “grew up” as pipelines were ripped in, troughs expanded, fences built, and salt/minerals placed?

BLM must develop a greatly expanded range of alternatives that roll back roading linked to livestock facilities that would be removed or de-commissioned to allow protection and enhancement of remaining sage-grouse or other sensitive and imperiled species, as well as to protect the public/ investment in restoration and provide an expanded range of hiking and non-motorized recreational activities including wildlife observation and other wildlife-related activities.

BLM must provide mapping that overlays facilities. For fence repair, and routine pipeline activity, ranchers can ride horses. Road proliferation in areas where ranchers have created roads along pipelines and fences should not be allowed to be carried forward. How much has the road network increased since 1976? Since 1987?

Which roads are maintained? The proliferation of roads is linked to gravel pits and the damage that has been done. An example of the damage that extensive gravel pits do is the gravel pit developed above Clover Creek for the USAF destroying intact sagebrush. Rehab has been a failure. Soil erosion continues. BLM must prohibit any further gravel development in native shrublands, native grasslands, - i.e. any native communities and sage-grouse recovery habitats.

This is all tied together. BLM's Alt IV has zoned vast areas for ROWs. See Map M-77 ROW exclusion areas. This shows that nearly the entire JFO outside Wilderness and canyons can be developed with ROWs granted under Alt IV; disposal (Map 88, page M-89), industrial-style development and extreme Visual scarring (VRM Mapping 41), Oil and Gas, Geothermal, etc. Please review the devastation that would be allowed to occur and caused under the Preferred Alt - as vividly shown in the Map volume, pages 42, 57, 73, 77, 83, 89, 96, 101, 106, etc.

In review of this mapping that shows the BLM plans for all manner of development to occur over vast areas – it again becomes apparent that BLM contrived components of Alt V to be purposefully damaging so that it could more readily discard even this weak alternative for conservation. See Map 76 – where ROW exclusion is identical between Alts. IV and V, Map 90 Oil Gas – same under all, Map 91 – same under all, Map 96 –

where BLM would have MORE wide-open damaging leasable mineral allocations than IV, Map 101 showing more wide-open damaging salable mineral allocations under Alt V than Alt IV, Map 106 –showing more wide-open damaging mineral withdrawals under Alt V than Alt IV. BLM must be aware that there are all kinds mineral extraction and rights-of-way threats related to new and emerging technologies – from rare earth minerals to solar farms.

The more areas zoned for development, the greater the likely number of roads, and size of the disturbance footprint of a road is likely to be. Blading large areas with side-ditches, and wide bladed swaths on road verges increases habitat fragmentation, provides large weed invasion corridors – especially since livestock graze and trample road verges then move crosscountry. We also stress that “avoidance” BLM proposes is only seasonal - there is nothing in the various development actions components to Alt IV that prohibits new or expanded roading across nearly the entire FO. Super-imposed on top of that are various efforts to maintain livestock wasteland “fuelbreaks” and intensive grazing schemes – potentially along nearly all of the vast livestock-industry caused road network shown in Map 56, Page M-57. Did BLM think WWP or other environmentalists wouldn’t bother with looking at these sections of the RMP where it has jiggered Alt V so as to be able to claim that Alt IV is more beneficial? BLM’s connivance at constructing “poison pill” provisions of Alternatives further demonstrates that a whole new range of alternatives that would actually conserve sage-grouse must be examined.

We stress that there is no mapping, or clear analysis other than the mass confusion and uncertainty of the Vegetation, Fuels, Grazing sections that allows a reader to understand the location and Footprint of Fuels and Targeted Grazing roading would be located and configured.

Until BLM fully lays out a new range of alternatives that clearly and forthrightly act to conserve sage-grouse, it can not have a basis for a legitimate science-based RMP, Travel Planning, or any other allocation process. This is all linked together.

BLM should develop a series of alternatives with specific goals for reduction of road densities in important areas and critical habitats, and lay out a specific decisionmaking process and time-frame to do so.

But first, what is the road density in the JFO at present? In the MUAs? The artificial VMAs? In key sage-grouse habitat? In restoration habitats? On top of the whole landscape needed by sage-grouse and pygmy rabbit populations? What is the total length of the plethora of roads in the Jarbidge? 3000 miles? 4000 miles? A drive across the U.S. in length? Just quickly guessing –Map 56, M-57 shows a nightmare of roading – the great majority tied to livestock. How does this compare to other BLM FOs in Idaho? In Nevada?

BLM must particularly focus on road closures in lands across the Sagebrush Sea ACEC, in the Browns Bench-China Mountain area, south of the Murphy Rogerson road, in association with adjacent Forest lands, in potential LEPA habitats, near Salmon-Falls

Creek, in the wild horse HMA, and other areas of importance.

The Travel Route designations in Alt. 5 are clearly preferable for a Wilderness experience in the near-linear and narrow Wilderness areas of the Jarbidge. How do the sights and sounds of vehicles, coupled with livestock activities, intrude on Wilderness areas? On untrammelled viewsheds, solitude? Primitive and unconfined recreation? What cumulative or indirect adverse intrusions –such as military overflights – add to the disturbance Footprint in the Wilderness areas?

BLM cannot just plan for road closures in large blocks of roadless lands. Large areas of LEPA Habitats, sage-grouse habitats, pygmy rabbit habitats, ACECs, bull trout and redband trout watersheds, and restored areas must be identified and roads removed and rehabbed. This will limit environmental disturbance, protect watersheds, provide secure less disturbed habitats, reduce weed proliferation including any restored lands – and have a host of beneficial effects. If livestock grazing continues in any of the areas with road closures or where roads are removed, all management activities should be conducted in a non-motorized manner.

BLM must consider all lands that may be adjacent to designated Wilderness as potential WSA lands, as well as adjacent to USFS lands or in other areas where the total natural and scenic wild land values would be significant. A complete and thorough inventory must be done, including of significant wild land areas less than 5000 acres in size, There are several areas in or near China Mountain, Dave Creek and other areas that although small in size, should be considered for Wilderness status due to the very appealing, scenic and beautiful character of the land.

BLM would never adopt a TMA as shown in Alt. 2 – so why include such an Alternative? We can only think this is to set a Low bar for comparison with other alternatives and result in an outcome with little real change in the Footprint of disturbance in a landscape that is collapsing from the high degree of chronic disturbance.

We Protest these deficiencies.

Harms from Communication Sites, Transmission , Wind and other Vertical Structures and Impacts Not Properly Controlled, Minimized, Mitigated

BLM should strive to limit and require bundling of communication sites. These are visible over vast distance, kill birds and bats that collide with them, and intrude on recreational uses and enjoyment. A full analysis of the adverse impacts of vertical and night-lit structures on native wildlife and migratory birds, as well as recreational uses must be provided. BLM should manage for no increase in communication sites, bundling of facilities, and severe constraints in visual intrusion as well as night lighting to protect migratory birds and limit intrusion.

See: <http://www.abcbirds.org/abcprograms/policy/collisions/>, Longicore et al. 2012, Manville et al. 2005, WWP China Mountain Wind DEIS comments (on cd).

<http://www.plosone.org/article/info:doi/10.1371/journal.pone.0034025>

We Protest the failure of BLM to provide sound siting and mitigation, especially given the extremely harmful Visual provisions of the FEIS.

Utility Avoidance Areas Must Be Expanded

Much larger areas of the landscape must be utility avoidance areas –due to the substantial large-scale adverse impacts powerlines, gas lines and other utilities can have on wildlife habitats and populations, recreational uses promoting fires, etc.

Alternative 5 plus a five mile buffer should be a MINIMUM alternative - and a range of several more protective alternatives must be provided. The FEIS did not do this. The mindset of BLM in alternatives development is abjectly divorced from reckoning with the dire status of habitats, wildlife, recreational uses, healthy wild lands, and long-term use and enjoyment of the American people.

We Protest this.

ROW Avoidance and Exclusion Areas

We are dismayed at how wide open to development BLM's limited set of industry-centric alternatives are. The mindset of BLM in alternatives development is divorced from reckoning with the dire status of habitats, wildlife, recreational uses, healthy wild lands, and long-term use and enjoyment of the American people.

BLM provides no evidence that there is any justifiable need for alternatives that would allow rights-of-way sprawling across the great majority of the public lands.

This is the whole purpose of planning – to prevent crises and environmental calamities (like the severe losses that would have occurred from the China Mountain Wind Farm). WWP incorporates all of our comments and concerns provided for the China Mountain process into these RMP Comments.

BLM must include full analysis of potential night lighting, noise and other issues associated with any renewable or other energy development, military or other right-of-way here. Night lighting on tall structures may result in death of migratory birds, interfere with birds like sage-grouse that move around during dim light conditions, and impair recreational uses. BLM must develop clear protocols for analyzing all of these disturbances and their effects.

We Protest these FEIS failures and deficiencies.

ROW/Transmission Corridors

Why doesn't BLM provide clear mapping of ROW Corridors under all Alternatives?

Why has BLM even considered potentially new ROWs south of Murphy Hot Springs? If this is the existing powerline BLM must prohibit any expanded use on this route. In areas of where a powerline may be present, that use should be capped and not additional power lines, water, or other pipelines structures, gas lines, etc. be built.

BLM has not provided adequate mapping of smaller powerlines so the full footprint on sage-grouse and other values can be understood- including the footprint of projects that have had a significant adverse impact on sage-grouse and other biota – such as the AF powerline to Juniper Butte, various other lines, etc. BLM must specify that the existing powerline to the town of Jarbidge is not a utility corridor other than for the current line.

In powerline or other right-of-way that already exist, BLM must require significant new mitigation for wildlife and other impacts with any right-of-way renewal or amendment.

We are very concerned about the minimal analysis of the proposed energy and transmission proposals such as Gateway– including all direct, indirect and cumulative effects. Throughout the RMP and mapping – BLM treats the JFO and plummeting species as if the Jarbidge were an island – removed from indirect and cumulative adverse effects of the large-scale wildfires that have burned so many areas, the very large Footprint of livestock disturbance, facilities and roading in neighboring areas of the sagebrush landscape and removed from the large-scale utility transmission and other energy proposals. Many of the actions in the RMP are linked or related to other energy actions. For example, China Mountain Wind was linked to SWIP. What is the Gateway line linked to? Coal and wind in Wyoming? There are inter-relationships – and cumulative effects that are not examined.

We Protest these deficiencies.

Wind Resource Potential

BLM must zone the China Mountain and all areas of the WWP Sagebrush Sea Alternative “off limits” to wind under all ROW alternatives. BLM will be unable to live up to its own conservation plan for sage-grouse conservation if it does otherwise.

We Protest the RMPs failure to do this –if it is not a rock solid exclusion. While Map M-105 of FEIS Alt VI shows wind only in the northern portion of the FO. We request that BLM clarify that this will be the only place any applications would be accepted. This can be the only areas where any solar can be allowed as well. The full adverse impacts of huge industrial energy facilities on public lands are not adequately addressed here.

Wind Potential

BLM must provide much broader area mapping of wind “potential”. This is necessary to understand the relative importance of the Jarbidge BLM lands for any wind development at all. BLM must provide detailed analysis of what is actually now a glut of wind power in southern Idaho – due to development on many private lands. BLM must conduct

detailed analysis of the relative benefits of private and development close to infrastructure, typically flatter lands, and in the case of Idaho – often in lands where irrigation water is increasingly scarce – so providing alternative income through wind siting is a significant benefit to the landowners too. How poor is the wind in the Jarbidge compared to other BLM Districts in the sagebrush biome?

All of these alternatives must also be examined across a broader landscape context so that the full cumulative effects can be understood.

WWP incorporates by reference all of e-mails, letters, wind MET Tower Appeals, and other information submitted to Jarbidge BLM since 2002 related to wind energy in the Jarbidge. Any right-of-way/Land Use authorization should be limited to areas with expanses of annual grass.

The EIS's presentation of information on wind energy is very confusing. Strict prohibitions must be laid down. Any further loss or fragmentation of sagebrush habitats is not able to be mitigated in the JFO. The wind, ROW and other portions of the RMP must reflect this ecological reality in firm and binding language.

By using loose wording and exceptions – like “if able to be mitigated”, BLM leaves the door wide open for political pressures to be brought and interference occur. This is especially the case in the Jarbidge, where politically powerful ranchers also stand to profit enormously from wind energy.

Land Tenure

Alternatives have too much land in sage-grouse habitat identified as available for disposal to comply BLM has failed to provide a reasonable range of alternatives in the context of the current dire status of SG populations in the FO here and in all other alternatives. There is no reason to get rid of BLM land just because it borders ranches – which is what BLM is proposing all around the Three Creek area. There is no indication at all that the administration costs are more. In fact, these lands are typically more readily accessed by good roads. All alternatives should focus on retaining all lands in the southern FO across the areas of the WWP proposed Sagebrush Sea ACEC.

BLM must have a goal of no net loss of BLM land, and strive to increase the amount of public land across the FO over the life of the plan. It must identify specific areas where the focus may be land acquisition. Disposals are also to likely further complicate and compound the “WUI” factor.

DEIS 2-180 showed BLM plans to dispose of lands for purposes never before allowed – including for a “public purpose” of Grazing”. How is disposing of lands for grazing “an important public objective”? It is an action that benefits private commodity uses. And in the case of the Jarbidge, this is primarily a few powerful and wealthy ranching dynasties,

and the Simplot ag. conglomerate. Yet this and other harmful provisions were “common” to all alternatives. Is this carried forward in the FEIS?

We support no DLE. Where has this occurred? We remind BLM that the whole reason for the Wildlife Tracts in the first place was because of the large-scale loss of lands in the north to DLE. Now this RMP, in violation of FLPMA, considers alternatives that would allow BLM to get rid of significant numbers of Wildlife Tracts – likely to ranchers or wind developers.

BLM must not allow submitted DLE applications to go forward, as it proposes under all Alternatives. Where are these? How many? Who? See LT-CA-MA-13, DEIS page 2-182.

We oppose disposal of lands as would be allowed under the part of DEIS LT-CA-MA-4 (2-181) – that serves as a huge loophole for actually enabling the disposal of historical properties, T&E habitat, Wildlife Tracts, cultural sites, etc. This provision allowing a loophole for disposal must be stricken from all alternatives.

What exactly can be considered under R&PP? We saw BLM’s Elko Mgr. Hankins dispose of lands by Jackpot, and elsewhere where mines or others wanted key parcels – and claim the parcels had really low value. Yet the Jackpot lands had high subdivision value. There are very shady actions associated with how BLM values lands when politically powerful interests want parcels for development.

Alternative 5 does not adequately protect important values of the public lands, either. It shows far too much land for disposal, including lands all around the wildlife tracts area, and the HMA. This is another poison pill that BLM has inserted, and this continued in the FEIS. Alt V should retain all important habitats – not just if lands are “consolidated” – whatever that means.

Please describe in detail the circumstances under which lands would to be sold to the state for R&PP? This is a matter of much concern given the political dealmaking for cronies that some Idaho governors may engage in. Idaho has no public “NEPA” environmental review process, so much damage could be done to values of lands remaining in BLM ownership, or to critically important habitats. Please recall the state land parcel Hog Farm proposal of a decade or so ago that would have sprawled across the Jarbidge. It is foreseeable that something as damaging as that could come around again.

BLM must greatly strengthen protections for public land retention – and lay out a clear decisionmaking framework.

We Protest these deficiencies.

Oil and Gas Development/All Leasable Minerals

BLM must place all lands in the southern and central FO as proposed in WWP’s Sagebrush Sea Alternative, and all lands important to sage-grouse conservation, as well

as special habitat and wild horse areas in the north, off-limits to Oil and Gas development. BLM instead would allow large-scale Oil and Gas disturbance in the critical lands west of Salmon Falls Reservoir and SF Creek in the SOUTHERN FO in Alt VI. FEIS 2-457, Map M-114. Constraints are minimal, and greatly inadequate to protect sensitive species, water, wildlife Any modern day arid lands EIS must also prohibit fracking.

What sense does it make to restore lands – and then have them torn to pieces by OG development? The RMP alternatives are internally inconsistent.

The Oil and Gas mapping shows that BLM would even allow the critical Browns Bench sage-grouse area to be developed. What part of the Oil and Gas industry destruction of sagebrush habitats that has unfolded in the American West over the past decade – and the collapse of sage-grouse, as well as big game habitats and populations when this development has occurred - does the Jarbidge BLM not understand? See Knick and Connelly 2009/2011.

BLM here seeks to use the very same “seasonal avoidance” and NSO provisions that have done almost nothing/been minimally effective to protect wildlife, recreation, waters, watersheds, and other public uses and values of the public lands from degradation and loss.

BLM must analyze in detail all of the adverse impacts of modern day Oil and Gas – including fracking and all the harmful activities and chemicals used in such activity so it can understand the full implications of allocating even a single acre in the JFO for Oil and Gas.

Please review all of the information in the Holloran, Naugle , and other sage-grouse studies in Wyoming and Montana. See also Connelly et al 2004, Knick and Connelly 2009/2011, Manier et al. 2013. Please review all of the recent information about the Pinedale anticline and other big energy field population declines. BLM has been completely unable to prevent deep losses to wildlife populations that occur with this development with the same meager measures that the RMP relies on. We also stress that the sage-grouse mule deer and other populations in Wyoming were much less stressed and reduced than the crisis now facing the Jarbidge. Anyone can understand that Oil and Gas, wind, geothermal or large-scale energy of any kind – will result in calamity in the Jarbidge.

BLM’s weak GOMAs would do little to nothing to prevent wholesale destruction and development for OG in the lands allowed Open, and Open with Constraints.

The ESA and other lease stipulations LE-CA-MA-2 under all Alts is greatly inadequate – BLM would make ineffective minor tweaks as full throttle development proceeded. BLM would not even close all ACECs under most Alts and remaining sagebrush habitats to OG leasing and development.

We Protest these failures to protect public lands resources.

Other Extractive Use/Development/Allocation Deficiencies

Mere seasonal closures are greatly inadequate for protection of lands from mineral activity. Zoning lands off-limits to the disturbance – and the habitat degradation, loss and fragmentation that results - must be done in the RMP. Plus, even though BLM might not allow road bulldozing in nesting season, it still allows livestock disturbances during these periods.

BLM provides a range of exploitation and development alternatives that do not comply with its Conservation Plan for GSG and the SSA, and would allow destruction of lands identified for restoration.

Why in the world are so few areas closed under all alternatives? Not even potential ACECs or LEPA habitats, are closed under Alt 5. BLM arbitrarily inserts harmful provisions into Alt V in comparison to Alt IV related to Leasable mineral allocations for no logical reason. Compare Maps M-96 to M-97). 4/5ths of the FO is wide Open to Oil and Gas and exploration, under Alt. V – while around ½ is Open under Alt. IV.

BLM arbitrarily poisons Alt V by leaving the LEPA ACEC wide open to grazing. Please also compare 2-194 to 2-196 – with lists of protections - to Alt V. It is clear, because this arbitrary poisoning of Alt V occurs in multiple places in the EIS, that this is not a mix-up with mapping – but is indeed what the industry-biased planners have based the RMP analysis on.

Alt IV has a seasonal restriction for big game winter habitat protection of 509,000 acres. Yet sage-grouse get a mere 248,000 acres for sage-grouse habitat protections in Alt. IVB. Alt V would have the arbitrary and contrived minimal sage-grouse restriction only. BLM has arbitrarily attempted to segregate sage-grouse habitat needs to small bits and pieces of the JFO. There is no reason whatsoever that the LEPA ACEC is somehow more important to deer than to sage-grouse. We believe these elaborate and irrational delineations are being done to avoid identifying large areas for sage-grouse that may result in ranchers having to change grazing use.

BLM in the DEIS attempted to “ghetto-ized” sage-grouse habitat to just the bits of sagebrush that remain in the JFO –compare Map 96, M-97 to Maps 9 and 10. BLM does not even include all of the remaining shrubland. We also stress that BLM mapping in the RMP is 20 acres or larger blocks of sagebrush –so it does not reflect the sagebrush remnants that assist in movement across the landscape. This mapping also appears to assume that the post-Murphy seeding of sagebrush is all a failure. Is that the case? We are greatly concerned that in the meaningless Alt VI of sage-grouse management zone, BLM would greatly sacrifice all the non-sage occupied acres, continuing on the very harmful management under the AGPs.

There is no possible way that responsible management and “avoidance” of sage-grouse

habitats could occur based on BLM's mapping of very little sagebrush remaining over much of the FO – if only these lands were more protected under the sage zone, which it appears would be the case.

Any claims of “protection” under Alt IV are a joke. The Mineral Leasing provisions in DEIS Alt IV 2-194 to 2-196 are riddled with exceptions, and this largely continues in the FEIS.

This also violates the ESA – see 2-195 to 2-196 – where BLM would allow exceptions to be made in opening up RCAs.

All aquatic species – from Jarbidge bull trout to Bruneau hot springs snail –are threatened by the geothermal development that would be allowed under all alternatives of the RMP. BLM must plan based on the situation that is occurring across public lands –including Idaho - where geothermal leases are being issued all over the place- even on lands formerly thought secure (such as long-billed curlew ACEC and LEPA habitats in the Four Rivers FO). Whether there is potential or not, speculators are using the public lands to gain lease to gain investment– and fueling destructive exploration and promoting development.

Then, DEIS 3-71 to 3-72 provides no real explanation of the arbitrary and often internally contradictory provisions within alternatives and the GOMAs laid out in Chapter 2. This is similar to Chapter 3 Affected Environment for the RMP. The Chapter 2 lists of loosely worded and uncertain GOMAs exceed the info provided on the Jarbidge environment.

New technologies are being developed all the time, and areas never thought to face energy threats are being opened up and leased. Modern-day geothermal leasing and development has a major harmful and adverse Footprint on the environment. Fracking is even being used in some areas for geothermal. Very significant adverse impacts can occur under geothermal leasing alone. BLM currently has a hopelessly segmented process where CEs and DNAs are heaped one upon the other through the geothermal process up to full throttle development. Under leasing, large areas can be bulldozed clear of vegetation, massive Deepwater-Horizon-on-dry-land drill rigs can be positioned. Fite, 2010 field observations in Nevada BLM lands. New road networks can be built and graveled. This all occurs prior to any NEPA analysis for the industrial facility “plant” that would be built.

This has the potential to greatly pollute and diminish the scarce waters of the FO.

New powerlines, night lights, heavy duty roads, constant human disturbance, noise, and severe visual intrusions accompany modern geothermal development.

The RMP is woefully lacking in essential ground water and aquifer analysis needed to understand a Baseline, and potential impacts. Geothermal IS exploding across the landscape.

As with all other Components of the environment, the RMP Affected Environment

Section is woefully lacking in essential Baseline data and analysis.

This RMP component also covers exploration activity and tremendous damage to soils, microbiotic crusts, vegetation communities, and rare and declining species' habitats can be done under exploration alone.

There is no adequate alternative to protect values of the public lands from OG, geothermal and other energy explo and development, mining and minerals activities, etc.

Chapter 4. Leasable Mineral –direct and indirect impacts. DEIS Alt IV 7-9% of FO inaccessible, 39% accessible under standard lease terms. Yet there is no analysis of these impacts. vs. Alt V – 4% inaccessible, **70% accessible under standard lease terms**. This is an arbitrary Poison pill placed by BLM to aid in rejection of Alt V.

We Protest these deficiencies.

Geothermal Development Potential

BLM must zone all lands in or near important Sage Grouse and Restoration Habitats as off-limits to geothermal potential. There is significant environmental damage done just by the “exploration” phase of geothermal activity alone.

We Protest this.

Salable Minerals

Please see Leasable minerals comments. This section is worse for the environment (salable minerals). Alternative V doesn't even have as much of a closure as Alt IV. Yet V is supposed to be the environmentally preferable alternative. This is a Poison Pill.

We Protest this.

Locatable Mineral Withdrawal

All lands in ACECs and sensitive species habitats should be Withdrawn from locatable mineral or other mining and exploration. Why in the world would BLM in 2011 develop a LUP and allow hard rock mining to occur in the remaining sagebrush habitats for the greatly fragmented Jarbidge?

BLM must fully consider the impacts of a modern-day cyanide heap leach mine and the impacts to soils, water, and habitats, populations recreational uses, etc. if such a mine was to be developed in lands in or near bull trout habitats. Alt IV allows development in lands east of Dave Creek including the East Fork area, and in the areas of the remaining lek complexes near Browns Bench-China Mtn- Three Creek and other portions of the Jarbidge foothills. BLM can – and must - place these lands off-limits. This includes the Toano Freight road, and HMA, too.

We Protest the deficiencies of the FEIS.

ACECs

Alternatives 1,2,3,4,6 should all be non-starter alternatives for ACECs, as they fail to protect necessary habitats for sage-grouse, pygmy rabbit, and recovery of slickspot peppergrass.

We fully support the Sagebrush Sea ACEC, and believe it is the only alternative that would sufficiently protect the relevant and important sage-grouse and other sagebrush species and habitats. It is the minimum that is necessary for viable populations and to allow sufficient land area for recovery including in the face of potential wildfires.

ACEC designation here is essential to prevent further irreparable losses and to sustain a viable population of sage-grouse, pygmy rabbits and other native species. BLM must fully take into account the plethora of threats these species face, and the “death by a thousand cuts” management that occurs on BLM lands if special ACEC protection is not applied. BLM must prepare a population viability analysis to examine outcomes and time to extinction of populations under Alts, 1, 2, 3, 4, 5.

The same must be done for managing for viable populations of LEPA, Bruneau Dunes tiger beetles, and other sensitive, rare and imperiled species.

We Protest these deficiencies.

More Settlement Requirements

BLM is required by the Settlement Agreement to “Make determinations for future management of the Jarbidge FO, consistent with the requirements of FLPMA, NEPA, implementing regulations, and BLM’s Planning Manual and Handbook”.

By developing alternatives with provisions, and in the case of II, II, VI, and portions of IV and the poison-pilled Alt V, that are not consistent with FLPMA and NEPA in the context of the severely altered JFO. BLM has violated the SSA.

BLM is also required to consider info including science submitted. Many components of the Alternatives are NOT consistent with current ecological science in the context of the large-scale habitat losses and population declines for sagebrush species in the Jarbidge that WWP has submitted throughout this process. Nor in the context of the rarity of bull trout, the tiny remnant populations of redband trout in the Elk Mountain area, and other beleaguered populations. Threats are magnified by looming predicted climate change effects, especially in the context of this landscape that has suffered such a high degree of disturbance and desertification.

We have provided copious comments throughout this process, including comments in

meetings with BLM that the RMP was not sufficient to conserve and enhance sage-grouse and other wildlife.

The Settlement requires that BLM “establish protocols and develop data necessary to evaluate current populations and habitats for BLM-designated “sensitive” species on the Jarbidge FO ...”.

The RMP fails to do this for sage-grouse, pygmy rabbit, bull tout and other rare, declining and imperiled species.

BLM has not developed appropriate “desired outcomes” to sustain, conserve and enhance native biota and waters.

BLM has not balanced uses - or acted to sustain, conserve and enhance sage-grouse and other rare biota in identifying lands available or not available for livestock grazing. It has not adequately incorporated current science on soils, micro crusts, vegetation, watershed characteristics, invasive species, sensitive and imperiled species, and acted to protect them in goals objectives and management actions in allocations - in Zoning lands Open to many forms of exploitation and developments. It has failed to develop sustainable alternatives range and appropriate allocations to address the many grave threats that native biota and a other important values of the public lands face here.

Wild Horses

One of the reasons the RMP is such a huge disappointment is that the Jarbidge has been so altered that any animals in this broken landscape need all the help they can get. BLM has not developed an RMP with a reasonable range of alternatives to meet the conservation challenges of 2011 in the Jarbidge. Instead this is in many ways a Plan that perpetuates an intensive resource extraction and development status quo and perpetuates serious conflicts between often conflicting allocations. It makes no sense to include an alternative that would not place the single, small HMA as a Priority for suppressing fires. BLM appears to have in many instances developed alternatives it knows it never would adopt – in order to set a low bar “range” that helps perpetuate the status quo. In any one alternative, even the most supposedly environmentally friendly Alt. V, many provisions within an alternative conflict with others. DEIS Map M-33 in Vol. 3 shows the HMA with all the fences. But the other maps – where wind, utility or other energy and all kinds of activities are overlaid – do not outline the HMA. So it is very difficult to tell what will and won’t occur there. All mapping should include an outline of the HMA so that the public can clearly understand how the HMA and horses will be managed/protected. The HMA should be VRM I. Not VRM 4. VRM 4 allows BLM to turn it into an industrial zone. The HMA should be closed to geothermal/fluid mineral leasing. The HMA should be closed to mineral allocations and locatable mineral development, as well as Rights of Way.

A range of alternatives that focus on removing and reducing fencing in the HMA should be developed, with a specific time frame to do this, and a goal that significant removal

occur within 5 years. The RMP should allow for consideration of expansion of the HMA if livestock permits in adjacent lands to the HMA are bought out and retired. The RMP should include an Oregon Trail, Wild Horse, and Fossil Bed Recreational SRMA. Hagerman fossil beds is nearby, and expanding and linking public visitor interests should be a focus. BLM should clearly identify a balanced method for determining carrying capacity, suitability, and AML. It must present a range of AML increase numbers and livestock reduction numbers as part of the RMP. This is the only HMA in south central Idaho, it is very small, and horses have a large following in the public, management emphasis should be on giving the horses more. A Goal of the RMP should be to increase the horse share of the allocation pie in the HMA or areas where use may be expanded. Horses can see more rugged areas of the HMA more effectively than livestock, travel further from water, and otherwise make use of the lands differently than do cattle.

BLM must fully explain all the changes that have occurred in the HMA (infrastructure expansion, seedings including species used, etc.) over all periods since the Wild Horse and Burro Act.

What is the basis for the current allocation? No transmission or energy corridors should be allowed in the HMA. In fact, since the HMA is so small and horses are vulnerable to disturbance from the dense road network, a five mile buffer surrounding the HMA should be “off-limits” to development and all kinds of leasing. BLM should focus fuels projects on using small statured native species and reductions in the large unpalatable exotic grass monocultures it has seeded incrementally for livestock and following fires. BLM’s past efforts have cost taxpayers a fortune - and have only served to exacerbate the fuels and weed problems.

RMP DEIS 4-674, 4-675 Tables 4-312 and 4-313 claims to show constraints with wind energy ROWs under all Alternatives. BLM presents a biased and self-serving analysis that lacks any detailed or clear basis for claims. BLM rigged the Alternatives components so that Alt IV would appear in the most favorable light. There is no valid analysis of the effectiveness of any of the measures that are claimed as protections or mitigation in conserving sage-grouse, recreational uses, or the other values of the public lands that large-scale wind or other energy or development rights-of-Way would greatly impair. There is no analysis of the effectiveness of claimed “constraints” in the context of the large habitat and population losses of the Jarbidge.

BLM uses a sage-grouse lek radius that is not defined here. We assume BLM is using a greatly inadequate two mile distance. Current science suggests wind and other energy developments should be located 5 miles or more from leks. In the case of the Jarbidge, where grouse are known to move over large distances to nest and fulfill their seasonal needs, the entire area of the Sagebrush Sea ACEC must be off-limits to wind development. There is no alternative that examines this.

4-674 refers to more areas in the No Action Alternative being in VRM I and II. Why is there no mapping of No Action VRM? Do VRM I and II categories under the current RMP mean that development would be constrained in the China Mountain area? BLM

knows there is intense controversy over the proposed China Mountain Wind development. It must clearly lay out what the current situation is related to No Action for China Mountain, and all remaining sagebrush habitats in the Jarbidge.

The analysis is devoid of substance (DEIS at 4-675 to 4-677). It is based nearly entirely on stating which of the flawed Alternatives is first, second, third, or fourth in a mixed bag of constraints (or lack of constraints). It does not examine critical biological conflicts with development in relation to fragmented sage-grouse and other habitats and populations.

For example: Impacts from Alt IV consists of two paragraphs, and a single sentence. All the Preferred Alt analysis says is that “Alt IV would have the highest level of constraint of all Alternatives”, and that “In the potential utility development area, management for sage grouse leks, soil resources, and wildlife seasonal periods results in more constraint on location and timing than in the other alternatives”. This is because BLM has placed greater emphasis on mule deer, and less emphasis on sage-grouse in its Preferred Alternative. BLM further skewed “constraints” on development in Alt V by allowing full throttle development VRM III and IV allocations over vast areas of remaining sagebrush habitats and recovery habitats across much of the proposed Sagebrush Sea ACEC.

In Alt V, BLM constructed the Alternative to minimize sage-grouse protections compared to Alt IV, and laced Alt V with Poison Pill VRM and other provisions. It developed Alt IV to promote habitat generalist mule deer above sagebrush-dependent sage-grouse.

BLM also appears to have done this to muddy the waters for the public in clearly understanding which alternative that is environmentally preferable.

Further, BLM can not tally up the Number of constraints listed under each Alternative – after it has purposefully skewed the Alternatives with a long list of Alt IV Mule deer “seasonal” constraints over a big land area, and then claim one Alternative is better than the other. There is no analysis of the effectiveness of each constraint.

By pointing to “constraints” that are only seasonal avoidance for construction, but still allow large-scale industrial development to be built - with predictably disastrous consequences as BLM well knows from the failure of these constraints with energy in Wyoming in the Pinedale Anticline and elsewhere, BLM ducks addressing the fact that No industrial/energy development/ROW is preferable to tinkering with seasonal road blading and habitat destruction “constraints” in its lame comparisons between Alternatives.

Valid comparative and cumulative impacts analysis cannot be conducted until much more careful and science-based analysis of a valid range of alternatives with internally consistent GOMAs occurs.

BLM must re-do this. It must set aside its industry-biased games of setting up in such a way that BLM can contrive analysis to gain adoption of very harmful Alternatives.

This limited and slanted presentation of Jarbidge BLM 's RMP impacts must be swept aside, and provide honest clear analysis that lays out alternatives, GOMAS and a cohesive Plan to conserve and recover sage-grouse.

Serious threats are posed by improperly sited energy developments – no matter how many constraints they were built using. The failures of constraints to mitigate impacts that BLM itself knows full well from Wyoming, and elsewhere have failed, also highlights the broader issue of BLM's failure to develop an effective framework for mitigation and for denying poorly sited and harmful ROWS and developments in the RMP.

Fire Mapping and Cumulative Effects

BLM fails in all parts of the RMP to provide adequate baseline information, mapping and analysis to understand the severity of impacts and threats from grazing, fire, energy and other activities that sage-grouse and other species of concern face across the biome, region and area of relevance to local populations. See Knick and Connolly (2009).

We have Attached mapping showing fires that have occurred in the broader landscape context of the Jarbidge from 1998 to 2010. Source: BLM and USGS Fire Data. USGS mapping has data from other land agencies.

Please view this map side-by-side with RMP Map 24 Fires 1987-2007, which shows significant burned areas of the Inside Desert during this period. On-line GS layers were not available for earlier periods so we did not have the 1987-mid-1990s data on our map that provides a bigger picture of the regional fragmentation and loss of sagebrush habitats.

Please also consider the NDOW 2008 sage-grouse reporting and mapping that overlays Nevada fires with leks.

It is clear that vast areas of the sagebrush habitats have been burned, resulting in long-term significant reductions in critical habitat components for sage-grouse and other sagebrush species. BLM fails to analyze cumulative effects of these losses to sage-grouse populations.

BLM also fails to provide a large context for its very high fence densities, roads and water developments, and many other sources of habitat disturbance that sage-grouse and other wildlife populations face.

We have also Attached a Map that shows the Jarbidge fence density in some context. We could find no on-line Nevada Forest and BLM fence layer – but Idaho BLM must obtain this info from sister agencies so the fence Footprint on sage-grouse, antelope, migratory bird and other populations over a broader landscape can be understood. This is particularly important for lands used by the same population of birds – where grouse from Jarbidge leks may move up on to the heavily fenced Forest lands in summer. What

is the fence density on Forest lands outside the forested Wilderness Area? What happens if fencing is overlaid with fire? Overlaid with water developments?

What is the current direct, indirect and cumulative Footprint of fragmentation and facilities that the Jarbidge grouse population faces?

We have also Attached a file based on 2006-2007 agency cheatgrass mapping. Note the yellow coloring in many areas of the Jarbidge. Since that that time, the risk of cheatgrass expansion and dominance has only grown. This is especially the case 4-5 years and after following wild fires like Murphy, and with continued intensive grazing pressures.

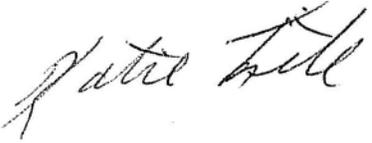

WWP recommends in all alternatives of the final RMP/EIS that the BLM allocate and or zone the lands of the Sagebrush Sea Alternative as a domestic sheep-free zone to protect Bruneau-Jarbidge bighorns and to allow bighorn sheep expansion into the Jarbidge Foothills canyons. A single domestic sheep operation prevents establishment of viable bighorn herds over vast areas of suitable landscape. The RMP must determine the relative value to the public of bighorn sheep recovery vs. one sheep operation. We have included a map showing the relationship of existing bighorn sheep populations and domestic sheep operations.

Western Watersheds Project is also concerned that the analysis of the social and economic consequences of each alternative in the Draft RMP/EIS is cursory and incomplete. The Draft RMP/EIS is focused solely on the economic benefits to grazing permittees when all Americans own these landscapes and will be impacted by the cost to administer the Field Office and by the economic cost of wildlife values foregone should the BLM continue to enable destructive livestock grazing that damages all native species habitat. The BLM needs to enlarge the social and economic analysis to include the income and expense of administering the public lands in the Field Office for each alternative. Nowhere in the FEIS is there any information that assesses the expense and income to administer the Field Office including the costs to American taxpayers of subsidizing livestock grazing on the Field Office managed lands. The BLM has also failed to address the economic value of recovered wildlife populations in each alternative of the EIS. Additionally the BLM must quantify the costs of degraded wildlife habitat that would continue to exist as a consequence of each alternative.

We request that non-BLM outside biologists/ecologists with USGS or some other impartial entity be brought in to produce a scientifically valid and tenable land use plan management document with a valid and reasonable range of alternatives. Despite the tremendous effort we have made, BLM continues to mislead and obscure the truth. The Twin Falls District - and JFO under apparently continued political pressures from the livestock industry - cannot be trusted to produce a credible document and range of alternative actions related to conserving and enhancing the important public lands and wildlife values of this damaged landscape. We Protest this has not been done to date, and it must be corrected in a SEIS.

Sincerely,

/kf

PO Box 71383
Washington, DC 200024-1383

Sent Cert. U. S. Mail Return Receipt Requested
Also Sent by email to: protest@blm.gov

Dear BLM Director,

This is an additional Protest from Western Watersheds Project (WWP) regarding the Final Jarbidge Resource Management Plan and its associated Final Environmental Impact Statement.

Biased and Arbitrary Consideration of public Comments and Science in Appendix P and RMP

WWP Protests the BLM's biased analysis and presentation of science-related information for biological and all other values of the Field Office in the Final EIS and analysis of Alternatives, including the appalling new high adverse impact Alternative VI.

Critical insight into the bias is shown by reviewing the dramatically different response to conservation-based comments vs. comments that minimize concerns about livestock impacts and advance the interests of livestock permittees in Appendix P.

The state of Idaho's comments must be viewed as a foremost example in the latter category. The state comments sought to strip and undercut environmental protections of the RMP – showing extreme bias towards livestock grazing and some other extractive users. No matter the lack of validity of the comment, BLM caved into the state.

The state of Idaho under C.L. Butch Otter has become increasingly known for its virulent anti-predator policies and highly controversial management of wildlife in general – such as proposed raven poisoning and pelican egg oiling. IDFG, the state agency that is supposed to be an independent voice for wildlife, is shackled and effectively silenced as being an advocate for nearly all wildlife –especially if wildlife habitat and conservation needs conflict with livestock interests or energy developer desires. Thus, state wildlife management, water quality oversight, and other state agency functions are now greatly subservient to industry wishes. The current politicized situation regarding state agencies requires that BLM take an even harder look at the full and compete range of science related to sage-grouse and other wildlife needs across this landscape.

This is vividly on display in the wildlife, sage-grouse and other sections regarding native biota in Appendix P, and how BLM responds to state comments. But it pervades the entire comment category and topic set.

The state set about undercutting the scientific references and basis that BLM used to lay out ecological damage and harms caused by livestock grazing.

BLM obliged – in Alt VI and RMP analyses, in blindly accepting what the state said (and wanted), while minimizing conservation-based input and other public voices.

At the same time, any comment that promoted protection to even a minor degree was acknowledged by BLM, phrasing may have been changed a bit, but the actual heart of the issue the conservation actions a commentor raised were largely ignored, downplayed or beneficial impacts minimized – or at times ignored altogether.

We Protest this arbitrary and biased EIS process and analysis.

FLPMA Requires BLM Prepare a SEIS, Balance Uses and Ensure Sustainability

Multiple use and sustained yield management means there must be a significant portion the public lands devoted to conservation – or sensitive species like sage-grouse, clean water, ad a wealth of public recreational uses will not be sustained – and will not be adequately buffered from adverse effects of climate change which are amplified by grazing and other intensive disturbances.

To manage for sustained yield, BLM must manage uses without permanent impairment of the productivity of the land and the quality of the environment. In doing this, BLM must weigh the relative values of the resources to society, and not economic return to a hand full of local ranching interests.

BLM must sustain natural landscapes, scenic resources, clean air, water wildfire, night skies, soundscapes, and opportunities for solitude, quiet and primitive recreation. See 2014 TWS Comments on cd re: BLM planning.

BLM should allocate these lands, waters, and habitats to conservation and restoration purposes – before allocating to livestock grazing and/or extractive uses. Allocations must extend far beyond the skyhigh “forage” estimates of unknown origin that the entire RMP with its mammoth grazing and livestock facility and linked road network footprint is based upon.

We Protest the lack of consideration of the full range of values, and also the lack of a full science-based consideration of cumulative effects acknowledging threats from grazing and resource extraction that must be considered beyond “forage” in making allocations.

FLPMA Requires BLM Prioritize ACECs – Instead Jarbidge Gutted and Cast Aside ACECs

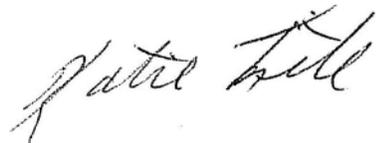

BLM has acted to gut rather than prioritize ACECs – again acting with extreme bias to placate ranchers and the state of Idaho at the expense of all other values of the public lands.

BLM’s Alt VI and the FEIS violate FLPMA in casting aside 600,000 acres of ACECs that meet the Relevance and Importance criteria.

A Supplemental EIS with a full and valid range of alternatives based on current baseline information and science must be developed.

Sincerely,

/kf

Attachments: IDMT SG IDT Meeting Notes 2014-09-04.docx

Hi Brent,
Attached are notes from yesterday's call, also on the SharePoint site. I asked David about the text for the 12 inch precipitation zones and he said that it is awaiting SOL approval. He hopes to have the notes out by COB today.

Idaho/Montana Sage-Grouse ID Team Meeting

September 4, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Rod Collins; Natalie Cooper; Bruce Schoeberl; Jason Pyron; Katie Powell; Kasey Prestwich; Karen Porter; Dustin Miller; Kelly Bockting; Brandon Knapton; Karen Rice; Gloria Jakovac; Jason Wright; Rob Mickelsen; Jesse Rawson; Jesse German; Elena Shaw

Handouts

- None

Action Items

- None

Meeting Minutes

Project Update

- Having a federal family meeting for the Rocky Mountain Region next week. Compiling numbers on existing rights and activities for the USFWS. Utilize numbers from the DEIS for Montana.
- White paper on Biologically Significant Unit (BSU) – Brent shared with some staff for review and will also send to Kelly. Using 2011 data for population and habitat. In general, we are not close to the disturbance cap. May receive national guidance on how the disturbance cap will be calculated, but Brent has been working on some new possible calculations. Call at 10 am today to discuss disturbance.
- Process – waiting to hear about changes in the proposed plan. Have changed to a disturbance “cap” and the waiver, exemption, modification language has been changed. Will likely change Core habitat from closed to NSO for fluid mineral leasing.
- Meeting with GIS and Rob to review the Forest Service plan. Would like to ensure that maps are consistent across BLM and FS boundaries.

Proposed Plan Follow Up

- Lands –Core/Important are not available for disposal/sale. Need to review existing plans for any description of lands identified for sale. Check if these lands are in Core/Important and if so, need to clearly identify that they are no longer available for sale (by parcel description). 1) Review LUPs; 2) take legal descriptions and compare to map; 3) make separate appendix that states which parcels are no longer for sale.
- Forest Service Wild Horse Territory – none in our subregion.
- Comments related to livestock grazing and fire – Brent will have to follow up with some staff about this.

- Some concern over prescribed fire in less than 12 in precipitation zones. Pat was supposed to provide language. This language will be sent with the notes from the Great Basin federal family meeting.
- For areas post-rehabilitation, when do they meet the criteria to be called effective mitigation? Must meet the key habitat standard and needs to be consistent within the plan (e.g., Table 2).
- Anthropogenic disturbance criteria – regarding co-location in Important habitat, will rephrase to say that it would be located to minimize effects, if possible, through co-location in Important. This is because co-location may not be the best way to minimize impacts in all areas.
- Need to review the proposed plan to make sure we have addressed Montana appropriately.

Idaho/Montana Sage-Grouse ID Team Meeting

September 11, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Paul Makela; Nika Lepak; Don Kemner; Bruce Schoeberl; Jason Pyron; Katie Powell; Karen Porter; Ethan Ellsworth; Connie Breckenridge; Kelly Bocking; Brandon Knapton; Karen Rice; Gloria Jakovac; Vince Guyer; Jason Wright; Rob Mickelsen; Jesse German

Handouts

- None

Meeting Minutes

Project Update

- Brent is almost done editing the proposed plan. A few items to follow up on.
- Disturbance meeting tomorrow. Have discussed doing a moving window analysis for the anthropogenic disturbance calculation. Showed that much of WY, eastern MT, UT, and OR are over the 3 percent cap. Other areas are under the 3% cap. This calculation doesn't roll up easily to a larger scale.
- Have been responding to questions from the Rocky Mountain meeting, such as a justification for three-tiered habitat management system.
- Brent will send out the BLM and Forest Service proposed plans with the allocation maps in the next couple of days.
- Brent scheduling a meeting with Montana staff in mid- to late October to make sure the proposed plan reflects their needs. Also reviewing the MT state GRSG plan that was just signed. Will need to incorporate that to some extent. Disturbance calculation and adaptive management still a question.
- Brent will share the BSU paper with the team.

Proposed Plan Additional Information/Work

- Implementation-related details needed (probably would not require changes to the proposed plan): 1) mitigation team and strategy (e.g., how the boards work); 2) the adaptive management evaluation process.
- Need definition of "high voltage" versus "minor rights-of-way". Check to see what the FS has and NPT recommends. Might be 100 kV.
- Brent will send Montana the habitat objectives table to review from their perspective.
- Rob is working on VDDT acres. Had a webinar yesterday to go over the results with Craig.
- How to manage habitat that is lost or gained? Lost habitat will still be managed for GRSG until there is a mapping plan amendment/adjustment on a five year basis. Some thought that gained/new GRSG habitat could be managed as general habitat, but since allocations are tied to

general habitat, changes would require a plan amendment. Don, Paul, and Ethan will work on criteria to include, such as following RDFs, seasonal restrictions, and buffers.

- Included broad prioritization language from the Great Basin Region federal family meeting that discourages use in Core/Important habitat and pushes uses outside of GRSG habitat.
- Continuing to work and identify lands for disposal in existing plans. When you acquire lands, they're not automatically open to mineral entry. Need to say that lands acquired would be managed for the appropriate management zone except not automatically open to minerals.
- Will need to augment the appendix describing project-level key habitat map adjustments based on site conditions/surveys. Ethan and Paul will work on this and share with others.
- Regarding disturbance, need to make sure that we are consistent in how ROWs are counted as disturbance. In the BSU description, it says we would follow the monitoring framework, but elsewhere it mentions ROW width.
- Waiting for the *Lepidium* conservation agreement to be signed. Will ensure those conservation measures are in our RDF appendix.
- Need to provide justifications/rationale for the decisions we made in the administrative record. List of items: Why 2011 for baseline? Why 10% and 20% change for adaptive regulatory triggers? Why is maximum number of males the appropriate measure? Why is 3% the disturbance cap? (need USFWS input on some of these).
- Questions about Forest Service versus BLM standards for grazing and what can be changed. Forest Service standards are designed to meet viability requirements for wildlife because of the certainty of implementation. Certainty of implementation is the same for Forest Service standards and guidelines, except that a standard needs a plan amendment to change. Biological benefit would be the same. Will have a meeting to discuss how GRSG concerns were incorporated into the Owyhee permit renewals. Implementation plans should help with consistency.
- Once the final EIS is out for internal review, would like to have a series of half-day or one-day workshops in each of the BLM district offices and including nearby Forests. Will have a presentation to the field on what the decisions are by program area. Then will work through some examples, to help with implementation Probably November at the soonest.

Idaho/Montana Sage-Grouse ID Team Meeting

September 18, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Nika Lepak; Natalie Cooper; Katie Powell; Trisha Cracroft; Brandon Knapton; Gloria Jakovac; Vince Guyer; Jason Wright; Jesse German

Meeting Minutes

Meetings This Week and Ongoing

- Meeting in Reno regarding implementation of the FIAT.
- Another meeting in Reno with Deputy State Directors to talk general implementation planning.
- Meeting in DC this week with regional leads to discuss the federal family meeting outcomes. Brent has been responding to more questions on our plan.
- Coordination meeting with the states will be the week of October 9th. Unsure what the agenda is or intended outcomes.

Project Update

- We have been finishing GIS calculations and developing maps.
- Brent sent the next version of the draft proposed plan which highlights the actions that have been changed. Some further changes are being made to conifer objectives and additional language in mapping section regarding management areas. Very nearly complete.
- Brent will try to include the maps with the next version.
- Brent will be following up with state director Tim Murphy and sending final version to field and district office managers likely within the next week. Would like to put together a day-long workshop for each of the district offices (including BLM and FS staff), likely after the FEIS goes to WO for review.
- EMPSi starting on effects analysis and including revisions based on feedback from BLM and Forest Service, changes to the proposed plan, the Forest Service proposed plan, VDDT, and GIS. EMPSi staff will contact BLM staff if needed for input. Goal is to send all sections to lead BLM counterpart by next Friday and CC Brent and Meredith.
- Disturbance team met last Friday. Goal was to determine definitive scale and how it will be measured. Did not get conclusions on these topics. Will set up another call, but probably not this week due to other meetings.
- Awaiting outcomes and possible changes from federal family meetings, though some of the GBR outcomes have been incorporated into the current version of the plan.
- Staff have been working on the land tenure assignment. Some of the parcels are split between GRSG management zones. Decision was to take the whole parcel out of consideration for disposal if part of it is within GRSG habitat. Staff should identify split parcels. Due by the end of the month.

Subject: ID/MT IDT meeting notes

Hi Brent,
Attached are notes from this morning's IDT call (thanks Annie!). Sorry I couldn't make it, as I was pulled off to another meeting. The schedule you proposed sounds good to me as long as we don't have substantial changes to incorporate to the ADPP. If we do have some changes, we may need more than a week to turn around revisions between 10/24 and 11/1, but we can cross that bridge when we come to it.
We are still pending the vegetation GIS – do you know if Diane has what she needs to do these calculations? I know there were some questions about which vegetation layer to use.
Let's touch base tomorrow or early next week before you're out to make sure everything is tracking and will move along while you're gone.
Thanks,

Meredith

Idaho/Montana Sage-Grouse ID Team Meeting

September 25, 2014 11:00 a.m. MST

Attendees: Brent Ralston; Nika Lepak; Kelly Bockting; Gloria Jakovac; Jason Wright; Karen Rice; Vince Guyer; Kasey Prestwich; Trisha Cracroft; Brandon Knapton; Rob Mickleson

Meeting Minutes

Project Update

- There was a project management call for the Great Basin Region with an update on the project from the Washington Office
- A schedule has been prepared and is under review at the department level.
- At this point, specific dates have not been shared.
- Should be seeing the schedule in the next week or so.
- A couple policy decisions (below) have been made, though most won't specifically affect IDMT.
 1. A *No Net Unmitigated Loss* approach has been adopted across both RM and GB regions. IDMT's approach is linked to Key Habitat. We'll need to figure out and define what this means for MT.
 2. Lek Buffers: Right now a team of USGS scientists is reviewing literature on lek buffers in order to determine an approach on which lek buffers are best for various activities. IDMT did this already and submitted that information to the Washington Office and WO has commissioned the USGS to do the same thing.
 - The USGS team should have results back to BLM by October 6th. USGS is considering pulling in outside scientists and the Solicitor is looking into whether this would violate FACA (Federal Advisory Committee Act).
 - IDMT's approach won't be modified too much by the results of this research, since IDMT has already done this work within their subregion. This work is more likely to impact other subregions.
 3. Cumulative Effects Analysis: All the *Important* management zones will be lumped together with the *General* management zones for the CEA. This was a decision made by the WO Solicitors and is more of a worst-case-scenario look at cumulative effects. The tentative deadline of getting the CEA data to the NOC is the 2nd or 3rd week of October. For the most part it's all ready to go. This timeframe will be easy to meet.
 4. Record of Decision: Currently leadership is leaning towards the idea of having two RODs, one for each region (GB and RM).
 5. The final review of the FEIS won't be due to Washington until after the holidays. We're looking to have our pieces pulled together by after Thanksgiving and then hand that over to EMPSi for editing etc. so that we'll be on track to get everything to Washington by January.
 6. *This decision DOES impact IDMT*
 - We're changing the names of our management areas again.
 - We still have 3 habitat categories: Priority, Important, and General.

- These will now be referred to as *Habitat Management Areas*. We will now need to refer to our habitat categories as: PHMAs, IHMAs, and GHMAs.
- Other subregions will be using a similar naming convention.
- This will result in a lot of changes to our document, but it won't be impacting any substantive decisions we've made.
- This is most likely the final name change.

Work Items In Progress

- Brent has been working on a paper that describes the anthropogenic disturbance and adaptive management science and calculations. Brent will share this paper more broadly after it's been reviewed by Rob. Brent should be able to share this out by early next week.
 - October 24th will be the deadline to express any questions and concerns about this paper to Brent. If there are significant questions or concerns, please give Brent a call so these can be discussed.
- There is an information bulletin (IB) that will go out likely next week. It is currently being reviewed in the State Office. The IB transfers the Administrative Draft Proposed Plan and the Admin Appendices to District and FO managers that are involved in this process. This will probably result in workshops in January. The purpose of the workshops will be to share out pieces of the implementation strategy that have already been discussed, and also to discuss how to develop a final implementation plan to be included as part of the FEIS.
- EMPSi will send out revised sections to the BLM tomorrow (Friday). Please make sure you read through them and make sure they've captured all the important parts. When looking over the sections, consider the big picture and make sure the analysis captures that. Consider whether the section has captured all the management actions, whether the effects have been talked about, whether all administrative units have been accounted for (BLM, BLM MT, FS, FS MT, Sawtooth NF), and whether cumulative effects have been considered.
 - The timeline for the review of the section is as follows: EMPSi will get revised section to BLM on September 26th. The BLM will have until October 24th to review those sections and provide comments back to EMPSi. EMPSi will have until November 1st to turn those comments around and get the revised sections back to the BLM. The BLM will review the draft between November 1st and Thanksgiving. A pseudo-final draft will then be ready after Thanksgiving. The BLM will get one final look before the WO review in January.
 - These next 4 weeks are the last big look the BLM will get at these sections, so look carefully and be thorough.

Other

- There is a meeting scheduled in Montana at the Dillon Field Office on October 21st to go through the administrative draft proposed plan to make sure everything is captured for Montana. Kelly will look at the plan ahead of time to flag potential issues.
- There will be no call next week. Brent will be on leave starting next Wednesday.

Subject: RE: Quick Update and Naming Change

Thanks Brent,

I had a meeting that went a little longer than planned so I missed the call.

The name change is not a big deal, but my question is why? The overtone to all of this has been “consistency”, and you are more than aware of the State’s feelings on rangewide consistency. I just hope that we hope the NPT now has a good understanding of our overall approach to conservation and that it really is an outcome-based approach. I don’t want the name changing of the management zones to be a precursor to more “consistency” discussions.

Thanks for listening.

Dustin

Subject: Quick Update and Naming Change

We you guys missed an exciting call this morning. A couple things I wanted to let you know –

I heard some information on the conference in early November:

The Next Steppe: Sage-grouse and Rangeland Wildfire in the Great Basin 2014 Conference will be held on November 5-7, 2014, at the Boise Centre, Boise, Idaho.

State participation is encourage for this so there will likely be more information coming to you soon, I wanted to let you know the dates to help your schedule.

The second item regards our management zone names or title. There was a national decision at the Rocky Mountain Region Meeting to have all the EISs, including Wyoming’s refer to the GRSG delineated areas as Priority and General Habitat Management Areas or PHMAs and GHMAs. For Idaho we will therefore have – Priority Habitat Management Areas, Important Habitat Management Areas and General Habitat Management Areas. This change does not affect any substantive decisions but will change all the references from management zones to habitat management areas. I’ll be working on that effort for the ADPP. This should be the last name change, until it changes again!

Subject: Status and Cancellation of Upcoming Meeting

Currently BLM and Forest Service continue to work forward on development of the Proposed Plan Amendment in coordination with the State of Idaho and US Fish and Wildlife Service. Our major efforts at this point have been to finalize incorporation of public comments into any adjustments of the Proposed Plan and to incorporate the comments you have provided into the Proposed Plan and effects analysis.

The Proposed Plan is nearing finalization, expected in mid to late October. Internally we have been coordinating across subregions and briefing our leadership on status and components of the Proposed Plans. The Great Basin Subregions met with BLM, Forest Service and Fish and Wildlife Service leadership recently in to discuss the Great Basin plans and this we that same leadership is meeting to discuss the plans in the Rocky Mountain Region. It is my understanding that the leadership of the Federal agencies is working to schedule a coordination meeting with State governments toward the end of this month. After these meetings we should be able to finalize the Proposed Plan and begin the completion of the Final EIS.

I am scheduled to address the IAC Public Lands Committee next Tuesday, September 16th at 3 p.m. in Moscow, ID; and since it looks like I won't have much substantially new to share until mid-October, let's cancel our upcoming call tentatively scheduled for this Thursday.

Hopefully I'll see many of you next week in Moscow and if you have any questions or concerns we could talk then.

Subject: IMPORTANT: Disturbance call with FWS

You have been invited to the following event.

Title: IMPORTANT: Disturbance call with FWS

All,

As noted in the Great Basin and now the Rocky Mountain Federal Family Meetings, we have been asked by Neil Kornze, Steve Ellis, Jim Lyons, Noreen Walsh, Chris Iverson, and your State Directors to quickly come to a conclusion on how we will be dealing with Disturbance. Pat Deibert & Gordon Toevs are available Friday. I know this is not our usual meeting time, but if you are available, we really need you all to participate. Please set aside this block of time. We can break for lunch, but we have been given firm instruction to get this all resolved soon.

We will use the NetMeeting

Thank you,
Frank

Idaho/Montana Sage-Grouse ID Team Meeting

March 20, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Paul Makela; Don Major; Nika Lepak; Deb Koziol; Bruce Schoeberl; Jason Pyron; Kasey Prestwich; Kelly Bockting; Karen Rice; Vince Guyer; Jason Wright

Handouts

- ID swMT Recommended Proposed 031814

Meeting Minutes

Comment Response

- Comment response workshop in two weeks. Brent is securing a meeting room and he should know the meeting location tomorrow.
- EMPSi has been working on comment coding and preparing issue summaries and responses. There is some boilerplate language provided on the national level, but we'll also need to craft sub-region-specific responses.
- Will work through Montana comments on Tuesday and recreation, water, and fisheries on Thursday.

Ongoing Efforts

- Proposed plan data needs to be submitted to the NOC by 5/15.
- Goals/objectives: Will review next week. Need to create more quantifiable objectives, but this will likely be based off the VDDT modeling.
- GRSG habitat management objectives: Rob has been preparing a table to present the habitat objectives, similar to a table in the NV/CA EIS.
- Adaptive management: Brent is working on the language and hopes to have a meeting with others next week to discuss and refine.
- Disturbance threshold: Don and Jason working on, as well as the state task force. Expecting a response to the state from the task force tomorrow and will hopefully hear more early next week.
- Don has been working on developing the suite of metrics that will be incorporated (numerator) into the disturbance calculation and the appropriate scale (denominator) at which it will be calculated. May need to do this calculation at multiple scales. Paul, Don, and Jason will coordinate on this. Then will discuss, so what? What does it mean? Will need to discuss further with the USFWS.
- Kelly will coordinate with Montana staff regarding disturbance threshold/calculation for the state.
- Mitigation framework: broad scale guidance from the national level: 1) creation of a state board to look at mitigation and 2) develop mitigation strategy within one year of ROD. Working with the state to get more details on their framework which will help inform the mitigation strategy.

- Range: Nika will write up a white paper on how BLM will renew grazing permits. How to prioritize, how to apply habitat management objectives on an allotment basis, any additional decisions needed to clarify? How to deal with this in areas that don't have the ecological potential to be GRSG habitat? What we intend, what we want to accomplish, how we'll do it. Remove the ambiguity as to how this management will be applied. Potentially will include this as an appendix to the FEIS.
- Lands and realty management: still some work to be done to resolve differences between Alternatives D and E. State task force may propose excluding wind, solar and airports in Core Habitat. Specific exemption criteria for transmission lines.
- Buffer areas: Paul will provide input to ensure we're using the appropriate buffers.
- Monitoring: draft monitoring plan from the national level.
- Montana: which decisions should we include in the Dillon plan and where is existing guidance sufficient? Kelly is looking at the table.
- Management area mapping: Don has been working on this. Preliminary map that shared with USFWS and State. Some adjustments to map expected from the state, particularly in the Owyhee Front. No major changes expected in other areas.
- Review of recommended proposed plan.

Participant passcode: 96049

Agenda

1. Update on Status and Schedule
2. Public Comments and Responses
3. Development of Final EIS

Brent Ralston
Greater Sage-Grouse Planning Lead
Idaho and Southwestern Montana Subregion
Idaho State Office

Idaho/Southwest Montana Subregion Sage-Grouse RMP/EIS

Cooperating Agency Call

March 13, 2014 11:00 a.m. MST

Attendance

BLM/FS: Brent Ralston

Counties: Doug Balfour – Power County; Bill Frederiksen – Clark County; Todd Stefanic – NPS; Jack Depperschmidt – DOE; Dan Happel – Madison County; Robert Cope – Lemhi County; Bob Shirley – Air Force; Larry Schoen – Blaine County

Meeting Minutes

Project Update

- DEIS released on November 1 for a 90-day public comment period. Comment period ended on January 29, 2014. Held public comment meetings for 2 weeks in early January; they were well attended. Had an open house format that included a short presentation at the beginning of the meeting. Goal was to avoid confusion and clarify any concerns.
- Have received 16,000 comment letters/emails
- Many of the letters were email/form letter campaigns from wild horse advocacy group; Audubon Society; Wild Earth Guardians; and Idaho Cattlemen's Association.
- 300 unique letters – EMPSi is working to deliver a preliminary comment report by the end of this month.
- Received a number of comment letters from Cooperating Agencies – states of ID and MT; USFWS; EPA; several counties.

Ongoing Efforts

- IDT will be going through the substantive comments in early April and determining a response and changes to make to the EIS.
- Trying to minimize the changes to the existing alternatives. Focusing on creating another alternative that will be the proposed plan. Compared the preferred alternatives and found that in many cases they are very similar and in other cases, they augment each other. Identifying areas where the management between Alternatives D and E are not the same and trying to resolve these differences.
- The biggest difference between the two alternatives is the habitat zone mapping. Also differences in how infrastructure would be managed.
- Hoping to get some draft materials prepared by the end of April and Brent will share these when they're available.
- There was a Great Basin Region federal family meeting last month in Portland. Compared each of the sub-regions for consistency, particularly along the borders. Often there were some

differences, but most of the sub-regions were similar. ID/MT was different regarding oil, gas, and geothermal leasing, and mineral material sites.

- For infrastructure under Alternative E, in Core Areas there is an exemption process and Important areas are open if you meet certain criteria. Considering trying to make oil and gas management consistent with this and have all infrastructure managed similarly. Then evaluate on a site-specific basis.
- USFWS would like to see a disturbance threshold/cap in all the plans. Ongoing discussions with the USFWS to meet consistency with the COT. Trying to work out how to incorporate a disturbance threshold into the ID/MT plan.
- USFWS also requested additional direction and regulatory certainty on wildfire suppression activities in Alternatives D and E. A national Fire and Invasives Assessment team is putting together direction to use in the Great Basin that will address USFWS concerns.
- USFWS would like clarification on what exemptions would be allowed in Core in Alternative E.
- USFWS would also like to see quantifiable objectives for vegetation treatments, conifer removal, and activities to restore sagebrush habitat in Alternatives D and E.

Schedule

- April: reviewing public comments, crafting responses, and determining what needs to change in the FEIS. Drafting the proposed plan in April.
- May: revisions to the EIS. Re-do the effects analysis, including analysis on the proposed plan.
- Early June: prepare FEIS. Will send sections out for Cooperating Agency review as they are available. Done by mid-June followed by local, regional, and Washington Office reviews.
- Format: will have 3 volumes as previously. For the FEIS, one volume will include the Executive Summary, maps, and proposed plan.
- Governor's consistency review and protest during the summer. Prepare the ROD in the fall.

Other/Questions

- Question about whether people understood the scope of the effort and that some issues are not under BLM control/authority. BLM prepared a one page predation handout excerpted from the DEIS. For Pocatello, Salmon, and Dillon, Brent addressed predation during the introductory presentation.

Idaho/Montana Sage-Grouse ID Team Meeting

March 13, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Karen Porter; Don Kemner; Deb Koziol; Jason Pyron; Kathleen Hendrick; Katie Powell; Bruce Schoeberl; Kelly Bockting;
Karen Rice; Gloria Jakovac; Vince Guyer; Jason Wright; Rob Mickelsen; Mike Haney; Jim Klott; Jesse Rawson; Elena Shaw; Brandon Brown; Kasey Prestwich

Handouts

- ID_Management Action Evaluation_GRSG
- ID_Management Action Evaluation_WestNile

Action Items

- Brent: send working to-do list to the group.
- IDT: send suggested changes on working draft of preliminary proposed plan to Brent.

Meeting Minutes

Ongoing Efforts

- Brent sent a version of the draft preliminary proposed plan earlier this week. ID team should send suggested changes to Brent. He is working to incorporate the range and minerals management actions. Focus is to get the recommended proposed plan drafted in the next couple of weeks.
- Comment analysis: We'll be having a 3-day workshop April 1-3 in Boise (maybe at the Oxford Suites) to discuss issue statements and responses. Brent would like the following staff to attend: Paul Makela, Natalie Cooper, Glen Burkhardt, Karen Porter, Robin Fehlau, Bryce Bohn, Scott Hoefer, Connie Breckenridge, Rob Mickelsen. In addition, one representative from each field or district office: Jason Wright, Elena Shaw, Kelly Bockting, Brandon Knapton/Bruce Schoeberl.
- Effects analysis and GIS coordination: Brent has been meeting with GIS staff in the State Office on Thursday afternoons at 1 pm. Will be including resource program leads in these meetings to talk specifically about the recommended proposed plan: what is needed for effects analysis; indicators; what data layers do we have; what are we trying to show; how to display the information; and how to break the numbers down for effects analysis. We'll have EMPSi and their relevant resource staff on the calls as well.
- Other efforts update: working with state and USFWS to decide on a final map. Discussion on describing how we would make adjustments to the map. Talking with Paul on the key habitat map. Will describe how the map and adjustments fit in with the adaptive management regulatory triggers.
- Disturbance threshold: Jason has been working with BLM, USFS, and state task force. There is relative agreement on a 3% disturbance cap within nesting/wintering within core/important at

conservation area scale. Still discussing the appropriate biologically significant unit. Also some discussion on how to consistently apply the threshold at the project level and how that may impact the population triggers.

- Mitigation strategy is in progress and tied into the disturbance cap.
- Monitoring strategy is also in progress at the national level.
- Rob has been working with FS NEST team to develop language to include in plans. They have been taking the management actions and rephrasing them as plan language. We will put these actions in a matrix with BLM actions to facilitate comparison.
- Brent will send his working to-do list to the group.
- Brent and Kelly will continue to working together for management on Montana lands.
- Brent has been working on RDFs and seasonal restrictions.
- Rob has been working on habitat management objectives and we'll likely look at this next week.
- We'll eventually need to discuss quantifiable treatment objectives from the VDDT model.

Review of Management Actions

- Team reviewed GRSG and West Nile Virus management actions and discussed the management actions to include in the preliminary proposed plan. A smaller subgroup will have a follow up meeting regarding adaptive management triggers.

Subject: GRSG EIS Leadership and Schedule

We continue to make progress on the Final EIS for GRSG. There are a few pieces that need some additional attention as part of recent national and state coordination efforts. We continue to move forward with our effects analysis review. We should be on track to have most of the ID Team work done by the end of November.

We will have a call on Thursday October 23rd at 9:00 to discuss our status and next steps.

Participant passcode: 97575

Toll Free Number 877-324-1605

There are also some personnel movements that I wanted to apprise you of. Recently, Jake Vialpando has accepted a new position, creating a need for leadership on the Jarbidge and Owyhee Permit Renewal team that I will be moving into, and subsequently Jon Beck, who has been doing a stellar job filling the void I left in Idaho planning, will be moving in to pick up the reins of the GRSG effort. We are still working out many details as to how and when this transition will occur. Jon will become more involved as we continue forward and will be focusing on document preparation while I will still be the primary contact for coordination efforts with all of our partners.

For now none of this shuffling should affect our schedule – we are still on track to finish the internal review of the proposed plan by Friday. EMPSi continues to work on effects analysis and we will work to finalize that over the next several (3-4) weeks.

We will have share more information regarding the transition then on the call.

Idaho/Montana Sage-Grouse ID Team Meeting

October 23, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Paul Makela; Karen Porter; Natalie Cooper; John Beck; Ethan Ellsworth; Vince Guyer; Jesse German [Brent – I came on a minute late and may be missing a few individuals]

Meeting Minutes

News on Management Transition

- Brent will be transitioning to a new opportunity and John Beck will be taking over Brent's role as the Sage-Grouse planning lead.
- Brent will stay involved to complete the proposed plan (goal is to complete this over the next 2 weeks) and John will step in to work on the effects analysis. John will be working with EMPSi and the ID Team to review and revise sections.

Five Major Concerns about the Proposed Plan that need to be addressed

- FWS expressed concerns about mitigation. They'd like to see a commitment in the plan regarding the timeline for the implementation of mitigation measures. This information already exists but it is in an appendix. Brent will pull this information out of the appendix and put it in the plan.
- FWS also had questions about adaptive management- "untriggering." What does BLM plan to do if an adaptive management trigger is tripped, but then the habitat/population recovers? Is there a reversal of triggers set up?
 - Brent will set up a call for early next week to discuss this.
- FWS also is concerned about how triggers and adaptive management will work for populations that cross the border.
- FWS would like to see more specifics on how BLM plans to work with other players like the state implementation team, adaptive planning team, etc. on implementation. The plan needs to discuss the details of this.
- The Solicitors want to understand where IDMT stands regarding disturbance.

Update on RMP/EIS Efforts

- There have been several meetings recently between state directors and the states, and each state is being met with one-on-one to discuss the specific state plans and how that integrates with the federal plan. Idaho's was last week and went well.
- This week state directors got together to talk about consistency. Until we see what they discussed, it doesn't make sense to talk about and make decisions on adaptive management.

Proposed Plan

- Any comments/questions/concerns about the Proposed Plan are due to Brent by COB tomorrow, Friday, 10/24.
- We'll make the changes we can based on comments and if there are things that can't change due to direction from higher up, we'll note that in the record and move on.
- Have PAC boundaries changed? At this point the boundaries are the same- no one has yet mentioned changing them. The FIAT identifies "focus" and "emphasis" areas and it would be highly problematic if the FIAT recognized a high priority focus or emphasis area that is outside of priority habitat. To address this concern, the BLM will be including language about how habitat maps can be re-evaluated if FIAT identifies focus/emphasis areas that are in general habitat areas.
- EMPSi has created a new template for us to use.

Next Steps

- Once the Proposed Plan is done, it should be complete other than format tweaking. There will be no more discussion or revisions after that. After that we'll need to get GIS, numbers, tables and maps done. Then GIS will be completely done. There may be a little GIS/map clean-up work after this point, but that's it. The next big piece will be the effects analysis. We have about 6 weeks from today to get that done- aiming to finish that by the end of November. After that we can disband the sub-regional ID Team.
- After that point we'll just be stepping forward with the decision. During the 1st or 2nd week of December we should be pulling together the final EIS so we can send it to DC around the first of the year.
- The next three pieces are the Proposed Plan, the comment report, and the effects analysis.
- We currently have all the sections for Chapter 4. John will be looking at them and sitting down with each of the teams to address comments/concerns.
- There will likely be one more version of the effects analysis sent out for review, and then after that, the final version will be the last version.
- When the final comes out there will be a protest period and governor's review, and then the ROD, which says whether we are deciding to go forward with the Proposed Plan.
- There will be one major work effort between the Final and the ROD. We're going to have to step through the Proposed Plan and all our old plans and look at all management actions in existing plans to determine which management actions are being replaced by the Proposed Plan. That way we can include in the ROD which decisions in existing plans are no longer applicable due to the Proposed Plan. The time frame for this will be sometime between February and April.
- This effort will require some IDT folks, but the push may be more at the district/field manager level.
- When we're comparing the Proposed Plan to existing plans to see if we need to replace any management actions, will we have the ability to tweak language? Or will we need to take actions 100% as they are?
 - We will need to take actions as they are- no tweaking.

- Will there be meetings when the FEIS is on the street?
 - There will be implementation meetings which will involve all program leads. Protest response may require some district and field office help, but may be an effort that focuses primarily on the program leads in the state office.
- Brent hasn't made many changes to Chapter 1 since April. Plans to make a few changes and then will send to EMPSi. For Chapter 2- the Proposed Plan is in the works and Meredith is working on the rest of Chapter 2. Brent will send to that to EMPSi who will put it in the new format. Chapter 3 and Chapter 4- these are the pieces that we're working on now with the effects analysis. We will need to deal with similar sections in both these chapters at the same time.
- We will not putting the text of the document into ePlanning. We'll pdf all chapters and upload those to ePlanning so people can download them.

Other

- There will be a call next Thursday. Plan on an hour-long Thursday call every week from now until we're done with the effects analysis. Next Thursday's meeting may be in a webinar format and may be a little longer than an hour.

Idaho/Montana Sage-Grouse ID Team Meeting

October 30, 2014 9:00 a.m. MST

Attendees: Brent Ralston; Diane McConnaughey; Paul Makela; Nika Lepak; Natalie Cooper; Don Kemner; Mike McDonald; Karen Porter; Jon Beck; Kelly Bockting; Karen Rice; Gloria Jakovac; Vince Guyer; Jason Wright; Rob Mickelsen; Jesse German; Elena Shaw

Handouts

- None.

Action Items

- Meeting next Tuesday in the ID SO at 1 pm to discuss task force and adaptive management items (tentative, pending attendee availability).
- Meredith will follow up with Zoe regarding the livestock grazing GIS request.

Meeting Minutes

Update on Washington Office Direction

- Several meetings with the state and the Department regarding state plans and adjustments by state. Twelve overall issues that USFWS is looking at (discussed below).
- Last week, state directors met prior to ELT meeting and reviewed these 12 issues. Refined the issues and will be providing direction. Had expected direction last week, but new USFWS memo has delayed this. No direction yet on how the memo will factor into the direction. Still numerous discussions ongoing. USFWS memo is not widely distributed. Should have final approach communicated either tomorrow or early next week.
- Dan Ashe and Neil Kornze briefing Sally Jewell tomorrow.

USFWS Issues to be Resolved

- In addition, 5 related sub-issues for ID/MT to address.
- 1. PAC boundaries in UT and NV. Does not apply to ID/MT.
- 2. Management decisions for populations that cross state lines (e.g., SW Idaho, SE Oregon, NW Nevada; Bear Lake in ID/UT/WY). Once national guidance received, may have further discussion about these differences in management and develop rationale for how the outcomes for the bird would be similar.
- 3. Monitoring, specifically regarding adaptive management. ID/MT plan is fairly descriptive: population triggers collected by the state; BLM will track habitat through key habitat map and annual updates.
- 4. Disturbance calculation. Unsure on how this will affect the ID/MT effort but hopeful we will be consistent with WO guidance and white paper that will be released.

- 5. Adaptive management. ID/MT has a good description of how adaptive management works in Idaho; need to finalize for MT. Will have a call/meeting next Tuesday at 1 pm to discuss remaining issues (removing adaptive management once measurements are below trigger level. In other words, reversing a tripped trigger).
- 6. Mixed ownership lands and allocations – state/private/BLM lands. Does not apply to ID/MT plan.
- 7. Lek buffers – USGS is reviewing lek buffers related to anthropogenic disturbance. They will provide feedback on what is the best science for each of the buffers. They are not providing the buffers, but reviewing the science. It was supposed to be received in early October, but has not been received.
- 8. ROW Avoidance and exclusion areas – some potential changes for ID/MT.
- 9. NSO and oil/gas – all core/important areas in ID/MT identified as NSO. RDFs include a 2 mile lek buffer around any occupied lek. Probably no changes for ID/MT.
- 10. Closures related to limiting disturbance in priority habitat. Probably no changes for ID/MT.
- 11. Mitigation – USFWS would like to see a commitment to do a mitigation strategy after the ROD. This language was in the appendix and will be pulled into our proposed plan.
- 12. How to address improper grazing. WO looking at this and developing different approaches. Brent and Nika have been providing feedback.
- 5 sub-issues for ID/MT – 1) commitment to mitigation; 2) management direction across state boundaries; 3) disturbance; 4) additional detail on how the implementation task force would function. Would be similar to the Idaho Roadless Rule- Brent has drafted an MOU to describe the intent behind how the task force would work; 5) adaptive management and untripping hard triggers – define criteria for removing a tripped trigger.

Effects Analysis

- Resolution of a few issues.
- Vegetation – in the DEIS, we used one layer for vegetation and VDDT. Now, new layer (LANDFIRE EVT) from NOC for VDDT. Should we use the old DEIS layer or the new NOC VDDT layer to calculate all vegetation?
- Rob recommends using EVT just for VDDT. For proposed plan, use old vegetation layer used in the DEIS. Will only need to calculate Alternative G vegetation requests.
- VDDT – likely need to run other alternatives with the new EVT vegetation layer.
- Livestock grazing and seasonal habitat – GIS request to identify acres open to grazing and AUMs in different GRS habitat (related back to the habitat objectives table). Forest Service will be providing the same details and BLM will share what they have been working on with Forest Service.
- Paul proposes lumping nesting and late brood-rearing habitat as there is no map available for late brood-rearing. Will call it “breeding/late brood” and will encompass lek, nesting, early and late brood-rearing habitats. This will be one map. MT is providing their inputs. Initially talked about calculating AUMs in winter habitat, but grazing is less important in winter habitat. Paul feels there would be no value added to quantify that for grazing analysis. He will include a table

in Chapter 3 (GRSG section) to quantify seasonal habitats and undetermined areas by population areas. For effects analysis (grazing section), table for each alternative showing acres open to grazing and AUMs but only focusing on breeding/late-brood habitat. Forest Service analysis will be pretty similar. Have a description in the table or text regarding why winter habitat was not calculated.

- Meredith will follow up with Zoe to make sure this meets the intent of her GIS request.
- Minerals – Karen will revisit the issues they were working through regarding locatable minerals.
- Jon may have some follow up calls with resource specialists.

Schedule

- Schedule is changing, but the last schedule had final EIS to WO after the holidays. Effects analysis completed by end November, early December. FEIS release mid-late March. Will get a new schedule once direction from WO comes out.

Next Week

- Will have another 2 hour call next week and may have a webinar to go through various items and new direction.

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower

Handouts

- None

Action Items

EMPSi

- Provide a detailed list of what will need to be done (or re-done) to restructure the administrative records.

Meeting Minutes

WO Review Update

- Overview of ELT meeting
 - The Executive Leadership Team meeting was held yesterday, participants also included the State Directors. The meeting objective was to resolve the list of remaining issues.
 - There were many follow up actions, which will be summarized in a key issues document expected to be released to the PMs on Friday, 10/24.
 - Key outcomes from the ELT included:
 - A requirement for all sub-regions to incorporate in their FEISs vegetation objectives similar to Table 2-6 from Nevada plan. For Oregon and Utah, this will likely require additional analysis, which is necessary in order to underpin the commitments made for livestock grazing.
 - General habitat management areas will now be more restrictive – particularly for high voltage T-lines. PHMA **and** GHMA are avoidance for ROWs. No new corridors.
 - Geothermal will be included in the “smart from the start program,” which is a conservation objective, not necessarily an allocation. Originally, geothermal restrictions only applied in PHMA; they will now apply in GHMA as well. Geothermal is not excluded, but would be avoided, in a sense (although not the same as a planning-level avoidance allocation). This change is not likely to require updated impact analysis – it is more of an aspirational objective/statement of intent.

- A decision regarding NSO exceptions and modifications is pending. The ELT is working on a clause for mixed-use land patterns (e.g. in Montana and Colorado).
 - For Utah's PACs, the proposal originally on the table was to manage all GRSG habitat areas as priority habitat. However, because the range of alternatives did not analyze all areas as PH, this option cannot be moved forward. The ELT and SOL decision was to allow for as much as possible within the decision space contained in the DEIS.
- Buffers were discussed at the ELT meeting, but there will not be buffers input available by the end of the week.
- Utah's 4-mile disturbance buffer issue was not discussed.
- The ELT talked about drop in language for coal suitability, but only in terms of process and not specific suitable or unsuitable areas.
- Wind and solar was not discussed at the ELT; it is still exclusion. Potential impacts on renewable energy (including geothermal) are on Director Kornze's radar and there may be some additional discussion on this topic.
- ELT decisions supersede previous Federal Families meeting decisions. There needs to be a solid rationale for these recent decisions, especially those that shift decisions that have had a long record of decision making process.
- A livestock grazing vegetation objectives white paper was sent to the project leads last week. It included drop in language for the LUPs. The grazing modification commitments are now just for priority habitat.
- For disturbance monitoring, the denominator includes the entirety of PHMA in BSUs.
- In Nevada, the State has uploaded new mapping to the state's Sage-Grouse website. The FEIS will only include the revised maps and associated new analysis for the state's alternative. The proposed plan maps will not change and PACs will not be redrawn for the proposed plan. Sarah wants to have a follow up discussion with NV leads.
- Sarah will also follow up with Brent and Jon on ID map changes.
- Schedule Update.
 - The FWS is in the process of developing a listing decision schedule. FWS will be using eight models to assist in making its decision and will start running the models in January with preliminary outcomes expected in May. At a minimum, FWS will need the allocation decisions by January.
 - The WO is now leaning toward a 4 week review vs. a 2 week review given that it will be reviewing 14 plans concurrently.
 - Summer of 2015 is now the projected date for ROD releases.
 - The schedule will likely include one extra week for the contractors.
 - The ELT did not discuss cooperator review. Subregions should consider limiting cooperator review to 2 weeks so that responses to cooperator comments can be developed before WO feedback is received. Even if input from cooperators cannot be incorporated into the FEIS, there is still a need to have a transparent process. Nevada,

Oregon and Utah will likely need to send out the whole FEIS. Idaho may only need to send the impact analysis and CEA.

Tier II/CEA Update

- EMPSi is still working with WY and MT to incorporate changes and will provide an update on an upcoming call.

VDDT update

- Rob sent reports showing the amount of projected treatments in the first decade and 50 year average. The team felt the first decade treatment acres were those necessary to meet treatment objectives, beyond that it was hard to predict. Rob will be working more with UT this week.

Chapter 2 outline Questions

- Matt will be sending out responses to the subregion's questions by this afternoon.
- There will be changes to the template based on feedback received.

Follow up of outcomes from Federal Families Meeting

- The CEQ definition for feasibility is likely to be used.
- Lauren will work with FWS on appropriate language associated with the 12" precipitation maps, and hopes to have the language available for discussion next week.

Admin Record

- EMPSi is working on a process for combining the AR into a merged record.

Gateway South, which runs through WY, CO and terminates in UT was noted on the draft "12 points" memo, but isn't on the website. Does it count as one of the projects to which the language would apply?

Q

On Tue, Oct 28, 2014 at 12:18 PM, Magaletti, Matthew <mmagalet@blm.gov> wrote:
Hi everyone,

As a follow-up from today's call, below is a link that outlines the "priority transmission line projects" that are being coordinated by the Rapid Response Team for Transmission (RRTT).

<http://www.blm.gov/wo/st/en/prog/energy/transmission.html>

If you have additional questions related to these projects, let me know and I can touch base with Lucas Lucero here in our WO.

Best,

Matt

Electric Transmission Facilities & Energy Corridors

To build America's clean energy economy we must update our transmission grid for the 21st century, so that we can efficiently move power from the new energy frontier to the places it is consumed. - Secretary of the Interior Ken Salazar

The U.S. Department of the Interior and the Bureau of Land Management are committed to processing applications in an environmentally responsible manner for electric transmission facilities that expand and modernize the transmission grid. Processing of the applications will be done in accordance with applicable laws and through a coordinated approach that involves local and state governments, tribes, other federal agencies, local communities, and other stakeholders.

Electric Transmission Facilities & Energy Corridors
Oil and Gas
Coal
Oil Shale & Tar Sands
Rights-of-Way
Energy Policy Act of 2005
Public Events on Oil and Gas Comparative Assessment of the Federal Oil and Gas Fiscal System

We know the country that harnesses the power of clean, renewable energy will lead the 21st century.
- President Obama

The President has stated that the country that harnesses the power of clean, renewable energy will lead the 21st century. These facilities will accommodate additional electric capacity over the next several decades, including new renewable generation as well as improve reliability and reduce congestion in the western grid. These electric transmission facilities will transmit the energy that will power our future.

Interagency Rapid Response Team for Transmission (RRTT)

The RRTT aims to improve the overall quality and timeliness of electric transmission infrastructure permitting, review, and consultation by the Federal government on both Federal and non-Federal lands through:

- Coordinating statutory permitting, review, and consultation schedules and processes among involved Federal and state agencies, as appropriate, through Integrated Federal Planning;
- Applying a uniform and consistent approach to consultations with Tribal governments; and,
- Resolving interagency conflicts and ensuring that all involved agencies are fully engaged and meeting timelines.

Participating Agencies include: the Department of Agriculture, the Department of Commerce, the Department of Defense, the Department of Energy, the Department of the Interior, the Environmental Protection Agency, the Federal Electric Regulatory Commission, the Advisory Council on Historic Preservation, and the White House Council on Environmental Quality.

"Transmission is a vital component of our nation's energy portfolio, and these seven lines, when completed, will serve as important links across our country to increase our power grid's capacity and reliability," said Secretary of the Interior Ken Salazar. "This is the kind of critical infrastructure we should be working together to advance in order to create jobs and move our nation toward energy independence."

The RRTT will initially focus on seven projects. Four projects that involve BLM-managed public lands are:

Boardman to Hemingway Line to power Oregon and Idaho: The new 500 kilovolt (kV) transmission line proposed by Idaho Power would create an approximately 300 mile long, single-circuit electric transmission line from a proposed substation near Boardman, Oregon to the Hemingway Substation near Melba, Idaho--known as the Boardman to Hemingway Transmission Line Project or B2H Project. According to the developer of this project during peak construction, this project is estimated to create about 500 jobs in Idaho and Oregon.

Gateway West Project to bring new transmission across Wyoming and Idaho: Jointly proposed by Idaho Power and Rocky Mountain Power, this project would add approximately 1,150 miles of new, high-voltage transmission lines between the Windstar Substation near Glenrock, Wyoming and the Hemingway Substation near Melba, Idaho. According to the developer of this project, during peak construction, it is estimated to create between 1,100 and 1,200 jobs.

SunZia Transmission, LLC to bring power to New Mexico and Arizona:

SunZia Transmission, LLC plans to construct and operate up to two 500 kV transmission lines originating at a new substation in Lincoln County in the vicinity of Ancho, New Mexico, and terminating at the Pinal Central Substation in Pinal County near Coolidge, Arizona. According to the developer estimated job creation will be about 3,408 direct jobs during the construction period.

TransWest Express to stand-up transmission from Wyoming to Utah and Nevada: TransWest Express LLC plans to construct and operate a more than 700 mile, 600 kV, transmission line which is estimated by the developer to create 1,035-1,550 direct jobs per year at peak construction. This project will facilitate the development of new wind projects in Wyoming.

For a list and map of the transmission line pilot projects, please visit the [DOE Interagency Federal Permitting Transmission Tracking System](http://www.doe-etrans.us) at: www.doe-etrans.us.

Interagency Transmission MOU

The [Memorandum of Understanding](#) (MOU) was signed by nine Federal Departments and Agencies on October 23, 2009. The goal of the agreement is to speed approval of new transmission lines, reduce expense and uncertainty in the process, generate cost savings, increase accessibility to renewable energy and jumpstart job creation. The agreement will cut approval time off the normal Federal permit process and help break down the barriers to siting new transmission lines by:

- Designating a single Federal point-of-contact for all Federal authorizations;
- Facilitating coordination and unified environmental documentation among project applicants, Federal Agencies, states, and tribes involved in the siting and permitting process;
- Establishing clear timelines for agency review and coordination; and
- Establishing a single consolidated environmental review and administrative record.

Instead of applicants going to multiple agencies, a single lead agency will coordinate all permits and approvals. The new process will keep applications on track by requiring agencies to set and meet clear deadline and improve transparency by creating a single record to be posted on line at the following webpage: www.doe-etrans.us.

The BLM's guidance for consistent implementation of the Interagency Transmission MOU can be found in: [IM 2013-118- Revised Implementation Guidance for the Interagency Transmission Memorandum of Understanding](#)

West Wide Energy Corridors

Section 368 (a) of the [Energy Policy Act of 2005](#) (the Act), Public Law 109-58 (H.R. 6), enacted August 8, 2005, directs the Secretaries of Agriculture, Commerce, Defense, Energy, and the Interior (the Agencies) to designate under their respective authorities corridors on federal land in 11 Western States (Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming) for oil, gas, and hydrogen pipelines and electricity transmission and distribution facilities (energy corridors). A [Programmatic Environmental Impact Statement](#) (PEIS) was prepared that proposed the designation of more than 6,000 miles of Section 368 energy corridors among the various Agency land use plans is a forward-looking response, mandated by statute, to address a national concern.

To view a larger map of proposed energy corridors, [click on the map](#) or [select this link](#).

BLM Approved a [Record of Decision](#) for the PEIS on January 14, 2009. The ROD included a listing of [Interagency Operating Procedures](#) (IOP) intended to foster long-term, systematic planning for energy transport development in the West, provide industry with a coordinated and consistent interagency permitting process, and provide practicable measures to avoid or minimize environmental harm from future development within the corridors.

West Wide Energy Corridors Website: <http://corridoreis.anl.gov/>

West-Wide Energy Corridor Litigation and Approved Settlement Agreement

On July 7, 2009 multiple organizations (Plaintiffs) filed a Complaint in the *Wilderness Society, et al. v. United States Department of the Interior, et al.*, No. 3:09-cv-03048-JW (N.D. Cal.). The Plaintiffs raised a variety of challenges in response to the BLM's January 2009 Record of Decision.

The BLM, United States Forest Service (USFS), Department of Energy (DOE), and the Department of Justice worked collaboratively with the Plaintiffs to develop a settlement with specific actions to mutually resolve the challenges in the Complaint. The agencies and Plaintiffs agreed to settle these matters without any adjudication or admission of fact or law by any party and to avoid protracted and costly litigation as well as preserve judicial resources. The case was dismissed pursuant to the [Settlement Agreement](#) on July 11, 2012.

"This is a win-win outcome that will support the Obama administration's all-of-the-above energy approach by increasing the reliability of our pipeline and power line networks and unlocking American-made energy, while helping to ensure that transmission lines and natural gas pipelines that cross public lands are sited in the right places.

"By requiring periodic review of our nation's energy corridors, with the benefit of thorough public participation, the settlement agreement will help meet our nation's needs for expanded domestic energy infrastructure while protecting land, water and wildlife.

"The interagency agreements outlined in the settlement will provide greater certainty for transmission and pipeline developers, whose proposals are subject to environmental analysis under the National Environmental Policy Act." – Secretary of the Interior Ken Salazar

In fulfillment of the Settlement Agreement, BLM, USFS, and DOE executed a [Memorandum of Understanding](#)

(MOU) on July 8, 2013. The MOU includes a Work Plan for the Regional Periodic Reviews as Attachment A. The Agencies also approved a [Work Plan for the Corridor Study](#) with the execution of the MOU.

Included in the Settlement Agreement was the recognition of 36 of the 119 BLM approved corridors as Corridors of Concern (COC). The BLM Washington Office has developed a series of [Corridor Maps](#) showing all the approved corridors with COC highlighted in red. A listing of the [West Wide Energy Corridors](#) including COC with information about the areas of concern is available

As part of the Settlement Agreement the BLM and USFS agreed to issue new policy for use of the West Wide Energy Corridors on Agency administered lands. In fulfillment of that requirement the BLM issued a policy for the administration of West Wide Energy Corridors on BLM administered lands, [IM-2014-080](#), effective April 7, 2014.

Sage-Grouse Great Basin Region Project Management Team Weekly Call

October 7, 2014 10:00 a.m. PST

Attendance

BLM: Lauren Mermejo, NV; Quincy Bahr, UT; Joan Suther, OR; Jessica Rubado, OR; Matt Magaletti, WO; Johanna Munson, WY; Vicki Herren, WO

USFS: Randy Sharp; Madelyn Dillon

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Derek Holmgren; Peter Gower; Drew Vankat

Handouts

- None.

Action Items

Sub regional PMs and Forest Service

- ALL: Send questions on the Chapter 2 template to Matt by COB this Friday.
- Matt: Send Chapter 2 outline to Madelyn.
- Madelyn: Discuss vegetation objectives table with Rob.
- Joan and Matt: Discuss whether Alternative A should be added to the alternatives comparison table for the FEIS.
- Matt: Talk with the Solicitors to determine their preference on AR structure/organization.

Meeting Minutes

WO Review Updates

- Thanks to all for help with webinar prep. Went well and happy with attendance from states. WO staff out this week for Task Force meeting. They are having a combined Great Basin and Rocky Mountain discussion tomorrow.
- After task force meeting, planning one-on-one meetings with State Directors to talk to states. Matt is unsure of exact dates, but expect to be solidifying dates tomorrow. Intent is to meet with states before 10/20. OR State Director is out so WO should get Mike Haske involved.
- ELT meeting the week of Oct 20th. Set aside a full day on 10/20 for State Directors to finalize and synthesize decisions made over the past few months. Would like to have one list of decisions that can be distributed. WO staff will meet Thursday of next week to draft this decision document and send out to State Directors.
- Gordon Toevs is now on detail as branch chief for renewable energy in Reno. Vicki will be taking over his workload.
- Matt will be compiling questions on the Chapter 2 template that was distributed last week. Send questions to Matt by COB Friday.

- Disturbance cap white paper will not be distributed until after Oct 20th. It will outline methodology for 3% cap and include language recommended for proposed plan. Specifics for implementation will not be included. Will keep BSUs and recommends disturbance measured at fine/site scale using a method similar to DDCT. USFWS does not want to see disturbance measured at WAFWA scale, so no land use plan decisions tied to this scale.
- There is a push for subregions to have similar table to Table 2-6 in NV/CA plan. Would like to tie back to measurable objectives to make sure we are meeting LUP objectives. Madelyn will ask Rob what the Forest Service approach will be. Overall decision was to wait to see what direction comes out of the ELT meeting on the 20th. Timing a concern – if all subregions must develop and include this table, there could be schedule delays.

Tier II/CEA Updates

- Great Basin CEAs largely on hold due to the need for new data analysis. In the meantime, EMPSi has been working on the templates and finding information on relevant cumulative actions. Sent an internal review draft of Buffalo CEA to John Carlson and Jennie Morton for their feedback. This draft includes incorrect data sets but provides a sample analysis that will be revised. Once their feedback is incorporated, will share with Great Basin PMs.
- Once released to a wider distribution, EMPSi will hold conference call/workshop. Likely will occur in about a month.

Chapter 2 Outline Feedback

- Matt will send Chapter 2 outline to Madelyn.
- It is OK to include original comparison tables from DEIS, including those that are on larger (8.5 x 14 and 11 x 17) sheets.
- Decided not to include proposed plans as part of DEIS comparison table for several reasons. Table is already very large and not easy to read, and it may be hard to compare since there were many changes in the proposed plans.
- Joan and Matt will discuss whether Alternative A should be added to the comparison table for OR since it was not included originally (was included a separate appendix). Likely value in having Alternative A included in the table with allocation decisions.
- Decisions in the proposed plan should be numbered.

Administrative Record

- Need to determine how to structure and organize the administrative record now that there will be one ROD. Since there are many common citations between the plans, can prepare a master AR for the Great Basin region with information unique to each subregion pulled out separately. To this point EMPSi has been maintaining a duplicative record, one for each subregion.
- Matt will work with the Solicitors to determine their preference.

Schedule

- WO is still working on the schedule. The schedule they created at the WO debrief meeting had proposed plans out in February with ROD in August. This schedule was rejected and now compressing schedule to get RODs out by May. WO and EMPSi will absorb most of these schedule changes.
- Concerns about preparing the proposed plan data by the end of the month if the final decisions will be released on Oct 20th. Could require significant geospatial edits that would have broad changes and one week may not be sufficient to make adjustments. Matt suggests that when the draft decision document comes out on Oct 16th, subregions should talk to their State Director about issues and schedule concerns.

Other

- Forest Service buffers were not sent to USGS for their review. Anticipate initial response early this week and the start of the peer review process. Should be completed by end of October.
- Core Team in WO will meet weekly to track the action item list from federal family and debrief meetings.
- Thanks for wild horse specialists for meeting and crafting consistent language.

EMPSi: David Batts; Chad Ricklefs; Meredith Zaccherio; Holly Prohaska; Derek Holmgren; Peter Gower; Drew Vankat

Handouts

- None

Action Items

EMPSi

- Provide a detailed list of what will need to be done (or re-done) to restructure the administrative records.

Meeting Minutes

WO Review Update

- On 10/20, all state directors will meet to resolve the remaining 12 issues:
 - PAC boundaries;
 - Issues related to political boundaries;
 - Disturbance tracking;
 - Adaptive management;
 - Mitigation;
 - Mixed management landscapes;
 - Buffers;
 - ROWs;
 - Priority habitat NSO closures, ACECs, and withdrawals;
 - Coal suitability;
 - Livestock grazing; and
 - Smart from the start related to oil and gas drilling (e.g., leasing outside of PH first).
- Oregon – concerns regarding communication since staff are out of the office (e.g., no one has seen the meeting invitation for next week).
- PMs should talk to state directors about these issues since the list will not be sent to PMs. PMs should be prepared to make changes to your proposed plan.
- Schedule will likely be finalized at the meeting next week.
- Jim and Ed are meeting with states this week: WY today; call with Oregon Wednesday morning; meeting with Idaho on Thursday; call with NV on Thursday; unsure when UT meeting is.

- Last Wednesday's meeting in Denver with USFWS, the states and state directors – some disagreements between USFWS and states; USFWS felt that virtually every state plan (except for WY) does not do enough for state/private lands. However, states described their provisions for state/private lands (e.g., oil and gas in UT goes through Utah Division of Oil, Gas and Mining) and USFWS did not know about these things. USFWS wanted the states to write up everything they have regulatory oversight on.
- USFWS and states have disagreements on plans, but generally agreement between BLM and states. Some misunderstandings in UT regarding what actions can be done in priority habitat.

Tier II/CEA Update

- Expecting feedback from John Carlson on Buffalo Draft CEA today. Planning ahead to take advantage of our window now and prepare for when data are ready.

Administrative Records

- Two RODs – need to restructure ARs to support any litigation on the RODs. Solicitors said that a re-organization of AR would be appropriate. Instead of 4 separate ARs, there would be one AR with common files referenced together and unique information for each subregion coded separately.
- A lot of work already done that will need to be re-done. Want to make sure we're all on the same page before proceeding. EMPSi will provide a detailed list of what will need to be done (or re-done) in order to comply with this new direction. Hope to get approval on our next call to move forward.
- May need to have a different approach for the Rocky Mountain ARs.
- Public comments – how best to incorporate into record given the number of public comments submitted. Two approaches, both are acceptable from a legal standpoint: 1) incorporate all comments specific to each subregion in a zip file. Zip file would have unique identifying number and would be shown as one row in the index. Each file will still have an identifier that includes the commenter's name. This would be the easiest option; 2) enter the public comments individually and each comment would have an identifying number. Each comment would be a separate entry into the AR. Would take longer.
- All PMs are fine with using the easier option (option #1).

Forest Service Update

- Finished initial review of NV proposed plan, sent to Glen for review this week. Hope to meet with Glen, Randy and Forest Supervisor this Friday.
- Glen and Chris are meeting in WY and will be at the Idaho meeting and on the NV call with states.

Action Items from Past Calls

- Chapter 2 outline

- NV has sent in comments.
- UT – already matches up well with existing Chapter 2. UT detailed no action alternative is in an appendix.
- OR and Madelyn will be submitting comments today.
- Matt will be responding to comments later this week, early next week.
- Madelyn working with Rob and Carol-Anne regarding the vegetation objectives table.

Other

- OR – still working on adaptive management and RDFs.
- Will need consistent adaptive management triggers for shared populations. Will likely have a meeting to discuss, but will occur after the 10/20 meeting.
- Feel that there is inconsistency in the message from USFWS regarding the biologically significant unit for disturbance and adaptive management. Some areas were too big for disturbance calculation and too small for adaptive management. Lauren stated that there will be coordination meetings with the USFWS on this issue.
- UT – meeting with state and USFWS today. NRCS data for conifer percent cover shows there are many areas with high conifer cover in GRS habitat. Will discuss whether they want to re-draw habitat boundaries.

To: Kelly Bockting; Pat Fosse (pfosse@blm.gov); Cornelia Hudson; John Carlson (jccarls@blm.gov); 'Rob Mickelsen'; Jason Pyron (jason_pyron@fws.gov); Katie Powell (katie_powell@fws.gov); brent_esmoil@fws.gov; 'Meredith Zaccherio (meredith.zaccherio@empsi.com)'
Subject: Montana Coordination Meeting
Attachments: MT Coordination Mtg 102114.docx; Meeting info 10_21_14.docx

We are still on for a meeting at the Western Montana District Office/Dillon Field Office in Dillon, MT tomorrow starting at 8:00 a.m.

Attached is an agenda for our discussion and a short evaluation of the MT Governor's Plan that Kelly put together for discussion tomorrow.

We will display the ADPP using an overhead projector so I will not be bringing any hard copies of that with me.

Brent Ralston
Greater Sage-Grouse Planning Lead
Idaho and Southwestern Montana Subregion
Idaho State Office
208-373-3812

The following list is a few things I noticed in the MT GRSG conservation plan that may not be consistent with the ADPP:

- Stip #1, pg. 14. the 5% surface disturbance - wildfire IS included.
- Stip #2 pg. 14, NSO of 0.6 miles from lek including roads.
- Stip #3, pg. 14. seasonal use TL outside NSO are not consistent with dates and times used in Appendix B of IDSWMT ADPP. (pg 12 of the ADPP appendix)
- Stip #4, pg. 14. transportation, locate new roads 0.6 miles from leks, - the IDSWMT ADPP uses a BMP > 0.8 miles from nesting habitat for new paved or high traffic gravel roads??.
- Stip #6, pg. 15. overhead powerline siting > 0.6 miles and - IDSWMT used RDF not allowed <600meters, and BMP of 2 miles from lek in appendix A but Appendix B pg 4 of 17 states BMP of no new roads within .8 miles of leks.
- Stip #7, pg. 15. no noise increase over 10dBA above ambient, IDSWMT has an RDF of no repeated or sustained disturbance (ie. no noise level increase identified) For fluid mineral development RFD of 10 decibel increase above ambient is used. (pg. 7 appendix A)
- Stip #9 pg. 16. Sagebrush Eradication and Treatments, not sure what is included in "treatments", appears to be habitat restoration?
- Stip #10 pg. 16, Prescribed burns prohibited - no sagebrush habitat types identified that may be more suited to use of fire. Wildfires are included in the 5% disturbance cap. – IDSWMT ADPP habitat treatments, wildfire and conifer expansion are not included in the 5% disturbance. (pg. 5 appendix G)
- Stip # 11 pg.16. Monitoring and adaptive Response. – Uses a population trigger and the operator is to propose the adaptive management response?? - IDSWMT ADPP uses uses habitat based Adaptive Management.
- Stip #13 pg. 17. No net conifer expansion and recommends manual methods, and removal of all conifers <0.6 miles from leks.
- Stip #15, pg 17. Existing activities/disturbances are not subject to stipulations but the disturbance is calculated towards the disturbance cap and existing disturbance may exceed 5%.

General Habitat stip #1 Pg 19 NSO of 0.25 miles. – IDSWMT ADPP Appendix B (pg 3 of 17) lists research that states .25 and .6 buffers are not sufficient and uses a 2 mile buffer for structures in the anthropogenic catch all on pg. 8 of 17 (appendix C?)

*Also of note in the MT GRSG Habitat Plan there is Lek Status definitions on pg 28 – not consistent with ID SWMT occupied lek definition.

These are just a few things that I have noticed, (some of which may not be an issue but probably need discussion.) There may be more that others have picked up on if they have reviewed both documents.

I think we need to review the following from the 96 page ADPP appendix. RDF/BMP's (11 pages) and the Buffer and Restriction tables (17 pages), and Appendix G for ID (H for MT?) (21 pages long.) to make sure they are consistent with the rest of MT.

Should discuss the Appendix J “Lands no longer available for disposal”

National Greater Sage-Grouse
Idaho & Southwestern Montana Sub Region
Montana ADPP Coordination
October 21, 2014

Agenda

Purpose: Discuss Idaho and Southwestern Montana GRSG Administrative Draft Proposed Plan (ADPP) to ensure it contains and reflects the management direction appropriate to SW Montana and is as consistent as appropriate with other Montana land use plan direction for GRSG and with the Montana State plan.

- 8:00 Introductions, Format and Expectations
- 8:30 Montana Direction within ADPP
- 9:45 Break
- 10:00 Montana Direction within ADPP Appendices
- 11:00 Lunch Break
- 12:30 Montana Governor's Plan Consideration and Consistency
- 2:00 Break
- 2:15 Montana Data and Information for Final EIS
- 3:00 Other Concerns
- 4:00 Adjourn

Subject: FW: Webinar information - 11/5/14 Call
Attachments: ID swMT ADPP BLM Decisions 110514 No Maps_responses.docx

During our call today we went through roughly half of the comments we received on the ADPP. Attached is a file with those comments and responses through comment # 54.

There are various assignments associated with responding to comments that are detailed below. For those of you identified please look at the management action and the comment(s) associated – what I am looking for is a final version of the management action with the comments considered. Please send those to me and include Jon Beck on that email.

Next Thursday Jon will be leading another call where we will walk through the remaining comments and note responses or make some assignments for preparing responses. These responses all need to be completed by November 19th so we can incorporate those into the plan by November 21st.

Here are today's assignments by comment # -

Comment # 7-10 – State office GIS staff to update maps once our final direction is received from WO
19-20 – Rob Mickelsen – please verify the numbers in the table
21-27 Habitat objectives table – Paul, Ethan, Kelly, Rob to finalize table
28-29 Brent to prepare paragraph regarding Idaho/Montana management actions and denote within ADPP
30 – Paul and Don Kemner
31 – Brent
32 – Paul and Don Kemner
33-34 – Paul, Ethan & Don Kemner
35 – Kelly

- 36 – Paul, Ethan and Don Kemner
- 38 – Jason and Paul
- 39 – Kelly and John Carlson
- 40 – Revise the management action based on Tuesday’s meeting outcome – Jon and Brent
- 44 – Jon work with GIS to develop map of overlaid management areas
- 45 – Paul, Ethan, Don Kemner, Jason P., Katie work on language for sideboards on map adjustment
- 46 – Kelly and John Carlson
- 54 – Paul

In addition with the release of the REA Jon, Paul, Nika and Ethan are going to discuss what is appropriate and/or necessary to incorporate the REA into the final EIS.

Travis and Paul are also working to respond to some concerns on the mapping process from our solicitor’s office in WO. Brent will follow-up the week of the 17th with solicitor based on Travis and Paul’s work.

There are other comments that may warrant some attention before next Thursday. I’ve identified a few of those with who may be able to address below:

- 60 & 61 – Jason Wright and Paul
- 62, 63 & 65 – Nika, Steve Jirik, Paul, Jason Wright
- 66 – Nika, Paul, Steve J.
- 68 & 69 – Nika and Paul
- 76 – Natalie
- 84-88 – Nika, Ethan, Paul

Subject: Webinar information

Hi Brent,
The information for tomorrow's webinar is below. Let me know if you have any questions.
Thank you!

GRSG SR IDT Call

1. Please join my meeting from your computer, tablet or smartphone on Thu, Nov 6, 8:00 AM Pacific Standard Time

<https://global.gotomeeting.com/join/299731789>

2. Join the conference call.

Call in number: 877-324-1605 Code: 97575

Not at your computer? Click the link to join this meeting from your iPhone®, iPad®, Android® or Windows Phone® device via the GoToMeeting app.

Draft

Greater Sage-Grouse Land Use Plan Amendment and Environmental Impact Statement

*Great Basin Region
Nevada and Northeastern
California Subregion*

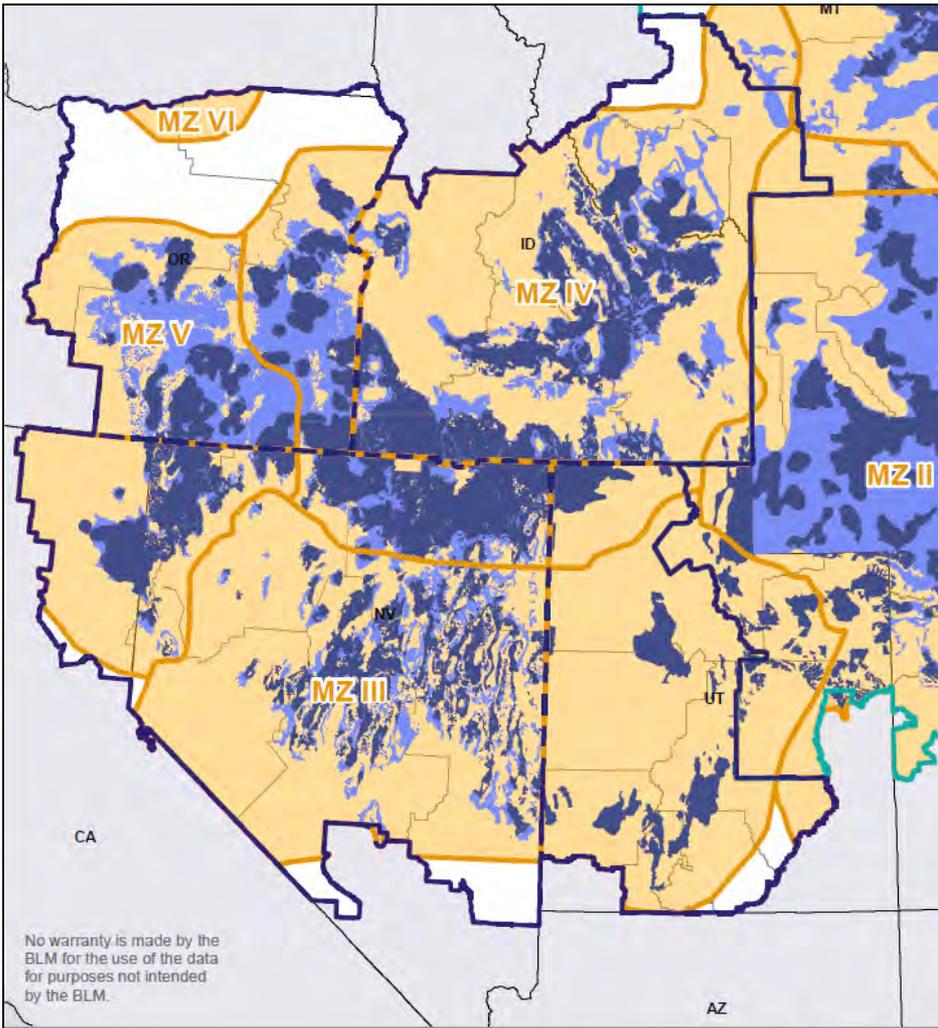

Greater Sage-Grouse Draft Land Use Plan Amendments and EIS

GREAT BASIN REGION – GREATER SAGE-GROUSE HABITAT OVERVIEW

Great Basin GRSG Habitat Overview

No warranty is made by the BLM for the use of the data for purposes not intended by the BLM.

-  Great Basin
-  Rocky Mountain
-  Western Association of Fish and Wildlife Agencies' (WAFWA) Management Zone
-  Preliminary priority habitat
-  Preliminary general habitat

IDMT_0019395

Great Basin GRSB Habitat Overview

- **Total Great Basin Habitat Area:** 61 million acres
- **Subregions:**
 - Idaho and southwestern Montana
 - Nevada and northeastern California
 - Oregon
 - Utah
- **Land management:**
 - BLM: 50% of habitat
 - FS: 7% of habitat
- **Land Use Plan (LUP) Revisions:**
 - 41 BLM Resource Management Plans (RMPs)
 - 12 Forest Service Forest Plans

Purpose and Need

of all Great Basin Greater Sage-Grouse EISs

Purpose

Identify and incorporate appropriate conservation measures in LUPs to conserve, enhance, and restore Greater Sage-Grouse (GRSG) habitat by reducing, eliminating, or minimizing threats to that habitat.

Need

Respond to the US Fish and Wildlife Service's (FWS) March 2010 "warranted, but precluded" Endangered Species Act (ESA) listing petition decision, which identified inadequacy of regulatory mechanisms as a significant threat to GRSG.

The principal regulatory mechanism for BLM and FS is conservation measures in BLM's and FS's LUPs.

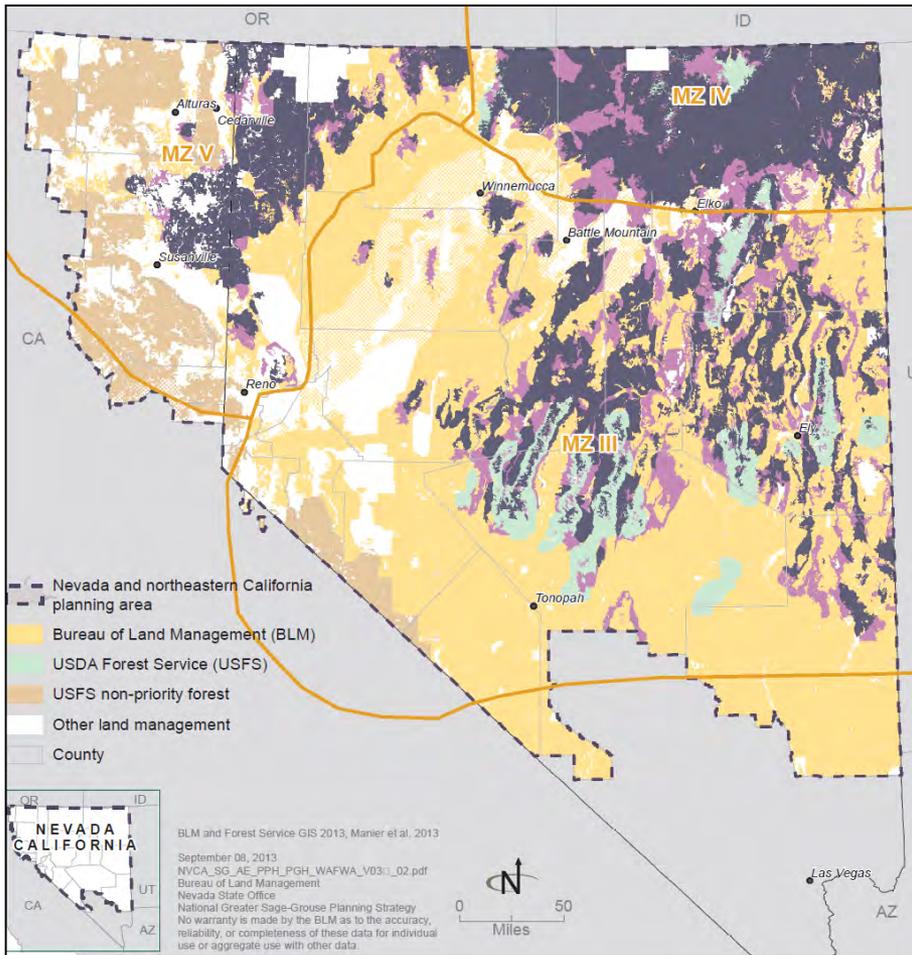

Greater Sage-Grouse Draft Land Use Plan Amendments and EIS

NEVADA AND NORTHEASTERN CALIFORNIA SUBREGION

Subregional GRSG Habitat Overview

Preliminary priority habitat
 Bureau of Land Management (BLM)
 USDA Forest Service (USFS)
 USFS non-priority forest
 Other land management
 County
 Western Association of Fish and Wildlife Agencies' (WAFWA) Management Zone
 Preliminary general habitat

Land Management by Habitat (In Millions of Acres)			
	BLM	FS	Total
Planning Area	45.36	4.508	49.94
Priority (PPH)¹	11.5	1.17	12.67
General (PGH)²	4.5	0.54	5.04

¹PPH: Preliminary Priority Habitat

²PGH: Preliminary General Habitat

Nevada/ Northeast California GRSG Habitat Overview

- **Total Habitat Area:** 21 million acres
- **Land management:**
 - BLM: 76% of habitat (16 million acres)
 - FS: 8% of habitat (1.7 million acres)
- **Land Use Plan (LUP) Revisions:**
 - 12 BLM Resource Management Plans
 - 2 Forest Service Forest Plans

Identified Threats to GRSG Habitat

Threat	Effect on GRSG Habitat in the NV & NE CA Subregion
Climate Change	habitat fragmentation due to climate stress
Conifer Invasion	encroachment of pinyon and/or juniper
Grazing	loss of habitat components due to livestock and wild horse and burro use
Hard Rock Mining	habitat fragmentation due to mineral exploration and development
Human Uses	habitat fragmentation and/or modification of GRSG behavior due to human presence and activities (e.g. recreation and OHV use)
Infrastructure	Habitat fragmentation from right-of-ways and renewable energy development
Invasive Species	conversion of GRSG habitat (e.g. to cheatgrass)
Oil and Gas Development	habitat fragmentation due to mineral exploration and development
Wildfire	loss of GRSG habitat due to wildfire

DEIS Proposed Alternatives

Alternative*	Description
Alternative A	No Action
Alternative B	Based on conservation measures in the National Technical Team (NTT) Report
Alternative C	Based on recommendations from individuals and conservation groups
Alternative D	BLM and FS subregional alternative; DEIS preferred alternative
Alternative E	Nevada State alternative
Alternative F	Based on recommendations from individuals and conservation groups

*Alternative A identifies PPH and PGH, but does not apply new management to those areas. Alternatives B - F propose new management to protect GRSG habitat. Depending on the alternative, proposed management actions apply to Preliminary Priority Management Areas (PPMAs), Preliminary General Management Areas (PGMAs), or Sage Grouse Management Areas (SGMAs).

DEIS Proposed Alternatives

Alternatives Comparison by Resource Area						
Resource Area	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Vegetation	Maintain current management	Improve and restore sagebrush communities	Passive restoration and limited vegetation treatments	Maintain and enhance sagebrush ecosystems	Landscape-scale sagebrush enhancements	Similar to B
Fire	Maintain current management	Focus fire suppression and increase fuels reduction in GRSG habitat	Limited fuels reduction and suppression in GRSG habitat	Similar to B with site specific applications as appropriate	Focus on reducing threats from large wildfire while increasing suppression, and rehabilitation	Similar to B, but only for PPMAs and not PGMAs
ACECs¹	Maintain current management	Same as A.	Designate GRSG habitat as new ACECs	Same as A.	Same as A.	Designate portions of GRSG habitat as new ACECs

¹ACECs: Areas of Critical Environmental Concern

DEIS Proposed Alternatives

Alternatives Comparison by Resource Uses

Resource Use Area	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Grazing	Maintain current management	Same as A.	Close all allotments containing GRSG habitat to grazing	Additional closures possible in riparian areas	Similar to A, but with adjustments to standards.	25% reduction in occupied habitat
Lands and Realty	Maintain current management	Exclude new ROWs in PPMAs; avoid in PGMAs	Exclude new ROWs in all GRSG habitat	Avoid new ROWs in all GRSG habitat	Same as D.	Same as C.
Locatable Minerals	Maintain current management	Petition for withdrawal in PPMAs	Petition for withdrawal in all GRSG habitat	Same as A.	Same as A.	Same as B.
Fluid Minerals	Maintain current management	Close PPMAs to leasing	Close all GRSG habitat to leasing	Apply no surface occupancy stipulations in GRSG habitat	Avoid, minimize, and mitigate features over 32 acres	Same as C.
Travel Mngmt.	Maintain current management	Manage PPMAs as limited to existing routes	Manage all GRSG habitat as limited to existing routes	Same as C.	Same as C.	Same as B, plus no new routes within 4 miles of leks

Selecting a Preferred Alternative

- The agencies selected a preferred alternative based on:
 - meeting the purpose and need
 - the agencies' multiple use and sustained yield missions
 - interdisciplinary team recommendations
 - environmental consequences analysis of the alternative
 - comments on the Administrative Draft EIS
- The BLM and Forest Service will select the final preferred alternative as part of the Final EIS, which may include elements of other alternatives.

Preferred Alternative

Alternative D

- Emphasizes balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape.
- Designates and applies management to PPMAs and PGMAs,
- Seeks to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses.

Preferred Alternative

Alternative D

GRSG Habitat Protection Measures

- Maintain or enhance sagebrush and perennial grass ecosystems
- Increase fire suppression and restoration
- Adjust livestock grazing standards to achieve GRSG habitat objectives
- Decrease surface disturbance from new ROWs and cross-country OHV use
- Eliminate future surface disturbance from wind and solar energy development

Summary of Effects

from GRSG habitat protection measures by action alternative

Effects Comparison by Program Area

Program Area	Alternative B	Alternative C	Alternative D (preferred)	Alternative E	Alternative F
Vegetation	Enhanced conditions	Potential impacts from fire	Enhanced conditions	Enhanced conditions	Enhanced conditions
Fire	Reduced threat	Increased threat	Reduced threat	Reduced threat	Reduced threat
Grazing	Maintained opportunities	Eliminated opportunities	Minimal reduction in opportunities	Maintained opportunities	Decreased opportunities
Lands and Realty	Decreased development opportunities	No new development opportunities	Decreased development opportunities	Decreased development opportunities	Little to no development opportunities
Locatable Minerals	Decreased new development opportunities	Decreased new opportunities	Maintained development opportunities	Maintained development opportunities	Decreased new opportunities
Fluid Minerals	Decreased new development opportunities	No new opportunities	Decreased new development opportunities	Decreased new development opportunities	No new opportunities
Travel Mngt.	Decreased travel opportunities	Decreased travel opportunities	Decreased travel opportunities	Decreased travel opportunities	Decreased travel opportunities

Tech edit

Ch 1 tech edited

EMPSi

Make metric/english consistent

MZ add language where possible -
Alts considered - WO may provide some text actions, go thru letters and double check
Brent - incorp new Alt E language

Habitat management object - get from Paul for Alt D; Brent to pull for Alt

Areas
populate vegetation tables - ask Rob for #s
Use new population areas for GRSG. Include % population of breeding
EMPSi oversee the teams, do with Ch 4
Diane to send GIS to MZ

RDFs/BMPs - MZ
Maps
where their management assumptions

Map - COT PAC, PH/GH,
population areas, etc -
crosswalk these
RFDs

Well I shared the report but I didn't really communicate the assignment that goes along with it. So here goes...

Everyone needs to take a look at this again, particularly noting any highlighted areas, and make sure these responses are good to go. If there are some edits or adjustments to the response please make that in track changes and send back to me by August 8th. If there is additional insight you can provide in resolving any of the highlighted areas also include that in track changes.

I've reattached the report again in case you misplaced it!!

Hi Brent,

Attached is the latest comment report. It is pretty similar to the report I gave you earlier in the month, but the planning related (NEPA, FLPMA, other laws) and minerals issues and responses have been updated. Let me know if you'd like anything else.

Section 3 - Edits Total

Number of Submissions: 27
Total Number of Comments: 62

Section 4 – NEPA

Total Number of Submissions: 2
Total Number of Comments: 2

Summary

The FEIS needs to identify an Environmentally Preferred Alternative, evaluate the plan according to the USFWS's Evaluation Criteria for Conservation Plans, and provide a summary comparison of the population effects under each alternative.

Response

1. Section 1505.2(b) requires that, in cases where an EIS has been prepared, the Record of Decision (ROD) must identify all alternatives that were considered, ". . . specifying the alternative or alternatives which were considered to be environmentally preferable." This alternative(s) will be identified in the ROD.
2. The Policy for the Evaluation of Conservation Efforts (PECE) is the USFWS responsibility and will be used by USFWS during their evaluation of BLM/FS land use plans as appropriate.
3. The FEIS includes discussion of population effects. For instance, [refer to chapter 4 section] incorporates consideration of Greater Sage-grouse populations in the cumulative effects analysis, which is organized by WAFWA MZ.

Section 4.1 - Public Notification

Total Number of Submissions: 1
Total Number of Comments: 1

Summary

BLM needs to publish the statistics for people that provided comment letters on the Draft EIS, as well as the comments, their responses, and changes made to the document in the FEIS.

Response

All substantive comments received on the Draft EIS were considered and reviewed for information that would result in changes to the document. Comments simply stating a preference for or against a specific alternative or opinions without reasonable basis were considered non-substantive since they do not meet the substantive comment requirement of BLM Handbook H-1790-1, Section 6.9.2.1. The substantive comments, along with the commenter and associated issue statements and responses, are presented in the Proposed LUPA/Final EIS in Chapter XX [or Appendix XX], along with a complete explanation of the procedures followed for analyzing comments. See Section XXX for

additional details on the comment analysis process.

[NOTE TO BLM: Section/Appendix numbers will be updated by EMPSi once this section has been added to the FEIS.]

Form letters, or identical letters submitted by different commenters, were identified as part of the DLUPA/DEIS comment response effort. Since these submissions are identical in nature, it is adequate for only one “master” form letter to be included as part of the comment response effort and reviewed for substantive comments. All form letters will be entered into the project decision file and all commenters will be entered into the project decision file as having submitted a comment during the DLUPA/DEIS comment period.

Index of parties, comments, and responses are provided in the FEIS. Changes made to the EIS are noted as... [NOTE TO BLM: Waiting on direction from national team on how will changes be noted between the DEIS and FEIS. EMPSi will include language on this topic in this response.]

Section 4.2 - Cooperating Agency Relationships

Total Number of Submissions: 5

Total Number of Comments: 5

Summary

The BLM did not coordinate with state and local agencies that would be affected by the actions considered in the EIS, as required by NEPA and FLPMA. Several agencies requested cooperator status for review and revisions to the Final EIS.

[NOTE to BLM: inserted UT issue statement and response for use in ID report. Meredith to talk to ID PM to make sure this accurately reflects the comments. If not, rewrite to make it accurate.]

Response

Both the CEQ and BLM Planning regulations define cooperating agency status, including what it is, who is eligible to become a cooperating agency, and how the lead agency should invite participation as a cooperating agency (40 CFR 1501 and 1508; 43 CFR 1601.0-5). Cooperating relationships are limited to government entities, state agencies, local governments, tribal governments, and other Federal agencies that have jurisdiction by law or special expertise. Additionally, per the regulations and BLM policy, there is no coordinating agency status (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental Partners, pages 21 and 31, respectively). To be a cooperating agency, the local agency must meet the eligibility criteria set out in the regulations and policies. The specific role of each cooperating agency is based on jurisdiction by law or special expertise, which is determined on an agency-by-agency basis and identified in the Memorandum of Understanding.

Cooperating agency relationships are described in the Final EIS in Section 5.XX, Cooperating Agencies. In December 2011, the BLM sent letters to XX tribal governments inviting them to be cooperating agencies. The BLM also sent letters to XX local, state, and federal agencies inviting them to participate as cooperating agencies for the LUPA/EIS. [NOTE TO BLM: use this if applies to ID subregion or delete: Subsequently, the State of Wyoming and 4 local government agencies in Wyoming requested and were granted cooperating agency status for the Idaho Sub-regional LUPA/EIS effort, given the portions of two National Forests that overlap into Wyoming and their proximity to the Idaho planning area.] To date, XX agencies agreed to participate on the EIS as designated cooperating agencies, XX of which have signed Memoranda of Understanding with the BLM's Idaho State Office (Table 5.XX, Cooperating Agencies).

In addition to the BLM's invitations to a wide variety of agencies to participate as Cooperating Agencies, DOI regulations (43 CFR 46.225(c)) require the BLM, as lead agency, to consider any request by a government entity to participate as a Cooperating Agency (BLM Desk Guide to Cooperating Agency Relationships and Coordination with Intergovernmental

Partners, pages 8-9). From the time that the Notice of Intent was published and throughout the development of the EIS, an agency could notify the BLM requesting Cooperating Agency status. Section 202 of FLPMA requires the BLM and Forest Service, to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located.

All agencies participating as cooperating agencies have been given opportunities to participate during various steps of the planning process, including regular briefings, requests for input on draft alternatives and the administrative draft EIS, and identification of issues and data during scoping and the DEIS comment periods, as required by 40 CFR 1503.2 and 40 CFR 1506.10. Further, coordination will continue with cooperating agencies in order to identify consistency issues and to be compliant with the relevant laws and regulations. While the laws and regulations associated with cooperating agencies and coordination with other federal agencies and state, local, and tribal governments state that coordination must occur, they do not prescribe the methods necessary to meet the legal or regulatory requirements. Based on the coordination efforts describe above, the BLM and Forest Service have met the legal and regulatory requirements for coordination to date, as described in [Section 5.XX](#).

Section 4.3 - Range of Alternatives

Total Number of Submissions: 29

Total Number of Comments: 80

Summary

1. The alternatives fail to meet NEPA adequacy because:

- a. they (individually or collectively) do not meet the purpose and need for the action
- b. alternatives were all largely the same, and that the BLM needed to provide more distinction (range) between them
- c. BLM needs to consider the alternatives presented by Cooperating Agencies and Environmental Organizations, including the County alternatives, the Conservation Groups' alternative, and alternatives for the listing of the species or not listing the species.
- d. specifically that Alternative D needed to include the Ecological Site Descriptions to provide adequate understanding of the current management
- e. and the BLM and Forest Service failed to adequately define the No Action Alternative.

2. Commenters also suggested that BLM and Forest Service did not provide adequate rationale for the need of the project.

Response

1. a. In accordance with NEPA, the BLM and FS have discretion to establish the purpose and need for action (40 CFR 1502.13). CEQ regulations direct that an EIS "...shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action" (40 CFR 1502.13). Also, under the CEQ regulations, the BLM and the Forest Service are required to "study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources as provided by section 102(2)(E) of the Act [NEPA]." (40 CFR 1501.2(c)). The breadth or narrowness of the purpose and need statement has a substantial influence on the scope of the subsequent analysis. The purpose and need statement provides a framework for issue identification and will inform the rationale for alternative selection. The range of alternatives developed are intended to meet the purpose and need and address the issue; thereby, providing a basis for eventual selection of an alternative in a decision (BLM NEPA handbook and Forest Service Handbook 1909.15 – National Environmental Policy Act Handbook Chapter 10 – Environmental Analysis).

As stated in the DLUPA/EIS, the BLM and the Forest Service prepared the Idaho LUP amendment with an associated EIS to be applied to lands with greater sage-grouse habitat. This effort responds to the FWS's March 2010

b. The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, four alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (current management, Alternative A).

Additionally, the resulting action alternatives offer a range of possible management approaches for responding to planning issues and concerns identified through public scoping, and to maintain or increase GRSG abundance and distribution in the planning area. While the goal is the same across alternatives, each alternative contains a discrete set of objectives and management actions and constitutes a separate RMPA with the potential for different long-range outcomes and conditions.

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives. Meaningful differences among the four alternatives are described in Table 2-2, Comparative Summary of Alternatives, in Section 2.8, Summary Comparison of Alternatives, of the Draft EIS.

c. Based on this alternative development process, the BLM considered input from cooperating agencies, environmental organizations, and the public. As described in 2.4.2, Alternative B, the BLM used the GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (NTT 2011) were used to form BLM management direction under Alternative B, which is consistent with the direction provided in BLM Washington Office Instruction Memorandum 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process).

During scoping for the Idaho GRSG RMPA/EIS, individuals and conservation groups submitted management direction recommendations for protection and conservation of GRSG and their habitat, including the Sage-grouse Recovery Alternative and proposed disturbance cap. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM input, were reviewed in order to develop BLM management direction for GRSG under Alternative C.

Alternative D incorporates adjustments to the NTT report (NTT 2011) to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses, and was developed in full cooperation with the Cooperating Agencies taking note of the agencies' concerns with socioeconomic issues.

The BLM and Forest Service considered the State of Idaho's Sage-Grouse Conservation Plan in its cumulative effects analysis (Draft EIS Chapter 5, Cumulative Effects, [Section 5.4](#), Special Status Species).

Whether the Greater Sage-grouse is determined for listing by the USFWS is outside the jurisdiction of the BLM and beyond the scope of this EIS. As noted in the Purpose and Need, the BLM was to consider regulatory mechanisms that would protect the species and its habitat. As such, the BLM did not develop alternatives should the USFWS choose to list or not list the Greater Sage-grouse.

e. Ecological Site Descriptions are provided for in Chapter 3, Affected Environment as part of the baseline studies; additionally, current management is described in Alternative A.

f. As clarified by the CEQ, the “no action alternative” for a land use plan amendment or revision means “no change” from current management or level of management intensity (CEQ 40 Questions, Question 3). The no action alternative may be thought of in terms of continuing with the present course of action. The No Action Alternative is described in Alternative A, and includes the current management for the programs within the scope of the analysis. However, the FWS determined that the current regulatory mechanisms were not “adequate” in their 2010 warranted but precluded for listing decision. Therefore, the No Action Alternative provides a baseline for comparison of the four action alternatives to the existing planning decisions.

2. The purpose and need is provided in chapter 1. Under FLPMA, the Secretary of the Interior, acting through the BLM has the discretion to engage in land use planning whenever appropriate for management of the public lands.

Section 4.4 - Best Available Info Baseline Data

Total Number of Submissions: 4
Total Number of Comments: 5

Summary

The EIS fails to meet NEPA adequacy for baseline data because the scale of baseline data used is too broad, the EIS failed to include the State and Transition models as part of the baseline information, and the No Action management actions, as presented, do not explain the regulatory mechanisms that are currently available to preserve sage grouse habitat.

Response

The CEQ regulations require an environmental impact statement to “succinctly describe the environment of the area(s) to be affected or created by the alternatives under consideration. The description shall be no longer than is necessary to understand the effects of the alternatives. Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Agencies shall avoid useless bulk in statements and shall concentrate effort and attention on important issues” (40 CFR 1502.15). Additionally, the [name of particular amendment] is a programmatic NEPA effort to conserve greater sage-grouse and its habitat across a broad geographic area. As such, the BLM and the Forest Service described the current conditions and trends in the affected environment broadly, across a range of conditions, appropriate to program-level land use planning actions.

The BLM and the Forest Service complied with these regulations in describing the affected environment. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The affected environment provided in [Chapter XX] and various appendices including [cite appendix(ces)] in the [name of particular amendment] is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the DLUPA/EIS. For example, [use relevant example for the particular issue...here’s one provided: listing every water quality-impaired stream within the planning area by name would not provide useful information at this broad-scale analysis, particularly where the proposed plan alternatives did not vary the level of riparian protections to provide reduced levels for non-impaired streams. The riparian protections within each alternative were applied to all streams, whether or not they were water quality-impaired. However, understanding the miles of impaired BLM streams, as presented in the DLUPA/EIS at Section 3.5.7, is useful in establishing a baseline by which the BLM may analyze the relative effects of each alternative’s broad-based approach.]

As specific actions come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tiered to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions.

Section 4.5 - GIS Data and Analysis

Total Number of Submissions: 8

Total Number of Comments: 13

Summary

Commenters noted several issues with the GIS data and analysis conducted in the Draft EIS:

- The maps and data layers do not provide enough detail to address "local ecological site variability". The data are too coarse and do not provide assurances to more localized decision making; some habitat type areas are inaccurately identified in the maps.
- BLM used old data layers to develop maps; BLM should use the newer data layers.
- the BLM needs to be consistent in their edge-mapping across state boundaries when there are different data sets used.

NOTE TO BLM: some comments relate to specific changes for the maps presented in the DEIS, and for the data layers to be made available for download from the BLM website.

Response

Before beginning the Idaho Sage grouse EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the planning area are substantially different than the data needed to support site-specific analysis of projects. The LUPA/EIS data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service and state agencies, including the state wildlife agency. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used. A few examples: threatened and endangered species and their habitats, water quality- limited (303d) streams, deer and elk herd management areas, invasive plants, and uses on State lands]. The Draft EIS notes that the BLM and FS would incorporate any refinements or updates if or when the data were made available.

As a result of these actions, the data gathered by the BLM and the Forest Service is of the appropriate scale and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives.

A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. The baseline data provides the necessary basis to make informed land use plan-level decisions. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The BLM and the Forest Service will conduct subsequent project-specific NEPA analyses for projects proposed for implementation under the land use plan, which may include but

are not limited to fuels treatment, habitat restoration, [etc.; list others as applicable]. The subsequent NEPA analyses for project-specific actions will tier to the land-use planning analysis and evaluate project impacts at the appropriate site-specific level (40 CFR 1502.20, 40 CFR 1508.28). As required by NEPA, the public will have the opportunity to participate in the NEPA process for site-specific actions.

NOTE TO BLM: Need to respond to the last comment related to consistency across state boundaries for our mapping efforts. There is no national response for this issue.

Section 4.6 - Indirect Impacts

Total Number of Submissions: 4

Total Number of Comments: 5

Summary

BLM's overall impact analysis is deficient in the following areas:

1. lack of discussion for where, when, and how BLM will have sufficient funding to implement the actions;
2. the analysis does not distinguish between the effects of each alternative;
3. did not fully analyze the No Action alternative by not acknowledging the existing laws and actions already in place that would manage the habitat;

Response

1. As a landscape level planning effort, none of the alternatives authorize site specific activities on public lands. The agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies' budgets as appropriated annually through the Federal budget process. As a consequence, agencies' costs and differences in program costs across alternatives have not been quantified. Information has been presented in several resource impact sections on the types of costs that might be associated with various sage-grouse conservation measures.

2. Direct the reader to the Effects Summary table in ch 2. Determine whether revisions to the table would be necessary to distinguish more between the effects.

3. All alternatives are subject to existing laws, even the no action (cite chapter 1 where those laws are listed). The no action was fully analyzed; however, the Purpose and Need for this effort responds to the FWS's 2010 finding that existing regulatory mechanisms in existing land use plans are inadequate to protect the species, therefore, the no action is not sufficient to meet this Purpose and Need.

Section 4.7 - Cumulative Impacts

Total Number of Submissions: 6

Total Number of Comments: 7

Summary

The EIS cumulative impacts analysis is inadequate because it does not adequately identify the reasonably foreseeable future actions, present a comprehensive listing of the effects across ALL subregions, nor analyze how the alternatives' actions would affect actions and decisions in neighboring states/jurisdictions.

Response

The BLM and the Forest Service thoroughly explained its consideration and analysis of cumulative effects in the Draft and Final LUPA/EIS in Section 4.24. The Draft and Final LUPA/EISs considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and the Forest Service have complied fully with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

The DLUPA/EISs contains a qualitative discussion of cumulative effects at the WAFWA Management Zone scale to set the stage for a more quantitative analysis to be contained in the Proposed Land Use Plan Amendment/FEIS. Additional quantitative cumulative analysis was added to the Final EIS in [Section 4.XX](#), Cumulative Impacts.

Section 4.8 – Disturbance Cap

No comments are associated with this issue.

Summary

Commenters felt there was no methodology or scientific backing for establishing the disturbance cap in the alternatives, and that the BLM/FS needed to demonstrate more range in the disturbance cap amounts presented in the alternatives.

Response

In determining the disturbance cap level for each alternative, the BLM utilized the recommendations and input specific to each alternative. For example, for Alternative B, the BLM utilized the cap levels recommended in the NTT Report. Conservation measures included in Alternative B focus primarily on GRSG PPH and include a 3-percent disturbance cap in PPH. PPH areas have the highest conservation value to maintaining or increasing GRSG populations.

For Alternative C, conservation measures were mostly focused on ADH (PPH, PGH, and linkage/connectivity habitat). These areas have been identified by CPW in coordination with respective BLM offices, and include a 3-percent cap on disturbance in ADH. This disturbance cap number for Alternatives B and C were incorporated as-is from the NTT Report and conservation group alternatives; the BLM did not modify the caps in the alternatives.

For Alternative D, the BLM intended to protect those areas that were most important for sage-grouse within PPH; in other words, the alternative would protect the best of the best habitat. The BLM utilized information from the Wyoming Core Strategy to support consideration of the five-percent disturbance cap, with the goal to represent the reasonable edge of the range of alternatives with a higher percentage.

While the caps would set a particular level of disturbance, the implementation of the disturbance caps would occur after the RMPA is approved in the Record of Decision. The BLM inventoried the habitat with the best available info at the

time of the DEIS, but would also do additional in-depth analysis & inventory within management zones at the implementation stage.

Section 4.9 - Mitigation Measures

Total Number of Submissions: 13

Total Number of Comments: 18

Summary

1. The BLM needs to include a monitoring, mitigation, and adaptive management plan/framework in the FEIS that will include specific criteria for determining sage grouse conservation success and how the disturbance percentages will be calculated.
2. BLM needs to clarify the relationship between the disturbance thresholds and the monitoring framework.
3. The BLM needs to release the mitigation strategy for public review.

Response

Mitigation and monitoring frameworks were introduced in the DE IS in Chapter 2 and in [Appendices X and X](#). An Adaptive Management strategy was also introduced in Chapter 2 of the DEIS. A more detailed mitigation framework, monitoring framework, and adaptive management strategy has been incorporated into chapter 2 of the FEIS, [section X](#) and [Appendices X, X, and X](#).

Mitigation will be applied to all implementation actions/decisions that take place on Federal lands within greater sage-grouse habitat during the life of this plan. Mitigation has been further defined as Regional Mitigation and the Framework is in [Appendix X](#). The Regional Mitigation Framework was developed to follow the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ 40 CFR 1508.20.

The Mitigation Framework, through the mitigation hierarchy, guides the BLM and Forest Service. The hierarchy direction is to first, avoid impacts entirely by not taking a certain action or parts of an action, second, if unable to avoid, minimize impacts by limiting the degree or magnitude of an action or parts of an action, and lastly, if avoidance or minimizing is not possible, compensate impacts associated with future implementation actions. If residual impacts to greater sage-grouse from implementation-level actions remain after applying avoidance or minimization measures, then compensatory mitigation projects will be used to offset the residual impacts in an effort to achieve the land use plan goals and objectives. As articulated in [Appendix X](#), compensatory mitigation will occur on sites that have the potential to yield the greatest conservation benefit to the greater sage-grouse, regardless of land ownership. These sites should be sufficiently "durable." According to BLM Manual Section 1794, durability is defined as "the administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist.

Specific mitigation strategies, based on the Framework, will be developed by regional teams (at the WAFWA Management Zone level) within one year of the issuance of the Record of Decision. These strategies will guide the application of the mitigation hierarchy to address greater sage-grouse impacts within that WAFWA Management Zone. The WAFWA Management Zone Regional Mitigation Strategy will be applicable to BLM and Forest Service lands within the zone's boundaries. Subsequently, the BLM/FS's NEPA analyses for implementation-level decisions that might impact greater sage-grouse will include analysis of mitigation recommendations from the relevant WAFWA Management Zone Regional Mitigation Strategy(ies).

The Monitoring Framework in [Appendix X](#) outlines the methods that the BLM and Forest Service will use to monitor

and evaluate the implementation and effectiveness of the planning strategy and the land use plans to conserve the species and its habitat. The regulations for the BLM (43 CFR 1610.4-9) and the Forest Service (36 CFR 219.12) require that land use plans establish intervals and standards, as appropriate, for monitoring and evaluations, based on the sensitivity of the resource to the decisions involved.

Implementation monitoring results will provide information to allow the BLM and FS to evaluate the extent that the decisions from the BLM resource management plans (RMPs) and Forest Service land and resource management plans (LRMPs) to conserve greater sage-grouse and their habitat have been implemented. Effectiveness monitoring will provide the information to evaluate whether BLM and Forest Service actions achieve the objective of the planning strategy (BLM IM 2012-044) and the conservation measures contained in the land use plans to conserve greater sage-grouse populations and their habitats.

Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and sagebrush conditions. This information will assist the BLM and the Forest Service with identifying whether or not they are achieving their land use plan goals and objectives, reaching an adaptive management soft or hard trigger, as well as providing information relative to the disturbance cap. Specifically, habitat degradation (percent of human activity in a biologically significant unit), habitat availability (percent of sagebrush in a biologically significant unit), and habitat degradation intensity (density of energy facilities and mining locations) will be gathered to inform the disturbance cap objective (insert PRMP/FEIS management action for disturbance cap here).

Adaptive management is a systematic approach for improving resource management by learning from management outcomes. An adaptive approach involves exploring alternative ways to meet management objectives, anticipating the likely outcomes of alternatives based on the current state of knowledge, implementing one or more of these alternatives, monitoring to learn about the impacts of management actions, and then using the results to update knowledge and adjust management actions accordingly.

Incorporating adaptive management into the [insert name of plan] will ensure a degree of certainty that the decisions in the plan will effectively contribute to the elimination or adequate reduction of one or more threats to the greater sage-grouse and its habitat. The adaptive management approach incorporates a set of triggers in the plan, a soft and hard trigger. These triggers were developed to inform the BLM/FS as to when the Federal agency needs to respond (take action) to address a declining trend in sage-grouse or sage-grouse habitat figures.

Soft triggers represent an intermediate threshold indicating that management changes are needed at the project/implementation level to address habitat and population losses. Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from greater sage grouse conservation goals and objectives as set forth in the BLM/FS plans. The adaptive management soft and hard triggers and land use planning responses to these triggers are described and analyzed fully in this EIS [insert management action where the triggers and responses are referenced].

The agencies will use the data collected from monitoring (Appendix X) to identify any changes in habitat conditions related to the goals and objectives of the plan. The BLM/FS will use the information collected through monitoring to determine when adaptive management triggers are met."

Section 5 – FLPMA

Total Number of Submissions: 7
Total Number of Comments: 12

Summary

The DLUPA/EIS has failed to comply with the multiple-use mandates found in the BLM's FLPMA and the Forest Service's

Multiple Use Sustained Yield Act because it has put protecting greater sage-grouse and sage-grouse habitat above legal requirements for balanced management.

Response

FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The FLPMA also directs the United States (US) Department of the Interior, Bureau of Land Management (BLM) to develop and periodically revise or amend its Resource Management Plans (RMPs), which guide management of BLM-administered lands, and provides an arena for making decisions regarding how public lands would be managed and used.

Consistent with the Multiple-Use Sustained-Yield Act of 1960 (16 U.S.C. 528–531) (MUSYA), the Forest Service manages National Forest System land to sustain the multiple use of its renewable resources in perpetuity while maintaining the long-term health and productivity of the land. Resources are managed through a combination of approaches and concepts for the benefit of human communities and natural resources. Land management plans guide sustainable, integrated resource management of the resources within the plan area in the context of the broader landscape, giving due consideration to the relative values of the various resources in particular areas. The Forest Service is required by statute to have a national planning rule: the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the National Forest Management Act of 1976, requires the Secretary of Agriculture to issue regulations under the principles of the Multiple-Use Sustained-Yield Act of 1960 for the development and revision of land management plans.

The [name of particular amendment] is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section I.XX, Purpose and Need). Both, the Forest Service's and BLM's planning processes allow for analysis and consideration of a range of alternatives in the DLUPA/EIS that identified and incorporated conservation measures to conserve, enhance, and restore greater sage-grouse habitat and to eliminate, reduce, or minimize threats to this habitat to ensure that a balanced management approach was recommended. The DLUPA/EIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. For example, [insert one or more examples of the range of actions considered, include references to sections/table where they can be found].

Additionally, the BLM and the Forest Service developed the [name DLUPA/EIS] with involvement from cooperating agencies, including [name various agencies, including the state wildlife agency, state's governor's office, other fed agencies, any local agencies/governments] to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Section 5.1 - Inventories

No comments are associated with this issue.

Section 5.2 - Consistency with other state, county, or local plans

Total Number of Submissions: 8

Total Number of Comments: 14

Summary

The BLM's actions considered in the alternatives conflict with local and state agency plans and policies; furthermore, the BLM did not review all of the county and state plans to ensure that conservation measures are as consistent as possible with other planning jurisdictions.

Response

To the extent possible under existing law, the BLM's land use plans must be consistent with officially approved or adopted resource-related plans of Indian tribes, other Federal agencies, and State and local governments (see 43 CFR 1610). The BLM has worked closely with State and local governments during preparation of the Draft LUPA/EIS. The Draft LUPA/EIS lists the cooperating agencies actively involved in the planning process in Section 5.3. As described in Section 5.4, Coordination and Consistency, the BLM requested the state, county, and tribal government cooperating agencies assist in the consistency reviews by reviewing the range of alternatives associated with the draft LUPA/EIS and identify potential inconsistencies between the alternatives and each agency's applicable plans. This allows the state, local, and tribal cooperating agencies to use their special expertise regarding the familiarity with their own state, local, or tribal plans. On the local level, it is a county's responsibility to accurately identify and communicate any inconsistencies between that county's plan and the proposed alternative.

The BLM works to find a balance among uses and needs as reflected in these local government plans and has done so in the preparation of the LUPA/EIS; a list of these plans can be found in Section 1.8, Relationship to Other Policies, Plans, and Programs. The BLM is aware that there are specific State or local laws relevant to aspects of public land management that are discrete from, and independent of, Federal law. However, BLM is bound by Federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA requires that BLM's land use plans be consistent with State and local plans "to the extent practical". In a situation where State and local plans conflict with Federal law, there will be an inconsistency that cannot be resolved. Thus, while State County and Federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the Federal agency planning process is not bound by or subject to County plans, planning processes, or planning stipulations. While the BLM is not obligated to seek consistency, the agency is required to describe the inconsistencies between the proposed action and the other plans, policies, and/or controls within the EIS, so that the State and local governments have a complete understanding of the impacts of the PRMP on State and local management options. This information has been updated in the FEIS in Section 1.8.

The BLM coordinates with cooperating agencies commensurate with each agency's recognized jurisdiction or expertise. In areas where the States of Idaho and Montana has clear jurisdiction, such as wildlife populations, the BLM has worked closely with that State agency. In cases where a county or agency has expertise, such as local county socioeconomic information, the BLM has worked closely with the group to incorporate the information into the EIS.

[NOTE TO BLM from WO: plans, policies that commenters felt needed to be reviewed for consistency:

Gooding conservation district sage grouse conservation plan
National Academy of Sciences 2013 recommendations for the WHB program
State of MT sage-grouse management strategy
Custer County plans
Owyhee County plans]

Section 5.4 - Planning Regs 43 CFR 1600

Total Number of Submissions: 2

Total Number of Comments: 2

Summary

The BLM did not provide an explanation for how and why they defined the planning area as they did.

Response

[NOTE TO BLM: This is from a national response.]

The framework for the scope of analysis for the project is based upon the BLM and the Forest Service Planning and NEPA manual and handbooks definitions of the planning, decision, and analysis areas. Specifically, Forest Service Manual 1900-Planning Chapter, Zero Code defines the Area of Analysis as “The geographic area within which ecosystems, their components, or their processes are evaluated during analysis and development of one or more plans, plan amendments, or plan revisions. This area may vary in size depending on the relevant planning issue. For a plan, an area of analysis may be larger than a plan area. For development of a plan amendment, an area of analysis may be smaller than the plan area and include multiple ownerships.”

For this environmental impact statement, decision areas are those public lands and mineral estates within the planning area that are encompassed by all designated habitat (ADH) (which includes preliminary priority habitat [PPH], preliminary general habitat [PGH], and linkage/connectivity habitat).

The definition of a Planning Area is the geographic area within which the BLM will make decisions during a planning effort. A planning area boundary includes all lands regardless of jurisdiction; however the BLM will only make decisions on lands that fall under the BLM’s jurisdiction (including subsurface minerals). Unless the State Director determines otherwise, the planning area for a RMP is the geographic area associated with a particular field office (43 CFR 1610.1(b)). State Directors may also establish regional planning areas that encompass several field offices and/or states, as necessary.

[SOL comments: Seems that this response needs to include more about the relationship between the Great Basin planning area boundaries (esp. the ID/SV MT boundary) and GRSG habitat. In other words, was there a biological + practical reason that the plans have been separated in this way? Relationship to WAFWA zone? Needs more explanation. Also, I see that this refers to PPH and PGH, and linkage/connectivity habitat...but what about Idaho’s other types of habitat-core, medial/important? Should they be explained here in the context of the planning area question? NOTE: Plan areas. National Forest System lands covered by land use plans. (36 CFR 219.16). If not included in DEIS already, make a notation that the FEIS will be updated to note definitions of planning, decision, and analysis areas to clarify these terms.]

Section 6 - Other Laws

Total Number of Submissions: 11
Total Number of Comments: 15

Summary

The BLM has failed to document how the EIS and/or actions considered in the EIS comply with other laws, including all Onshore Orders regulating oil and gas development, the Energy Policy Act of 2005 and Energy Policy and Conservation Act of 2000, the Taylor Grazing Act, the Mining and Minerals Policy Act, the Information Quality Act, the Wild Horse and Burro Act, other multiple use mandates (e.g., Multiple-Use Sustained Yield Act of 1960, Forest and Rangeland Renewable Resources Planning Act of 1974, National Forest Management Act of 1976), and compliance with other federal agency regulations (e.g., XXX).

Response

The Draft and Final EIS Section 2.5, Management Common to All Alternatives, state that all alternatives would comply with state and federal laws, regulations, policies, and standards, and implement actions originating from laws, regulations, and policies. Additionally, in Section XX.XX, Planning Criteria, the BLM has a criterion stating that all BLM alternatives would comply with existing laws, regulations, and policies. The BLM and FS have reviewed all actions in the Proposed LUPA and found them to be consistent and within the bounds of all required laws, regulations, and policies.

Section 7 - Sage Grouse

No comments are associated with this issue.

Section 7.1 - NTT report/findings

Total Number of Submissions: 11
Total Number of Comments: 32

Summary

Commenters contended that the NTT report is not based on the best available science, contains technical and methodological errors, is not based on local conditions, and has not undergone adequate peer review. Commenters questioned why the NTT report was used when the IM requiring its use has expired.

Response

A National Technical Team (NTT) was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM and the Forest Service in the planning process. The group produced a report in December 2011 that identified science-based management considerations to promote sustainable greater sage-grouse populations. The NTT report (NTT 2011) used the best current scientific knowledge to guide the BLM planning efforts through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands. The NTT report cited 122 references including published papers from the formal scientific literature such as Journal of Wildlife Management, Conservation Biology, Biological Conservation, Wildlife Biology, BioScience and others, as well as graduate theses and dissertations, conservation strategies, FWS 2010 finding, and others representing the best available science. The NTT report was intended to be used at a programmatic scale and may not reflect local conditions.

The BLM used the NTT report per BLM IM 2012-044 to construct an alternative that would meet the purpose and need. This report was not the only source of information for developing a range of alternatives (see Section 7.5, Range of Alternatives).

[NOTE TO BLM- Clarify in FEIS the policy requirements for Administrative Procedure Act (APA), NEPA relative to IM, and NTT and clarify the NTT process and FACA in the FEIS.]

BLM is implementing IM 2012-044 through the Greater Sage-grouse planning effort. When an IM expires without being superseded, it can still be applicable and provide guidance to the BLM. The fact that IM 2012-044 expired does not mean the BLM has no authority to continue to analyze the conservation measures identified in the NTT Report. The BLM is appropriately considering and evaluating the measures in the NTT Report, in addition to any other relevant science, through the Greater Sage-grouse planning process.

{Note: Suggest asking for National justification of why the NTT was an appropriate source}

Section 7.2 – BER

Total Number of Submissions: 1
Total Number of Comments: 2

Summary

The BER contains outdated baseline literature and should be updated with suggested literature.

Response

[NOTE TO BLM: The BLM is reviewing suggested literature and will include where necessary.]

A baseline environmental report, titled Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (*Centrocercus urophasianus*) (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. The data for this report were gathered from BLM, Forest Service, and other sources and were the best available at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

The BLM reviewed the literature sources provided by commenters to determine if there were new or updated sources that should be considered in the EIS. BLM's findings of this review were... [insert the results from the literature review. While it doesn't directly address the BER report being updated, it's addressing the point that BLM did make the effort to consider new or updated info in the EIS in addition to the BER report.]

While there was consistent direction provided in alternative develop, such as BLM WO IM 2012-044, variation across sub-regionals was needed to accommodate the local issues and specific state and Forest Service requirements. Alternative D was developed by the BLM in coordination with the Forest Service and local FWS. This alternative includes modifications to the conservation measures identified in the NTT report and is designed to address local ecological site variability. This alternative also emphasizes balancing resources and resource use among competing human interests, land uses, and the conservation of greater sage-grouse habitat. Alternative E was developed from recommendations by the State of Idaho's greater sage-grouse task force and would apply to all BLM-administered and National Forest System lands located in the state. See Section 2.1.2 regarding alternative development and explanation of components of each alternative. {Note: Suggest including more justification of the BER in response}

Section 7.3 – COT

Total Number of Submissions: 9
Total Number of Comments: 17

Summary

Commenters had two distinct views regarding the COT report. One group considered the report overly biased and not representative of the best available information. The other group suggested the DEIS was not fully consistent with the COT report habitat mapping and therefore requires revision to address those deficiencies.

Response

In March 2012, the FWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team released the Conservation Objectives Team (COT) report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to Federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

Table 2-20 demonstrates how the BLM and Forest Service management actions under each alternative address the threats to the populations in the Idaho and southwestern Montana sub-region. In Idaho, Core and Important Habitat Zones under Alternative E were used to derive the PACs in the COT. The BLM and Forest Service have continued to work with the USFWS and State agencies to develop a proposed plan.

[NOTE TO BLM: Clarify in the FEIS the validity of NTT, COT, and BER as relative to the established standards of scientific integrity under the ESA, the Data Quality Act, and the Presidential and DOI memoranda and orders. Ensure the FEIS clarifies how PACs were delineated (IDFG delineated based on Core and Important zones, and provided to FWS). Clarify MZs and population monitoring efforts in the FEIS.]

Section 7.4 - Policy Guidance

Total Number of Submissions: 1
Total Number of Comments: 1

Summary

The BLM and Forest Service should include additional information to improve consistency with USFWS's Policy for Evaluation of Conservation Efforts.

Response

The BLM and Forest Service are working closely with the USFWS to ensure certainty of implementation and effectiveness to the extent possible. However, certain management actions, such as restoration activities, are contingent on funding availability and thus some uncertainty remains.

Section 7.5 - Range of Alternatives

Total Number of Submissions: 28
Total Number of Comments: 90

Summary

Commenters proposed revisions or requested additional details and clarifications to the alternatives related to GRSG.

Topics of concern included:

- The size of lek buffers
- Level of predator control
- Need for and size of disturbance cap
- Restrictions on wind energy development
- Noise restrictions
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring
- Need for an improved definition of no net unmitigated loss
- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality
- Lack of active habitat restoration
- Habitat monitoring

Commenters were concerned about greater sage-grouse habitat mapping, including suggesting clarifications or revisions to the habitat map and concerns about using the map for site-scale projects.

Commenters were also concerned that Manual 6840 was not used as the baseline policy governing present GRSG conservation in the No Action alternative.

Response

As noted above in the response in Section 4.3, Range of Alternatives, Section 2.1 of the Draft EIS describes how the Idaho and southwestern Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA and worked closely with the State with assistance from the USFWS.

Meaningful differences among the six alternatives are described in Table 2-2, Comparative Summary of Alternatives by Acres Allotted, and in Section 2.6, Detailed Description of Alternatives, of the Draft EIS. [Specify where changes have been made to the FEIS regarding each of the bullets below]. Refer to tab 32 regarding predator control. All of these issues have been addressed in new management actions prepared for the proposed plan and analyzed in Chapter 4 (and reference relevant appendices regarding AM and monitoring, etc.).

Regarding the following issues:

The size of lek buffers -lek buffers will be revised in final plan/FEIS reflecting additional review of best science.

- Level of predator control
- Need for and size of disturbance cap- Additional specificity regarding the disturbance cap has been further explained in the FEIS.
- Restrictions on wind energy development
- Noise restrictions. Noise and seasonal stipulations for both construction and long-term implementation of land use activities has been included in the final EIS. [NOTE TO BLM (from Makela)- Project leads should discuss how to consistently address impacts from military flights and firm up discussion at 4-15. Consider adding additional detail from Mt. Home AFB Integrated Resource Mgt. Plan.]
- Livestock grazing management changes
- Inadequate description of adaptive management and monitoring. The BLM and FS believe the management actions described in the Proposed Plan will adequately address sage-grouse conservation needs without the need for additional large scale designations.
- Need for an improved definition of no net unmitigated loss- Additional specificity regarding the no net habitat loss objectives has been further explained in the FEIS.

- Leasable mineral restrictions
- Juniper removal
- Existing and new fencing as they relate to sage-grouse strikes and mortality. The BLM and FS used the latest science in developing management actions relative to fences that adequately address collision risk. No change has been made to the document regarding this issue in the FEIS.
- Lack of active habitat restoration- Site specific projects are not identified in the broad scale plan, but there are a number of restoration actions described in Table 2-18 Vegetation/Restoration section in the DEIS and in the Proposed Plan.
- Habitat monitoring- The BLM and FS, in coordination with the state, have clarified monitoring and mapping expectations in the FEIS.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives. The Proposed Plan will contain a mechanism that allows for evaluation of circumstances on case by case basis at the site specific scale that would be addressed via subsequent project level NEPA analysis.

Manual 6840 is referenced in Chapter 1, Section 1.x, Planning Criteria, and provides general guidance for special status species, but it does not provide language relative to specific conservation actions for specific species. [BLM- ensure Manual 6840 is discussed in Alternative A and also relevant FS policy].

[NOTE TO BLM: Ensure Proposed Plan has appropriate provisions/clarity for actions in General management areas. Needs additional discussion.]

Section 7.6 - Best Available Info Baseline Data

Total Number of Submissions: 38

Total Number of Comments: 97

Summary

Commenters suggested new or additional literature for the BLM and Forest Service to consider in the DLUPA/EIS related to:

- Determination of GRSG population size and trends – inaccuracy of past counts; insufficient data to determine trend.
- Effects of livestock grazing, predation, drought, noise, and anthropogenic development
- Appropriate lek buffers and disturbance cap to incorporate
- Mitigation
- Hunting– outside scope but managed via the Idaho and Montana state plans
- GRSG habitat requirements
- Accuracy of the habitat mapping
- Infrastructure
- West Nile virus

Response

As described in Section 4.4 of this comment report, The BLM and the Forest Service used the most recent and best information available that was relevant to a land-use planning-level analysis including the Baseline Environmental Report (BER; Manier et al. 2013), NTT report (NTT 2011), and COT report (USFWS 2013). Additionally, the BLM and the Forest Service consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the U.S. Fish and Wildlife Service, Idaho Department of Fish and Game, scientific literature, field and district office data. Considerations included but were not limited to [list the types of data or GIS layers that were gathered/used.].

Of the suggested studies and references put forth by the commenters, the BLM and Forest Service reviewed them to determine if they presented new information that would need to be incorporated into the FEIS, were references already included in the draft EIS, or if the references provided the same information as already used or described in the Draft EIS. The BLM determined that several of these references contained new or relevant information regarding xxx

resources and the analysis was clarified and references cited in Sections XXX of the FEIS. In some cases, the additional literature was essentially the same as existing sources and was not incorporated.

A description of the habitat mapping process for each alternative is presented in Section 2.6, Detailed Description of Alternatives.

Section 7.7 - Impact Analysis

Total Number of Submissions: 22

Total Number of Comments: 70

Summary

The BLM and Forest Service should conduct additional, more comprehensive analysis of the impacts on greater sage-grouse to provide more substantiated conclusions. Commenters provided suggestions on how to improve or modify the impact analysis for greater sage-grouse in several topic areas including:

- Hunting
- Predation
- Anthropogenic disturbance, disturbance caps, and lek buffers
- Expanding on beneficial effects on GRSG from range improvements
- Greater sage-grouse population size and trend
- Livestock grazing, fences, and trailing
- Noise as related to low-level military overflights
- Success of habitat improvement projects
- Prescribed fire
- Herbicides
- West Nile virus
- More detailed analysis of Alternative A
- Climate change
- Need to identify areas for restoration
- Coal suitability

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas.

Response

The LUPA/FEIS provides an updated and expanded discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As described in Chapter 2.3.2, coal was not an issue for analysis. As required by 40 CFR 1502.16, the LUPA/FEIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man’s environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources should the proposal be implemented. The LUPA/FEIS provided sufficiently detailed information to aid in determining whether to proceed with the proposed plan in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service

Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. Therefore, effects on GRSG population levels are not required to be quantified as part of the impact analysis. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM: Eventually need to fill this in:] Impacts from XX on greater sage-grouse were considered in Section 4.x of the Draft EIS. Include discussion of what changes were made and where. If no change made, describe why the impact analysis is adequate for that topic. Some template text:

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to [speak to the specific topic or theme of the issue statement, e.g., anticipated fluid mineral development of the planning area] was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions. Specifically, [insert a summary of the information that was updated and include a citation for where the reader could find it in the FEIS.]

The facts that sagebrush takes decades to re-establish and that disturbance from light and noise affect GRSG mean that avoidance, minimization of impacts and mitigation of impacts are not sufficient methods of protecting GRSG and sage brush habitat. Additionally, this concept was considered within the range of alternatives- Alternative D does not withdraw lands from mineral entry. No change to the EIS has resulted from this comment. [NOTE TO BLM: Consider whether inserting text to this effect into the EIS is appropriate.]

Section 7.8 - Cumulative Impact Analysis

Total Number of Submissions: 3
Total Number of Comments: 3

Summary

The BLM and Forest Service need to provide additional analysis regarding the cumulative effects of livestock grazing and land treatments. In addition, the agencies should predict greater sage-grouse population changes based on expected cumulative actions.

Response

As described in Section 4.7 of this comment report, the BLM and Forest Service analyzed cumulative effects to GRSG in the DLUPA/EIS in Section 4.16 of the EIS. The BLM and Forest Service expanded and quantified cumulative impacts for the proposed LUPA/FEIS. Section 7.7 of this comment report describes how land treatments and domestic livestock were addressed in the Environmental Consequences section of the DEIS. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Envtl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th

Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

The BLM and Forest Service have complied with the requirements of 40 CFR 1508.7 and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level. Therefore, effects on GRS population levels are not required to be quantified as part of the cumulative impact analysis.

The BLM and Forest Service added quantitative analysis to Section 4.16 related to XXX topics. [Note to BLM/FS: insert description of any revisions made]

Section 7.9 - Mitigation Measures

Total Number of Submissions: 12
Total Number of Comments: 34

Summary

The BLM and Forest Service mitigation strategy is inadequate or needs clarifications. Topics of concern include:

- Certainty that mitigation will be implemented
 - Lack of scientific evidence that mitigation and habitat restoration results in greater sage-grouse population increases
 - Adequacy of the monitoring program
 - Effectiveness of compensatory mitigation
 - How mitigation proposals will be evaluated
 - Siting of mitigation actions
 - Durability of mitigation investments
 - Consideration of using mitigation banks
 - Creation of a mitigation program
 - Framework behind exceptions and associated mitigation, e.g., science behind allowing exceptions; offsetting losses and prove mitigation is successful
 - Need for mitigation given the restrictive management in the alternatives
 - Link between compensatory mitigation and adaptive management
-

Response

The Mitigation, Monitoring, and Adaptive Management strategies are described more fully in Section XX of this comment report and included in Chapter 2 and Appendices X, X, and X of the DEIS. Refer to BLM Mitigation Manual.

Section 8 – ACECs

No comments are associated with this issue.

Section 8.1 - Range of Alternatives

Total Number of Submissions: 9
Total Number of Comments: 10

Summary

Issue 1: In the Draft EIS/LUPA, the BLM/FS did not accurately or consistently represent the number of ACECs being proposed under each alternative, particularly Alternative C.

Issue 2: Alternatives in the Draft EIS/LUPA do not provide an adequate range of management actions for ACECs by only considering new ACECs under two of the action alternatives (C and F).

Issue 3: Whether ACECs or another administrative designation, the BLM/FS should ensure any administrative designation established for the protection of sage-grouse habitat will provide adequate non-discretionary protections.

Response

Response 1: The FEIS has been revised to ensure consistent representation of proposed ACECs under Alternatives C and F.

[NOTE TO BLM: Review EIS/LUPA for consistent representation of proposed ACECs under Alternatives C and F.]

Responses 2 and 3: As noted in section 4.3, NEPA Range of Alternatives, of this report, the alternatives, including the management actions for the fire ACEC program, meet the purpose and need for the EIS. Alternatives within the EIS have established that not all protective management for the Greater Sage Grouse is limited to ACEC designation. Only Alternatives C and F proposed to establish ACECs for the protection and management of the Greater Sage Grouse. While the other alternatives do not propose such designations, they still contain similarly specific management prescriptions to manage and protect the Greater Sage Grouse and its habitat that would be equivalent to protections afforded via an ACEC or other designations.

Section 10 - Climate Change

Section 10.4 - Cumulative Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 5

Summary

The EIS does not adequately address the cumulative effects of climate change on sage-grouse or sage-grouse habitat, including the cumulative effects of livestock grazing on vegetation communities and the likelihood of a changing climate to result in an increase in invasive weeds.

Response

Assessing the impacts of grazing on climate change is outside the scope of this document, except as it pertains to reducing impacts on GRS and GRS habitat within the planning area and in consideration of valid existing rights and the BLM's multiple use mandate under the Federal Land Policy and Management Act. The PRMP/FEIS does disclose the potential effects associated with global climate change on the Greater Sage-grouse in [Section XX](#). However, pursuant to 40 CFR 1500.1(b), information must be "of high quality" in order to be considered in the analysis. As explained in Section xx of the EIS, it is speculative to attempt to predict the specific nature or magnitude of such changes.

NOTE TO BLM: Based on the NEPA and CEQ guidance for cumulative impacts analysis, determine if the DEIS analysis is adequate or not. If not, make necessary corrections and note what was modified here. Include direction to reader where to find revised analysis (e.g., "See Section 5.XXX for additional information."). The BLM will review. Follow up needed with Bryce.

Section 12 - Fire and Fuels

Section 12.1 - Range of Alternatives

Total Number of Submissions: 11
Total Number of Comments: 15

Summary

The BLM and the Forest Service should examine the location and size of proposed fuel breaks in further detail as fuel breaks in large areas of intact sagebrush limit fire and related habitat destruction. Specifically, one commenter requests use of green-strips, including non-native species, for fuel breaks. Use of prescriptive fire as a management tool should be further examined.

Timelines for long-term fire management measures should be established in the FEIS. One commenter recommends that measures be implemented one year after the ROD. Implementation details of fire control measures should be specified. The BLM/Forest Service should acknowledge the importance of flexibility in fire management plans in the FEIS and allow for on-the ground decision making for effective fire-management. Alternative language should be revised for clarity.

Response

Fuel breaks are site-specific - see Oregon response. Use of prescribed fire varies by alternative. [needs more subregional input].

Section 12.2 - Best available information baseline data

Total Number of Submissions: 4
Total Number of Comments: 5

Summary

The FEIS should include citations indicating that implementation of fuel breaks in sagebrush systems reduces the rate of spread of fire. In addition, citations should be provided to support the use of prescribed fire to improve GRSG habitat. The BLM and Forest Service should recognize livestock grazing as an effective fire management tool due to its role in controlling invasive plants and decreasing fuel loads.

Response

The EIS affected environment section provides the appropriate information for the scope and scale of the project (see section 4.4, NEPA Baseline Information of this report). However, upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 3 have been updated and revised to include clarifications or new information. Section 3.XX, [insert section name], in the FEIS has been revised to update information regarding fuel

Commented [BGH1]: Location and size of fuel breaks will be dictated by fire behavior modelling of current fuel loading, height and expected weather conditions. Included is sideboards placed by other vegetation limiting factors such as Lepa guidelines, etc. Modelling will use industry standard Behave program. Prescribed fire will be utilized to assist in achieving desired future conditions of vegetation management projects as needed. All on the ground decisions for fire suppression operations reside with the incident commander.

breaks and **Section 3.XX, [insert section name]**, has been updated to clarify the relationship between livestock grazing and fire.

Commented [BGH2]: Livestock grazing falls under the Biological method of fuels treatments. It is a tool that may or may not be used, pending treatment objectives and Rangeland health standards and guides.

Section 12.3 - Impact Analysis

Total Number of Submissions: 6
Total Number of Comments: 7

Summary

The DEIS does not contain sufficient analysis of indirect impacts of reduced grazing on fuel loads and related wildfire risk. Additionally, the analysis of impacts of fire suppression activities should be reexamined. It is particularly important that this analysis is clarified as lack of sufficient regulatory mechanisms for wildland fire was cited as a primary threat to GRSG in the FWS listing decision.

Response

The impact analysis provides the appropriate information for the scope and scale of the project (see section 4.6, NEPA Impact Analysis, of this report). Upon BLM and Forest Service reviews and public comment suggestions, some sections in Chapter 4 have been updated and revised to include clarifications to the text. **Section 4.XX, [insert section name]**, in the FEIS has been revised to clarify the impacts of reduced grazing on fuel loads. **[BLM/Forest Service- need to add review impacts in Ch 4 for consistency with this language added to chapter 3 for relation between grazing and fire. Review impacts analysis to make sure that impacts analysis has sufficient info on impacts of reduced grazing on fuel loads]**

In addition, impacts analysis discussion has been modified to clarify the impacts of different suppression measures proposed by Alternative. **[BLM/Forest Service- need to review and modify discussion of impacts of fire suppression measures (i.e. specific conservation measures under B vs. approach under E)]**

Commented [BGH3]: Reduced grazing pressure and the possible reduced amount of introduction of invasive seed source may assist in land health by allowing the perennial vegetation to outcompete the invasive species. Perennial vegetation is not as available to ignition in the spring, thus shortening the current invasive dominated fire regime.

Section 13 - Fish and Wildlife

Section 13.1 - ESA Consultation

Total Number of Submissions: 3
Total Number of Comments: 3

Summary

The BLM fails to address avoiding the potential to list the GRSG under the Endangered Species Act (ESA) and that the bird does not meet the criteria to be listed under the ESA.

Response

As stated in Chapter 1, Section 1.1, Background in the DRMP, this plan amendment effort is the result of the July 2011, BLM National Greater Sage-Grouse Planning Strategy (BLM 2011). The Strategy responds to the March 2010, US Fish and Wildlife Service (USFWS) 12-Month Finding for Petitions to List the Greater Sage-Grouse (*Centrocercus*

urophasianus) as Threatened or Endangered (75 Federal Register [FR] 13910, March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG was “warranted, but precluded” for listing as a threatened or endangered species.

Section 14 - Lands and Realty

Total Number of Submissions: 1

Total Number of Comments: 1

Summary

The BLM should prohibit the construction of new permanent infrastructure within lands specially designated for sage-grouse protection, because studies show GRSG avoid areas with development.

Response

The alternatives consider a range of alternatives regarding ROW avoidance and exclusion. Table 2-3 identifies existing ROW avoidance and exclusion areas in the lands and realty section.

Section 14.1 - Range of Alternatives

Total Number of Submissions: 11

Total Number of Comments: 20

Summary

Commenters requested clarification regarding: types of exclusions, valid existing rights, aboveground fiber optic lines, and disposal under current land use plans.

Commenters also suggested additions to the range of alternatives considered and provided information on the feasibility of the alternatives (e.g., co-location, perch diverters, and burying lines).

Commenters noted that the document has contradicting management actions regarding geothermal development between lands and minerals sections.

Commenters noted that Alternative E did not adequately address the purpose and need.

Need to include:

Comment #14-0049-8: reclaim areas that have been developed for powerlines that are no longer in use.

Comment #14-0153-41: Comment stated that BLM did not evaluate the NTT recommendation that all electrical distribution lines be buried within Core Areas.

Response

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest

Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the management opportunities presented in the Analysis of the Management Situation (AMS) and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/EIS that best addressed the issues and concerns identified by the affected public. The range of alternatives in the DLUPA/EIS represented a full spectrum of options including a no action alternative (Alternative A).

Proposed avoidance and exclusion area designations vary by alternative, as explained on page 2-33 in Table 2-3. Under Alternative D, all new ROWs, unless specifically excluded, would be avoided, whenever possible, see LR-3 (ex. wind facilities, etc). Required design features that would apply to specific types of facilities in greater sage-grouse habitat are located in Appendix C.

The EIS/LUP includes an alternative that allows for placement of fiber optic lines on existing infrastructure (Alternative D Action LR-6 and LR-7 in Table 2-18).

Under Alternative D Table 2-18, LR-9, new power lines outside of existing ROWs, would be buried, where feasible. Reclamation of lands, once facilities are removed, are part of standard BMPs, Appendix C. Amendments to existing facilities that are otherwise excluded may be allowed under Alternative D, LR-6. Under Alternative D, lands currently identified for retention within priority greater sage-grouse habitat would be retained unless disposal of those lands would increase the extent or provide for connectivity of priority habitat (LR -19 and LR-21), Alternatives A through F propose retention of all utility corridors (Table 2-18).

Lands and Minerals management actions did contradict on the topic of geothermal development (D-LR-3, page 2-162 and D-MLM-1, page 2-180) and the FEIS will correct this contradiction.

The first of the assumptions under Lands and Realty Assumptions, Page 4-158, is that BLM and the Forest Service will protect valid existing rights, as long as those ROWs comply with the terms and conditions of their ROW grant. The agencies will consider all safety concerns into all decisions to authorize a pipeline, including burying a transmission line.

Section 14.2 - Best available information baseline data

Total Number of Submissions: 5

Total Number of Comments: 9

Summary

Commenters raised concerns with the baseline assumption (as noted in Ellis 1984 and Connelly et al. 2000) that power lines and other vertical structures increase perching opportunities for raptors and increase the potential for GRSG to abandon leks).

Commenters suggested that the BLM and the FS should have considered several additional references in their analysis, related to the relationship between GRSG and transmission lines. For example, commenters noted the DEIS did not include studies that found underground powerlines have more environmental impacts than overhead powerline placement.

Commenters questioned the data in Table 3-36, which includes the acreage of transmission lines within greater sage-grouse habitat.

Need to include:

Comment #14-0049-25 requested the LUPA include a minimum four-mile buffer from active leks for new powerlines or

similar ROW developments.
Comment #14-0049-31 request to include that infrastructure would be co-located when possible.

Response

Many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The National Technical Team report (NTT 2011), Conservations Objectives Team (COT; FWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangewide Conservation of Greater Sage-Grouse (also referred to as the Baseline Environmental Report [BER]; Manier et al. 2013) are the most widely used reports that have been incorporated in BLM and Forest Service EISs that address the effects of implementing greater sage-grouse conservation measures on lands they manage. Additionally, the BLM and the Forest Service developed the Idaho Draft Environment Impact Statement/Land Use Plan Amendment with involvement from cooperating agencies, including Idaho Department of Fish and Game to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Management actions included in the Draft EIS/LUPA for the underground placement of powerlines are intended to reduce the potential for long-term impacts on GRS habitat and species viability. Literature referenced in the FEIS demonstrates that overhead powerlines provide perching opportunities for ravens and other avian predators.

BLM and the Forest Service has reviewed scientific literature provided by commenters regarding the effects of powerlines on greater sage-grouse, buffers, perch diverters, and overhead versus burying lines, and the DEIS has been revised, as appropriate.

Transmission acreages came from the peer-reviewed Baseline Environmental Report (Manier et al. 2013).

Section 14.3 - Impact Analysis

Total Number of Submissions: 2
Total Number of Comments: 5

Summary

Commenters stated that the BLM/FS should have concluded that because of Alternative E's adaptive trigger strategy the impacts from wind energy would be reduced compared to Alternative A.

Commenters stated that the agencies should carefully evaluate the impacts of stipulating co-location of electrical powerlines.

Commenters requested information on the impact of transmission lines on a landscape level would be more appropriate to reference in relation to sage-grouse persistence in the landscape and that information from Walker et al. 2007 has been used selectively in regards to transmission infrastructure.

Include:
Comment #14-183-38: Request that BLM re-consider and evaluate the stipulation that electrical powerlines must be co-located

Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts,

of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Impacts from lands and realty to wind energy were discussed in DEIS/LUPA Chapter 4, page 4-331. BLM groups Alternative A and Alternative E together in regards to impacts on wind energy. Under Alternative E, the BLM and the Forest Service would limit impacts from wind and solar energy development through the use of triggers in addition to the general stipulations identified in the GRSG section, as well as required design features. This is clarified in the FEIS (see section).

Management actions included in the Draft EIS/LUPA for the co-location of new infrastructure in existing ROWs are intended to reduce the amount of surface disturbance in GRSG habitat and concentrate new development in habitat areas already affected by anthropogenic activities. The BLM and FS recognize that co-location is not feasible in all circumstances, particularly for new powerlines. Under all alternatives, the BLM and FS would continue to review proposed infrastructure projects on a case-by-case basis. Such a review would include preparation of the appropriate NEPA documentation and coordination with the responsible federal, state, and local permitting agencies.

Section 15 - Leasable Minerals

Section 15.1 - Range of alternatives

Total Number of Submissions: 6

Total Number of Comments: 14

Summary

The DEIS needs a better explanation on how valid existing rights are defined and how they will be protected, including fringe or preference right leases. The alternatives need to follow the NTT report recommendations more closely, as well as reflect current USFWS policy recommendations.

The BLM needs to clarify the location of non-leased Known Phosphate Areas in relation to GRSG habitat. The plan is potentially more restrictive to phosphate leasing than a listing under the ESA and did not properly define the environmental baseline for leasable minerals. Without prohibiting new phosphate mining in GRSG habitat, the LUPA does not protect GRSG from the potential impacts of selenium being released to the environment and poisoning wildlife, including GRSG, through transport in air and water and subsequent bioaccumulation. The EIS fails to explain or discuss the authority that the BLM has to close public lands to leasable mineral prospecting and leasing under the LUPA process under Alternatives B, C and D.

The reliance upon vague RDFs under Alternative D is a failure of the BLM to adopt best science that calls for specific restrictions based on observed GRSG response to surface disturbances.

Response

[NOTE TO BLM: The BLM should examine the existing discussion of valid existing rights that will survive the proposed LUPA and should expand that discussion if it seems insufficient.]

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM and the Forest Service consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the BLM and the Forest Service fully considered the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, six alternatives were analyzed in detail in the DLUPA/DEIS that best addressed the issues and concerns identified by the affected public. The DLUPA/DEIS includes alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. BLM agrees that it cannot impose an NSO on an existing lease. A definition of valid and existing rights has been added to the Glossary in the FEIS.

[NOTE TO BLM: Multiple changes were recommended to the FEIS by Porter- see separate tracking sheet.]

[NOTE TO BLM: Have minerals program elaborate on where the phosphate leases are relative to the management designations for the various Alternatives. Makela- is there an adequate baseline description for leasable minerals? Also, BLM look into the issue of restrictions in proposed plan relative to restriction under an ESA listing for minerals development.]

[NOTE TO BLM: determine whether there are mineral leases in the ACECs proposed by Alts C and F. Determine mineral potential in ACECs proposed by Alts. C and F.]

[NOTE TO BLM: Add to GLOSSARY- Valid Existing Rights]

Selenium bioaccumulation is not identified by the US Fish and Wildlife Service or the NTT Report as a major threat to GRSG and is not part of the conservation strategy being applied by the BLM. No change to the EIS has resulted from this comment.

According to 43 CFR 3501.17 and H-1601-1, Land Use Planning, the BLM has the authority to close areas to non-energy leasable mineral prospecting and leasing. The regulations providing this authority do not need to be described in the EIS because they are outlined in the CFR and describing all governing regulations in the EIS would be impracticable.

[NOTE TO BLM: BLM to examine its jurisdiction to prioritize GRSG conservation over laws relating to KPLAs and to describe that result in the comment response, along with any appropriate changes to the EIS.]

[NOTE TO BLM: BLM's preferred alternative may be changed in the FEIS, to keep all lands in KPLAs open to future non-energy solid mineral leasing, but to close areas in PPMA and PMMA outside of KPLAs. An exception would be made when additional lands are needed to recover ore on the lease (fringe acreage leasing, lease modifications).]

The RDFs were adopted from BMPs in Appendix D of the NTT report. In that appendix, it states that "BMPs are continuously improving as new science and technology become available and therefore are subject to change. Include from the following BMPs those that are appropriate to mitigate effects from the approved action." Wording from NNT report has been added to the discussion of RDFs in the FEIS.

Section 15.2 - Best available information baseline data

Total Number of Submissions: 1

Total Number of Comments: 1

Summary

The oil and gas conditions in the Payette area are different than those studied in the NTT report and should not be used as baseline data. The impacts described by Johnson et al 2011 are overstated and should be replaced by information from Coates et al 2013.

Response

The reasonably foreseeable development scenario for oil and gas assumes a conventional oil and gas field. The current development occurring in the Payette area of Idaho is not within sage grouse habitat. BLM's preferred management action has been changed in the FEIS to applying a year-round No Surface Occupancy stipulation in PPMA and PMMA. Seasonal restrictions would be applied in PGMA. Lands outside of GRSG habitat would not be subject to stipulations developed in this EIS.

[NOTE TO BLM: Review section on 4-8 for best available science for basis of decisions. Have a biologist help determine.]

Section 15.3 - Impact Analysis

Total Number of Submissions: 3
Total Number of Comments: 5

Summary

The impact analysis in the DEIS of management actions on leasable mineral development is insufficient.

Response

The acres of unleased KPLA land unavailable for development by alternative has been corrected in the Ch. 4 tables in the FEIS. The section describing the impacts from leasable minerals management for Alt E has been revised. The impacts of non-energy leasable minerals management actions to socio-economics have been included in the FEIS and the impacts with respect to disturbance caps have been analyzed in more detail.

[NOTE TO BLM: Tables of acres of unleased KPLA land unavailable for development by alternative in Ch. 4 need to be corrected.]

[NOTE TO BLM: Impacts from leasable minerals management in alt E needs to be revised.]

[NOTE TO BLM: Include a discussion of the effects of phosphate management actions to socio-economics in Ch 4. Also, references to section 4.1.1.2 should be corrected and should refer to section 4.1.2.2.]

[NOTE TO BLM: Distinguish between Impacts from Alts F and B. Note: This is a disturbance cap question.]

Section 15.4 - Cumulative impact analysis

Total Number of Submissions: 2
Total Number of Comments: 6

Summary

The DEIS did not adequately analyze cumulative impacts of management actions on leasable mineral development, including impacts to the Western Phosphate Field, the American agriculture industry, and national food security.

Response

The BLM and the Forest Service thoroughly explained their consideration and analysis of cumulative effects in the DLUPA/EIS in Section 4.24.20. The DLUPA/EIS considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) Federal and non-Federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions. This discussion summarizes CEQ guidance from June 24, 2005, stating that "[g]enerally, agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." This is because a description of the current state of the environment inherently includes the effects of past actions. Information on the current conditions is more comprehensive and more accurate for establishing a useful starting point for cumulative effects analysis. The CEQ interpretation was accepted by the Ninth in *NW Env'tl. Advoc. v. Nat'l Marine Fisheries Serv.*, 460 F.3d 1125, 1141 (9th Cir. 2006). The BLM and the Forest Service explicitly described their assumptions regarding proposed projects and other reasonably foreseeable future actions. On Forest Service-administered lands, reasonably foreseeable actions are those that would occur under their current land use plans from a broad-scale perspective.

Additional information on the cumulative impacts on the Western Phosphate Field, unleased KPLAs, socio-economic impacts from loss of phosphate resources, reasonably foreseeable actions, and proposed conservation measures have been added to Sections XXX and XXX (minerals and socio-economics cumulative impacts). [NOTE TO BLM: Review cumulative section and add necessary information.]

Section 16 - Livestock Grazing

Total Number of Submissions: 2
Total Number of Comments: 3

Summary

[NEED SUMMARY]

Response

[NOTE TO BLM: May need to go up to solicitor's office for review.]

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Further, the BLM may designate lands as "available" or "unavailable" for livestock grazing through the land use planning process (H-1601, Land Use Planning Handbook, Appendix C). A decision to cease livestock grazing is not permanent. It is subject to reconsideration, modification and reversal in subsequent land use plan decisions. The Taylor Grazing Act requires that the Secretary "make such rules and regulations ... [and] do any and all things

necessary ... to insure the objects of ... grazing districts, namely, to regulate their occupancy and use, to preserve the land and its resources from destruction or unnecessary injury [and] to provide for the orderly use, improvement and development of the range." (43 USC § 315a).

FLPMA grants the Interior Secretary the authority to make land use planning decisions, taking into consideration multiple use and sustained yield, areas of critical environmental concern, present and potential uses of the land, relative scarcity of values, and long-term and short-term benefits, among other resource values (43USC 1711 Sec 201 (a)). 43 CFR § 4100.0-8 provides that the BLM shall manage livestock grazing on public lands in accordance with applicable land use plans. Actions taken under land use plans may include making some, or all of the land within grazing districts, unavailable for grazing during the life of the plan as well as imposing grazing use restrictions, limitations or other grazing management related actions intended to achieve such goals and objectives (H-1601, Land Use Planning Handbook, Appendix C).

A "chiefly-valuable-for-grazing" determination is required only when the Secretary is considering creating or changing grazing district boundaries. Such a determination is neither required nor appropriate when establishing grazing levels within a district. (See USDI Solicitor Memorandum Clarification of M-37008 (May 13, 2003)). This RMP is not considering creating or changing grazing district boundaries. Although lands have been identified as "chiefly-valuable-for-grazing" per the Taylor Grazing Act for purposes of establishing grazing districts within the public domain (see, 43 U.S.C. § 315) this does not negate the BLM's authority or responsibility to manage those lands to achieve resource condition goals and objectives under the principals of multiple use and sustained yield as required by FLPMA and its implementing regulations.

Section 16.1 - Range of alternatives

Total Number of Submissions: 24

Total Number of Comments: 64

Summary

Multiple commenters requested that the alternatives require closure of voluntarily relinquished allotments. Commenters questioned why changes to grazing management are needed when livestock grazing is not listed as a primary threat to GRSG. More than one commenter noted that grazing should only be restricted where it can be shown that grazing is directly related to the failure to meet GRSG habitat objectives. Additionally, commenters stated that the DEIS failed to consider increased grazing and question the rationale behind this decision. Some commenters also requested additional consideration of reduced grazing levels and utilization levels, as well as temporary or permanent closure of all or some GRSG habitat to grazing.

Several commenters requested that the LUPA/EIS provide specifics regarding habitat assessments schedules and application of standards, and use of ecological site descriptions, require immediate application of certain terms and condition to permits, and impose grazing restrictions for priority or general habitat.

Response

The ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. See response in section 4.3 NEPA Range of Alternatives of this report. The DEIS analyzed a range of alternatives including no grazing and a 25 percent reduction in grazing. Reduction in AUMs under Alternative F would be specified in site specific decisions at the permit renewal level. Language in the FEIS for Alternative F reduction has been clarified.

[BLM and Forest Service- need to review the language in Alt F mgmt. actions related to the 25% reduction and review related analysis. Determine if revision needed to table 4-5].

Livestock grazing is identified by USFWS as a threat to GRSG in the March 23, 2010 Federal Register Notice, and therefore it is addressed in this LUPA. Existing regulatory mechanisms, including the fundamentals for rangeland health, would continue to provide the basis for managing grazing in GRSG habitat. However, the preferred alternative would provide additional consistency in application of BLM rangeland health standards and guidelines relative to GRSG habitat, and would provide additional guidance for prioritizing land health assessments and review of grazing permits to ensure that grazing management is compatible with attainment of sage-grouse habitat objectives within the planning area. In addition, RDFs and best management practices would be adopted to reduce effects of range improvements and livestock trailing across public lands. Grazing use would be modified when it is identified as the cause for not meeting Sage Grouse objectives. The intent of the land use plan amendment is to change management under all resource programs, where necessary, to benefit Sage Grouse habitat. Standards and Guidelines assessments result in a determination of causal factors for non-achievement of any applicable standard, including standards for wildlife habitat. Where livestock management is determined to be a causal factor for non-achievement of a standard, management must be modified to conform with applicable guidelines.

The BLM is required to follow the grazing regulations, including the decision process at 43 CFR 4160, when modifying permit or leases. Therefore, modifications to terms and conditions of permits and leases would be applied as needed during the permit renewal process.

As stated in the preferred alternative [mgmt. action #] habitat objectives would be adjusted based on site potential. Site specific requirements would be specified in NEPA for permit renewal. Language in the preferred alt. has been modified to clarify (see section X.X.X).

Section 16.2 - Best available information baseline data

Total Number of Submissions: 13

Total Number of Comments: 42

Summary

Multiple commenters asserted and presented citations supporting their position that grazing has the potential to benefits GRSG by controlling cheatgrass and reducing wildfire risk. Other commenters presented citations supporting the position that grazing damages GRSG habitat and increases cheatgrass risk.

Several commenters requested more detailed information about current grazing management and habitat conditions in the planning area.

Other commenters noted the importance of ranching in the local economy, and also that ongoing collaboration between private ranchers and federal agencies has helped preserve GRSG habitat and should be acknowledged in the EIS.

Response

Before beginning the LUPA/EIS and throughout the planning effort, the BLM and the Forest Service considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The BLM and the Forest Service also used the most recent and best information available that was relevant to a land-use planning-level analysis (refer to response in section 4.4, NEPA Baseline data- Best Available Science for additional information). [NOTE TO BLM- review text in section 4.4 response once complete to ensure consistency]

Section 3.X, livestock grazing discusses the current level of grazing in the planning area and management systems in place. Impacts of current and historic grazing on other resource and resource uses are discussed under the appropriate

resource and resource use headings (i.e. [Section 3.X](#), Sage grouse Habitat). Section 4.2.2 in the DEIS provides an overview of the ecological impacts of livestock grazing. The DEIS analyzed the effects of no grazing and reduced grazing on components of sage-grouse habitat, including changes in wildfire risk and cheatgrass incursion. See changes to [Section 3.X](#), fire management, for additional discussion of cheat grass-wildfire dynamics. **[NOTE TO BLM/EMPSi-Review the text in Ch 3 veg related to fire/livestock.]**

Discussion of socioeconomic impacts of current grazing operations in the planning area is discussed in [Section 3.X](#), Socioeconomics.

Additional language has been added to the FEIS ([section X.X.X](#)) recognizing the role of Rural Fire Protection Districts and other collaboration efforts **[Note- need to add language to FEIS]**

Section 16.3 - Impact Analysis

Total Number of Submissions: 6

Total Number of Comments: 11

Summary

Some comments detailed beneficial impacts of grazing, and the adverse impacts of grazing restrictions on to livestock operations, Rangeland Fire Protection Associations, and the local economy.

One commenter notes that limitations on water developments can have impacts on grazing management and need to be clarified and analyzed in greater detail.

Response

Impacts to livestock grazing from current livestock grazing management are addressed in section 4.9.4 of the DEIS. Impacts to the socioeconomic aspect of livestock grazing are discussed in Section 4.19 of the DEIS.

While a land use planning-level action is broad in scope and, therefore, does not require site specific impact analysis, a thorough review of the EIS's impact analysis relevant to grazing and indirect socioeconomic impacts and was found to need additional information and support for the conclusions/findings. The BLM and the Forest Service have updated this information in the Proposed Land Use Plan Amendment/FEIS to provide the necessary information to make informed land use plan-level decisions (see changes in section 4.19). Impacts to Rangeland Fire Protection Associations are discussed in [section 4.X](#), fire management. BMPs for livestock developments including water have been revised in the FEIS and related impacts on livestock grazing management have been clarified.

Section 17 - Locatable Minerals

Section 17.3 - Impact Analysis

No comments are associated with this issue.

Summary

The EIS fails to provide justification as to why “withdrawal from mineral entry” is necessary to protect GRSG and its habitat when the same objective can be achieved through avoidance, minimization of impacts, and mitigation of impacts within the designated areas. The current approach in the EIS does not meet FLPMA requirements for finding ways to remain flexible in balancing conservation and resource uses.

Response

This concept was considered within the range of alternatives, as explained under Section 4.3, NEPA Range of Alternatives in this section. No change to the EIS has resulted from this comment.

Section 17.4 - Cumulative impact analysis

Total Number of Submissions: 1
Total Number of Comments: 1

Summary

The DLUPA/DEIS fails to adequately analyze the cumulative impact of locatable mineral withdrawals across the GRSG range.

Response

Additional information on the cumulative effect of withdrawals across GRSG range has been added to **Section XXX** (locatables cumulative effects section) of the EIS. **[NOTE TO BLM: Could include roll-up of withdrawals from plans for incorporation into EIS]**

Section 20 - Recreation

Section 20.1 - Range of alternatives

Total Number of Submissions: 2
Total Number of Comments: 3

Summary

In the EIS/LUPA, the BLM/FS should incorporate additional management actions (e.g. SRP/SUP stipulations, OHV noise regulations, seasonal restrictions on OHV events near leks, and rerouting of OHV events away from leks, and hunting) to limit the potential for impacts on Sage-Grouse from recreation activities. Any management actions limiting recreation activities in sage-grouse habitat should be based on the best available science with proven habitat conservation results.

Response

The EIS considers an adequate range of alternatives to protect GRSG, including varying levels of restriction on recreational activities and special recreation permits/special use permits (insert correct management actions and table number). During subsequent implementation-level travel management planning, new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including speed. New travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions during subsequent implementation level travel management planning. 43 CFR 8340 requires all OHVs to comply with state laws including noise and spark arrester requirements.

Contemporary hunting seasons in the Idaho and Southwest Montana Sub-region are very conservative with respect to their length and bag limits. GRSG hunting and its effects are described in more detail in Sections XX and XX of the FEIS.

Section 22 - Socioeconomics and Environmental Justice

Section 22.3 - Impact Analysis

Total Number of Submissions: 22

Total Number of Comments: 39

Summary

The socioeconomic analysis in the DEIS is overly broad and does not provide sufficient analysis of impacts to individuals, local communities or counties. The DEIS should also expand analysis of the restrictive management actions on planning area operators, communities and services including but not limited to grazing operators and mining.

Finally, the analysis methodology is inadequate to provide a comprehensive analysis of direct, indirect, and cumulative analysis of the socioeconomic impacts on the planning area communities.

Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the DLUPA/EIS provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29; Forest Service Handbook 1909.12 – Land Management Planning). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM and the Forest Service will conduct subsequent NEPA analyses that include site-specific project and

implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

[BLM provide input on why county level analysis was not completed]

Impacts were considered on numerous resources, resource uses, and socioeconomic conditions, which included [list noted issues]. See Section 4.22 of the Draft EIS.

The DLUPA/EIS describes the methodology and assumptions used for conducting the impact analysis (see Section 4.22.2 of the Draft EIS). The methodology and assumptions provide an adequate starting point for discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.24, the DLUPA/EIS identified methodologies used and made reference to the scientific and other sources relied upon for conclusions in the analysis. Based on these methodologies and assumptions, the DLUPA/EIS provided sufficiently detailed information to aid in determining whether to proceed with the preferred alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

[Add language on budget issues as appropriate: As a landscape level planning effort, none of the alternatives prescribe project specific analysis on BLM or USFWS managed lands. Furthermore, the agencies' selection of an alternative does not authorize funding to any specific project or activity nor does it directly tie into the agencies budgets as appropriated annually through the federal budget process. As a consequence, agencies' costs and differences in differences in program costs across alternatives have not been quantified. Information has been presented in several resource impacts sections on the types of costs that might be associated with various sage-grouse conservation measures]

Section 23 - Soil

Section 23.2 - Best available information baseline data

Total Number of Submissions: 1

Total Number of Comments: 1

Summary

One commentor notes that the DEIS lacks references to support discussion of macrobiotic crusts.

Response

[BLM/Forest Service- review soils section to determine if references needed to support discussion]

Section 24 - Travel Management

Section 24.1 - Range of alternatives

Total Number of Submissions: 8

Total Number of Comments: 11

Summary

The Draft EIS/LUPA failed to consider a full suite of travel management-related management actions that would protect sage grouse habitat while allowing for continued administrative access, particularly for existing livestock grazing permittees. Commenters proposed that management actions should be included in the proposed plan to prohibit and reclaim/restore roads in GRSG habitat, limit motorized events, close PPHP to OHV use, apply additional seasonal travel restrictions, and apply a maximum route density within proximity of leks in PPH and PGH. Commenters also requested that proposed management actions preserve motorized access on existing routes per the 3-State OHV and National Route Designation decisions and maintain administrative access in grazing allotments.

Response

Section 1.4 of the Draft EIS describes how the Idaho Montana GRSG LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR 1500 in the development of alternatives for this draft LUPA/EIS, including seeking public input and analyzing reasonable alternatives. The alternatives include management options for the planning area that would modify or amend decisions made in the field office RMPs, as amended, to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives. Since this is a plan amendment to address GRSG conservation, many decisions from the field office RMPs are acceptable and reasonable. In these instances, there was no need to develop alternative management prescriptions.

During subsequent implementation-level travel management planning new travel management plans would evaluate vehicle routes and determine the need for permanent or seasonal road closures, and mode of travel (e.g. motorcycle, ATV, and UTV) restrictions, including noise levels and speed. The route designation process will be completed as subsequent implementation level planning using current Travel Management policies and will include public and local agency involvement. Addressing these issues at the implementation level allows the BLM and Forest Service to take new information into account as it becomes available.

Needs for administrative access to valid existing rights, grandfathered uses, or permitted activities would taken into consideration during site-specific NEPA analysis. Restrictions applied to recreational OHV use may not apply to permitted administrative uses.

The BLM and Forest Service have not added a restriction that would limit road densities to less than 0.09 km per km squared (Wisdom et al. 2011) in GRSG habitat because the threshold established by Wisdom used coarse road data. When taking into consideration actual road density information, use of this threshold is not appropriate. The BLM and Forest Service have included surface disturbance thresholds, which would restrict the density of disturbance tied to new and existing roads in GRSG habitat.

Section 24.2 - Best available information baseline data

Total Number of Submissions: 2

Total Number of Comments: 2

Summary

Chapter 3 of the Draft EIS/LUPA does not depict the number of acres designated as open to cross-country motorized travel.

Response

[NOTE TO BLM: Add current CTTM area designation acres to Chapter 3.]

Section 24.3 - Impact Analysis

Total Number of Submissions: 3

Total Number of Comments: 6

Summary

For various reasons, commenters assert that the Draft EIS/LUPA does not adequately analyze the impacts of proposed management actions on travel management. For example, commenters contend that the analysis is not based on sound science or is narrowly focused and biasedly uses studies that only demonstrate the negative effects from OHV use; does not adequately describe the magnitude of OHV vs. "naturally occurring" impacts across alternatives; and does not distinguish between motorized and non-motorized impacts. Commenters further request the BLM/FS consider conducting site-specific studies to support proposed management and assert that there would be indirect effects (e.g. ban on new road construction) incurred by existing ROW authorization holders by deferring travel management planning.

Response

As described in Section 4.6 of this comment report, the LUPA/FEIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. Further, as described in Section 4.4. of this comment report, the BLM used the most recent and best available information that was relevant to a land-use planning-level analysis.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-I, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The DLUPA/EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The mechanism being used to determine landscape level travel area designations (open/limited/closed) is 43 CFR 8340 which regulates OHV travel on public lands. BLM does not have a similar regulation for non-motorized travel. Non-motorized travel can be regulated through supplementary rules. Supplemental rules and site specific route designations will be addressed at the implementation level in the future.

New construction related to power line access would be exempted under 43 CFR 8340.05 (3).

While multiple studies on OHV use have been cited, BLM is using the BLM Travel Management Manual and Handbook (M-1626 & H-83421) to address travel planning in the EIS and will continue to use the same policy for future implementation and planning.

Section 24.5 - Mitigation measures

Total Number of Submissions: 1
Total Number of Comments: 1

Summary

The LUPA/EIS should adopt additional travel-related mitigation measures to educate the public and prevent the spread of invasive species from travel-related sources through mitigation measures such as those described at playcleango.org.

Response

Appendix C of the DEIS/LUPA includes required design features and best management practices, including those that are based on the best available science to prevent the spread and effects of non-native plant species. See RDF # 290.

NCT note: ID and NV should use the same response as it is the same issue statement.

1. BLM reviewed the measures provided by commenters on playcleango.org
2. they were found to be the same as (similar as?) those already provided in Appendix XX.
3. Review of the impact analysis confirmed that the outcomes from the suggested mitigation measures would be the same as those described in the EIS (see section XX).
4. Conclusion (e.g., no changes needed).

Section 25 - Tribal Interest

Section 25.1 - Consultation requirements

Total Number of Submissions: 1
Total Number of Comments: 1

Summary

The BLM should consider additional areas for ACEC designation and should consult with the Shoshone-Bannock Tribes about these designations.

Response

The BLM and Forest Service recognize their responsibility to ensure that meaningful consultation and coordination concerning GRSG planning is conducted with federally recognized tribes, including the Shoshone-Bannock Tribes, to consider tribal treaty rights and trust resources. [BLM-FS-include relevant legal citations. Note consultation efforts to date]

Section 25.4 - Impact Analysis

Total Number of Submissions: 1
Total Number of Comments: 2

Summary

The BLM must ensure tribes, in particular the Shoshone-Bannock Tribe, maintain opportunities to access the public domain, exercise off-reservation treaty rights, and continue their traditional customs and practices.

Response

The BLM, Forest Service recognize their responsibility to consider potential impacts to Tribal resources.

Article 4 of the Fort Bridger Treaty, signed in 1868, retains the Eastern Band Shoshone and Bannock Tribes' rights to hunt, fish, gather natural resources, and provide other associative right necessary to effectuate these rights. Other treaties ensure similar rights for other tribes.

Section 26 - Vegetation Sagebrush

Section 26.1 - Range of alternatives

Total Number of Submissions: 6

Total Number of Comments: 12

Summary

Commenters recommended that the preferred alternative include:

- Specific vegetation treatment acreage objectives
- Passive sagebrush restoration
- Limitations on vegetation treatments in sagebrush areas. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions.
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment.
- Restore non-native seedings to increase GRSG habitat
- Apply additional restrictions for herbicide application in GRSG habitat
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe.
- Include specific objectives to measure success in invasive species eradication

Response

As described in Section 4.3, the ID/SWMT LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA.

Some of the recommended components were addressed in the DEIS and additional info will be included in the FEIS as detailed below.

- Specific vegetation treatment acreage objectives [need National Policy team input- to decide how treatment objectives will be incorporated]
- Passive sagebrush restoration: In the DEIS Alternative C and management changes that allow progress towards standards and guidelines allow for passive sagebrush restoration. In some areas passive restoration may not be sufficient to improve GRSG habitat and active restoration may be necessary (Davies et al. 2011) (see pp 4-54 DEIS [check page]).

- Limiting vegetation treatments in sagebrush areas is covered under Alternative D ([provide pg reference]. To meet COT report objectives, include regulatory mechanisms to avoid sagebrush removal or manipulation in sage-grouse breeding or wintering habitats with minor exceptions. [include info from FEIS specific to meeting COT report objectives if appropriate]
- Establish Priorities for pinyon-juniper removal including reduced grazing in conjunction with pinyon-juniper treatment: Priorities for PJ removal are addressed in the DEIS ([check that preferred alt includes removal within 1000m of leks per COT report objectives, if not explain rationale]
- Restore non-native seedings when beneficial to GRSG habitat: Alternative C in the DEIS supports restoration of native vegetation to areas that have been seeded with non-native species when beneficial to GRSG [cite mgmt. action]. The preferred alternative provides direction for restoring non-native seedings. [provide mgmt. action number and check language to refine if needed in mgmt. action]
- Apply additional restrictions for herbicide application in GRSG habitat: Herbicide/Pesticide BMPs are covered under the Veg treatment PEIS (BLM 2007x). The IDMT GRSG EIS tiers to the analysis in this document.
- Commit to a program to plan, fund, execute and monitor large scale integrated invasive species infestation and eradication projects in a measurable timeframe. Include specific objectives to measure success: This EIS is intended to provide treatment methods, priority and objectives and the conditions under which these treatment objectives would occur. Specifics regarding treatment effectiveness, funding and implementation would be covered in site specific management actions. BLM and Forest Service would follow agency specific monitoring requirements.

Section 26.2 - Best available information baseline data

Total Number of Submissions: 13
Total Number of Comments: 24

Summary

The DEIS fails to provide adequate baseline information related to sagebrush vegetation. Commenters questioned the source of BLM data and requested the FEIS utilize additional baseline data on cheatgrass extent and evaluate effectiveness of continuing programs against weeds and juniper encroachment. Commenters provided additional literature to consider. Commenters also advocated an adaptive approach to vegetation management based on site-specific habitats.

Response

As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level. Adaptive management would be incorporated into vegetation treatment and restoration programs under Alternatives D and E. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

[BLM: provide direction if any change to analysis is necessary. Notes during cmt response mtg: Clarify use of 70% cover from NTT; update EIS with new rare plant list.]

Change to make: Footnote in Table 3-4 change source to – ID team input and EIS vegetation model. Cite the VDDT appendix.]

The BLM and Forest Service has clarified the vegetation modeling and data sources in Chapter 3. [Insert details regarding location and changes made]

Section 26.3 - Impact Analysis

Total Number of Submissions: 2

Total Number of Comments: 3

Summary

Commenters express concern about unintended or undesirable impacts of vegetation management programs to control weeds or restore sagebrush habitat. The DEIS inadequately analyzes impacts from vegetation restoration

Response

As described in Section 4.6, the DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives.

Contiguous blocks: Site-specific calculations will be conducted at the implementation level.

PJ: Clarification will be provided in [Section XX](#).

Section 26.4 - Cumulative impact analysis

Total Number of Submissions: 1

Total Number of Comments: 1

Summary

BLM's cumulative impacts analysis for vegetation failed to consider the impacts of limited resources on sage-grouse protection.

Response

Funding and availability of resources is outside the scope of this EIS.

Section 26.5 - Mitigation measures

Total Number of Submissions: 3

Total Number of Comments: 7

Summary

Commenters requested detailed plans of action and clarification on mitigation and monitoring, including timing of re-seeding and restoration after fire.

Response

Mitigation has been further defined as a Regional Mitigation Framework and is detailed in **Appendix X**. The Framework is incorporated in the **[insert Proposed Plan/Proposed Plan Amendment]** and was developed to achieve a net conservation gain to the species by implementing conservation actions. Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for greater sage-grouse and its habitats. If impacts to greater sage-grouse or its habitat from authorized land uses remain after applying avoidance and minimization measures, then compensatory mitigation projects will be used to fully offset impacts to achieve conservation benefits. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

Specific mitigation strategies, based on the Framework, will be developed by regional teams within one year of the issuance of the Record of Decision and be consistent with the BLM's Regional Mitigation Manual MS-1794, Forest Service Handbook FSH 1909.15, and CEQ regulations at 40 CFR 1508.20.

Mitigation measures for specific projects are implementation level decisions and will be included in site-specific analysis which is outside the scope of this EIS.

Section 27 - Vegetation Riparian

Section 27.1 - Range of Alternatives

Total Number of Submissions: 2
Total Number of Comments: 3

Summary

Commenters suggested management approaches for riparian vegetation, including removal of invasive tamarisk, limitations on or removal of livestock grazing, and maintenance of sage-grouse habitat objectives.

Response

As described in Section 4.3, the Idaho and Southwestern Montana LUPA/EIS planning team employed the BLM and Forest Service planning process to develop a reasonable range of alternatives for the LUPA. **[BLM: provide direction if any change to analysis is necessary.]**

Section 27.2 - Best Available Info Baseline Data

Total Number of Submissions: 2
Total Number of Comments: 2

Summary

Commenter requests baseline data related to Proper Functioning Condition of riparian areas in sage-grouse habitat. Commenter questions whether PFC protects stability of riparian habitat for sage-grouse.

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

Response

Comprehensive PFC data is not available on a sub-regional level but is displayed when available. Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse. Modifications to PFC methods are outside the scope of this planning effort.

Section 27.5 - Mitigation Measures

Total Number of Submissions: 2
Total Number of Comments: 2

Summary

Commenter notes that current PFC assessment methods should be modified to address sage-grouse needs. Commenter requests site-specific management of riparian habitat to balance competing uses.

Response

Proper Functioning Condition of riparian systems according to BLM Manual 1737 includes stabilization of streambanks, maintenance of ponding, reduction in erosion, and other features beneficial to sage-grouse.

Under the proposed plan, adaptive management would be incorporated into vegetation treatment and restoration programs, including riparian management. Adaptive management would allow BLM increased flexibility to adjust programs based on data collected during operation, to respond to changing conditions and improve effectiveness of vegetation management programs.

[BLM: provide direction if any change to analysis is necessary.]

Section 29 - Water

Section 29.3 - Impact Analysis

Total Number of Submissions: 2
Total Number of Comments: 2

Summary

The EIS fails to address impacts on the soil and watershed conditions resulting from grazing-sourced manure, soil erosion and pathogen contamination under each alternative and to provide appropriate mitigation measures. Such an

analysis should include a list of impaired waters and the sources of contamination for those waters. The EIS also fails to address the negative impact on GRSG of restricting or removing water developments under Alternative D.

Response

NOTE TO BLM: BLM should review impact discussions under soil and water resources under each alternative and consider mentioning any appropriate beneficial impacts on soils and watersheds that would result from grazing restrictions.

NOTE TO BLM: BLM should review impacts on GRSG from grazing under Alternative D and consider whether it is appropriate to identify adverse impacts on GRSG through the restriction or removal of grazing-related water developments.

[NOTE TO BLM: Discuss with biologists the impacts of the removal of water development on Sage Grouse.]
303d listed streams are discussed in Section 3.16.2.

Section 30 - Wild Horse and Burros

Total Number of Submissions: 4

Total Number of Comments: 6

Summary

Commenters stated that livestock and wild horses were inappropriately grouped together in management actions. Some commenters were also concerned with the 25% proposed reduction of AML under Alternative F and the basis for reduction; they requested reevaluation of reduction based on the fact that wild horse habitat overlaps a minimal percentage of GRSG habitat.

Some commenters also stated that the proposed management should provide flexibility to increase AML/AUM and/or open HAs if data becomes available demonstrating that genetic viability of wild horses and burros is threatened.

Commenters also stated that the preferred alternative would give the BLM too much discretion to reduce AMLs or zero out HMAs which would violate the BLM's legal mandate to protect WHB.

Response

The BLM and the Forest Service considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. See Section 4.3, NEPA Range of Alternatives, in this report for an expanded explanation on what constitutes a reasonable range of alternatives. **[NOTE TO BLM-check final response in section 4.3 for consistency]**

The BLM protects, manages, and controls wild horses in accordance with the Wild Free-Roaming Horses and Burros Act of 1971 (Public Law 92-195, as amended), the purpose of which is to "manage wild horses and burros within herd management areas (HMAs) designated for their long-term maintenance, in a manner designed to achieve and maintain a thriving natural ecological balance (TNEB) and multiple use relationships." The FLPMA directs the BLM to manage wild horses and burros as one of numerous multiple uses including mining, recreation, domestic grazing, and fish and wildlife. It also required a current inventory of wild horses and burros. Additional guidance is found in 43 CFR 4700, Protection, Management, and Control of Wild Free-roaming Horses and Burros.

Adjusting AML does fall within the legal mandate of the BLM to protect WHB and other resources. Through the BLMs program of monitoring and analysis of data, AMLs have been established and will continue to be adjusted based on the analysis of data. AMLs can be adjusted based on the limitations and capability of the range, including the four habitat components (forage, water, cover, and space), while managing for healthy populations of WHBs in balance with other uses and resources (including sage grouse). An explanation of the relationship between AMLs and AUMs has been

included in the FEIS in [section X.X.X](#).

Should the 25% reduction be carried forward in the preferred alternative, genetic viability would be considered in the adjustment of AMLs. Increasing AMLs and/or opening HAs is outside the purpose and need for this project.

Section 30.1 - Best available information baseline data

Total Number of Submissions: 2
Total Number of Comments: 3

Summary

Commenters requested documentation of critical genetic data on each of the wild horse and burro herds in the planning area. This will provide BLM basis for identifying which HMAs would not be feasible to place AML reductions on while maintaining genetically viable herds. Commentors also requested exact population data for all wild horse populations in HMAs and HAs and clearly defined maps of HMAs and HAs. Finally, commenters stated that any land policy changes resulting from the sage grouse plan must be in conformance with the National Academy of Sciences 2013 recommendations for reform of the federal wild horse management program.

Response

The prerequisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendixes in the Draft LUPA/DEIS is sufficient to support, at the general land use planning-level of analysis, the environmental impact analysis resulting from management actions presented in the Draft LUPA/DEIS. A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data (see response to section 4.4 in this report for more details). **[NOTE TO BLM- check final language in section 4.4 response for consistency]** Much of the data in the DLUPA/DEIS is presented in qualitative and map form, and is sufficient to support the gross scale analyses required for land use planning. The DEIS includes maps of HMAs and HAs. Population data is included in [Table 3.X](#) of the DEIS. These maps and tables have been reviewed for accuracy prior to inclusion in the FEIS. Genetic documentation of WHB is an ongoing implementation level process used to monitor the genetic health of BLM's wild horse and burro populations (see IM 2009-061).

The NAS report has been considered in the development of the FEIS and actions appropriate the land management planning level included as appropriate. Findings of the NAS would also be considered under separate site-specific NEPA actions.

Section 30.2 - Impact Analysis

Total Number of Submissions: 6
Total Number of Comments: 9

Summary

Commenters stated that the analysis on GRSG from wild horses and burros are not distinguished from livestock which inaccurately increases the threat.

Commenters identified contradictions in the document such as where the document states that "Under all alternatives, no direct change would occur to areas allocated as HMAs/WHBTs for wild horses and burros", then the report proceeds to summarize how every single alternative would restrict wild horse and burro usage in their own federally designated habitats.

Response

The DLUPA/EIS provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives for a land use planning effort (see detailed response in section 4.6, NEPA Impacts Analysis).
[NOTE TO BLM- check final response in section 4.6 to ensure consistency]

The USFWS identified grazing as a threat in the NTT and COT report but did not specifically delineate between livestock and WHB grazing. However, within the DEIS, the BLM and Forest Service did analyze impacts on WHB and domestic livestock grazing separately and also analyzed the impacts on GRSG from WHB and domestic livestock grazing separately. Impacts on GRSG from WHB and domestic livestock grazing are identified in Section 4.X of the DLUPA/DEIS. Impacts on WHB from GRSG management strategies are identified in Section 4.X of the DLUPA/DEIS. BLM appropriately analyzed the impacts to WHB from actions not related to changes in AML.

Text in the WHB impact section has been reviewed and relationship between allocation and management actions clarified in the FEIS.

[NOTE TO BLM- insert the recommended text below in the FEIS: Under all alternatives, with the exception of Alternative XX, management actions for wild horses and burros would not result in direct changes to HMA status, to AMLs within designated HMAs, or acreage designated as HMAs. Impacts under all alternatives, with the exception of Alternative XX, would be limited to any future changes that may result in AML and/or acreage adjustment as well as reconsideration of HMA status that are based on achievement of GRSG habitat objectives for improving habitat conditions, as described in further detail below.

Under Alternative XX, in contrast, AMLs would be directly reduced by 25 percent for all HMAs within PPMAs. This would result in a reduction of the established AMLs for all HMAs that are located entirely or partially within mapped occupied GRSG habitat. As a result of AML reduction under Alternative XX, costs of wild horse and burro management would increase, due to a need for additional horse gathers for removal and/or population growth suppression (PGS) treatments.]

Section 31 – Lands with Wilderness Characteristics

Section 31.1 - Range of Alternatives

Total Number of Submissions: 3
Total Number of Comments: 4

Summary

All lands with wilderness characteristics that overlap with Greater Sage-Grouse habitat represent good opportunities for Greater Sage-Grouse conservation and should be analyzed to see how managing those lands to protect wilderness characteristics would coincide with Greater Sage-Grouse conservation. The BLM should consider lands with wilderness protection as an alternative to ACEC protection for some areas.

The BLM should complete Lands with Wilderness Characteristics inventories and the DEIS should consider potential

Lands with Wilderness Characteristics in the scope of this process.

Response

Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document regarding lands with wilderness characteristics will not be completed.

As described in Section 8 of this comment report, Alternative C considers ACEC designation for Greater Sage Grouse habitat and species protection.

Section 3 I.2 - Best Available Info Baseline Data

Total Number of Submissions: 4

Total Number of Comments: 4

Summary

The BLM should work with Upper Snake staff to ensure lands with wilderness characteristics inventories and management are consistent between this EIS/LUPA and the Upper Snake RMP.

The BLM must provide a map of the lands with wilderness characteristics and where it overlaps with priority habitat. The FEIS should explain how the BLM will comply with the 2014 appropriations bill for the Department of the Interior, Environment and Related Agencies and with Secretary Salazar’s Secretarial Order No. 3310.

Response

BLM Upper Snake Field Office continues to evaluate lands with wilderness characteristics within the planning area. Decisions related to lands with wilderness characteristics will be addressed in the Upper Snake EIS/LUP. Per BLM Manual 6320, Considering Lands with Wilderness Characteristics in the BLM Land Use Planning Process, “In some circumstances, consideration of management alternatives for lands with wilderness characteristics may be outside the scope of a particular planning process (as dictated by the statement of purpose and need for the planning effort). For example, a targeted amendment to address a specific project or proposal may not in all circumstances require consideration of an alternative that would protect wilderness characteristics. In these situations, the NEPA document associated with the plan amendment must still analyze effects of the alternatives on lands with wilderness characteristics.” Therefore, analysis in this planning document related to lands with wilderness characteristics will not be completed.

The BLM is not making decisions on lands with wilderness characteristics in this planning effort. Doing so is outside the purpose and need and scope of this EIS.

[NOTE TO BLM: Consider including a map displaying the overlap of lands with wilderness characteristics and priority habitat should be included in the EIS.]

NCT note: Consider using similar language to section 8 of this document. Language relevant to ACEC issues may be applicable to LWC and may help clarify why LWC is out of scope. It does not seem that the response fully addresses the issue statement. Answer to Secretary Salazar's Secretarial Order No. 3310? Possibly use some of the language developed by NVCA in section 31.0 of this document.

Section 31.3 - Impact Analysis

Total Number of Submissions: 2
Total Number of Comments: 2

Summary

If the BLM does not complete lands with wilderness characteristics inventories, the BLM should use GIS to inventory roadless areas and consider those as potential lands with wilderness characteristics for planning purposes.

Response

No decisions related to the management of lands with wilderness characteristics will be made at this part of the planning effort. Decision related to the management of lands with wilderness characteristics are out of the scope of this plan amendment process.

NCT note: It seems like this response could be combined with section 31.2 of this document. Responses are nearly identical and basically already included in the summary.

Section 32.1 - Predation

Total Number of Submissions: 5
Total Number of Comments: 6

Summary

Some commenters state that the BLM does not adequately address the threat of predation or fully analyze the direct, indirect, and cumulative impacts of predation on GRSG populations; Predation was identified as a threat by the state of Idaho. Others question the inclusion of analysis of impacts of anthropogenic structures on predators of GRSG, given that the USFWS did not identify predation as a primary threat to GRSG.

Response

As stated in Section 2.3.1 in the DRMPA/DEIS, predator removal is outside the scope of LUPA. The BLM and the Forest Service have updated the description of the threat of predation in Section 3.2.1 and addressed the potential effects of predation on GRSG populations in the [Section 4.x](#).

The BLM and the Forest Service have authority to manage the habitat and have provided an updated analysis in [Section 4.x](#) of the FEIS to describe how the numerous management actions across the range of alternatives could affect the habitat and indirectly the effects of predation. Altering the sagebrush habitat of the greater sage-grouse can create an influx of predators into an area and lead to a population decline. Roads, fences, power lines, and other infrastructure as well as the development of trails and other disturbances may improve access for potential predators near GRSG habitat

and increase risks to the species.

Section 32.2 – Noise

Total Number of Comments: 1

Summary

Commentor states that noise studies cited in the DEIS are not public and therefore the results are not reproducible; alternative data should be utilized.

Response

Blickley et al.'s research on noise and GRSG has since been published:

Blickley J.L, D. Blackwood, and G.L. Patricelli. 2012. Experimental evidence for the effects of chronic anthropogenic noise on abundance of greater sage-grouse at leks. Conservation Biology Vol 26. No 3. 461-471
This literature has been added to the noise section in the FEIS.

[Change to FEIS- add citation and data from this study in noise section. Consider addition of other data to support claims]

Section 32.3 - Weeds

Total Number of Submissions: 2

Total Number of Comments: 4

Summary

Issue 1: Commenters request analysis of past vegetation treatment programs and recommend scientific literature on effects of vegetation treatments.

Issue 2: One commenter requests baseline data on cheatgrass in planning area.

Issue 3: Partnerships with private landowners to control cheatgrass should be considered in the FEIS.

Response

Response 1: As described in Section 4.4, the BLM and FS considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land use plan-level.

As a result of these actions, the BLM and Forest Service gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the DLUPA/DEIS. The BLM and Forest Service utilized the available data to provide an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives. [Insert any changes that were made to the EIS as a result of comment received. If no changes necessary, reference the section in the EIS that contain the relevant information].

Analysis of proposed weed treatment methods tiers off of analysis in the Final Vegetation Treatments Using Herbicides

on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement (PEIS) [BLM 2007x]

Response 2: Potential occurrence of cheatgrass has been modeled (section 3.3.5). Acre of cheatgrass potential in GRSG habitat are shown in the DEIS based on Manier et al. 2013 (see Ttable 3-15, Acres of Cheatgrass Potential within GRSG) [Can incorporate concept of limited info regarding cheatgrass mapping] Information presented is appropriate for the planning level actions and analysis. Further analysis will occur on a site-specific basis at the implementation level.

Response 3: Cooperation with all landowners would be undertaken as feasible and is included in the range of alternatives.

Subject: RE: current version RTC reports
Importance: High

Both David Batts and I agree that it is important that the comment reports have FS input; as such, it is critical that we're integrated now as the schedule will likely not allow a separate FS review period. We would appreciate an opportunity to review the report before it goes to our WO and OGC for their review, as BLM has done, to help alleviate any concerns on the part the WO or OGC.

While I understand that some changes might occur based on the FFM that would tier to responses, I think a review of a current version of the report now would help mitigate the time needed to do so later when time is tighter.

Given the process confusion, it's of concern to me that we're not providing NeST with sufficient time to complete the needed review. NWCO and UT RTC reports are farthest along, with NV and ID not far behind. We have the current versions of both NV and ID. Both Joe and Brent suggested that NeST review those versions now and get comments back to them next Friday, but it sounds like NWCO and UT should be first up for review, with ID and NV second. I spoke with Pam M earlier today, and I'm fine with that effort as concerns our opportunity for RTC review. I'm aware when to expect that report and what might affect that schedule, so no concerns on WY9. Also, Pam Bode has been keeping us informed of the WY9 schedule.

So, if Quincy and Bridgett can send me their current versions. I'll ask NeST to review those first, followed by ID and NV perhaps when their next versions are ready rather than what's currently available. As mentioned, we want an opportunity to review before AFEIS by the WO and OGC, and we don't want to hold up the process.

Thanks.

Subject: Re: current version RTC reports

It was my understanding that such a review will be inclusive of the review of the FEIS, not in addition to it. The responses will be included as an appendix in the FEIS, and BLM WO, DOI Solicitors, FS WO, and FS OGC would review them in the same review process as the FEIS. If I am in error on the timing, please clarify. One way or another, I don't want to hand over anything for review until we know what the proposed plan will be after the FFM, since some responses refer to the proposed plan.

Hi BLM-ID,

In coordinating with FS, we noticed that the GRSG guidance document you received was missing one piece of direction. I have added the following bullet point to your SFA guidance :

"· Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land."

I've also attached a map that specifically identifies these two areas for your reference (please ignore all the other identified areas on the map with regard to the above bullet point).

I have reattached the guidance for purposes of version control, but this is the only change you will see in it. Sorry about the oversight, and thanks a lot as always. Let me know if you have any questions.

BLM-IDAHO

Greater Sage-Grouse Planning Issues for the BLM Planning Teams to Insert and Analyze in Administrative Draft Proposed Plan (ADPP)

January 30, 2015

*The March 4, 2010 decision by the U.S. Fish and Wildlife Service that the greater sage-grouse warranted listing but was precluded [Endangered and Threatened Wildlife and Plants; 12-Month Findings for Petitions to list the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered] set in motion the most comprehensive land-use planning initiative in the BLM's history.*

In 2011, the BLM began updating land-use plans across the West so as to ensure not only the long-term viability of the greater sage-grouse on public lands and the continued economic vitality of the West. This has been a complex and demanding process involving collaboration with an unprecedented number of stakeholders, including Governors, State Fish and Game agencies, the U.S. Fish and Wildlife Service and many others. The BLM's mandate of multiple use and sustained yield has required us to balance the full range of resource uses on public lands, including the conservation of crucial wildlife habitat. As we have worked through this process, public land managers throughout the BLM have made difficult resource management decisions.

These documents provide key guidance that will enable the BLM to finalize land use plans that will contribute to the conservation of the Greater Sage-Grouse and other sagebrush associated species across the West. The guidance outlines a suite of tools, such as disturbance limits in key habitats and mitigation approaches, which will help us to reach this goal. These mechanisms will work in concert to conserve sage-grouse habitat so that we can achieve our twin goals of thriving Greater Sage-Grouse populations and robust Western economies.

Issue:

Development in Highly Important Landscapes

Direction:

As more specifically provided in this guidance, the ADPP will include Sagebrush Focal Areas (SFA), consisting of the BLM and FS-managed lands within the area depicted in the October 27, 2014 USFWS memo, *Greater Sage-Grouse: Additional Recommendation to Refine Land Use Allocations in Highly Important Landscapes*. In the Special Status Species Section of Chapter 2, include the following management action drop in language (for the Proposed Plan only):

“Designate Sagebrush Focal Areas (SFA) as shown on Map X (x acres). SFAs will be managed as PHMA, with the following additional management:

- 1) Recommended for withdrawal from the General Mining Act of 1872, subject to valid existing rights.*
- 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.*

- 3) *Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions)."*

The NOC will provide updated shapefiles that delineate the SFAs.

Except as otherwise provided below, the ADPP will provide that all BLM- and FS-managed lands (including subsurface) within SFAs will be allocated and managed as PHMA and include the management actions above.

- *Do Not Include the following in SFA Management*
 - Hawley Mountain WSA (ID), Shoshone WSA (ID), Cedar Buttes WSA (ID), Lower Salmon Falls Creek (ID), Little Jack Wilderness (ID), Bruneau-Jarbidge Wilderness (ID) in non-habitat – The current management in these areas is generally protective of GRSG. As applicable, these will continue to be managed so as not to impair their suitability for preservation as wilderness, or under the terms of the Wilderness Act to preserve wilderness character.
 - To the extent that these areas were analyzed for contingent management as general or priority habitat, the ADPP will include contingent allocations and management direction that would apply in the event that Congress releases the areas from WSA status
 - Non-habitat areas outside Little Jack and Bruneau-Jarbidge Wilderness and Salmon Falls Creek ACEC which were previously shown within the SFA –These areas will not be managed as PHMA or SFA.
- Do Include Forest Service Lost River Mountains North (~5,000 acres) Area and South Area (~6,000 acres)– these areas will be treated as PHMA, with the SFA management actions for this FS-land.
- Do Include Donkey Hills ACEC –In order to consolidate parcels for protection as SFAs, this area will be treated as PHMA and included for SFA management.
- *Do Not Include Other Agency Land in SFA Management* – while lands managed by other agencies will be shown on the SFA maps, BLM ADPP decisions will not be applied to them.
- *Do Not Include Private/State Lands in SFA Management* – while private lands may be within the SFA boundaries, ADPP decisions will not be applied to them, but may apply to Federal subsurface underlying such lands as provided below.
- *Subsurface Estate:*
 - Under private/state lands: subsurface estate in PHMA and GHMA should be treated as PHMA with SFA management actions.

- Under other Federal lands: subsurface state should be treated as PHMA with SFA management actions if it is not already withdrawn (such as in Refuges or Parks) and PHMA or GHMA management was analyzed in the DEIS.

Additional direction/drop in language for the ADPPs on SFAs will be forthcoming.

Issue:

Direction:

Mitigation

The ADPP will include the updated Mitigation Framework (Attachment I) and drop-in Chapter 2 language to reflect the following language:

“In all sage-grouse habitat, in undertaking BLM management actions, and, consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.”

Issue:

Direction:

Mapping

Not Applicable

Issue:

Direction:

Disturbance

Per the original April 2014 NPT guidance on disturbance, the ADPP will use the 3% disturbance cap at the Biologically Significant Unit (BSU) and project scale. The density calculation (an average of 1 facility per 640 acres) applies to energy and mining facilities. The disturbance cap will not be applied to foreclose development of locatable minerals on unpatented claims located under the 1872 Mining Law; the disturbance from locatable mining will be accounted for in determining the percent disturbance and whether the cap has been exceeded. BLM-ID will use the disturbance calculation methodology developed prior to this guidance (see Attachment II).

Planning units will include the following land use plan actions within their ADPPs that states:

- a. If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSB Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid*

existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.

- b. If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).*

Issue:

Direction:

Vegetation Objectives

The ADPP will establish and incorporate vegetation and GRSG habitat objectives (see Attachment III for specific guidance and a GRSG Habitat Objectives Table template that follows the Sage-Grouse Habitat Assessment Framework Technical Reference-6710-1). The vegetation and GRSG habitat objectives guidance states that the values for the desired conditions in the GRSG Habitat Objectives Table are to be used, at a minimum, to meet the applicable land health standard in sage-grouse habitats. Planning units may include additional indicators and desired condition values as appropriate. The desired condition value for each indicator can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%).

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP. The vegetation objective should be placed in the Vegetation section of the ADPP. Planning units will include the following land use plan vegetation objective within the Vegetation section of their ADPPs:

In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).

Issue:

Direction:

Livestock Grazing

The following management actions will be included in the Livestock Grazing section of the ADPP.

- The BLM will prioritize (1) the review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas,*

including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (ex., fire) and legal obligations.

- *The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.*
- *Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.*
- *At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.*

Attachment III provides guidance as to how the BLM will incorporate GRGS decisions from the Sage-Grouse RMP/Amendments into grazing permits/leases.

Issue:

Direction:

Mineral Materials (Salable Minerals)

All Priority Habitat Management Areas will be closed to mineral materials development. All Important Habitat Management Areas and General Habitat Management Areas will be open to mineral materials development, consistent with the Idaho Anthropogenic Disturbance Criteria.

Issue:

Direction:

High-voltage Transmission and Major Pipeline ROWs and Corridors

1) Apply the recommended NPT allocation guidance for PHMA of avoidance.

2) GHMA will remain open. BLM-ID will employ a location and design process to ensure protection.

3) For sub-regions that have planned priority transmission lines that traverse their planning area (Gateway West, Boardman to Hemingway, and TransWest Express, including those portions of Gateway South that

are co-located), apply the following language as a management action in their ADPP:

“Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs) are designated as avoidance areas for high voltage transmission line ROWs, except for the transmission projects specifically identified below. All authorizations in these areas, other than the excepted projects, must comply with the conservation measures outlined in this proposed plan, including the RDFs and avoidance criteria presented in [insert citation here] of this document. The BLM is currently processing an application for [Insert name of transmission project] and the NEPA review for this project is well underway. The BLM is analyzing GRSG mitigation measures through the project’s NEPA review process, which will include analysis of the following conservations measures.”

Issue: Coal Suitability
Direction: Not Applicable in Idaho

Issue: Fluid Mineral Resources (Including Geothermal)
Direction: All ADPPs will include the following as a conservation objective:

“Priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of PHMA and GHMA. When analyzing leasing and authorizing development of fluid mineral resources, including geothermal, in PHMA and GHMA, and subject to applicable stipulations for the conservation of Greater Sage-Grouse, priority will be given to development in non-habitat areas first and then in the least suitable habitat for Greater Sage-Grouse. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 C.F.R. 3162.3-1(h).”

“Where a proposed fluid mineral development project on an existing lease could adversely affect GRSG populations or habitat, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing an APD for the lease to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the GRSG and its habitat informs and helps to guide development of such Federal leases.”

Issue: No Surface Occupancy (NSO) Exception Language
Direction: Follow NPT guidance for Priority Habitat Management Areas. No-surface-occupancy stipulations will be included in new fluid mineral

leases at the time of leasing only and may not be applied to existing fluid mineral leases that did not include no-surface-occupancy stipulation at the time of leasing. Include the following language into the ADPP:

“No waivers or modifications to a fluid mineral lease no-surface-occupancy stipulation will be granted. The Authorized Officer may grant an exception to a fluid mineral lease no-surface-occupancy stipulation only where the proposed action:

- (i) Would not have direct, indirect, or cumulative effects on GRSG or its habitat; or,*
- (ii) Is proposed to be undertaken as an alternative to a similar action occurring on a nearby parcel, and would provide a clear conservation gain to GRSG.*

Exceptions based on conservation gain (ii) may only be considered in (a) PHMAs of mixed ownership where federal minerals underlie less than fifty percent of the total surface, or (b) areas of the public lands where the proposed exception is an alternative to an action occurring on a nearby parcel subject to a valid Federal fluid mineral lease existing as of the date of this RMP [revision or amendment]. Exceptions based on conservation gain must also include measures, such as enforceable institutional controls and buffers, sufficient to allow the BLM to conclude that such benefits will endure for the duration of the proposed action’s impacts.

Any exceptions to this lease stipulation may be approved by the Authorized Officer only with the concurrence of the State Director. The Authorized Officer may not grant an exception unless the applicable state wildlife agency, the USFWS, and the BLM unanimously find that the proposed action satisfies (i) or (ii). Such finding shall initially be made by a team of one field biologist or other GRSG expert from each respective agency. In the event the initial finding is not unanimous, the finding may be elevated to the appropriate BLM State Director, USFWS State Ecological Services Director, and state wildlife agency head for final resolution. In the event their finding is not unanimous, the exception will not be granted. Approved exceptions will be made publically available at least quarterly.”

Issue:

Direction:

Adaptive Management

Follow the NPT Adaptive Management Guidance and Sideboards. When a hard trigger is hit in a BSU, the designated response will be put in place in that BSU. Triggers and responses have been developed with local state and FWS experts.

When a hard trigger is hit in a BSU within a PAC that has multiple BSUs, including those that cross state lines, the WAFWA Management Zone Greater Sage-Grouse Conservation Team will convene to determine the causal factor, put project level responses in place, as appropriate and discuss further appropriate actions to be applied. The team will also investigate the status of the hard triggers in other BSUs within the PAC and will invoke the appropriate plan response. Adoption of any further actions at the plan level may require initiating a plan amendment process.

Issue:

Direction:

Application of Lek Buffers

The ADPP will require the use of lek buffer-distances for all new BLM-managed and BLM-authorized anthropogenic disturbances in both GHMA and PHMA (see Attachment IV) through this drop-in Chapter 2 language:

“In undertaking BLM management actions, and consistent with valid and existing rights and applicable law in authorizing third-party actions, the BLM will apply the lek buffer-distances identified in the USGS Report Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review ([Open File Report 2014-1239](#)) in accordance with Appendix X.”

Allocation Direction

*Southwest Montana will follow the allocations designated for the MT ADPP

	Idaho/SW MT*

Attachment I

GREATER SAGE-GROUSE RMPA/FEIS TEMPLATE LANGUAGE FOR ADDRESSING MITIGATION

[] = Instructions

[] = Fill in the blank

[This mitigation language addresses greater sage-grouse. However, if you are working on a plan revision, you may need to add additional language to be more inclusive of other resource and value objectives (e.g. cultural resources, national historic trails, recreation values, other special status species) that may need to be mitigated.]

Chapter 1 - Introduction

[Nothing new to add to EIS]

Chapter 2 – Alternatives – [Proposed Plan/Proposed Plan Amendment]

- Add these two new sections (below) to the **Chapter 2 Alternatives** section.
- Replace the Regional Mitigation placeholder language that was included in the draft EIS with the new “Mitigation” section, below.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Consistent with the proposed plan’s goal outlined in [Table 2-X – Description of Alternatives], the intent of the [Proposed Plan/Proposed Plan Amendment] is to provide a net conservation gain to the species. To do so, in undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.”

Mitigation

Mitigation Standards. In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionality as described further in Appendix X).

Greater Sage-Grouse Conservation Team. The BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/USFS will invite governmental and Tribal partners to participate in this Team, including the State Wildlife Agency and U.S. Fish and Wildlife Service, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/USFS will strive for a collaborative and unified approach between Federal agencies (e.g. FWS, BLM, and USFS), Tribal governments, state and local government(s), and other stakeholders for greater sage-grouse conservation. The Team will provide advice, and will not make any decisions that impact Federal lands. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

Developing a Regional Mitigation Strategy. The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy will be developed within one year of the issuance of the Record of Decision. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can provide a net conservation gain to the species. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, and compensation; additionality, timeliness, and durability) and further explained in Appendix [X].

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

Incorporating the Regional Mitigation Strategy into NEPA Analyses. The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

Implementing a Compensatory Mitigation Program. Consistent with the principles identified above, the BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

Chapter 3 – Affected Environment

[Nothing to add]

Chapter 4 – Environmental Consequences – [Proposed Plan/Proposed Plan Amendment]

Mitigation

This Chapter describes the environmental consequences associated with the impacts to greater sage-grouse and its habitat from activities carried out in conformance with this plan, in addition to BLM/USFS management actions. In undertaking BLM/USFS management actions, and consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and

compensating for impacts by applying beneficial mitigation actions. In addition, to help implement this [Proposed Plan / Proposed Plan Amendment], a WAFWA Management Zone Regional Mitigation Strategy (per Appendix [X]) will be developed within one year of the issuance of the Record of Decision. The Strategy will elaborate on the components identified in Chapter 2 (avoidance, minimization, compensation, additionality, timeliness, and durability), and will be considered by the BLM/USFS for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The implementation of a Regional Mitigation Strategy will benefit greater sage-grouse, the public, and land-users by providing a reduction in threats, increased public transparency and confidence, and a predictable permit process for land-use authorization applicants.

Appendix [X]

- Add this new Appendix.
- Ensure a degree of consistency between this nationally standardized language and that found in the rest of the EIS.
- Fine tune this language, if necessary, but maintain consistency with the other BLM/USFS plan amendments.
- Remove references to USFS for plans that do not address US Forest Service lands

Appendix (X) – Mitigation – [Proposed Plan/Proposed Plan Amendment]

General

In undertaking BLM/USFS management actions, and, consistent with valid existing rights and applicable law, in authorizing third party actions that result in habitat loss and degradation, the BLM/USFS will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see glossary).

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy that will inform the NEPA decision making process including the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. A robust and transparent Regional Mitigation Strategy will contribute to greater sage-grouse habitat conservation by reducing, eliminating, or minimizing threats and compensating for residual impacts to greater sage-grouse and its habitat.

The BLM's Regional Mitigation Manual MS-1794 serves as a framework for developing and implementing a Regional Mitigation Strategy. The following sections provide additional guidance specific to the development and implementation of a WAFWA Management Zone Regional Mitigation Strategy.

Developing a WAFWA Management Zone Regional Mitigation Strategy

The BLM/USFS, via the WAFWA Management Zone Greater Sage-Grouse Conservation Team, will develop a WAFWA Management Zone Regional Mitigation Strategy to guide the application of the mitigation hierarchy for BLM/USFS management actions and third party actions that result in habitat loss and degradation. The Strategy should consider any State-level greater sage-grouse mitigation guidance that is consistent with the requirements identified in this Appendix. The Regional Mitigation Strategy should be developed in a transparent manner, based on the best science available and standardized metrics.

As described in Chapter 2, the BLM/USFS will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of greater sage-grouse, within 90 days of the issuance of the Record of Decision. The Strategy will be developed within one year of the issuance of the Record of Decision.

The Regional Mitigation Strategy should include mitigation guidance on avoidance, minimization, and compensation, as follows:

- Avoidance
 - Include avoidance areas (e.g. right-of-way avoidance/exclusion areas, no surface occupancy areas) already included in laws, regulations, policies, and/or land use plans (e.g. Resource Management Plans, Forest Plans, State Plans); and,
 - Include any potential, additional avoidance actions (e.g. additional avoidance best management practices) with regard to greater sage-grouse conservation.
- Minimization
 - Include minimization actions (e.g. required design features, best management practices) already included in laws, regulations, policies, land use plans, and/or land-use authorizations; and,
 - Include any potential, additional minimization actions (e.g. additional minimization best management practices) with regard to greater sage-grouse conservation.
- Compensation
 - Include discussion of impact/project valuation, compensatory mitigation options, siting, compensatory project types and costs, monitoring, reporting, and program administration. Each of these topics is discussed in more detail below.
 - Residual Impact and Compensatory Mitigation Project Valuation Guidance
 - A common standardized method should be identified for estimating the value of the residual impacts and value of the compensatory mitigation projects, including accounting for any uncertainty associated with the effectiveness of the projects.

- This method should consider the quality of habitat, scarcity of the habitat, and the size of the impact/project.
- For compensatory mitigation projects, consideration of durability (see glossary), timeliness (see glossary), and the potential for failure (e.g. uncertainty associated with effectiveness) may require an upward adjustment of the valuation.
- The resultant compensatory mitigation project will, after application of the above guidance, result in proactive conservation measures for Greater Sage-grouse (consistent with BLM Manual 6840 – Special Status Species Management, section .02).
- **Compensatory Mitigation Options**
 - Options for implementing compensatory mitigation should be identified, such as:
 - Utilizing certified mitigation/conservation bank or credit exchanges.
 - Contributing to an existing mitigation/conservation fund.
 - Authorized-user conducted mitigation projects.
 - For any compensatory mitigation project, the investment must be additional (i.e. additionality: the conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project).
- **Compensatory Mitigation Siting**
 - Sites should be in areas that have the potential to yield a net conservation gain to the greater sage-grouse, regardless of land ownership.
 - Sites should be durable (see glossary).
 - Sites identified by existing plans and strategies (e.g. fire restoration plans, invasive species strategies, healthy land focal areas) should be considered, if those sites have the potential to yield a net conservation gain to greater sage-grouse and are durable.
- **Compensatory Mitigation Project Types and Costs**
 - Project types should be identified that help reduce threats to greater sage-grouse (e.g. protection, conservation, and restoration projects).
 - Each project type should have a goal and measurable objectives.
 - Each project type should have associated monitoring and maintenance requirements, for the duration of the impact.
 - To inform contributions to a mitigation/conservation fund, expected costs for these project types (and their monitoring and maintenance), within the WAFWA Management Zone, should be identified.
- **Compensatory Mitigation Compliance and Monitoring**
 - Mitigation projects should be inspected to ensure they are implemented as designed, and if not, there should be methods to enforce compliance.
 - Mitigation projects should be monitored to ensure that the goals and objectives are met and that the benefits are effective for the duration of the impact.

- Compensatory Mitigation Reporting
 - Standardized, transparent, scalable, and scientifically-defensible reporting requirements should be identified for mitigation projects.
 - Reports should be compiled, summarized, and reviewed in the WAFWA Management Zone in order to determine if greater sage-grouse conservation has been achieved and/or to support adaptive management recommendations.
- Compensatory Mitigation Program Implementation Guidelines
 - Guidelines for implementing the State-level compensatory mitigation program should include holding and applying compensatory mitigation funds, operating a transparent and credible accounting system, certifying mitigation credits, and managing reporting requirements.

Incorporating the Regional Mitigation Strategy into NEPA Analyses

The BLM/USFS will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM/USFS management actions and third party actions that result in habitat loss and degradation and the appropriate mitigation actions will be carried forward into the decision.

Implementing a Compensatory Mitigation Program

The BLM/USFS need to ensure that compensatory mitigation is strategically implemented to provide a net conservation gain to the species, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be managed at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/USFS will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the Record of Decision. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/USFS will remain responsible for making decisions that affect Federal lands.

Glossary Terms

Additionality: The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (adopted and modified from BLM Manual Section 1794).

Avoidance mitigation: Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g. may also include avoiding the impact by moving the proposed action to a different time or location.)

Compensatory mitigation: Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

Compensatory mitigation projects: The [restoration](#), [creation](#), [enhancement](#), and/or [preservation](#) of impacted resources (adopted and modified from 33 CFR 332), such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements). (adopted and modified from BLM Manual Section 1794).

Compensatory mitigation sites: The durable areas where compensatory mitigation projects will occur. (adopted and modified from BLM Manual Section 1794).

Durability (protective and ecological): the maintenance of the effectiveness of a mitigation site and project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations. (adopted and modified from BLM Manual Section 1794).

Minimization mitigation: Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (40 CFR 1508.20 (b))

Residual impacts: Impacts that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

Timeliness: The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

Attachment II

Greater Sage-Grouse (GRSG) Land Use Plans Disturbance Caps Guidance

Purpose

- I. Provide the planning units with land use planning actions that need to be incorporated into the administrative draft proposed plans to respond to the 3% disturbance cap once it is exceeded in either the Biologically Significant Units (BSU) or at the project scale.
- II. Provide guidance on the use of the west-wide habitat degradation (disturbance) data layers as well as the use of locally collected disturbance data for BSUs to determine if the disturbance cap has been exceeded as the land use plans (LUP) are being implemented.
- III. Provide guidance on the use of locally collected disturbance data for project authorizations to determine if the disturbance cap has been exceeded as the LUPs are being implemented.
- IV. Provide guidance on the inclusion of fire in disturbance calculations.
- V. Provide guidance on the use of the density of energy and mining facilities during authorizations
- VI. Provide guidance on the use of the BER analysis in the land use plans (Chapter 2, Affected Environment) and the use of the “west-wide” sagebrush availability and habitat degradation data/estimates for the Priority Habitat Management Areas in each population for monitoring and management purposes as the LUPs are being implemented.
- VII. Provide guidance on what is considered in the disturbance calculations versus what is considered for the disturbance cap.

Guidance

- I. Planning units will include the following land use plan actions within their administrative draft proposed land use plans (ADPPs) that states:
 - a. *If the 3% anthropogenic disturbance cap is exceeded on lands (regardless of land ownership) within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, then no further discrete anthropogenic disturbances (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.) will be permitted by BLM within GRSG Priority Habitat Management Areas in any given Biologically Significant Unit until the disturbance has been reduced to less than the cap.*
 - b. *If the 3% disturbance cap is exceeded on all lands (regardless of land ownership) within a proposed project analysis area in a Priority Habitat Management Areas, then no further anthropogenic disturbance will be permitted by BLM until disturbance in the proposed project analysis area has been reduced to maintain*

the area under the cap (subject to applicable laws and regulations, such as the 1872 hard rock mining law, valid existing rights, etc.).

- II. Use of west-wide habitat degradation data as well as the use of locally collected disturbance data to determine the level of existing disturbance:
 - a) In the GRSG Priority Habitat Management Areas in any given Biologically Significant Unit, use the west-wide data at a minimum and/or locally collected disturbance data as available (e.g., DDCT) for the anthropogenic disturbance types listed in Table 1.

- III. Use of locally collected disturbance data for project authorizations:
 - a) In a proposed project analysis area, digitize all existing anthropogenic disturbances identified in the GRSG Monitoring Framework and the 7 additional features that are considered threats to sage-grouse (Table 2). Using 1 meter resolution NAIP imagery is recommended. Use local data if available.

- IV. Fire-burned and habitat treatment areas will not be included in the project scale degradation disturbance calculation for managing sage-grouse habitat under a disturbance cap. These areas will be considered part of a sagebrush availability when rangewide, consistent, interagency fine- and site-scale monitoring has been completed and the areas have been determined to meet sage-grouse habitat requirements. These and other disturbances identified in Table 3 will be part of a sagebrush availability evaluation and will be considered along with other local conditions that may affect sage-grouse during the analysis of the proposed project area.

- V. Planning units are directed to use a density cap related to the density of energy and mining facilities (listed below) during project scale authorizations. If the disturbance density in a proposed project area is on average less than 1/ 640 acres, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than an average of 1/ 640 acres, either defer the proposed project or co-locate it into existing disturbed area (*subject to applicable laws and regulations, such as the 1872 Mining Law, valid existing rights, etc.*).
 - Energy (oil and gas wells and development facilities)
 - Energy (coal mines)
 - Energy (wind towers)
 - Energy (solar fields)
 - Energy (geothermal)
 - Mining (active locatable, leasable, and saleable developments)

- VI. Planning units are directed to continue using the baseline data from the 2013 USGS Baseline Environmental Report (BER) in the Affected Environment section of the proposed plans/ FEISs. West-wide sagebrush availability and habitat degradation data layers will be used for the Priority Habitat Management Areas in each population for monitoring (see the GRSG Monitoring Framework in the Monitoring Appendix of the EIS) and management purposes as the LUPs are being implemented. The BER reported on individual threats across the range of sage-grouse while the west-wide disturbance calculation consolidated the anthropogenic disturbance data into a single measure using formulas from the GRSG Monitoring Framework. These calculations will be completed on an annual basis by the BLM's National Operation Center. Planning units will be provided the 2014 baseline disturbance calculation derived from the west-wide data once the RODs are signed that describe the Priority Habitat Management Areas.
- VII. Planning units are directed to use the three measures (sagebrush availability, habitat degradation, density of energy and mining) in conjunction with other information during the NEPA process to most effectively site project locations, such as by clustering disturbances and/or locating facilities in already disturbed areas. Although locatable mine sites are included in the degradation calculation, mining activities under the 1872 mining law may not be subject to the 3% disturbance cap. Details about locatable mining activities should be fully disclosed and analyzed in the NEPA process to assess impacts to sage-grouse and their habitat as well as to BLM goals and objectives, and other BLM programs and activities.

Additional Information/Formulas

A collaborative effort in Idaho developed a disturbance calculation method that includes the 3% disturbance cap plus a modifier that includes effective habitat and is described in Appendix G of their ADPP. The formulas below are excerpted from that Appendix.

Disturbance Calculations for the BSU:

$$\begin{aligned} & \text{Disturbance Percentage} \\ & = \left(\frac{\text{Footprint Acres from Anthropogenic Disturbance}^1}{\text{Acres within the BSU} * \left(\frac{\text{Acres of Effective Habitat within the BSU}}{\text{Acres within the BSU}} + 0.3 \right)} \right) \times 100 \end{aligned}$$

Disturbance Calculations for Project Analysis Areas (PAAs):

$$\text{Disturbance Percentage} = \left(\frac{\text{Footprint Acres from Anthropogenic Disturbance}^{1,2}}{\text{Acres within the PAA} * \left(\frac{\text{Acres of Effective Habitat within the PAA}}{\text{Acres within the PAA}} + 0.3 \right)} \right) \times 100$$

¹ see Table 3. ² see Table 2.

Project analysis area (PAA) method for permitting surface disturbance activities:

1. Determine potentially affected occupied leks by placing a four-mile buffer around the project boundary as defined by the proposed area of physical disturbance related to the project. All occupied leks within this buffer will be considered affected by the proposed project.
2. Next place a four mile boundary around each of the occupied leks identified in item 1, above.
3. The polygon formed by the merging and dissolving of polygons from step 1 and 2 creates the Project Analysis Area (PAA) for surface disturbance activities.
4. Map existing disturbances within the analysis area or use locally available spatial data. Use of digitized NAIP imagery is recommended.
5. Calculate percent existing disturbance using the formula above. If existing disturbance is less than 3%, proceed to next step. If existing disturbance is greater than 3%, defer the project.
6. Add proposed project disturbance footprint area and recalculate the percent disturbance. If disturbance is less than 3%, proceed to next step. If disturbance is greater than 3%, defer project.
7. Calculate the disturbance density of energy and mining facilities (listed above). If the disturbance density is less than 1 facility per 640 acres, averaged across project analysis area, proceed to the NEPA analysis incorporating mitigation measures into an alternative. If the disturbance density is greater than 1 facility per 640 acres, averaged across the project analysis area, either defer the proposed project or co-locate it into existing disturbed area.
8. If a project that would exceed the degradation cap or density cap cannot be deferred due to valid existing rights or other existing laws and regulations, fully disclose the local and regional impacts of the proposed action in the associated NEPA.

Table 1. Anthropogenic disturbance types for disturbance calculations. Data sources are described for the west-wide habitat degradation estimates (Table copied from the GRSG Monitoring Framework)

Degradation Type	Subcategory	Data Source	Direct Area of Influence	Area Source
Energy (oil & gas)	Wells	IHS; BLM (AFMSS)	5.0ac (2.0ha)	BLM WO-300

Background

In the USFWS's 2010 listing decision for sage-grouse, the USFWS identified 18 threats contributing to the destruction, modification, or curtailment of the sage-grouse's habitat or range (75 FR 13910 2010). In April 2014, the Interagency GRSG Disturbance and Monitoring Sub-Team finalized the Greater Sage-Grouse Monitoring Framework (hereafter, framework) to track these threats. The 18 threats have been aggregated into three measures to account for whether the threat predominantly removes sagebrush or degrades habitat. The three measures are:

Measure 1: Sagebrush Availability (percent of sagebrush per unit area)

Measure 2: Habitat Degradation (percent of human activity per unit area)

Measure 3: Density of Energy and Mining (facilities and locations per unit area)

The BLM is committed to monitoring the three disturbance measures and reporting them to the FWS on an annual basis. However, for the purposes of calculating the amount of disturbance to provide information for management decisions and inform the success of the sage-grouse planning effort, the data depicting the location and extent of the 12 anthropogenic types of threats will be used at a minimum in the BSUs and those same 12 anthropogenic and the additional 7 types of features that are threats to sage-grouse will be used in the project analysis areas.

ACRONYMS				
PHMA = Priority Habitat Management Area BSU = Biologically Significant Unit				
EVT = Existing Vegetation Type EpS = Areas of Biotic Potential				
¹ Only mines with a Plan of Operation (>5 acres of disturbance) will be included.				
² Westwide data will be used only if state or local data are not available.				
³ This footnote was removed from the table. January 2015.				
⁴ This may be one of several variables used to inform Adaptive Management. The BSU is the scale at which Adaptive Management will be applied.				
⁵ A moving window analysis will be conducted at this scale by the NOC using westwide data. If available, state and local data/analysis should be used for Adaptive Management				
⁶ The project analysis area will be based on a 4-mile radius polygon around the project area combined with a 4-mile buffer around any lands within the project boundary in PHMA (Idaho methodology).				
⁷ See Table 2				

Attachment III

Greater Sage-Grouse (GRSG) Land Use Plans Vegetation Objectives Guidance

Purpose

- I. Provide the planning units with land use planning vegetation objectives that need to be incorporated into the administrative draft proposed plans.
- II. Provide guidance on the use of a template for GRSG habitat objectives in the Special Status Species section of the ADPPs.
- III. Provide guidance on prioritizing land health assessments in sage-grouse habitats and conducting assessments at the watershed scale using the sage-grouse habitat objectives.

Guidance

- I. Planning units will include the following land use plan vegetation objective within the Vegetation section of their administrative draft proposed land use plans (ADPPs) that states:

In all Sagebrush Focal Areas and Priority Habitat Management Areas, the desired condition is to maintain a minimum of 70% of lands capable of producing sagebrush with 10 to 30% sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).
- II. Planning units will populate the GRSG Habitat Objectives table template to provide vegetation objectives for sage-grouse life history stages based on the ecology in your region to be used to meet the applicable land health standard in GRSG habitats. Planning units are encouraged to work across boundaries when developing the objectives to ensure regional continuity and will provide appropriate peer-reviewed science to support the habitat values for the indicators. These desired condition value can be a range of values rather than a single value (e.g., the value for the desired condition for sagebrush canopy cover in breeding and nesting habitat could be 15-25%). Planning units may include additional indicators and desired condition values as appropriate (see the Sage-Grouse Habitat Assessment Framework (HAF, *Technical Reference 6710-1*) for appropriate indicators). The HAF contains values for habitat suitability indicators in sage-grouse seasonal habitats from the Connelly et al. (2000) sage-grouse guidelines and has incorporated many of the core indicators in the AIM strategy (Toevs et al. 2011) as well. Planning units may use the indicator values from Connelly et al. (2000) while developing the land use plan Sage-Grouse Habitat Objectives table.

When using the indicators to guide management actions or during land health assessments, consider that the indicators are sensitive to the ecological processes operating at the scale of interest and that a single habitat indicator does not necessarily define habitat suitability for an area or particular scale. Indicators must be collectively reviewed, assessed based on the site potential, and put into spatial and temporal context to correctly determine habitat suitability which will include more than one scale and multiple indicators. Assessment and evaluation of these objectives will follow the steps described in the HAF.

The GRSG Habitat Objectives table is to be placed in the Special Status Species section of the ADPP and is to be used as a minimum to meet the applicable land health standard in sage-grouse habitats.

Greater Sage-Grouse Habitat Objectives

	Sagebrush canopy cover above snow		
	Sagebrush height above snow		

- III. The BLM will prioritize land health assessments in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. Field offices are to conduct land health assessments at the watershed scale and use the GRSG habitat objectives when assessing the applicable standard in GRSG habitats.

When conducting land health assessments, the BLM should follow, at a minimum, “Interpreting Indicators of Rangeland Health” (Pellant et. al. 2005) and the “BLM Core Terrestrial Indicators and Methods” (MacKinnon et al. 2011). For assessments being conducted in GRSG designated management areas, the BLM should collect additional data to inform the HAF indicators that have not been collected using the above methods. Implementation of the principles outlined in the AIM strategy will allow the data to be used to generate unbiased estimates of condition across the area of interest; facilitate consistent data collection and rollup analysis among management units; help provide consistent data to inform the classification and interpretation of imagery; and provide condition and trend of the indicators describing sagebrush characteristics important to sage-grouse habitat.

Attachment IV

Incorporating GSGR RMP Decisions into Grazing Authorizations

Purpose

The purpose is to provide recommended ADPP language; outline the process for prioritizing the review and processing of grazing permits/leases to determine if modification is necessary (prior to renewal and in accordance with prioritization criteria); provide direction for including specific management thresholds and defined responses that will allow adjustments to livestock grazing within the terms and conditions of permits; and provide a process for prioritizing compliance monitoring within Sagebrush Focal Areas (SFAs) and Priority Habitat Management Areas (PHMAs).

Background

The BLM manages approximately 18,000 livestock grazing permits and leases on the public lands. Livestock grazing is an integral part of the BLM multiple-use mission and is authorized by the Taylor Grazing Act (1934), the Federal Land Policy Management Act (1976) and the Public Rangeland Improvement Act (1978). By statute and regulation, grazing leases and permits are normally issued for 10-year periods. Annually, a range of 1,200 to 3,200 grazing permits expire and the BLM receives 500 to 1,500 grazing permit/lease transfer requests.

The BLM currently issues permits/leases in accordance with:

- All applicable law, regulation, policy (NEPA, consultation, proposed/final grazing decision-also known as a fully processed permit); or
- Various appropriation authorities enacted between 1999 and 2014 extending terms and conditions of expiring or transferred permits/leases that the BLM is unable to fully process before their expiration; or
- Section 402(c)(2) of FLPMA (as amended by Public Law 113-291, enacted December 19, 2014).

Congress has acted to ensure that grazing permittees could continue to graze if the BLM is unable to complete the environmental analysis mandated by the NEPA and other applicable laws. Since 1999, a provision (“the rider”) has been included in the Interior Appropriations bill that, in various forms, generally authorizes the BLM to renew grazing permits and leases under their same terms and conditions until it fully processes the permit renewal in compliance with NEPA, ESA, and other legal or regulatory requirements. The most recent rider is contained in Section 411, Public Law 113-76.¹ The FLPMA amendment to Section 402 (c) allows BLM to renew

¹ The Consolidated Appropriations Act, 2014 includes the provision Section 411 which states: “Section 415 of division E of Public Law 112–74 is amended by striking “and 2013” and inserting “through 2015.” The terms and conditions of section 325 of Public Law 108-108 (117 stat. 1307), regarding permits at the Department of the Interior and the Forest Service, shall remain in effect through fiscal year 2015. A grazing permit or lease issued by the Secretary of the Interior for lands administered by the Bureau of Land Management that is the subject of a request for a grazing preference transfer shall be issued, without further processing, for the remaining time period in

grazing permits and leases under the same terms and conditions. This relieves the BLM's renewal processing workload, allowing the BLM to prioritize permit processing based on sensitivity of the resources at issue.²

The BLM may modify terms and conditions of a permit or lease at any time following completion of appropriate analysis and consultation, cooperation, and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public.³ Under 43 C.F.R. 4160.1, the BLM must serve a proposed decision on any affected applicant, permittee or lessee, any agent and lien holder of record. Copies of the decisions are provided to the interested publics.

Recommended Language to be incorporated as Livestock Grazing Management Actions within the GRSG ADPPs:

- The BLM will prioritize the review of grazing permits/leases, including those prior to renewal to determine if modification is necessary, and processing of grazing permits and leases, in Sagebrush Focal Areas (SFAs) followed by PHMAs outside of the SFAs. In setting workload priorities, precedence will be given to existing permits/leases in areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource conditions (ex., fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to

the existing permit or lease using the same mandatory terms and conditions. If the authorized officer determines a change in the mandatory terms and conditions is required, the new permit must be processed as directed in section 325 of Public Law 108-108.” Where a FO is unable to fully process a permit renewal in compliance with all applicable laws prior to the permit expiration, Section 411 extends the authority to renew the grazing permit with the same terms and conditions as the expiring permit. Section 325 provides the process for authorizing grazing until a permit or lease is issued in compliance with all applicable law and regulatory processes.

² The newly amended section 402(c) of FLPMA provides permanent authority to BLM to renew expiring permits. That section states, “The terms and conditions in a grazing permit or lease that has expired, or was terminated due to a grazing preference transfer, shall be continued under a new permit or lease until the date on which the Secretary concerned completes any environmental analysis and documentation for the permit or lease required under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.) and other applicable laws.”

³ 43 CFR 4130.3-3 states: Following consultation, cooperation and coordination with the affected lessees or permittees, the State having lands or responsible for managing resources within the area, and the interested public, the authorized officer may modify terms and conditions of the permit or lease when the active grazing use or related management practices are not meeting the land use plan, allotment management plan or other activity plan, or management objectives, or is not in conformance with the provisions of subpart 4180 (Fundamentals of Rangeland Health and Standards and Guidelines for Grazing Administration).

help ensure compliance with the terms and conditions within the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.

- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

Addressing GRSG RMP Amendments/Revisions Objectives in Grazing Permits/Leases

BLM will develop criteria to prioritize the workload to process permits/leases (either fully processed or reauthorized based on the Appropriations rider, or issued under Section 402(c)(2) of FLPMA) and determine whether modification is necessary prior to renewal within PHMAs, beginning with those in SFAs. In setting priorities, those containing riparian areas and areas not meeting Land Health Standards (43 C.F.R. 4180) will take precedence. Potential criteria for prioritizing permit modifications could include:

- Are there riparian areas or wet meadows in the permit/lease area?
- Was current livestock grazing identified as a causal factor for not meeting Land Health Standards?
- Since the last allotment/watershed evaluation, is there current monitoring information to determine that the watershed/allotment is currently achieving or making significant progress towards achieving land health standards?
- Does the permit have terms and conditions adequate to ensure proper grazing practices to meet GRSG habitat objectives found in the Special Status Species section of the land use plan?
- Is there data that indicates that the GRSG habitat objectives, including the Habitat Objectives table, found in the Special Status Species section of the land use plan are being met?
- Is there a request from the permittee to modify the terms and conditions of his/her permit?

Additionally, if an existing permit/lease within PHMAs requires modification because current grazing is a significant causal factor for not meeting the Land Health Standards, the BLM will prepare the appropriate NEPA analysis and issue the proposed/final grazing decision under 43 C.F.R. Subpart 4160, subject to administrative appeal and potential judicial challenge.

The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within SFAs and PHMAs will include specific management thresholds based on GRSG Habitat Objectives Table and/or Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA. Adjustments to meet seasonal Sage-Grouse habitat requirements could include:

- Season or timing of use;
- Numbers of livestock (includes temporary non-use or livestock removal);
- Distribution of livestock use;
- Intensity of use; and
- Type of livestock (e.g., cattle, sheep, horses, llamas, alpacas and goats).

Compliance Monitoring

The BLM will monitor grazing permits/leases renewed or modified in accordance with the direction contained in this guidance as follows: Allotments within SFAs, followed by those in other PHMA, and focusing on those with riparian areas, will be prioritized for monitoring to ensure compliance with the terms and conditions in the permits. The BLM will collect, at a minimum, the following monitoring data:

- Vegetation Condition
- Actual Use
- Utilization
- Use Supervision

Concerning Voluntary Relinquishments

All ADPPs will include the following language:

At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.

For completing this, BLM offices should use [WO IM 2013-184 Relinquishment of Grazing Permitted Use](#) or the most recent policy guidance.

Attachment V

Applying Lek Buffer-Distances When Approving Actions

- *Buffer Distances and Evaluation of Impacts to Leks*

Evaluate impacts to leks from actions requiring NEPA analysis. In addition to any other relevant information determined to be appropriate (e.g. State wildlife agency plans), the BLM will assess and address impacts from the following activities using the lek buffer-distances as identified in the USGS Report *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review* ([Open File Report 2014-1239](#)). The BLM will apply the lek buffer-distances specified as the lower end of the interpreted range in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer-distances is as follows:

 - linear features (roads) within 3.1 miles of leks
 - infrastructure related to energy development within 3.1 miles of leks.
 - tall structures (e.g., communication or transmission towers, transmission lines) within 2 miles of leks.
 - low structures (e.g., fences, rangeland structures) within 1.2 miles of leks.
 - surface disturbance (continuing human activities that alter or remove the natural vegetation) within 3.1 miles of leks.
 - noise and related disruptive activities including those that do not result in habitat loss (e.g., motorized recreational events) at least 0.25 miles from leks.

Justifiable departures to decrease or increase from these distances, based on local data, best available science, landscape features, and other existing protections (e.g., land use allocations, state regulations) may be appropriate for determining activity impacts. The USGS report recognized “that because of variation in populations, habitats, development patterns, social context, and other factors, for a particular disturbance type, there is no single distance that is an appropriate buffer for all populations and habitats across the sage-grouse range”. The USGS report also states that “various protection measures have been developed and implemented... [which have] the ability (alone or in concert with others) to protect important habitats, sustain populations, and support multiple-use demands for public lands”. All variations in lek buffer-distances will require appropriate analysis and disclosure as part of activity authorization.

In determining lek locations, the BLM will use the most recent active or occupied lek data available from the state wildlife agency.

- *For Actions in GHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis.

 - Impacts should first be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.
 - If it is not possible to relocate the project outside of the applicable lek buffer-distance(s) identified above, the BLM may approve the project only if:
 - Based on best available science, landscape features, and other existing protections, (e.g., land use allocations, state regulations), the BLM determines that a lek buffer-distance other than the applicable distance identified above offers the same or a greater

level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or

- The BLM determines that impacts to GRSG and its habitat are minimized such that the project will cause minor or no new disturbance (ex. co-location with existing authorizations); and
- Any residual impacts within the lek buffer-distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (Appendix X).

- *For Actions in PHMA*

The BLM will apply the lek buffer-distances identified above as required conservation measures to fully address the impacts to leks as identified in the NEPA analysis. Impacts should be avoided by locating the action outside of the applicable lek buffer-distance(s) identified above.

The BLM may approve actions in PHMA that are within the applicable lek buffer distance identified above only if:

- The BLM, with input from the state fish and wildlife agency, determines, based on best available science, landscape features, and other existing protections, that a buffer distance other than the distance identified above offers the same or greater level of protection to GRSG and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area.
- The BLM will explain its justification for determining the approved buffer distances meet these conditions in its project decision.

June 2015

Dear Reader:

Enclosed is the Idaho and Southwestern Montana Sub-regional Greater Sage-Grouse (GRSG) Proposed Land Use Plan Amendment (Proposed LUPA) and Final Environmental Impact Statement (FEIS), one of fifteen sub-regional efforts being conducted as part of the Bureau of Land Management (BLM) and Forest Service National Greater-Sage Planning Strategy. The BLM and Forest Service prepared the Proposed LUPA/FEIS in consultation with cooperating agencies, taking into account public comments received during this planning effort.

The purpose of the Proposed LUPA is to amend the following: (1) BLM Idaho Resource Management Plans (RMPs) Birds of Prey National Conservation Area Resource Management Plan (RMP) (2008); Bruneau RMP revision (and existing 1983 Bruneau RMP); Challis RMP (1999); Craters of the Moon National Monument RMP (2006); Four Rivers RMP revision (and existing 1988 Cascade and 1983 Kuna RMPs); Jarbidge RMP revision; Jarbidge RMP Revision, Lemhi RMP (1987); Owyhee RMP (1999); Pocatello RMP; Shoshone-Burley RMP revision (and existing 1980 Bennett Hills/Timmerman Hills, 1985 Cassia, 1975 Magic, 1985 Monument, 1981 Sun Valley, and 1982 Twin Falls Management Framework Plan (MFPs)/RMPs); Upper Snake RMP revision (and existing 1983 Big Lost, 1985 Medicine Lodge, 1981 Big Desert, 1981 Little Lost-Birch Creek MFPs/RMPs) and the Dillon (MT) RMP; and (2) the following Forest Service Land and Resource Management Plans (LRMPs) Boise Revised Forest Plan (2010), Beaverhead-Deerlodge Forest Plan (2009), Revised Caribou Forest Plan (2003), Curlew National Grassland Plan (2002), Challis Forest Plan (1987), Salmon Forest Plan (1988), Sawtooth Revised Forest Plan (2012), Targhee Revised Forest Plan (1997), to identify and incorporate appropriate conservation measures to conserve, enhance and/or restore GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The need for action is in response to the U.S. Fish and Wildlife Service's (USFWS) March 2010, "warranted, but precluded" Endangered Species Act listing petition. The USFWS found that the inadequacy of regulatory mechanisms was identified as a significant threat to GRSG in their finding on the petition to list the GRSG. Land use plan conservation measures were identified as the BLM's and Forest Service's principal regulatory mechanism.

This Proposed LUPA/FEIS has been developed in accordance with the National Environmental Policy Act of 1969, as amended, the Federal Land Policy and Management Act of 1976, as amended, and the National Forest Management Act of 1976, as amended. The Proposed LUPA is largely based on Alternatives D and E, the co-preferred alternatives in the Draft LUPA/DEIS, which was released on November 1, 2013. The Proposed LUPA/FEIS contains the Proposed Plan, a summary of changes made between the Draft LUPA/DEIS and Proposed LUPA/FEIS, impacts of the Proposed Plan, a summary of the written and verbal comments received during the public review period for the Draft LUPA/DEIS, and responses to the comments.

In accordance with 36 C.F.R. § 219.59, the Forest Service will waive their objection procedures of this subpart and instead adopt the BLM's protest procedures outlined in 43 C.F.R. § 1610.5-2.

Pursuant to the BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this Proposed LUPA and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions within 30 days from date the Environmental Protection Agency (EPA) publishes the Notice of Availability of the FEIS in the Federal Register. For further information on filing a protest, please see the accompanying protest regulations in the pages that follow (labeled as Attachment #1). The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.).

Emailed protests will not be accepted as valid protests unless the protesting party also provides the original letter by either regular mail or overnight delivery postmarked by the close of the protest period. Under these conditions, the BLM will consider the emailed protest as an advance copy and will afford it full consideration. If you wish to provide the BLM with such advance notification, please direct emailed protests to: protest@blm.gov.

All protests must be in writing and mailed to one of the following addresses:

<u>Regular Mail:</u>	<u>Overnight Delivery:</u>
Director (210)	Director (210)
Attn: Protest Coordinator	Attn: Protest Coordinator
P.O. Box 71383	20 M Street SE, Room 2134LM
Washington, D.C. 20024-1383	Washington, D.C. 20003

Before including your address, phone number, email address, or other personal identifying information in your protest, be advised that your entire protest – including your personal identifying information – may be made publicly available at any time. While you can ask us in your protest to withhold from public review your personal identifying information, we cannot guarantee that we will be able to do so.

The BLM Director, in agreement with the responsible official for the Forest Service, will make every attempt to promptly render a decision on each protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior on each protest.

Responses to protest issues will be compiled and formalized in a Director's Protest Resolution Report made available following issuance of the decisions.

Upon resolution of all land use plan amendment protests, the BLM and the Forest Service will issue an Approved LUPA and Record of Decision (ROD). The Approved LUPA and ROD will be mailed or made available electronically to all who participated in the planning process and will be available on the BLM website at http://www.blm.gov/id/st/en/prog/nepa_register/sage-grouse_rmp_revision.html and the Forest Service website at <http://www.fs.usda.gov/detail/r4/home/?cid=STELPRD3815825>

Unlike land use planning decisions, implementation decisions included in this Proposed LUPA are not subject to protest under the BLM planning regulations, but are subject to an administrative review process, through appeals to the Office of Hearings and Appeals (OHA), Interior Board of Land Appeals (IBLA) pursuant to 43 CFR, Part 4 Subpart E. Implementation decisions generally constitute the BLM's and the Forest Service's final approval allowing on-the-ground actions to proceed. Where implementation decisions are made as part of the land use planning process, they are still subject to the appeals process or other administrative review as prescribed by specific resource program regulations once the BLM and the Forest Service resolves the protests to land use planning decisions and issues an Approved LUPA and ROD. The Approved LUPA and ROD will therefore identify the implementation decisions made in the plan that may be appealed to the Office of Hearing and Appeals.

Sincerely,

Jeffery L. Foss
Acting Idaho State Director
Bureau of Land Management

Jamie E. Connell
Montana State Director
Bureau of Land Management

Protest Regulations

[CITE: 43CFR1610.5-2]

TITLE 43--PUBLIC LANDS: INTERIOR
CHAPTER II--BUREAU OF LAND MANAGEMENT, DEPARTMENT OF THE INTERIOR
PART 1600--PLANNING, PROGRAMMING, BUDGETING--Table of Contents
Subpart 1610--Resource Management Planning
Sec. 1610.5-2 Protest procedures.

- (a) Any person who participated in the planning process and has an interest which is or may be adversely affected by the approval or amendment of a resource management plan may protest such approval or amendment. A protest may raise only those issues which were submitted for the record during the planning process.
- (1) The protest shall be in writing and shall be filed with the Director. The protest shall be filed within 30 days of the date the Environmental Protection Agency published the notice of receipt of the final environmental impact statement containing the plan or amendment in the Federal Register. For an amendment not requiring the preparation of an environmental impact statement, the protest shall be filed within 30 days of the publication of the notice of its effective date.
- (2) The protest shall contain:
- (i) The name, mailing address, telephone number and interest of the person filing the protest;
 - (ii) A statement of the issue or issues being protested;
 - (iii) A statement of the part or parts of the plan or amendment being protested;
 - (iv) A copy of all documents addressing the issue or issues that were submitted during the planning process by the protesting party or an indication of the date the issue or issues were discussed for the record; and
 - (v) A concise statement explaining why the State Director's decision is believed to be wrong.
- (3) The Director shall promptly render a decision on the protest.
- (b) The decision shall be in writing and shall set forth the reasons for the decision. The decision shall be sent to the protesting party by certified mail, return receipt requested. The decision of the Director shall be the final decision of the Department of the Interior.

Administrative Draft
Cooperating Agency Review

1 **Changes to Chapter 1 between Draft LUPA/EIS and Proposed LUPA/Final EIS**

- 2 • General corrections (e.g., typographical errors), clarifications, and acreage recalculations were
3 included.
- 4 • Additions and clarifications to the planning criteria (Section 1.6.1) and Memoranda of
5 Understanding (Section 1.7.5).
- 6 • A discussion of USFWS was expanded to include the Priority Areas for Conservation and
7 how they relate to GRSG management areas in the LUPA as well as a discussion of
8 Sagebrush Focal Areas (Section 1.1.2).
- 9 • A discussion was added to describe a new USGS report published regarding lek buffers since
10 the DEIS (Section 1.1.3).
- 11 • Text was added to describe the Montana Executive Order related to GRSG (Section 1.1.4).
- 12

Administrative Draft
Cooperating Agency Review

1 **Chapter 1. Introduction**

2 **1.1 Background**

3 Greater Sage-Grouse (GRSG; *Centrocercus urophasianus*) are large, ground-dwelling birds that
4 reside primarily in sagebrush ecosystems. Sagebrush ecosystems were and, in some respects,
5 still are ubiquitous across the intermountain regions of western North America. While
6 historical Euro-American settlement of these lands has been slower and sparser than in other
7 regions of the country, habitat conversion to suit human purposes has contributed to
8 widespread loss and decline of sagebrush habitat availability or quality and associated wildlife
9 populations. These human purposes include agriculture and urban development, energy and
10 mineral resource development, and a long history of dispersed (but sometimes intensive)
11 uses such as domestic grazing.

12 More recently, large wildfires, often fueled or exacerbated by invasive plant species such as
13 cheatgrass, have led to large areas of sagebrush loss in the intermountain west and Great
14 Basin. The estimated distribution of contiguous sagebrush habitats, prior to Euro-American
15 contact (Schroeder et al. 2004), was nearly twice that which is available today. This influences
16 the availability of habitat for GRSG across the species' range (**Figure 1-1**, Greater Sage-
17 Grouse Distribution). Although early documentation is sparse and possibly unreliable, it is
18 suspected that GRSG were similarly more abundant historically at a continental scale
19 (Schroeder et al. 2004). GRSG population trends are variable across their distribution, and
20 while some populations appear stable, population numbers show long-term declines
21 collectively across several regions (Connelly et al. 2004). Proximate reasons for population
22 declines differ across the range-wide distribution of GRSG, but ultimately, the underlying
23 cause is loss of suitable sagebrush habitat (Connelly and Braun 1997; Leonard et al. 2000;
24 Aldridge et al. 2008).

25 The Federal Land Policy and Management Act of 1976 (FLPMA) directs the United States
26 (US) Department of the Interior, Bureau of Land Management (BLM) to develop and
27 periodically revise or amend its Land Use Plans (LUPs), which guide management of BLM-
28 administered lands. The National Forest Management Act of 1976 (NFMA) directs the US
29 Department of Agriculture (USDA) Forest Service to develop and periodically revise or
30 amend its Land and Resource Management Plans (LRMPs), which guide management of
31 National Forest System lands. For the purpose of this document, the term LUP applies to all
32 BLM Resource Management Plans (RMPs) and older Management Framework Plans
33 (MFPs) and Forest Service LRMPs.

34 This plan amendment effort is the result of the July 2011, BLM National Greater Sage-
35 Grouse Planning Strategy (Strategy) (BLM 2011). The Strategy responds to the March 2010,
36 US Fish and Wildlife Service (USFWS) *12-Month Finding for Petitions to List the Greater Sage-
37 Grouse (Centrocercus urophasianus) as Threatened or Endangered* (75 Federal Register [FR] 13910,
38 March 23, 2010) (2010 Finding). In the 2010 Finding, the USFWS concluded that GRSG
39 was “warranted, but precluded” for listing as a threatened or endangered species. The
40 USFWS reviewed the status and threats to GRSG in relation to the five Listing Factors

Figure 1-1 Greater Sage-Grouse Distribution

1 provided in Section 4(a)(1) of the Endangered Species Act (ESA). Of the five Listing Factors
2 reviewed, the USFWS determined that Factor A, “*the present or threatened destruction, modification,*
3 *or curtailment of the habitat or range of the Greater Sage-Grouse,*” and Factor D, “*the inadequacy of*
4 *existing regulatory mechanisms*” posed “*a significant threat to the Greater Sage-Grouse now and in the*
5 *foreseeable future*” (USFWS 2010) (emphasis added). The USFWS identified the conservation
6 measures in LUPs as the principal regulatory mechanisms for the BLM and Forest Service.

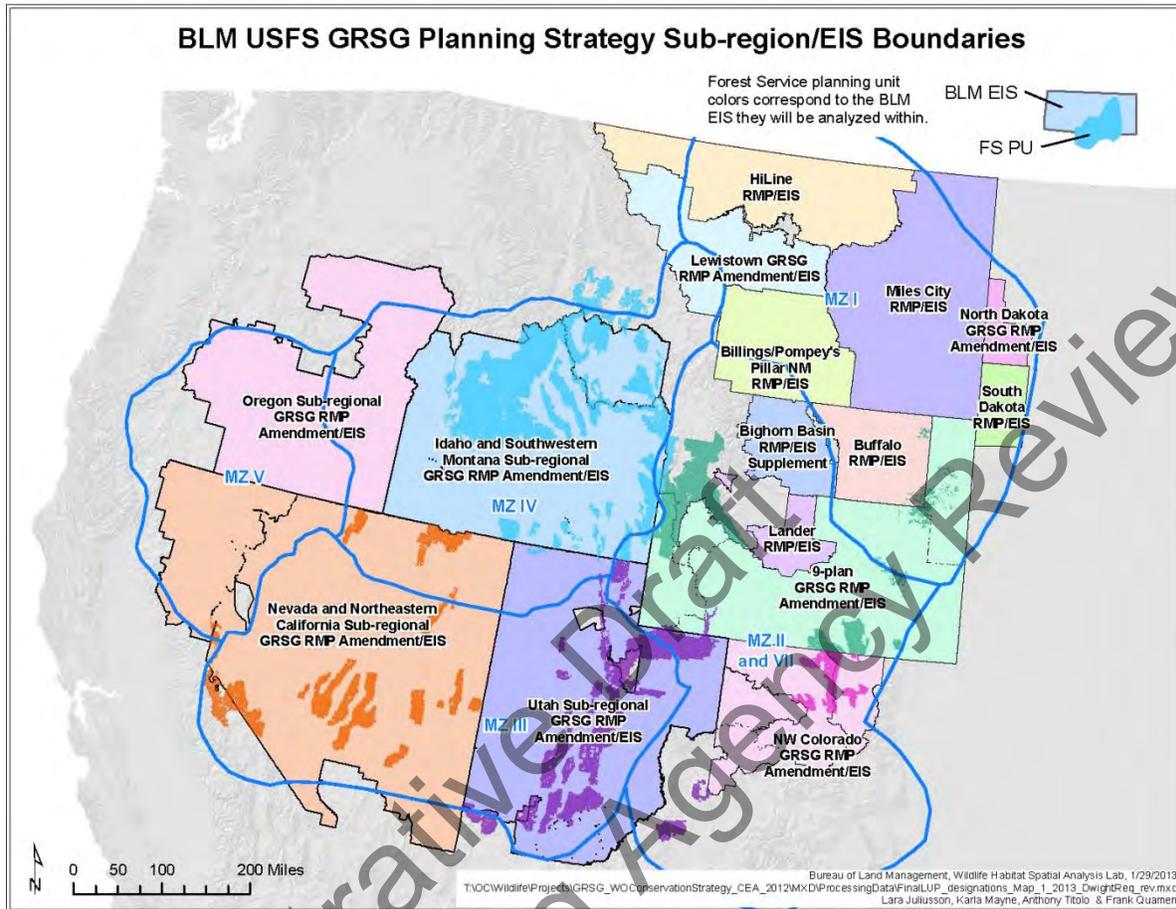

7 In response to the USFWS findings, the BLM and Forest Service intend to prepare plan
8 amendments with associated Environmental Impact Statements (EISs) to incorporate
9 specific conservation measures across the range of the GRSG, consistent with national BLM
10 and Forest Service policy. The planning strategy will evaluate the adequacy of BLM and
11 Forest Service LUPs and address, as necessary, amendments throughout the range of the
12 GRSG (with the exception of the bi-state population in California and Nevada and the
13 Washington State distinct population segment, which will be addressed through other
14 planning efforts). The BLM is the lead agency and the FS is a cooperating agency in
15 developing these EISs. These EISs have been coordinated under two administrative
16 planning regions: the Rocky Mountain Region and the Great Basin Region. These regions
17 are drawn roughly to correspond with the threats identified by the FWS in the 2010 listing
18 decision, along with the Western Association of Fish and Wildlife Agencies (WAFWA)
19 Management Zones framework (National Sage-grouse Conservation Planning Framework
20 Team, December 2006). Stiver et al. (2006) delineated seven GRSG Management Zones,
21 based on the distribution of 41 GRSG populations and 7 floristic provinces to guide general
22 conservation goals and rangewide management within the range of the species. More
23 detailed site-specific data, such as for seasonal habitats, vegetation characteristics, and related
24 factors are more appropriately addressed in finer scale planning efforts or activities.

25 The Rocky Mountain Region comprises LUPs in the states of Montana, North Dakota,
26 South Dakota, Wyoming, Colorado, and portions of Utah. This region comprises the
27 WAFWA Management Zones I (Great Plains), II (Wyoming Basin), and a portion of VII
28 (Colorado Plateau). The USFWS has identified a number of threats in this region, the major
29 ones being habitat loss and fragmentation caused by development (e.g., oil and gas
30 development, energy transmission, and wind energy development).

31 The Great Basin Region comprises LUPs in California, Nevada, Oregon, Idaho, and
32 portions of Utah and Montana. This region comprises the WAFWA Management Zones III
33 (Southern Great Basin), IV (Snake River Plain), and V (Northern Great Basin). The USFWS
34 has identified a number of threats in this region, the major ones being wildfire, loss of native
35 habitat to invasive species, and habitat fragmentation.

36 Both the Rocky Mountain and Great Basin regions are further divided into sub-regions,
37 which is the level of this National Environmental Policy Act of 1969, as amended (NEPA)
38 analysis. These sub-regions are generally based on the identified threats to the GRSG and
39 the WAFWA Management Zones (see **Figure 1-2**, BLM USFS GRSG Planning Strategy
40 Sub-region/EIS Boundaries, showing the sub-regional boundaries and WAFWA
41 Management Zones).

Figure 1-2
BLM USFS GRSG Planning Strategy Sub-region/EIS Boundaries

1 On December 9, 2011, a Notice of Intent was published in the Federal Register to initiate
2 the amendment of LUPs across nine western states, including California, Oregon, Nevada,
3 Idaho, Utah, and Southwest Montana in the Great Basin Region and Northwest Colorado,
4 Wyoming, Montana, South Dakota, and North Dakota in the Rocky Mountain Region. This
5 Idaho and Southwestern Montana Sub-Regional Plan Amendment and EIS is one of fifteen
6 separate EISs that are currently being conducted to analyze and incorporate specific
7 conservation measures across the range of the GRSG, consistent with National BLM and
8 Forest Service policy. A goal of all such LUPAs is to ensure consistency of goals objectives
9 and management actions, to the extent practicable, across the region, as well as across the
10 range of the GRSG.

11 On December 27, 2011, the BLM Washington Office released Instructional Memorandum
12 (IM) No. 2012-044, *BLM National Greater Sage-Grouse Land Use Planning Strategy*. This IM
13 provides direction to all of the planning efforts across the GRSG range to consider all
14 applicable conservation measures when revising or amending its LUPs in GRSG habitat,
15 including the measures developed by the NTT that were presented in the December 2011

document – *A Report on National Greater Sage-Grouse Conservation Measures* (NTT Report), included as Attachment 1 of the IM. The IM also directs the inclusion and refinement of preliminary priority habitat (PPH) and preliminary general habitat (PGH) to be used in applying the conservation measures included in the NTT Report. The conservation measures developed by the NTT, should be considered in the land use planning process. The NTT report provides the latest science and best biological judgment, as of December 2011, to assist in making management decisions relating to the GRSG. The IM requires that the BLM consider all applicable conservation measures developed by the NTT when revising or amending its RMPs in GRSG habitat.

To augment this planning document at a biologically meaningful scale for GRSG, a Baseline Environmental Report (BER) for GRSG was produced by the US Geological Survey (USGS) for the BLM and Forest Service (Manier et al. 2013). The BER is a science support document that provides information to provide context for the individual planning units and issues within the larger WAFWA GRSG MZs. The BER examines each threat identified in the USFWS listing decision and summarizes the current scientific understanding of various impacts on GRSG populations and habitats. When available, the BER also identifies patterns, thresholds, indicators, metrics, and measured responses that quantify the impacts of each specific threat.

The Draft EIS included six alternatives that mapped GRSG habitat using different habitat classification schemes (**Table 1-1**).

Table 1-1
Crosswalk between Habitat Classifications in the Draft and Final EIS

Alternative	DEIS Habitat Classification	FEIS Habitat Classification
Alternative A	Preliminary Priority Habitat (PPH)	Priority Habitat Management Area (PHMA)
	Preliminary General Habitat (PGH)	General Habitat Management Area (GHMA)
Alternative B	Preliminary Priority Management Area (PPMA)	Priority Habitat Management Area (PHMA)
	Preliminary General Management Area (PGMA)	General Habitat Management Area (GHMA)
Alternative C	Preliminary Priority Management Area (PPMA)	Priority Habitat Management Area (PHMA)
Alternative D	Preliminary Priority Management	Priority Habitat Management Area

Table 1-1		
Crosswalk between Habitat Classifications in the Draft and Final EIS		
Alternative	DEIS Habitat Classification	FEIS Habitat Classification
	Area (PPMA)	(PHMA)
	Preliminary Medial Management Area (PMMA)	Important Habitat Management Area (IHMA)
	Preliminary General Management Area (PGMA)	Priority Habitat Management Area (PHMA)
Alternative E	Idaho Core Habitat Zone (CHZ)	Priority Habitat Management Area (PHMA)
	Montana Preliminary Priority Management Area (PPMA)	
	Utah Sage-grouse Management Area (SGMA)	
	Idaho Important Habitat Zone (IHZ)	Important Habitat Management Area (IHMA) – Idaho only
Alternative F	Idaho General Habitat Zone (GHZ)	General Habitat Management Area (GHMA)
	Montana Preliminary General Management Area (PGMA)	
	Preliminary Priority Management Area (PPMA)	
Alternative F	Preliminary General Management Area (PGMA)	General Habitat Management Area (GHMA)
	Preliminary Restoration Management Area (PRMA)	Occur within General or Important Habitat Management Area (GHMA; IHMA)

3
4

The Proposed Plan uses a three-tiered habitat classification system: Priority Habitat Management Areas (PHMA) Important Habitat Management Areas (IHMA) and General Habitat Management Areas (GHMA).

1 **Priority Habitat Management Areas (PHMAs)** focus on conserving the two key meta-
2 populations in the sub-region. These meta-populations consist of a large aggregation of
3 interconnected breeding subpopulations of GRSG that have the highest likelihood of long-
4 term persistence. PHMAs include adequate area to accommodate continuation of existing
5 land uses and landowner activities.

6 **Important Habitat Management Areas (IHMAs)** contain additional habitat and
7 populations that provide a management buffer for the PHMA and to connect patches of
8 PHMA. IHMAs are typically adjacent to PHMAs but generally reflect somewhat lower
9 GRSG population status and/or reduced habitat value due to disturbance, habitat
10 fragmentation or other factors. There are no IHMAs designated within the Southwestern
11 Montana Conservation Area.

12 **General Habitat Management Areas (GHMAs)** encompass habitat that is outside of
13 PHMAs or IHMAs. GHMAs contain approximately 10 percent of the occupied leks that are
14 also of relatively low male attendance compared to leks in PHMA or IHMA. GHMAs are
15 generally characterized by lower quality disturbed or patchy habitat of low lek connectivity.

16 **1.1.1 Forest Service Involvement**

17 The Forest Service is a cooperating agency with the BLM as part of the BLM GRSG
18 Planning Strategy. Across the range of the GRSG the Forest Service manages approximately
19 8 percent of the total GRSG habitat. Combined with the approximately 52 percent managed
20 by the BLM, both agencies manage approximately 60 percent of GRSG habitat across its
21 range (Knick 2011).

22 The Forest Service has partnered with the BLM to help complete the LUPAs and EISs to
23 implement the Strategy. As part of the initial Notice of Intent published in the Federal
24 Register on December 9, 2011, numerous Forest Service LUPs were identified to be
25 amended through this combined effort. After further evaluation a Notice of Correction was
26 published in the Federal Register on February, 10, 2012, which added several additional
27 Forest Service LUPs to the list of plans to be amended through this process.

28 The Forest Service “Interim Conservation Recommendations for Greater Sage-Grouse and
29 Greater Sage-Grouse Habitat” (Forest Service Washington Office [WO] 2600 Memo,
30 October 2, 2012) provides interim recommendations for GRSG and habitat management in
31 Forest Service Regions 1, 2, and 4, on the 20 Forest Service units involved in the GRSG land
32 use planning process. These recommendations are applicable until interim directives are
33 adopted or until the amendment for the LUP unit is completed (77 *Federal Register* 12792;
34 March 2, 2012). The recommendations identify considerations for project decision-making
35 as well as existing direction and legal requirements that may be relevant to Forest Service
36 management of GRSG habitat. The recommendations do not supersede more protective
37 conservation measures in existing LUPs. The goal is to promote consistency in management
38 of activities on National Forest System lands with guidance in the BLM IM No. 2012-043,
39 Greater Sage-Grouse Interim Management Policies and Procedures (December 22, 2011).

1 The Forest Service has structured its planning effort in a manner similar to the BLM
2 Strategy, with involvement at the national, regional and sub-regional levels, as described in
3 detail in **Section 1.1.1**. Since December 2011, the BLM and Forest Service have been
4 working jointly through scoping, issue and alternative development, effects analysis and
5 document completion. At the culmination of this process, the Forest Service intends to issue
6 a separate Record of Decision (ROD) to amend or revise (if needed) Forest Service LUPs.

7 **1.1.2 USFWS Involvement**

8 The USFWS is a cooperating agency with the BLM as part of this Strategy. The USFWS is
9 ultimately responsible for the evaluation and findings regarding potential ESA listing of the
10 GRSG. The 2010 Finding indicated that GRSG is warranted for listing but precluded by
11 higher priority listing actions (“warranted but precluded”), this designation places the GRSG
12 on the federal list of candidate species.

13 ***GRSG Conservation Objectives: Priority Areas for Conservation and How They*** 14 ***Correlate with Priority and General Habitat Management Areas***

15 In 2012, the Director of the USFWS asked the Conservation Objectives Team (COT),
16 consisting of state and USFWS representatives, to produce recommendations regarding the
17 degree to which the threats need to be reduced or ameliorated to conserve GRSG so that it
18 would no longer be in danger of extinction or likely to become in danger of extinction in the
19 foreseeable future. The COT Report (USFWS 2013a) provides objectives based upon the
20 best scientific and commercial data available at the time of its release. The BLM and Forest
21 Service planning decisions analyzed in the LUP/EISS are intended to ameliorate threats
22 identified in the COT report and to reverse the trends in habitat condition. The COT Report
23 can be viewed online at the following address:

24 [http://www.fws.gov/mountain-prairie/species/birds/sagegrouse/COT/COT-Report-with-
Dear-Interested-Reader-Letter.pdf](http://www.fws.gov/mountain-prairie/species/birds/sagegrouse/COT/COT-Report-with-
25 Dear-Interested-Reader-Letter.pdf)

26 The highest level objective in the COT Report is identified as meeting the objectives of
27 WAFWA’s 2006 GRSG Comprehensive Strategy of “reversing negative population trends
28 and achieving a neutral or positive population trend.”

29 The COT Report provides a WAFWA Management Zone and Population Risk Assessment.
30 The report identifies localized threats from sagebrush elimination, fire, conifer
31 encroachment, weed and annual grass invasion, mining, free-roaming wild horses and
32 burros, urbanization, and widespread threats from energy development, infrastructure,
33 grazing, and recreation (USFWS 2013a, p. 18).

34 Key areas across the landscape that are considered “necessary to maintain redundant,
35 representative, and resilient populations” are identified within the COT Report. The USFWS
36 in concert with the respective state wildlife management agencies identified these key areas
37 as Priority Areas for Conservation (PACs).

38 Within the Idaho and southwestern Montana sub-region, the PACs consist of a total
39 11,232,800 acres. Under the Proposed Plan, the PACs are comprised of 7,111,200 acres of

1 PHMA managed by the BLM and Forest Service, 3,489,400 acres of IHMA managed by the
2 BLM and Forest Service, 272,400 acres of GHMA managed by the BLM and Forest Service,
3 and 359,900 acres of non-habitat managed by the BLM and Forest Service.

4 On October 27, 2014, the USFWS provided the BLM and Forest Service a memorandum
5 titled "[Greater Sage-Grouse: Additional Recommendations to Refine Land Use Allocations
6 in Highly Important Landscapes](#)". The memorandum and associated maps provided by the
7 USFWS identify areas that represent recognized "strongholds" for GRSG that have been
8 noted and referenced as having the highest densities of GRSG and other criteria important
9 for the persistence of the species. The USFWS did recognize areas within the Idaho and
10 Southwestern Montana planning area as "strongholds" for GRSG.

11 **1.1.3 Other Federal Agency Involvement**

12 On November 21, 2014 the USGS published "Conservation Buffer Distance Estimates for
13 Greater Sage-Grouse—A Review" (USGS 2014). The USGS review provided a compilation
14 and summary of published scientific studies that evaluate the influence of anthropogenic
15 activities and infrastructure on GRSG populations. The BLM has reviewed this information
16 and examined how lek buffer-distances were addressed through land use allocations and
17 other management actions in the Draft Idaho and Southwestern Montana Sub-Region
18 GRSG LUPA/EIS. Based on this review, in undertaking BLM management actions, and
19 consistent with valid and existing rights and applicable law in authorizing third party actions,
20 the BLM will apply the lek buffer-distances in the USGS Report "Conservation Buffer
21 Distance Estimates for Greater Sage Grouse-A Review (Open File Report 2014-1239)" in
22 GHMA, IHMA, and PHMA as detailed in **Appendix DD**.

23 **1.1.4 State Government and Wildlife Agencies Involvement**

24 The various state wildlife agencies are involved in the BLM GRSG planning strategy as
25 cooperating agencies and are involved with the RMTs and the Sub-Regional interdisciplinary
26 teams. While working to help develop the EIS, the states of Idaho and Utah have also
27 worked through their own authorities and processes to develop state plans to be included as
28 alternatives in the BLM GRSG Planning Strategy as a potential approach to management for
29 consideration by the BLM and Forest Service.

Figure 1-3 USFWS Priority Areas for Conservation with Preliminary Priority and General Habitat

Administrative Draft
Cooperating Agency Review

1 The Governor of the State of Montana issued Executive Order 10-2014 which created the
2 Montana Sage Grouse Oversight Team and the Montana Sage Grouse Habitat Conservation
3 Program. The executive order outlines a number of conservation strategies for state agencies
4 to follow for land uses and activities in GRSG habitat in addition to establishing the
5 Montana Sage Grouse Oversight Team and habitat conservation program. The State
6 conservation efforts are complimentary to the conservation measures proposed in the BLM
7 land use plans and when combined would provide conservation efforts across land
8 ownership boundaries.

9 **1.1.5 Idaho and Southwestern Montana Sub-Region**

10 The BLM Idaho and Montana state offices and Forest Service Beaverhead-Deerlodge, Boise,
11 Caribou, Challis, Salmon, Sawtooth, and Targhee national forests and Curlew National
12 Grassland are preparing the Idaho and Southwestern Montana Sub-Regional EIS. This is to
13 consider amending up to 29 LUPs to incorporate conservation measures into the
14 management of GRSG habitat for all included BLM-administered and National Forest
15 System lands (**Figure 1-4**). This planning area is the geographic area within which the BLM
16 and Forest Service will provide direction during this planning effort, and the planning area
17 boundary includes all lands regardless of jurisdiction. For this EIS, the planning area is the
18 entire sub-region (**Figure 1-4**). Lands addressed in the LUPA will be BLM-administered and
19 National Forest System lands (including surface-estate and split-estate lands) in GRSG
20 habitats. Any direction provided in the LUPA will apply only to federal lands or mineral
21 estate administered by either the BLM or the Forest Service. The LUPA will be limited to
22 providing land use direction specific to the conservation of GRSG and their habitat. The
23 proposed LUPA is intended to identify and incorporate appropriate regulatory mechanisms
24 to maintain, enhance, and restore GRSG habitat. It also is intended to eliminate, reduce, or
25 minimize threats to GRSG priority and general habitats on BLM-administered and National
26 Forest System lands in the Idaho and Southwestern Montana Sub-region. The proposed
27 LUPA addresses both ESA Listing Factors A and D (see Section 1.1 above) and is intended
28 to provide consistency in the management of GRSG habitats across Idaho and Southwestern
29 Montana Sub-region BLM and Forest Service offices. The LUPs identified in **Table 1-2**,
30 BLM and Forest Service Land Use Plans Proposed for Amendment, are proposed to be
31 amended during this effort to incorporate appropriate conservation measures. The Butte
32 RMP is not identified in **Table 1-2** and is not going to be amended due to the limited extent
33 and quality of GRSG habitat present within the Butte Field Office; however, the area
34 covered by the Butte RMP will be considered as part of the effects analysis described in
35 **Chapter 4**.

1.2 Purpose and Need

The BLM and the Forest Service are preparing a LUPA with associated EIS for LUPs containing GRSG habitat. This effort responds to the USFWS’s 2010 Finding which identified inadequacy of regulatory mechanisms as a significant threat. The USFWS identified the principal regulatory mechanisms for the BLM and Forest Service as conservation measures embedded in LUPs. Changes in management of GRSG habitats are necessary to avoid the continued decline of populations that are anticipated across the species’ range. These plan amendments will focus on areas affected by threats to the GRSG habitat identified by the USFWS in the 2010 Finding. Within the Idaho and Southwestern Montana Sub-region the primary threats to GRSG include habitat loss and fragmentation due to increased occurrence of wildfire, expansion of invasive species, human development and infrastructure. **Table 1-3**, Identified Threats to Greater Sage-Grouse , lists the threats, in order of priority, that have been identified across the GRSG range and specifically within Idaho and Montana. At the local scale, the relative risk of these threats may differ. For example, even though the USFWS at the national level, the State of Idaho at the state level, and the Challis Local Working Group (LWG) at the local level have identified predation as a lower threat, the Custer County Board of Commissioners has identified excessive predation as the greatest threat to GRSG within Custer County (see **Appendix R**).

**Table 1-3
Identified Threats to Greater Sage-Grouse**

USFWS 2010 Finding	2006 Idaho GRSG Conservation Plan	2005 Montana GRSG Management Plan
Invasive Species	Wildfire	Fire
Infrastructure	Infrastructure	Harvest management
Fire	Annual Grassland	Livestock grazing management
Agriculture	Livestock Impacts	Noxious weed management
Grazing	Human Disturbance	Mining and energy development
Oil and Gas	West Nile Virus	Outreach, education, and implementation;
Urbanization	Prescribed Fire	Power lines and generation facilities
Mining	Seeded Perennial Grassland	Predation
Conifer Invasion	Climate Change	Recreational disturbance of GRSG
Predation	Conifer Encroachment	Roads and motorized vehicles
Disease	Isolated Populations	Vegetation
Water Development	Predation	Other wildlife
Hunting	Urban/Exurban Development	
Climate Change	Sagebrush Control	
	Insecticides	
	Agricultural Expansion	
	Sport Hunting	
	Mines/Landfills/Gravel Pits	
	Falconry	

20 Source: USFWS 2010a; Idaho Sage-Grouse Advisory Committee 2006; Montana Sage-Grouse Work Group 2005

1
2 The purpose of the LUPA is to identify and incorporate appropriate conservation measures
3 into LUPs to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or
4 minimizing threats to that habitat. The BLM will consider such measures in the context of its
5 multiple-use mandate under the Federal Land Policy and Management Act (FLPMA).
6 Because the BLM and Forest Service administer a large portion of the GRSG habitat within
7 the affected states, changes in BLM and Forest Service management of GRSG habitats are
8 anticipated to have a considerable beneficial impact on present and future GRSG
9 populations.

10 **1.3 Description of the Greater Sage-Grouse Planning Area**

11 **1.3.1 Overview**

12 The Idaho and Southwestern Montana Sub-region includes BLM-administered and National
13 Forest System lands in Idaho and southwestern Montana, excluding the Idaho panhandle
14 (**Figure 1-3** and **Table 1-4**, Acres of GRSG Habitat by Surface Management). The specific
15 field offices and national forests included in the planning area are: Bruneau Field Office,
16 Burley Field Office, Challis Field Office, Four Rivers Field Office, Jarbidge Field Office,
17 Owyhee Field Office, Pocatello Field Office, Salmon Field Office, Shoshone Field Office,
18 Upper Snake Field Office, Boise National Forest, Caribou-Targhee National Forest, Curlew
19 National Grassland, Salmon-Challis National Forest, and Sawtooth National Forest in Idaho;
20 and Butte Field Office, Dillon Field Office, and Beaverhead-Deerlodge National Forest in
21 southwest Montana. The Idaho and Southwestern Montana Sub-region also includes the
22 portion of the Sawtooth National Forest located within Box Elder County in Utah, and the
23 maps of the Idaho and Southwestern Montana Greater Sage-Grouse LUPA will display these
24 lands as part of the planning area. The acres of GRSG habitat by county is displayed in
25 **Table 1-5**, Acres of GRSG Habitat by County .

26 There are approximately 77,800 acres of BLM-administered lands in Elko County, Nevada,
27 located north of the Humboldt-Toiyabe National Forest and south of the Idaho-Nevada
28 state line adjacent to the Bruneau and Jarbidge Field Offices in Idaho. For purposes of the
29 GRSG LUPAs in Idaho and in Nevada, planning for these lands will occur through the
30 Nevada and Northeastern California Greater Sage-Grouse LUPA, and the regulatory
31 measures and direction that are put in place for the GRSG through the ROD will be
32 implemented and administered by the Jarbidge and Bruneau Field Offices in Idaho.
33 Therefore, the decision and planning areas for the Idaho and Southwestern Montana Greater
34 Sage-Grouse LUPA end at the Idaho/Nevada state line and will not include lands in
35 Nevada; however, maps will continue to include these Nevada lands as part of the Idaho and
36 Southwestern Montana Sub-region based on the recognized administrative boundary.

37 PPH and PGH have been delineated as defined by BLM IM No. 2012-043 for both Idaho
38 and Montana. Although slightly different processes were used to delineate these areas the
39 habitat described is analogous and will be discussed in conjunction for the purposes analysis.
40 In Idaho, PPH and PGH were identified based on a model incorporating sage-grouse
41 breeding bird density and lek connectivity models, informed with additional ancillary broad
42

Table 1-4
Acres of GRSG Habitat by Surface Management

Surface Land Management	Acres PPH	Acres PGH	Acres Outside Habitat	Total Acres
BLM Total	7,272,100	1,971,800	3,205,100	12,449,000

¹Acres included are within the planning area. Acres for counties that extend beyond the planning area only reflect those acres within the county and within the planning area. Counties which do not contain any federal PPH or PGH are not included in the table.

²Acreage totals may not match other tables exactly, as a result of rounding errors and GIS overlay offsets.

1

³Only acres for the Sawtooth National Forest that are located in Box Elder County are included; therefore, the only county acres contained in the Idaho and southwestern Montana Sub-region are those administered by the Sawtooth National Forest.

1 scale habitat data, seasonal habitat maps, connectivity information, expert opinion,
2 population persistence model, local priority areas and agriculture and conifer filters (Makela
3 and Major 2012).

4 In Montana, PPH was delineated based on Montana Fish, Wildlife, and Park's (MFWP)
5 modeling of GRSG Core Areas using a model based on male lek attendance and refined with
6 seasonal habitat, telemetry, connectivity information and field review; occupied habitats not
7 identified as Core Areas were delineated as PGH (MFWP 2009).

8 Through this land use planning process, the BLM and Forest Service continue to refine PPH
9 and PGH data to: (1) identify priority habitat and analyze actions within priority habitat to
10 conserve GRSG habitat functionality, and/or where appropriate, improve habitat
11 functionality, and (2) identify general habitat and analyze actions within general habitat that
12 provide for major life history function (e.g., breeding, migration, or winter survival) in order
13 to maintain genetic diversity needed for sustainable GRSG populations.

14 While PPH and PGH delineations reflect a relatively broad characterization of habitat
15 priorities at the landscape scale, there may be variations or discrepancies locally due to the
16 nature of the modeling involved. For purposes of this planning effort, the April 2012 map
17 (Makela and Major 2012) provides a common basis for comparing baseline conditions and
18 impacts analysis for each alternative on GRSG habitat in the sub-region. For the remainder
19 of this document, PPH and PGH refer to the areas identified in the April 2012 map of
20 GRSG habitat (**Figure 1-4**).

21 The vast majority of the Idaho and Southwestern Montana Sub-region lies within WAFWA
22 Management Zone (MZ) IV (Stiver et al. 2006). A small portion of southeastern Idaho is
23 within MZ II and is associated with the Wyoming Basin population. Within the sub-region,
24 GRSG occupy all or portions of ten population areas described in Connelly et al (2004;
25 **Figure 1-5**, Idaho and Southwestern Montana Greater Sage-Grouse Population Areas). Two
26 populations (Great Basin Core, Wyoming Basin) occupy habitat in adjacent states. Habitat
27 mapping has been coordinated across state boundaries.

28 The distribution of GRSG is closely aligned with the distribution of sagebrush-dominated
29 landscapes (Schroeder et al. 2004). In the sub-region, large expanses of sagebrush still occur
30 in portions of southwestern and south-central Idaho, in association with the Great Basin
31 Core population shared with Nevada, Oregon, and Utah, as well as in portions of the Snake-
32 Salmon-Beaverhead population north of the Snake River.

33 At broad scales, PPH and PGH encompass areas of intact sagebrush, suitable for GRSG
34 habitat needs. PPH and PGH may also contain inclusions of conifer encroachment and
35 perennial grass dominated areas, generally occupied by GRSG or potentially suitable for
36 future restoration. At finer scales, PPH and PGH encompass areas of intact suitable
37 sagebrush habitat that is generally occupied by GRSG, as well as areas of conifer expansion
38 and perennial grassland potentially suitable for future restoration.

Figure 1-5 Idaho and Southwestern Montana Greater Sage-Grouse Population Areas

1 If current trends in wildfire, populations and habitat activities continue, then populations of
2 sage-grouse in MZ IV are estimated to decline by 55 percent between 2007 and 2037, and by
3 66 percent in MZ II (USFWS 2010, citing unpublished version of Garton et al. 2011).
4 Modeling suggests that if current conditions and trends continue, at least 13 percent of the
5 GRSG populations may decline below effective population sizes of 50 within the next 30
6 years and at least 75 percent of the populations may decline below effective population sizes
7 of 500 within the next 100 years (Garton et al. 2011).

8 **1.3.2 Land Uses**

9 Land uses occurring within GRSG habitat on BLM-administered and National Forest
10 System lands in the Idaho and Southwestern Montana Sub-region are livestock grazing and
11 associated infrastructure; rights-of-way (ROWs) for a variety of linear and site-type facilities;
12 travel and recreation; off-highway vehicle (OHV) use; energy (nonrenewable, renewable, and
13 geothermal), mineral development (including hardrock and phosphate mining); and
14 geothermal leasing, exploration, and development.

15 These uses generally occur throughout the planning area to varying degrees. For example
16 phosphate leasing is typically confined to southeast Idaho and oil and gas leasing typically
17 occurs in the eastern portion of the sub-region. Livestock grazing occurs throughout the
18 sub-region as do recreation, OHV use and various ROW authorizations for linear and site-
19 type facilities.

20 **1.4 Planning Process**

21 **1.4.1 BLM Planning Process**

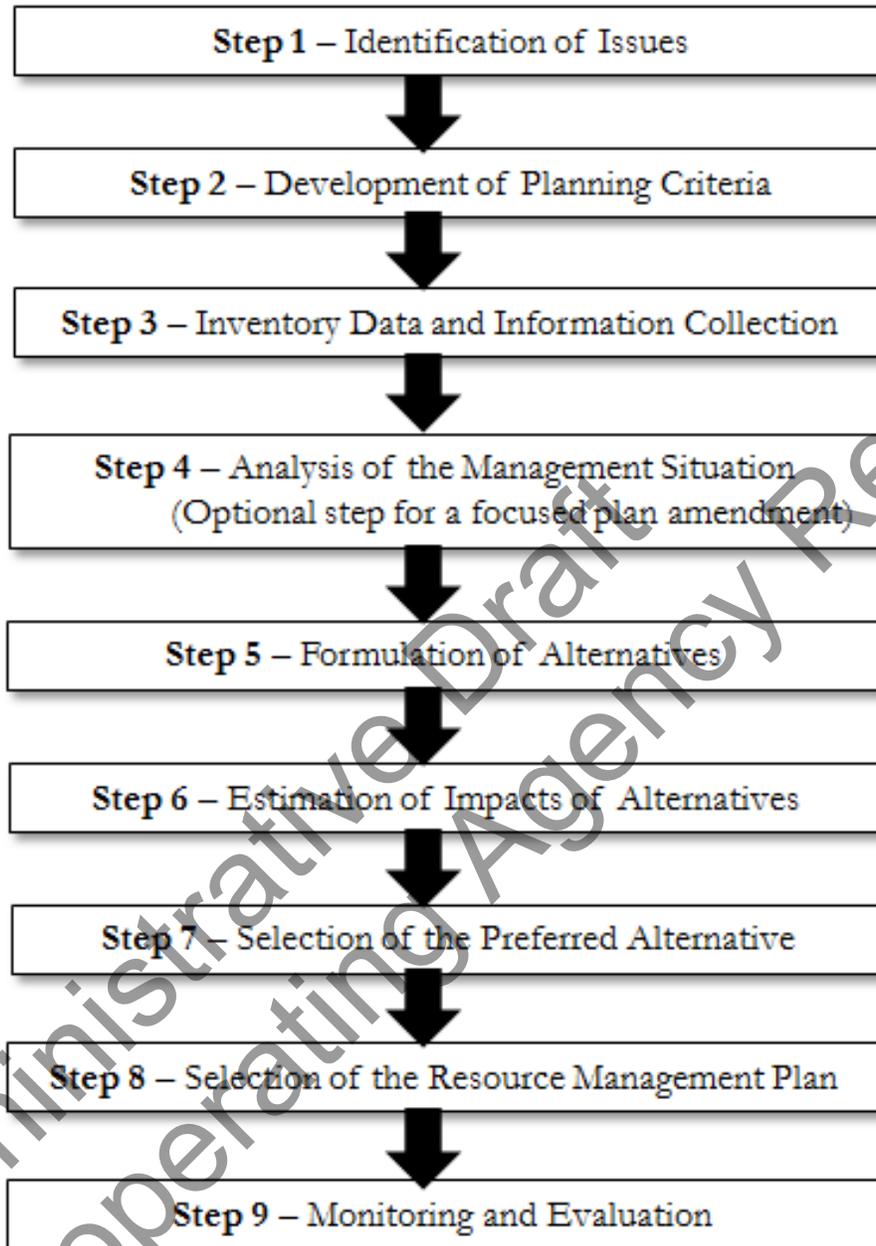

22 FLPMA requires the BLM to use RMPs as tools by which "present and future use is
23 projected" (43 United States Code [USC] 1701(a)(2)). FLPMA's implementing regulations for
24 planning (43 Code of Federal Regulations [CFR] Part 1600), state that LUPs are a
25 preliminary step in the overall process of managing public lands "designed to guide and
26 control future management actions and the development of subsequent, more detailed and
27 limited scope plans for resources and uses" (43 CFR 1601.0-2). Public participation and
28 input are important components of land use planning.

29 Under BLM regulations, an RMP revision or amendment of an existing plan is a major
30 federal action requiring disclosure and documentation of environmental effects as described
31 in the NEPA. Thus, this EIS accompanies the amendment of the existing RMPs (**Table 1-**
32 **2**). This EIS analyzes the impacts of six alternatives for the Idaho and Southwestern
33 Montana Sub-region LUPA, including the No Action Alternative. The science used to
34 analyze these impacts is current through August 2013.

35 The BLM uses a nine-step planning process (**Figure 1-6**, BLM Nine Step Planning Process)
36 to develop or revise RMPs (43 CFR Part 1600 and planning program guidance in the BLM
37 Handbook H-1601-1, Land Use Planning Handbook (BLM 2005a)). The planning process is
38 designed to help the BLM identify the uses of BLM-administered lands desired by the public
39

Figure 1-6
BLM Nine Step Planning Process

Source: 43 CFR 1610.4

1 and to consider these uses to the extent they are consistent with the laws established by
2 Congress and the policies of the executive branch of the federal government.

3 Once an RMP is approved, it may be changed through amendment. An amendment can be
4 initiated in response to monitoring and evaluation findings, new data, new or revised policy,
5 a change in circumstances or a proposed action that may result in a change in the scope of
6 resource uses or a change in the terms, conditions, and direction provided in the approved
7 plan. If the BLM decides to prepare an EIS, the amending process shall follow the same
8 procedure required for preparation and approval of the plan, but the focus shall be limited to
9 that portion of the plan being amended (43 CFR 1610.5-5).

10 As depicted in **Figure 1-6**, the planning process is issue-driven (Step 1). The planning
11 process is undertaken to resolve management issues and problems as well as to take
12 advantage of management opportunities. The BLM uses the public scoping process to
13 identify planning issues to direct (drive) the revision or amendment of an existing plan. The
14 scoping process is also used to introduce the public to preliminary planning criteria, which
15 set the parameters or "sideboards" for conducting the planning process (Step 2).

16 The BLM uses existing data from files and other sources and collects new data to address
17 planning issues and to fill data gaps identified during public scoping (Step 3). Using these
18 data, information concerning the resource management programs, and the planning criteria,
19 the BLM completes an Analysis of the Management Situation (AMS) (Step 4) to describe
20 current management and develop or inform the affected environment portion of the LUP.
21 Typically, the AMS is conducted at the outset of planning for an entire LUP or LUP revision
22 and is incorporated by reference into development of a single focus plan amendment. AMSs
23 are required for plan revisions but not necessarily for plan amendments, and an AMS has not
24 been completed specific to this sub-regional planning effort. In this case, direction for the
25 plan amendment is provided through national policy (BLM IM 2012-044).

26 Results of the first four steps of the planning process clarify the purpose and need and
27 identify key planning issues that need to be addressed by the amendment. Key planning
28 issues reflect the focus of the LUP amendment and are described in more detail in **Section**
29 **1.5.2, Issues Identified for Consideration in the Idaho and Southwestern Montana Sub-**
30 **Region.**

31 Alternatives constitute a range of management actions that set forth different priorities and
32 measures to emphasize certain uses or resource values over other uses or resource values
33 (usually representing a continuum from extraction and development to
34 preservation/conservation) pursuant to the multiple-use and sustained yield mandate, so as
35 to achieve certain goals or objectives consistent with the purpose and need. During
36 alternative formulation (Step 5), the BLM collaborates with cooperating agencies to identify
37 goals and objectives (desired outcomes) for resources and resource uses within the planning
38 area. The alternatives represent a reasonable range of planning strategies for managing
39 resources and resource uses. Chapter 2 of the DEIS, Alternatives, describes and summarizes
40 the Preferred Alternative and the other draft alternatives considered in detail.

1 The draft LUPA/EIS also includes an analysis of the impacts of the Preferred Alternative
2 and the other draft alternatives in Chapter 4, Environmental Consequences (Step 6). With
3 input from cooperating agencies and BLM specialists, and consideration of planning issues,
4 planning criteria, and the impacts of alternatives, the BLM identifies and recommends a
5 preferred alternative from among the alternatives presented in the EIS (Step 7). This is
6 documented in the draft LUPA/EIS, which is then distributed for a 90-day public review
7 and comment period.

8 Following receipt and consideration of public comments on the draft LUPA/EIS and in
9 preparation of the Proposed LUPA/Final EIS, the BLM considers all comments it receives
10 during the public comment period (Step 8). This Proposed LUPA has been crafted, in whole
11 or in part, from components of the draft alternatives. It amends plans on final approval of
12 the Record of Decision.

13 Monitoring, the repeated measurement of activities and conditions over time, and evaluation,
14 in which the plan and monitoring data are reviewed to see if management goals and
15 objectives are being met and if management direction is sound, are components of plan
16 implementation (Step 9). Monitoring data gathered over time are examined and used to draw
17 conclusions on whether management actions are meeting stated objectives, and if not, why.
18 Conclusions are then used to make recommendations on whether to continue current
19 management or what changes need to be made in management practices to meet objectives.

20 The two types of monitoring of the planning process include implementation and
21 effectiveness monitoring. Land use plan monitoring is the process of (1) tracking the
22 implementation of land use planning direction and (2) collecting and assessing
23 data/information necessary to evaluate the effectiveness of land use planning direction. The
24 two types of monitoring are described below.

25 **Implementation Monitoring:** Implementation monitoring is the most basic type of
26 monitoring and simply determines whether planned activities have been implemented in the
27 manner prescribed by the plan. Some agencies call this compliance monitoring. This
28 monitoring documents the BLM's progress toward full implementation of the direction
29 provided in the LUP. There are no specific thresholds or indicators required for this type of
30 monitoring.

31 **Effectiveness Monitoring:** Effectiveness monitoring is aimed at determining if the
32 implementation of activities has achieved the desired goals and objectives. Effectiveness
33 monitoring asks the question: Was the specified activity successful in achieving the
34 objective? This requires knowledge of the objectives established in the LUP as well as
35 indicators that can be measured. Indicators are established by technical specialists in order to
36 address specific questions, and thus to focus on collection of only necessary data. Success is
37 measured against the benchmark of achieving desired future conditions established by the
38 plan.

39 Regulations at 43 CFR 1610.4-9 require that the proposed LUPA establish intervals and
40 standards, as appropriate, for monitoring and evaluation of the plan, based on the sensitivity

1 of the resource decisions involved. Progress in meeting the plan objectives and adherence to
2 the management framework established by the plan is reviewed periodically. The Council on
3 Environmental Quality (CEQ) regulations implementing NEPA state that agencies may
4 provide for monitoring to assure that their decisions are carried out and should do so in
5 important cases (40 CFR 1505.2(c)). To meet these requirements, the BLM will review the
6 plan on a regular schedule in order to provide consistent tracking of accomplishments and
7 provide information that can be used to develop annual budget requests to continue
8 implementation.

9 LUP evaluations will be used by BLM to determine if the direction provided in the LUP,
10 supported by the accompanying NEPA analysis, is still valid. Evaluation of the LUP will
11 generally be conducted every five years per BLM policy, unless unexpected actions, new
12 information, or significant changes in other plans, legislation, or litigation triggers an
13 evaluation. LUP evaluations determine if direction provided is being implemented, whether
14 mitigation measures are satisfactory, whether there are significant changes in the related
15 plans of other entities, whether there are new data of significance to the plan, and if direction
16 should be changed through amendment or revision. Evaluations will follow the protocols
17 established by the BLM Land Use Planning Handbook H-1601-1 in effect at the time the
18 evaluation is initiated. Specific monitoring and evaluation needs are identified by
19 resource/uses throughout Chapter 2.

20 **1.4.2 Forest Service Planning Process**

21 The Forest and Rangeland Renewable Resources Planning Act of 1974, as amended by the
22 NFMA (16 USC 1600 et seq.), requires the Forest Service to develop, maintain, and, as
23 appropriate, revise LRMPs for units of the National Forest System using a systematic
24 interdisciplinary approach to achieve integrated consideration of physical, biological,
25 economic, and other sciences. Consistent with the Multiple-Use Sustained-Yield Act of 1960
26 (16 USC 528-531), the overall goal of managing the National Forest System is to sustain the
27 multiple uses of its renewable resources in perpetuity while maintaining the long-term
28 productivity of the land. LRMPs provide broad guidance and information for project and
29 activity decision-making. In particular, LRMPs coordinate outdoor recreation, range, timber,
30 watershed, wildlife and fish, and wilderness. Public participation and input are important
31 components of land use planning.

32 LRMPs developed under the 1982 planning rule procedures (36 CFR parts 200 to 299,
33 revised July 1, 2000) have resulted in:

- 34 i. Establishment of forest multiple-use goals and objectives
- 35 ii. Establishment of forest-wide management requirements (standards and
36 guidelines)
- 37 iii. Establishment of management areas and management area direction
38 (management area prescriptions) applying to future activities in that management
39 area

- 1 iv. Designation of suitable timber land and establishment of allowable timber sale
- 2 quantity
- 3 v. Nonwilderness allocations or wilderness recommendations
- 4 vi. Establishment of monitoring and evaluation requirements

5 NFMA requires LRMPs to be maintained, amended, and revised. Adaptive management
6 requires ongoing adjustment of goals, objectives, management area prescriptions, standards,
7 and guidelines constraining land uses. An amendment can be started in response to
8 monitoring and evaluation findings, new data, new or revised policy, a change in
9 circumstances or a proposed action that may result in a change in the scope of resource uses,
10 or a change in the standards and guidelines of the approved plan. Plan development is part
11 of the collaborative and adaptive cycle: (1) monitor, (2) evaluate monitoring results and any
12 new information, and (3) change activity and resource management, change the plan, change
13 the monitoring, or do an assessment.

14 The Forest Service responsible official may amend a plan in response to the need for change.
15 For this amendment, the process involves eight steps (36 CFR, Part 220):

- 16 i. Consideration of need for change
- 17 ii. Public notice for initiating plan amendment. Development of the proposed plan
- 18 amendment
- 19 iii. Documentation of affected environment and environmental consequences in an
- 20 EIS. Public notice for proposed plan amendment, draft EIS, and 90-day
- 21 comment period
- 22 iv. Response to comments
- 23 v. Issuance of final EIS and draft decision document, beginning of the 60-day
- 24 public objection period before approval of the decision document
- 25 vi. Upon resolution of any objection⁴ (36 CFR, Part 219 subpart B), approval of the
- 26 plan by the responsible official

27 Under Forest Service regulations, an LRMP revision or amendment of an existing plan is a
28 federal action requiring appropriate NEPA documentation. This EIS analyzes the possible
29 amendment of the Beaverhead-Deerlodge National Forest LRMP and the amendment of the
30 individual LRMPs for the Boise, Caribou, Challis, Salmon, Sawtooth, and Targhee national
31 forests and Curlew National Grassland. This EIS analyzes the impacts of various alternatives
32 for the plan amendment, including the no action alternative.

⁴Because the Forest Service is a cooperating agency and thus a participant in the multifederal agency effort, the responsible officials for the Forest Service have waived the objection procedures of 35 CFR, Part 219, Subpart B, and adopted the administrative review procedure of the BLM, as provided for by 36 CFR, Part 219.59(a). This is in agreement with the responsible officials of the BLM. A joint agency response will be provided to those who file for administrative review of this effort.

1 In addition, both agencies have certain existing program-specific plans or amendments that
2 implement their respective LUPs (for example oil and gas and geothermal leasing analyses).
3 Similar to the broad scale LUPs, these program-specific plans may also be amended to
4 reflect new information or changed circumstances that result from this analysis.⁵

5 **1.5 Public Input and Identification of Issues**

6 **1.5.1 The Scoping Process**

7 Scoping is an early and open process for determining the scope, or range, of issues to be
8 addressed and for identifying the significant issues to consider in the planning process.
9 Scoping identifies the public and agency concerns, defines the relevant issues and
10 alternatives that will be examined in detail in the EIS, and eliminates those that are not
11 within the scope or have been covered by prior environmental review. A planning issue is
12 defined as a major controversy or dispute regarding existing and potential land and resource
13 allocations, levels of resource use, production and related management practices on BLM-
14 administered and National Forest System lands that can be addressed through a range of
15 alternatives. The environmental impacts of these alternative management scenarios are
16 analyzed and addressed in this final EIS.

17 A public scoping period was initiated on December 9, 2011, with the publication of a Notice
18 of Intent to begin a planning effort in the Federal Register. Scoping is designed to be
19 consistent with the public involvement requirements of FLPMA, NFMA, and NEPA. The
20 cooperative process included soliciting input from interested state and local governments,
21 tribal governments, other federal agencies and organizations, and individuals to identify the
22 scope of issues to be addressed in the plan amendment, and to assist in the formulation of
23 reasonable alternatives. The scoping process is an excellent method for opening dialogue
24 between the BLM, Forest Service, and the general public about management of GRSG and
25 their habitats on BLM-administered and National Forest System lands and for identifying
26 the concerns of those who have an interest in this subject and in GRSG habitats. As part of
27 the scoping process, the BLM also requested that the public submit nominations for
28 potential Areas of Critical Environmental Concern (ACECs) for GRSG and their habitats.

29 Public outreach during the public scoping period included: press releases announcing the
30 original and extended scoping period for the EIS process; a newsletter mailed in December
31 2011 to over 14,000 agency officials, organizations, and members of the public in the Great
32 Basin Region; 26 open houses throughout the Great Basin Region; and a National GRSG
33 conservation Web site (<http://www.blm.gov/wo/st/en/prog/more/sagegrouse.html>) and a
34 regional Web site for the Great Basin Region (<http://www.blm.gov/wo/st/en/prog/more/sagegrouse/western.html>), which provides access to materials distributed at scoping
35

⁵Regulations at 36 CFR, Part 228.102, require the Forest Service to decide which NFS lands are administratively available for oil and gas leasing. The Forest Service decision also includes necessary lease stipulations to protect surface resources. The Forest Service does not have regulations that address geothermal leasing, but the agency follows a process similar to oil and gas in that it conducts an analysis of leasing National Forest System lands and makes a decision that is consistent with but independent of the LRMP.

1 meetings, as well as information on the public involvement process. The formal public
2 comment period as required by NEPA began on December 9, 2011, with the publication of
3 a Notice of Intent in the Federal Register. It was extended through a Notice of Correction
4 published February 10, 2012, and ended on March 23, 2012.

5 Scoping included scheduled open-house meetings in the following 26 locations (see Chapter
6 5 for details):

- 7 • Tonopah, Ely, Elko, Winnemucca, and Reno, Nevada
- 8 • Boise, Idaho Falls, Salmon, Twin Falls, and Pocatello, Idaho
- 9 • Lakeview, Ontario, Baker City, Burns, and Prineville, Oregon
- 10 • Price, Vernal, Salt Lake City, Randolph, Snowville, Richfield, Kanab, and Cedar
11 City, Utah
- 12 • Alturas and Susanville, California
- 13 • Dillon, Montana

14 In addition, news releases were used to notify the public regarding the scoping period and
15 the planning process and to invite the public to provide written comments from many
16 sources including via email, fax, and regular mail (see Chapter 5 for details). Comments
17 obtained from the public during the scoping period were used to define the relevant issues
18 that would be addressed by a range of reasonable alternatives.

19 A total of 585 unique written submissions for the Great Basin Region were received during
20 the public scoping period. Submissions resulted in a total of 7,472 unique comments. In
21 addition, a total of 30,397 form letters were received.

22 For the Idaho and Southwestern Montana Sub-region planning process, scoping comments
23 received from the public were placed in one of three categories:

- 24 i. Issues identified for consideration in the Idaho and Southwestern Montana Sub-
25 Region LUPA
- 26 ii. Issues to be addressed through policy or administrative action (and therefore not
27 addressed in the LUPA)
- 28 iii. Issues eliminated from detailed analysis because they are beyond the scope of the
29 LUPA (and therefore not addressed in the LUPA)

30 Some important issues to be addressed in the LUPA were identified by the public and the
31 agencies during the scoping process for the statewide planning effort. The Final Scoping
32 Summary can be located at:

33 http://www.blm.gov/wo/st/en/prog/more/sagegrouse/documents_and_resources.html

1 The Scoping Summary was prepared in support of the planning effort and summarizes the
2 scoping process. The Scoping Report identified issues in 13 broad categories. Section 1.5.3
3 describes the refined issues for the Idaho and Southwestern Montana Sub-Region. Other
4 resource and use issues are identified in the BLM Planning Handbook and Manual (H1610-
5 1). All of these issues were considered in developing the alternatives brought forward for
6 analysis.

7 **1.5.2 Issues Identified for Consideration in the Idaho and Southwestern Montana** 8 **Sub-Region**

9 During the scoping process, the BLM and Forest Service received feedback from members
10 of the public, including various public, governmental and nongovernmental groups. This
11 feedback, along with internal assessment and concerns described in the 2010 Finding, has
12 been compiled to describe issues and analysis concerns that are discussed in this document.
13 During comment analysis, individual comments were evaluated to determine whether they
14 constituted issues relevant to this planning process. These issues were then evaluated to
15 determine where in the planning process they most appropriately applied – project design;
16 alternative development, or environmental effects.

17 Issues that applied to all parts of the planning process were further evaluated to determine
18 planning issues. A planning issue is defined as a major controversy or dispute regarding
19 existing and potential land and resource allocations, levels of resource use, production and
20 related management practices on BLM-administered and National Forest System lands that
21 can be addressed through a range of alternatives. Planning issues can drive the development
22 of an alternative, may involve resources that are adversely affected by the proposed action,
23 or involve unresolved conflicts regarding alternative uses of available resources. Planning
24 issues provide focus for the analysis and are used to compare and contrast the environmental
25 effects of the alternatives.

26 In addition to planning issues, analysis issues are identified and utilized in the effects analysis
27 to compare alternatives. These issues are further described below.

28 **1.5.3 Planning Issues**

29 Issues identified as planning issues for this Draft LUPA/EIS are described below. These
30 issues have been grouped according to their related threat to GRSG, as described in the 2010
31 Finding, and a brief description of the threat is provided. These issues were used to drive
32 differences between the alternatives analyzed in detail and will be discussed in the analysis
33 and throughout the remaining chapters of this document.

34 ***Wildfire***

35 Wildfire (primarily lightning- and human-caused) in sagebrush ecosystems is one of the
36 primary factors linked to the loss of sagebrush-steppe habitat and corresponding population
37 declines of GRSG. Loss of sagebrush habitat to wildfire has been increasing in the western
38 portion of the GRSG range due to an increase in fire frequency, which has been facilitated in
39 drier, lower elevations by the replacement of native perennial bunchgrass communities by
40 invasive annuals such as cheatgrass. The USFWS conservation objective for wildfire – retain

1 and restore healthy native sagebrush plant communities within the range of GRSG (USFWS
2 2013) – is applicable to this planning issue.

3 **Issues:**

- 4 • **What measures should be undertaken to manage fuels and wildland fires,**
5 **while protecting GRSG habitat?**
- 6 • **How would the BLM and Forest Service evaluate, authorize, and**
7 **implement program activities to reduce the threat (habitat loss and**
8 **fragmentation) to GRSG habitat from wildland and prescribed fire?**

9 ***Vegetation – Invasive Species, Conifer Encroachment***

10 The increase in mean fire frequency has been facilitated by the incursion of nonnative annual
11 grasses into sagebrush ecosystems (Billings 1994; Miller and Eddleman 2001). Exotic annual
12 grasses and other invasive plants also alter habitat suitability for GRSG by reducing or
13 eliminating native forbs and grasses essential for food and cover (75 *Federal Register* 13910,
14 and references therein). Annual grasses and noxious perennials continue to expand their
15 range, facilitated by ground disturbances, including wildfire (Miller and Eddleman 2001),
16 improper grazing (Young et al. 1972, 1976), agriculture (Benvenuti 2007), motorized
17 recreation, and infrastructure associated with energy development (Bergquist et al. 2007).
18 The USFWS conservation objective for nonnative, invasive plant species – maintain and
19 restore healthy, native sagebrush plant communities (USFWS 2013) – is tied to this threat.

20 The intentional removal or treatment of sagebrush (i.e., using prescribed fire, or any
21 mechanical and chemical tools to remove or alter the successional status of the sagebrush
22 ecosystem) can contribute to habitat loss and fragmentation. Removal and manipulation of
23 sagebrush may also increase the opportunities for the incursion of invasive annual grasses,
24 particularly if the soil crust is disturbed (Beck et al. 2012). The USFWS conservation
25 objective for sagebrush removal – avoid sagebrush removal or manipulation in GRSG
26 breeding or wintering habitats (USFWS 2013) – is tied to this threat.

27 GRSG are negatively impacted by the expansion of pinyon and/or juniper in their habitats,
28 even if the under-story sagebrush habitats remain (Freese et al. 2009). GRSG avoid these
29 areas of expansion (Casazza et al. 2010), and as the pinyon and/or juniper increases in
30 abundance and size, the underlying habitat quality for GRSG diminishes. The USFWS
31 conservation objective for pinyon-juniper expansion – remove pinyon-juniper from areas of
32 sagebrush that are most likely to support GRSG (post-removal) at a rate that is at least equal
33 to the rate of pinyon-juniper incursion (USFWS 2013) – is applicable to this planning issue.

34 **Issues:**

- 35 • **How will the BLM and Forest Service address the potential expansion of**
36 **nonnative annual grasses (i.e., cheatgrass) and associated loss of**
37 **sagebrush habitats as a result of climate change?**

- How would the BLM and Forest Service conserve, enhance, or restore GRSG habitat such as sagebrush communities and minimize or prevent the introduction or spread of noxious weeds and invasive species?
- How would the BLM and Forest Service evaluate, authorize, and implement program activities to reduce the threat (habitat loss and fragmentation) to GRSG habitat from conifer encroachment and spread of noxious and invasive species?

Infrastructure

The increasing demands on BLM-administered and National Forest System lands for the location of wind towers, cellular towers, utility lines, roads, and other infrastructure cause continued development within the GRSG range, resulting in habitat loss and fragmentation, which in turn result in GRSG population declines. Infrastructure development can cause fragmentation that leaves the remaining habitat in noncontiguous patches, alteration that renders patches unusable to a species, or other changes (such as installation of power lines or cellular towers) that cause habitat avoidance (USFWS 2010). The cumulative impacts of infrastructure is a concern because sage-grouse population persistence may not be influenced by a single anthropogenic (human-built or human-caused) line or point feature (such as a power line or tower), but by multiple anthropogenic features acting in synergy (Leu and Hanser 2011). Development of infrastructure for any purpose (e.g. roads, pipelines, power lines, and cellular towers) results in habitat loss and fragmentation, and may cause GRSG habitat avoidance. Infrastructure can also provide sources for the introduction of invasive plant species and may also facilitate predation by providing perching or nesting opportunities for ravens and raptors. Surface mining and associated facilities within GRSG habitats result in the direct loss of habitat and habitat fragmentation. The USFWS conservation objectives listed below for the following threats are applicable to this planning issue:

- Energy development – design energy development to ensure it will not impinge upon stable or increasing GRSG population trends
- Infrastructure – avoid development of infrastructure within PACs
- Mining – maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining (USFWS 2013)

Issues:

- How would the BLM and Forest Service manage program activities (land use authorizations, mining, mineral leasing, energy development – including renewable energy) to reduce the threat (habitat loss, fragmentation and reduced productivity) to GRSG habitat from additional infrastructure development and management of ongoing infrastructure development (ROWs, oil and gas development, Coal/Strip Mining, Hard Rock Mining, Wind Energy Development, Solar Energy Development) while recognizing valid existing authorizations?

- 1 • **How would the BLM and Forest Service manage existing and proposed**
2 **infrastructure development to reduce resulting mortality (direct and via**
3 **predation) of GRSG?**

4 ***Human Disturbance***

5 Various activities occurring within GRSG habitat can disturb GRSG, altering their behavior
6 and potentially disrupting aspects of their life history requirements, leading to lowered
7 productivity and reduced populations. These activities can include ROW, energy
8 (nonrenewable and renewable) and mineral development, as well as commercial operation
9 activities and recreational activities. Aspects of these activities can cause direct and indirect
10 disturbance to GRSG (construction activities, operational activities, maintenance activities,
11 noise, vehicles, etc.). The USFWS conservation objectives listed below for the following
12 threats are applicable to this planning issue:

- 13 • Energy development – design energy development to ensure it will not impinge
14 upon stable or increasing GRSG population trends
- 15 • Infrastructure – avoid development of infrastructure within PACs
- 16 • Mining – maintain stable to increasing GRSG populations and no net loss of
17 GRSG habitats in areas affected by mining
- 18 • Recreation – manage direct and indirect human disturbance (including noise) to
19 avoid interruption of normal GRSG behavior (USFWS 2013)

20 **Issues:**

- 21 • **How would the BLM and Forest Service evaluate, authorize, and**
22 **implement program activities to reduce the threat (loss of productivity) to**
23 **GRSG habitat from human presence?**
- 24 • **How would the BLM and Forest Service evaluate, authorize, and**
25 **implement program activities to reduce the threat (habitat loss and**
26 **fragmentation) to GRSG habitat from recreation and travel management**
27 **activities?**
- 28 • **How would motorized, nonmotorized, and mechanized travel be managed**
29 **to provide access to federal lands and a variety of recreation opportunities**
30 **while protecting GRSG and their habitat?**

31 ***Livestock Grazing***

32 Livestock grazing is the most widespread land use across the sagebrush biome (Connelly et
33 al. 2004) and almost all sagebrush areas are managed for livestock grazing (Knick et al. 2003).
34 Improper livestock management, in relation to local ecological conditions, may have negative
35 impacts on GRSG seasonal habitats (USFWS 2010a, and references therein). Structures
36 which support range management activities can have negative impacts on GRSG by
37 increasing fragmentation (e.g., fences and roads) or diminishing habitat quality (e.g.,
38 concentrating ungulates in winter habitats). Fences can be deleterious to GRSG populations

1 and habitats, with threats including habitat fragmentation and direct mortality through
2 strikes (Stevens et al. 2012). Fences can also improve habitat conditions for GRSG (e.g., by
3 protecting brood-rearing habitats in riparian areas from overgrazing). The USFWS
4 conservation objectives listed below for the following threats are applicable to this planning
5 issue:

- 6 • Grazing – conduct grazing management for all ungulates in a manner consistent
7 with local ecological conditions that maintains or restores healthy sagebrush
8 shrub and native perennial grass and forb communities and conserves the
9 essential habitat components for GRSG (e.g., shrub cover, nesting cover)
- 10 • Range management structures – avoid or reduce the impact of range
11 management structures on GRSG habitat
- 12 • Fences – minimize the impact of fences on GRSG populations (USFWS 2013)

13 **Issues:**

- 14 • **How would the BLM and Forest Service evaluate, authorize, and**
15 **implement grazing management activities (grazing, water developments,**
16 **fences, and structures) to reduce the threat (habitat loss, fragmentation,**
17 **productivity, disease vector production) to GRSG and their habitat?**
- 18 • **What measures would the BLM and Forest Service put in place to protect**
19 **and improve GRSG habitat while maintaining grazing privileges?**
- 20 • **What measures would be put in place to manage habitat for other wildlife**
21 **species and reduce conflicts with GRSG?**
- 22 • **What measures would the BLM and Forest Service put in place to reduce**
23 **the impacts of wild horses and burros on GRSG habitat?**

24 ***Management and Monitoring***

25 Effective conservation strategies are predicated on identifying key areas across the landscape
26 that are necessary to maintain redundant, representative, and resilient populations.
27 Delineation of key GRSG habitats recognizes the extensive reach of habitat threats and the
28 existing loss and degradation of habitats, and acknowledges that preservation of every
29 remaining area of GRSG habitat is improbable (Kiesecker et al. 2011; USFWS 2013). With
30 input from the state wildlife agencies, the BLM and Forest Service have identified PPH and
31 PGH. These areas, along with the PACs identified by USFWS, form a foundation to assess
32 application of habitat designations and related management actions as part of this effort.

1 **Issues:**

- 2 • **How would the BLM and Forest Service use the best available science to**
3 **designate priority and general habitat categories for GRSG habitat within**
4 **the planning area?**
- 5 • **How would the BLM and Forest Service accurately monitor the impact of**
6 **land uses on GRSG and its habitat?**

7 ***Urbanization and Agricultural Conversion***

8 Ex-urban development (dispersed homes on small acreages) results in direct habitat loss,
9 habitat fragmentation, and the introduction of invasive plants species. Urban and ex-urban
10 activities also increase the presence of predator subsidies (e.g., trash, landfills and bird
11 feeders) allowing for increased predators associated with humans that may have
12 disproportionate impacts on GRSG (e.g., red fox, skunks, and raccoons). Agricultural
13 conversion is typically defined as the conversion of sagebrush habitats to tilled agricultural
14 crops or re-seeded exotic grass pastures, resulting in habitat loss and fragmentation. The
15 USFWS conservation objectives listed below for the following threats are applicable to this
16 planning issue:

- 17 • Ex-urban development – limit urban and ex-urban development in GRSG
18 habitats and maintain intact native sagebrush plant communities
- 19 • Agricultural conversion – avoid further loss of sagebrush habitat for agricultural
20 activities (both plant and animal production) and prioritize restoration (USFWS
21 2013)

22 **Issues:**

- 23 • **What opportunities exist to adjust public land ownership that would**
24 **increase management efficiency for GRSG and their habitat?**
- 25 • **How would the BLM and Forest Service manage lands and realty**
26 **decisions to reduce habitat fragmentation and conversion of GRSG**
27 **habitat?**
- 28 • **How would the BLM and Forest Service evaluate, authorize, and**
29 **implement land tenure adjustments to reduce the conversion of (habitat**
30 **loss and fragmentation) GRSG habitat to agricultural or urbanization**
31 **uses?**

32 ***Social and Economic Concerns***

33 Management of the BLM-administered and National Forest System lands within the sub-
34 region affect the economies of the associated counties and states. Conversely, the local
35 demographics, social structure, and values within the counties and states influence the
36 demand for uses and opportunities provided by the BLM-administered and National Forest
37 System lands. In many counties, management uses (mining, grazing, energy development) of
38 the BLM-administered and National Forest System lands are a vital component of the

1 economic and social stability in these counties. Noncommodity values around aesthetics and
2 recreation opportunities can also play an important role in local economics and sense of
3 place.

4 **Issue:**

- 5 • **How could the BLM and Forest Service promote or maintain activities**
6 **that provide social and economic benefit to local communities while**
7 **providing protection for GRSG habitat?**

8 ***Special Management Designations***

9 The BLM and Forest Service have the ability to designate and manage unique and important
10 areas for their associated values. The BLM calls these ACECs and the Forest Service calls
11 these Zoological Areas. Several ACECs already exist within the sub-region. These areas
12 prescribe management to protect the unique values identified during their designation.
13 Existing special management areas such as Wilderness, Wilderness Study Areas (WSAs), and
14 Wild and Scenic Rivers, may in some areas protect GRSG by restricting resource uses in
15 these areas.

16 **Issue:**

- 17 • **What areas would be designated by the BLM or Forest Service to benefit**
18 **the maintenance, enhancement, and restoration of GRSG and GRSG**
19 **habitat?**

20 ***Analysis Issues***

21 The following issues were identified through the internal and external scoping process;
22 however, they were not used to drive the development of the alternatives. They will be
23 displayed as components of the analysis in **Chapter 4** and may show differences between the
24 effects of the alternatives.

25 **Issues:**

- 26 • **How would the BLM and Forest Service protect water and soil**
27 **resources in order to benefit GRSG habitat?**
28 • **How would the BLM and Forest Service incorporate the analysis of the**
29 **impacts of a changing climate on GRSG habitat?**

30 ***Issues not Addressed***

31 The following discussion describes various comments or issues raised during the scoping
32 period which are outside the scope of this LUPA process. This discussion is taken from the
33 May 2012 National Greater Sage-Grouse Planning Strategy Scoping Summary Report (BLM
34 2012).

1 Comments related to national policy decisions and issues outside the scope of the LUPA will
2 not be addressed as part of this planning effort, including decisions on BLM-administered
3 and National Forest System lands within the purview of other planning efforts or decisions
4 made by other federal, state, or local agencies.

5 *National Policy Decisions*

6 Commenters expressed concern with decisions at the national level, including, but not
7 limited to, the LUP revision process and implementation of NEPA, decisions on wilderness
8 and WSAs, and hunting regulations on federal lands.

9 *Outside the Scope of the Planning Effort*

10 Commenters expressed concern with development and management of GRSG on decisions
11 outside of the BLM and Forest Service jurisdiction. Specific themes included the following:

- 12 • How will the BLM and Forest Service work with wildlife management agencies
13 to ensure appropriate management of hunting for GRSG on both public and
14 private lands?

15 Many commenters questioned why hunting of GRSG is allowed if the bird is in
16 need of protection. Others stated that hunting should be used as a method to
17 control GRSG predators.

18 Hunting is regulated by state wildlife agencies; these comments therefore relate
19 to state-regulated actions and are outside the scope of the current planning
20 effort. Additionally, hunting opportunities for GRSG have been reduced in
21 response to general population declines of known origin (e.g., disease and habitat
22 loss) and unknown origin. While hunting has not been demonstrated as the
23 primary cause of decline in GRSG populations, the cautionary recommendations
24 outlined in the Sage-Grouse management guidelines (Idaho Sage-Grouse
25 Advisory Committee 2006) and Connelly et al. (2000) remain appropriate.

- 26 • How did the USFWS determine the warranted but precluded decision?

27 Commenters questioned population levels and the need to incorporate range-
28 wide conservation measures. Others questioned the effectiveness of ESA listing
29 as a method of species conservation.

30 These comments relate to decisions under the purview of the USFWS and will
31 not be addressed in the current planning effort.

- 32 • How can the BLM and Forest Service manage livestock grazing?

33 Commenters asked that grazing be limited or completely stopped due to
34 detrimental ecosystem effects. Other stated that grazing programs should be
35 reformed as the requirements are too limiting and impact ranchers' livelihoods.
36 In addition, some commenters state that grazing provides habitat enhancements
37 for sensitive species.

1 Decisions about national livestock grazing policies would not be made in this
2 planning effort.

- 3 • How should renewable energy be managed and developed in relation to
4 economic instability and wildlife mortality?

5 Commenters stated concerns about renewable energy development, including
6 economic instability due to government subsidies and risk of wildlife mortality,
7 specifically for bats and birds.

8 General decisions about renewable energy management on BLM-administered
9 and National Forest System lands are outside the scope of this planning effort.

10 In addition, comments were received related to issues that are outside the scope of this
11 effort, including the following:

- 12 • Compensation of private land owners for conservation efforts and off-site
13 mitigation
- 14 • BLM and Forest Service funding
- 15 • Designation of Special Management Areas
- 16 • NEPA procedures and costs

17 In addition to these issues described in the Scoping Summary Report, feedback specific to
18 the Idaho and Southwestern Montana Sub-region and predator control was provided to
19 BLM through public meeting comments and cooperating agency feedback. While predation
20 is included in several of the planning issues as a concern related to development, actual
21 predator control activities are outside the authority of the BLM and Forest Service and,
22 therefore, will not be considered further in the planning process.

23 **1.5.4 Public Comment on the Draft LUPA/EIS**

24 The BLM and Forest Service released the Draft LUPA/EIS to the public on November 1,
25 2013. Following the release of the Draft LUPA/EIS, there was a 90-day public comment
26 period, which began on November 1, 2013, and ended on January 29, 2014. During this
27 time, the BLM and Forest Service hosted seven open houses where the public had the
28 opportunity to learn about the Draft LUPA/EIS, to ask questions of the BLM, the Forest
29 Service, and the USFWS staff, and to fill out comment cards. Open houses were held in the
30 following locations:

- 31 • Murphy, ID- January 6, 2014
- 32 • Idaho Falls, ID, January 7, 2014
- 33 • Salmon, ID, January 8, 2014

- 1 • Dillon, MT, January 9, 2014
- 2 • Pocatello, ID, January 13, 2014
- 3 • Twin Falls, ID, January 14, 2014
- 4 • Boise, ID, January 15, 2014

5 The BLM and Forest Service received written comments by mail, e-mail, and submitted at
6 the public meetings. Using a systematic approach of labeling, reviewing, and categorizing
7 each comment, the BLM and Forest Service identified and formally responded to all
8 substantive public comments. Substantive comments were categorized based on the content
9 of the comment. Each retained the link to the commenter.

10 Subsequently, the BLM and Forest Service drafted statements summarizing the issues
11 contained in each comment category. They then developed responses to each issue
12 statement. As part of the response statement, the BLM and Forest Service indicated whether
13 the comments resulted in a change to the LUPA/EIS. The Comment Analysis Report in
14 **Appendix T** contains the issue statements and summary response for each comment
15 category.

16 **1.6 Development of Planning Criteria**

17 Planning criteria are based on appropriate laws, regulations, BLM and Forest Service Manual
18 and Handbook sections, and policy directives, as well as on public participation and
19 coordination with cooperating agencies, other federal agencies, state and local governments,
20 and Native American tribes. Planning criteria are the standards, rules, and factors used as a
21 framework to resolve issues and develop alternatives. Planning criteria are prepared to
22 ensure decision-making is tailored to the issues and to ensure that the BLM and Forest
23 Service avoid unnecessary data collection and analysis.

24 **1.6.1 Preliminary Planning Criteria**

- 25 • The BLM and Forest Service will use the WAFWA *Conservation Assessment of*
26 *Greater Sage-Grouse and Sagebrush Habitats* (Connelly et al. 2004) and any other
27 appropriate resources (e.g., Knick et al. 2011) to identify GRSG habitat
28 requirements and best management practices.
- 29 • The approved LUPA will be consistent with the BLM's National Greater Sage-
30 Grouse Conservation Strategy.
- 31 • The approved LUPA will comply with FLPMA, NEPA, and CEQ regulations at
32 40 CFR, Parts 1500-1508; Department of the Interior regulations at 43 CFR and
33 46 and 43 CFR, Part 1600; the BLM H-1601-1 Land Use Planning Handbook,
34 Appendix C: Program-Specific and Resource-Specific Decision Guidance
35 Requirements, as amended, for affected resource programs; the 2008 BLM
36 NEPA Handbook (H-1790-1); and all other applicable BLM policies and
37 guidance.

- 1 • The approved LUPA will comply with NFMA, NEPA, CEQ regulations at 40
2 CFR, Parts 1500-1508l; Regulations of the Secretary of Agriculture at 36 CFR,
3 Part 219; Forest Service Manual 1920; and Forest Service Handbooks 1909.12
4 and 1909.15.
- 5 • The approved LUPA will comply with the Wild Free-Roaming Horses and Burro
6 Act of 1971 (as amended) which directs that "*All management activities shall be at the*
7 *minimal feasible level and shall be carried out in consultation with the wildlife agency of the*
8 *State wherein such lands are located in order to protect the natural ecological balance of all*
9 *wildlife species which inhabit such lands, particularly endangered wildlife species.*"
- 10 • The LUPA will be limited to providing land use direction or to amending certain
11 program-specific decisions, for the conservation of GRSG habitats on BLM-
12 administered and National Forest System lands in the planning area.
- 13 • The BLM and Forest Service will consider allocations and prescriptive standards
14 to conserve GRSG habitat, as well as objectives and management actions to
15 restore, enhance, and improve GRSG habitat.
- 16 • The LUPA will recognize valid existing rights and authorizations, such as mining
17 claims, mineral leases, and approved mineral operating plans.
- 18 • Lands addressed in the LUPA will be BLM-administered and National Forest
19 System lands (including split-estate lands) in GRSG habitats. Any direction
20 provided in the LUPAs will apply only to BLM-administered and National
21 Forest System lands.
- 22 • Where more restrictive land use allocations or decisions are made in existing
23 RMPs, those more restrictive land use allocations or decisions will remain in
24 effect and will not be amended by this LUPA.
- 25 • The BLM and Forest Service will use a collaborative and multi-jurisdictional
26 approach with the public and adjacent jurisdiction, where appropriate, to
27 determine the desired future condition of BLM-administered and National
28 Forest System lands for the conservation of GRSG and their habitats and to
29 consider the impacts of proposed actions on all the resources in the region.
- 30 • As described by law and policy, the BLM and Forest Service will strive to ensure
31 that conservation measures are as consistent as possible with other planning
32 jurisdictions within the planning area boundaries.
- 33 • The BLM and Forest Service will consider a range of reasonable alternatives,
34 including appropriate management prescriptions that focus on the relative values
35 of resources while contributing to the conservation of the GRSG and its habitat.
- 36 • The BLM and Forest Service will address socioeconomic impacts, including
37 environmental justice, of the alternatives. Socio-economic analysis will use an
38 accepted input-output quantitative model such as IMPLAN, RIMSII, or JEDI
39 for renewable energy analysis.

- 1 • The BLM and Forest Service will use best available scientific information,
2 research, technologies, and results of inventory, monitoring, and coordination
3 consistent with the Information Quality Act, to determine appropriate local and
4 regional management strategies that will enhance or restore GRSG habitats.
- 5 • Management of GRSG habitat that intersects with WSAs on BLM-administered
6 lands will be guided by BLM Manual 6330 Management of Wilderness Study
7 Areas. Land use allocations made for WSAs must be consistent with Manual
8 6330 and with other laws, regulations, and policies related to WSA management.
- 9 • Management of other special designation areas (e.g., Wild and Scenic Rivers,
10 National Historic Trails, Wilderness Areas, National Monuments, National
11 Conservation Areas) will be guided by the appropriate BLM and Forest Service
12 manual or handbook.
- 13 • Management of GRSG habitat that intersects with National Forest System
14 wilderness areas will be guided by Forest Service Manual 2300 – Recreation,
15 Wilderness, and Related Resource Management.
- 16 • For BLM-administered lands, all activities and uses within GRSG habitats will
17 follow existing land health standards. Standards and guidelines (S&G) for
18 livestock grazing and other programs that have developed S&Gs will be
19 applicable to all alternatives for BLM-administered lands.
- 20 • Management of National Forest System lands for livestock grazing will follow
21 guidance in Forest Service Manual (FSM) 2200, Range Management, and Forest
22 Service Handbook (FSH) 2209.13, Grazing Permit Administration.
- 23 • For National Forest System lands, all activities and uses within GRSG habitats
24 will follow guidelines in Forest Manual 2500 – Watershed and Air Management.
- 25 • The BLM and Forest Service will consult with Native American tribes to identify
26 sites, areas, and objects important to their cultural and religious heritage within
27 GRSG habitats.
- 28 • The BLM and Forest Service will coordinate and communicate with state, local,
29 and tribal governments to ensure that the BLM and Forest Service consider
30 provisions of pertinent plans, seek to resolve inconsistencies between state, local,
31 and tribal plans, and provide ample opportunities for state, local, and tribal
32 governments to comment on the development of amendments.
- 33 • The BLM and Forest Service will develop vegetation management objectives,
34 including objectives for managing noxious weeds and invasive species (including
35 identification of desired future condition for specific areas), within GRSG
36 habitat.
- 37 • The LUPA will be based on the principles of adaptive management.
- 38 • Reasonable Foreseeable Development Scenarios (**Appendix B**) and planning for
39 Fluid Minerals will follow the BLM Handbook H-1624-1 and current fluid

1 minerals manual guidance for fluid mineral (e.g., oil and gas, coal-bed methane,
2 and oil shale) and geothermal resources. For mineral resources on National
3 Forest System lands, the Forest Service will apply guidance provided in Forest
4 Manual 2800 – Minerals and Geology, as applicable.

- 5 • The LUPA will be developed using an interdisciplinary approach to prepare
6 reasonable foreseeable development scenarios, identify alternatives, and analyze
7 resource impacts, including cumulative impacts on natural and cultural resources
8 and the social and economic environment.
- 9 • The most current approved BLM and Forest Service corporate spatial data will
10 be supported by current metadata and will be used to ascertain GRSG habitat
11 extent and quality. Data will be consistent with the principles of the Information
12 Quality Act of 2000.
- 13 • State wildlife agencies' GRSG data and expertise will be used to the fullest extent
14 practicable in making management determinations on federal lands.

15 **1.7 Relationship to Other Policies, Plans and Programs**

16 This planning process will recognize the many ongoing programs, plans, and policies that are
17 being implemented in the planning area by other land managers and government agencies.
18 The BLM and Forest Service will seek to be consistent with or complementary to other
19 management actions whenever possible.

20 **1.7.1 Federal Plans**

21 Federal plans that will be considered during the GRSG planning effort include, but are not
22 limited to, the following:

- 23 • Vegetation Treatment on BLM Lands in Thirteen Western States (BLM 1991a)
- 24 • Final Vegetation Treatments on Bureau of Land Management Lands in 17
25 Western States Programmatic Environmental Impact Statement and Associated
26 Record of Decision. USDI, Bureau of Land Management, 2007 (FES 07-21)
- 27 • Final Vegetation Treatments on Bureau of Land Management Lands in 17
28 Western States Programmatic Environmental Report. USDI, Bureau of Land
29 Management, 2007 (FES 07-21)
- 30 • Approved Resource Management Plan Amendments/Record of Decision for
31 Designation of Energy Corridors on Bureau of Land Management-Administered
32 Lands in the 11 Western States, January 2009, and the ROD on Forest Service
33 Designation of Section 368 Energy Corridors on National Forest System Lands
34 in 10 Western States (Forest Service 2009)
- 35 • BLM and Forest Service Final Programmatic Environmental Impact Statement
36 for Geothermal Leasing In the Western United States (2008) and associated
37 Records of Decision and Management Plan Amendments

- 1 • Final Programmatic Environmental Impact Statement on Wind Energy
2 Development on BLM-administered Lands in the Western United States. FES
3 05-11. June 2005
- 4 • Final Programmatic Environmental Impact Statement for Solar Energy
5 Development in Six Southwestern States. October 2012
- 6 • Supplement to the Draft Programmatic Environmental Impact Statement for
7 Solar Energy Development in Six Southwestern States. October 2011
- 8 • Greater Sage-grouse (*Centrocercus urophasianus*) Conservation Objectives: Final
9 Report. USFWS, February 2013
- 10 • Forest Service oil and gas leasing availability analyses prepared to comply with 36
11 CFR, Part 228.102

12 1.7.2 State Plans

13 State plans that will be considered during the GRSG planning effort include the following:

- 14 • Greater Sage-Grouse Comprehensive Conservation Strategy. National Sage-
15 Grouse Conservation Planning Framework Team, Western Association of Fish
16 and Wildlife Agencies, 2006
- 17 • Montana Greater Sage-Grouse Habitat Conservation Strategy, 2009
- 18 • Management Plan and Conservation Strategies for Sage-Grouse in Montana –
19 Final, Montana Sage Grouse Work Group, 2005
- 20 • Conservation Plan for the Greater Sage-Grouse in Idaho, as amended, Idaho
21 Sage-Grouse Advisory Committee, 2009
- 22 • Idaho Energy Plan, Idaho Governor’s Office of Energy Resources, 2012
- 23 • Idaho Invasive Species Strategic Plan 2012-2016
- 24 • Idaho Greater Sage-Grouse Local Working Group (LWG) Plans
 - 25 - Big Desert
 - 26 - Challis
 - 27 - Curlew Valley
 - 28 - Dillon
 - 29 - East Idaho Uplands
 - 30 - Jarbidge
 - 31 - North Magic Valley
 - 32 - Owyhee County
 - 33 - Shoshone Basin

- 1 - Upper Snake
- 2 - West Central

1.7.3 County Plans

County plans that will be considered during the GRSG planning effort are listed in **Table 1-6**, County Land Use and Sage-Grouse Management Plans. Blank rows indicate that the given county does not have a Land Use or Sage-Grouse Management Plan.

Table 1-6
County Land Use and Sage-Grouse Management Plans

1.7.4 Endangered Species Recovery Plans

Endangered species recovery plans are prepared by the USFWS to promote the recovery of threatened and endangered species. The following geographically relevant endangered species recovery plans have been identified:

- Draft Recovery Plan for Three of the Five Distinct Population Segments of Bull Trout (*Salvelinus confluentus*)
- Draft Recovery Plan for the Jarbidge River Distinct Population Segment of Bull Trout
- Northern Rocky Mountain Wolf Recovery Plan
- Recovery Plan for the Bruneau Hot Springsnail (*Pyrgulopsis bruneauensis*)
- Recovery Plan for the Northern Idaho Ground Squirrel
- Revised Grizzly Bear Recovery Plan
- Snake River Aquatic Species Recovery Plan

1.7.5 Memoranda of Understanding

There are several memoranda of understanding (MOU) in effect that pertain to management of resources on BLM-administered and National Forest System lands. These include:

- Between the BLM, Forest Service, USFWS, National Marine Fisheries Service and the Environmental Protection Agency regarding implementation of the Interior Columbia Basin Strategy. The purpose of this MOU is to cooperatively implement the “The Interior Columbia Basin Strategy” to guide the amendment and revision of forest (Forest Service) and resource management (BLM) plans and project implementation on public lands administered by the Forest Service and BLM throughout the Interior Columbia Basin.
- Between the BLM and the Forest Service Concerning Oil and Gas Leasing Operations (2006). The purpose of this MOU is to establish joint BLM and

1 Forest Service policies and procedures for managing oil and gas leasing and
2 operational activities pursuant to oil and gas leases on National Forest System
3 lands, consistent with applicable law and policy. The MOU was signed in 2006
4 for the purpose of efficient, effective compliance with statutory and regulatory
5 requirements. The MOU establishes the roles of the Forest Service and the BLM
6 in processing Applications for Permits to Drill and review of subsequent
7 operations.

- 8 • Between the BLM and the Forest Service concerning Implementation of Section
9 225 of the Energy Policy Act of 2005 Regarding Geothermal Leasing and
10 Permitting (2006).
- 11 • Interagency Agreements between the BLM and Forest Service concerning
12 Mineral Leasing (1984) and Leasable Mineral Operations (1987). These
13 agreements currently pertain to management of leasable minerals other than oil
14 and gas and geothermal.
- 15 • Between the Department of the Interior, the USDA and the US Environmental
16 Protection Agency Regarding Air Quality Analyses and Mitigation for Federal Oil
17 and Gas Decisions Through the NEPA Process (2011). Through the MOU, the
18 signatories commit to a clearly defined, efficient approach to compliance with
19 the NEPA regarding air quality and air quality related values (AQRVs), such as
20 visibility, in connection with oil and gas development on Federal lands.
- 21 • Between the WAFWA, the Forest Service, Natural Resources Conservation
22 Service (NRCS), Farm Service Agency, the BLM, USFWS, and USGS (2008).
23 The purpose of the MOU is to provide for cooperation among the participating
24 State and federal land, wildlife management and science agencies in the
25 conservation and management of GRSG sagebrush (*Artemisia* spp.) habitats and
26 other sagebrush-dependent wildlife throughout the Western United States and
27 Canada.
- 28 • Between the Idaho BLM and Nevada BLM regarding management responsibility
29 and authority regarding lands in Nevada but accessed through Idaho.
- 30 • Between Twin Falls District BLM and Elko District BLM (2013) clearly
31 identifying the administrative boundaries between the districts as the
32 Nevada/Idaho state line within the China Butte, Player Butte, Player Canyon,
33 and Horse Creek allotments, and defines the Twin Falls District and Elko
34 District management responsibilities in the Nevada portions of the identified
35 allotments.
- 36 • Between the State of Idaho (Governor's Office, Idaho Department of Fish and
37 Game [IDFG], Office of Species Conservation [OSC], Idaho Department of
38 Agriculture [IDA]) and the BLM and USDA (Forest Service, Animal and Plant
39 Health Inspection Service [APHIS], NRCS) for the purpose of supporting and
40 implementing the intent and actions contained in the 2006 Conservation Plan for
41 the Greater Sage-Grouse in Idaho.

- 1 • Montana Idaho Airshed Group MOU, which includes federal, state, and private
2 partners and encompasses prescribed burning activities on federal lands (e.g., pile
3 burns and seedbed preparation).
- 4 • Between the Forest Service Sawtooth National Forest Minidoka Ranger District
5 and the BLM Twin Falls District Burley Field Office concerning consolidated
6 management of the Forest Service Goose Creek Allotment and the BLM West
7 Goose Creek Allotment.
- 8 • Between the BLM and APHIS (2012) for the purpose of establishing guidelines
9 to assist field personnel in carrying out their wildlife damage management
10 responsibilities.
- 11 • Between the BLM and the Department of Energy (2011) regarding grazing,
12 ROWs, fire suppression and other aspects of shared management of lands within
13 the Idaho National Laboratory.
- 14 • While it is not an MOU, the BLM Dillon Field Office is a signatory on the
15 Montana Cooperative Fire Management and Stafford Act Response Agreement;
16 a multiparty agreement involving various federal and county agencies regarding
17 fire suppression efforts.

18 In addition, the BLM has entered into numerous MOUs with various federal, state, and
19 county agencies for the purpose of establishing cooperating agencies for the BLM and
20 Forest Service National Greater Sage-Grouse Planning Strategy. The following agencies and
21 entities have established cooperating agency status for the purpose of working on the Idaho
22 and Southwestern Montana Sub-regional GRSG planning effort:

- 23 • **Federal**

- 24 - USFWS
- 25 - Forest Service
 - 26 ○ Beaverhead-Deerlodge National Forest
 - 27 ○ Boise National Forest
 - 28 ○ Caribou-Targhee National Forest
 - 29 ○ Salmon-Challis National Forest
 - 30 ○ Sawtooth National Forest
- 31 - NRCS
- 32 - National Park Service – Craters of the Moon National Monument and
33 Preserve
- 34 - Department of Energy – Idaho National Laboratory

- 35 • **State**

- 36 - Idaho Department of Fish and Game

- 1 - Idaho Office of Species Conservation
- 2 - Montana Fish Wildlife and Parks
- 3 • **County**
- 4 - Idaho Association of Counties
- 5 - Bingham County, Idaho
- 6 - Blaine County, Idaho
- 7 - Box Elder County, Utah (through the Utah BLM State Office)
- 8 - Cassia County, Idaho
- 9 - Clark County, Idaho
- 10 - Custer County, Idaho
- 11 - Fremont County, Idaho
- 12 - Jefferson County, Idaho
- 13 - Lemhi County, Idaho
- 14 - Owyhee County, Idaho
- 15 - Power County, Idaho
- 16 - Twin Falls County, Idaho
- 17 - Beaverhead County, Montana
- 18 - Madison County, Montana

19 **1.7.6 Activity Plans and Amendments**

20 Each BLM field office and Forest Service district has many specific planning documents
21 including: allotment management plans, livestock management plans, activity plans,
22 coordinated resource management plans, cooperative resource management plans, habitat
23 management plans, fire management plans, and normal fire rehabilitation plans.

24 **1.7.7 Habitat Management Plans**

25 A Habitat Management Plan (HMP) provides guidance for the management of a defined
26 habitat for a target wildlife species, protecting and improving habitat for that species and for
27 other species utilizing the habitat. These plans are usually written in coordination with State
28 Wildlife Agencies. Idaho Department of Fish and Game has a variety of fish and wildlife
29 management plans which are either species specific (e.g., mule deer, elk, bighorn sheep, and
30 Yellowstone cutthroat trout) or statewide in scope (e.g., Comprehensive Wildlife
31 Conservation Strategy and Fisheries Management Plan). The plans most relevant to the
32 GRSG in the Idaho and Southwestern Montana sub-region are the Idaho 2006 Conservation
33 Plan for GRSG and the Montana 2005 Management Plan and Conservation Strategies for
34 GRSG.

1 **1.7.8 Secretarial Order 3336**

2 Wildfire has been identified as one of the primary factors linked to loss of sagebrush-steppe
3 habitat and corresponding population declines of greater sage-grouse (Connelly and Braun,
4 1997; Miller and Eddleman, 2001). While fire is a naturally occurring disturbance in the
5 sagebrush steppe, the incursion of non-native annual grasses has facilitated an increase in
6 mean fire frequency which can preclude the opportunity for sagebrush to become re-
7 established. As such, the RMP includes requirements (referred to as Greater Sage-grouse
8 Wildfire and Invasive Species Habitat Assessment in appendices in Draft documents) - that
9 landscape scale Fire and Invasives Assessments be completed and updated regularly to more
10 accurately define specific areas to be treated to address threats to sagebrush steppe habitat
11 from wildfire. Within the Great Basin, the first five priority areas of conservation (PACs)
12 were singled out for the initial round of assessments because fire was identified as a primary
13 threat to greater sage-grouse habitat and the first phase of these assessments were completed
14 in March of 2015. Additionally, the Secretary of Interior issued Secretarial Order 3336 on
15 January 5, 2015 which establishes the protection, conservation and restoration of “the health
16 of the sagebrush-steppe ecosystem and, in particular, greater sage-grouse habitat, while
17 maintaining safe and efficient operations as a critical fire management priority for the
18 Department”. The Secretarial Order will result in a final report of activities to be
19 implemented prior to the 2016 Western fire season. This will include prioritization and
20 allocation of fire resources and the integration of emerging science, enhancing existing tools
21 to implement the Resource Management Plan and improve our ability to protect sagebrush-
22 steppe from damaging wildfires.

Proposed Action and Alternatives

This Page Intentionally Blank

Administrative Draft
Cooperating Agency Review

1 **Chapter 2. Proposed Action and Alternatives**

2 **2.1 Changes between the Draft LUPA/EIS and Proposed LUPA/Final EIS**

3 As a result of public comments, best science, cooperating agency coordination, and internal
4 review of the Draft LUPA/EIS, the BLM and Forest Service have developed the Proposed
5 LUPA/FEIS for managing BLM-administered and National Forest System lands in the
6 Idaho and Southwestern Montana GRSG sub-region. The Proposed LUPA/FEIS focuses
7 on addressing public comments, while continuing to meet the BLM's and Forest Service's
8 legal and regulatory mandates. The Proposed LUPA/FEIS is a variation of the co-preferred
9 alternative (Alternatives D and E), and is within the range of alternatives analyzed in the
10 DEIS.

11 Changes made to the Proposed LUPA/FEIS from the co-preferred alternative (Alternatives
12 D and E) in Draft LUPA/EIS are the following:

- 13 • During review of the DEIS, mapping adjustments were made in
14 response to public comments and were based on agency field
15 and personnel input and discussions with State of Idaho and
16 USFWS. Specifically, adjustments were intended to address the
17 broad scale nature of the initial map and to address disparities.
18 Specifically, certain portions of the Alternative D and
19 Alternative E maps still encompassed some areas of non-habitat,
20 such as timber or farm lands; or they were missing some areas of
21 potential restoration or other locally definable areas or habitat;
22 or were designated inappropriately as Core and/or Important.
23 As a result, in preparing the Proposed Plan/FEIS, BLM, Forest
24 Service, USFWS and the State of Idaho worked together to
25 refine the GRSG Habitat Management Area map. To resolve
26 map disparities between Alternatives D and E, and to provide
27 more recognizable boundaries of Habitat Management Areas on
28 the ground, BLM and Forest Service worked closely with field
29 personnel in December 2013. During the winter and spring of
30 2014, BLM and Forest Service also worked closely with the State
31 of Idaho and USFWS (Idaho Fish and Wildlife Office, Boise) in
32 re-evaluating the Core, Important or General Management Zone
33 designations of Alternative E, in order to move forward with a
34 map for the Proposed Plan that met BLM and Forest Service
35 objectives for habitat and State of Idaho and USFWS objectives
36 for populations.
- 37 • Allocations for PHMA, IHMA, and GHMA — allocations in
38 the proposed plan/FEIS provide more opportunities for uses in
39 GHMA, while still maintaining conservation management by
40 establishing screening criteria for project/activity review in
41 GRSG habitat. Allocations that were changed between the
42 preferred Alternative and the Proposed Plan are as follows:

- 1 • Major ROWs in PHMA, analyzed as exclusion in Alternative
2 D, were changed to Avoidance and analyzed in the Proposed
3 Plan.
- 4 • Major ROWs in GHMA, analyzed as avoidance in
5 Alternative D, were changed to open and analyzed in the
6 Proposed Plan (Idaho).
- 7 • Minor ROWs in GHMA, analyzed as avoidance in
8 Alternative D, were changed to open and analyzed in the
9 Proposed Plan.
- 10 • Solar development in PHMA, analyzed as avoidance in
11 Alternative E, was changed to exclusion and analyzed in the
12 Proposed Plan.
- 13 • Wind development in PHMA, was not analyzed in
14 Alternative E, but analyzed as Exclusion in the Proposed
15 Plan.
- 16 • Wind development in IHMA, was not analyzed in
17 Alternative E, but was analyzed as Avoidance in the
18 Proposed Plan.
- 19 • Salable minerals in PHMA, analyzed as open in Alternative
20 E, was changed to closed to new development and analyzed
21 in the Proposed Plan.
- 22 • Non energy leasables in PHMA, analyzed as open in
23 Alternative E, was changed to closed and analyzed in the
24 Proposed Plan.
- 25 • Sagebrush Focal Areas (SFAs) — these areas have been
26 identified in the Proposed Plan based on recommendations
27 in a USFWS memorandum, and are proposed to be managed
28 as PHMA with the following additional management:
29 recommended for withdrawal; NSO without waiver,
30 exception, or modification for fluid mineral leasing; and
31 prioritized for management and conservation actions
32 including, but not limited to review of livestock grazing
33 permits/leases. Alternatives B and C proposed withdrawal
34 from locatable minerals development; alternatives B and D
35 proposed closure of PPMA to fluid mineral development
36 whereas Alternative E proposed the Idaho Core Habitat
37 Zone as open to fluid minerals with NSO. Alternatives C
38 and F proposed no grazing in occupied GRSG habitat
39 whereas other alternatives were open with varying
40 management actions. See DEIS at Chapter 4. As such, the

1 management of these areas as SFAs and the impacts of the
2 associated management decisions was addressed in the DEIS
3 and is qualitatively within the spectrum of alternatives
4 analyzed.

5 BLM and the Forest Service will manage these areas, totaling
6 approximately 3,842,900 acres (3,606,100 acres of BLM;
7 236,800 acres of Forest Service) within the Idaho and
8 Southwestern Montana sub-region, as SFAs because of the
9 importance of these necessary pockets of habitat to the
10 conservation of the species range-wide. Specifically, SFAs
11 include characteristics such as existing high-quality sagebrush
12 habitat; highest breeding densities; have been identified as
13 essential to conservation and persistence of the species;
14 represent a preponderance of current federal ownership and
15 in some cases are adjacent to protected areas that serve to
16 anchor the conservation importance of the landscape. While
17 SFAs provide essential habitat for the conservation of
18 GRSG, a broad, landscape approach that integrates
19 appropriate conservation efforts across habitats occurring
20 outside the SFAs, in accordance with the Proposed Plan, is
21 also integral since effective conservation strategies are
22 predicated on identifying key areas across the landscape that
23 are necessary to maintain redundant, representative and
24 resilient GRSG populations (see LUPA/DEIS Issues
25 **Section 1.5.2**, Management and Monitoring). In light of the
26 landscape level approach to GRSG conservation provided
27 through this planning effort and as defined by the
28 characteristics set forth above, as well as additional
29 considerations, including potential for impacts from climate
30 change, fire and invasives, these areas have been identified as
31 SFAs.

32 As noted in the DEIS, the goals of this planning effort are to
33 protect both the habitat and the species. While action
34 Alternatives B through F, and portions of Alternative A
35 emphasize a slightly different mix of resources and resource
36 uses, all have goals to 1) conserve, enhance, and restore the
37 sagebrush ecosystem that GRSG populations depend on in
38 order to maintain or increase their abundance and
39 distribution, in cooperation with other conservation
40 partners; and 2) to protect GRSG habitats from disturbances
41 that will reduce distribution or abundance of GRSG (see
42 LUPA/DEIS **Section 2.2.1** Management Common To All
43 Alternatives and **Table 2-17**). The BLM and Forest Service
44 committed to using the best available scientific information
45 to determine appropriate local and regional management

1 strategies to enhance and restore GRSG habitats (see
2 LUP/DEIS **Section 1.6.1** Preliminary Planning Criteria and
3 **Section 4.1.2** Incomplete or Unavailable Information).

- 4 • USGS Buffer Study—Included a management action to
5 incorporate the lek buffer-distances identified in the USGS
6 report titled Conservation Buffer Distance Estimates for Greater
7 Sage Grouse—A Review: USGS Open File Report 2014-1239
8 (Mainer et al. 2014) during NEPA analysis at the implementation
9 stage. Although the buffer report was not available at the time
10 of the DEIS release, applying these buffers was addressed in the
11 DEIS and is qualitatively within the spectrum of alternatives
12 analyzed. Specifically, (Alternatives B, C, D, E, and F) identified
13 and analyzed allocation restrictions such as closure to fluid
14 minerals, recommendation for locatable mineral withdrawal,
15 elimination of grazing, saleable mineral restrictions, and ROW
16 avoidance and exclusion. Alternatives B and C were the most
17 restrictive. The following were analyzed in the DEIS: 1) closing
18 PHMA to fluid minerals development (Alternatives B and C); 2)
19 recommending withdrawal of PHMA to locatable minerals
20 (Alternatives B and C); 3) closing occupied GRSG habitat to
21 livestock grazing (Alternatives C and F); and 4) closing PHMA
22 to saleable minerals (Alternatives B, C, and F) and applying a 3
23 km buffer restriction for saleable minerals around leks
24 (Alternative B). In additions to specific management actions
25 designed to protect GRSG habitat, the DEIS included a
26 Required Design Features and Best Management Practices
27 Appendix D that applies protective measures during project
28 implementation. Of all the action alternatives identified,
29 Alternative E analyzed fewer restrictions on development in
30 GRSG habitat than any of the other action alternatives.
31 However, the No Action was still the least restrictive of all
32 alternatives analyzed. Accordingly, the management decision to
33 require lek buffers for development within certain habitat types
34 is within the range of alternatives analyzed.
- 35 • Adaptive management—Identification of hard and soft adaptive
36 management triggers for population and habitat and identified
37 appropriate management responses. Chapter 2 of the DEIS
38 identified that the BLM/Forest Service would further develop
39 the adaptive management approach by identifying hard and soft
40 triggers and responses. All of the adaptive management hard
41 trigger responses were analyzed within the range of alternatives.
42 For example, in a Conservtion Area, if a hard trigger is reached
43 in IHMA, all IHMA in the Conservation Area would be managed

1 as PHMA for all resources. Adaptive triggers were analysed in
2 Alternatives D and E of the Draft EIS

- 3 • Monitoring and Disturbance – The monitoring framework was
4 further refined in the FEIS, and further clarification as to how
5 disturbance cap calculations would be measured were developed
6 for the FEIS. During the public comment period, BLM received
7 comments on how monitoring and disturbance cap calculations
8 would occur at implementation. The DEIS outlined the major
9 components of the monitoring strategy, as well as provided a
10 table portraying a list of anthropogenic disturbances that would
11 count against the disturbance cap. A BLM Disturbance and
12 Monitoring Sub-team further enhanced the two Appendices
13 (**Appendix G**, Disturbance and Adaptive Management,
14 **Appendix H**, Anthropogenic Disturbance Calculation, and
15 **Appendix E**, GRSG Final Monitoring Framework) in the FEIS.
- 16 • Mitigation Strategy; Net Conservation Gain –The net
17 conservation gain strategy is in response to the overall
18 landscape-scale goal which is to enhance, conserve, and restore
19 GRSG and its habitat. All of the action alternatives provided
20 management actions to meet the landscape-scale goal (GRSG
21 Goals: Goal 1, 2, 3 and 5; Special Status Species Objectives: MA-
22 OBJ-1,2, and 3; HM-OBJ-1 and 2; Vegetation Management
23 Objectives VEG-OBJ-1, 2, and 3, Wildland Fire Management
24 Objective Fuel-OBJ – 1). WAFWA Management Zone
25 Cumulative Effects Analysis on GRSG – a quantitative
26 cumulative effects analysis for GRSG was included in the FEIS.
27 This analysis was completed to analyze the effects of
28 management actions on GRSG at a biologically significant scale
29 which as determined to be at the WAFWA Management Zone.
30 The DEIS, in Chapter 4, included a qualitative analysis and
31 identified that a quantitative analysis would be completed for the
32 FEIS at the WAFWA Management Zone.
- 33 • Forest Service Plan Amendment—Chapter 2 separates the
34 Forest Service Proposed Plan and the BLM Proposed Plan.
35 This is because the Forest Service has different guidance for
36 writing planning language; however, the actions are basically the
37 same for both the BLM and FS under the Proposed Plan.
- 38 • Public Comment on DEIS—Updated the FEIS based on public
39 comment received on the DEIS (see **Appendix T**, Public
40 Comment Report)

41 NEPA requires agencies to prepare a supplement to the draft EIS: 1) the agency makes
42 substantial changes in the proposed action that are relevant to environmental concerns; or 2)
43 if there are significant new circumstances or information relevant to environmental concerns

1 and bearing on the proposed action or its impacts. A supplement is not necessary if a newly
2 formulated alternative is a minor variation of one of the alternatives is qualitatively within
3 the spectrum of alternatives analyzed in the Draft EIS.

4 The Proposed LUPA includes components of the alternatives analyzed in the Draft EIS.
5 Taken together, these components present a suite of management decisions that present a
6 minor variation of alternatives identified in the Draft LUPA/Draft EIS and are qualitatively
7 within the spectrum of alternatives analyzed.

8 As such, the BLM has determined that the Proposed LUPA is a minor variation and that the
9 impacts of the Proposed LUPA would not affect the human environment in a substantial
10 manner or to a significant extent not already considered in the EIS. The impacts disclosed in
11 the Proposed RMP/Final EIS are similar or identical to those described Draft LUPA/Draft
12 EIS.

13 **2.2 Introduction**

14 The LUPA/EIS complies with NEPA, which directs the BLM and Forest Service to “study,
15 develop, and describe appropriate alternatives to recommended courses of action in any
16 proposal that involves unresolved conflicts concerning alternative uses of available
17 resources...” (NEPA Section 102[2][e]). At the heart of the alternative development process
18 is the required development of a reasonable range of alternatives. Public and internal (within
19 BLM and Forest Service) scoping (see **Section 1.5**, Scoping and Identification of Issues)
20 identified issues that present opportunities for alternative courses of action, while the
21 purpose and need for action described in **Section 1.2**, Purpose and Need, provides
22 sideboards for determining “reasonableness.”

23 This chapter introduces and details the Proposed Plan. The Proposed Plan is a mix of
24 management actions selected from the range of alternatives in the Draft LUPA/EIS and is
25 based on best science, public scoping comments, public comments on the Draft LUPA/EIS
26 and internal agency discussion. The alternatives that were in the Draft LUPA/EIS are also
27 included in this chapter. These include the No Action Alternative, which would continue
28 the existing policies of the BLM and Forest Service; five action alternatives; and the
29 alternatives considered but eliminated from detailed analysis.

30 The identification of the co-Preferred Alternatives in the Draft LUPA/EIS did not
31 constitute a commitment or decision in principle, and there is no requirement to select either
32 of the co-Preferred Alternatives or any of the separate alternatives presented in the Draft
33 LUPA/EIS in the Final LUPA/EIS as the Proposed Plan. The BLM and Forest Service
34 have the discretion to select any of the alternatives as their Preferred Alternative(s) in the
35 Draft LUPA/EIS. The agencies also have the discretion to modify the Preferred
36 Alternative(s) between the Draft EIS and the Final EIS into the Proposed Plan. The
37 modifications are allowable as long as the actions presented in the Proposed Plan within the
38 Proposed LUPA/Final EIS were within the range of alternatives in the Draft EIS. The
39 various parts of the separate alternatives that were analyzed in the Draft EIS can be “mixed

1 and matched” to develop an alternative – known as the Proposed Plan - in the Final EIS, as
2 long as the reasons for doing so are explained (40 CFR 1506.2(b)).

3 **2.3 Introduction to Draft Alternatives**

4 LUP decisions consist of identifying and clearly defining goals and objectives (desired
5 outcomes) for resources and resource uses, followed by developing allowable uses and
6 management actions necessary for achieving the goals and objectives. These critical
7 determinations guide future land management actions and subsequent site-specific
8 implementation actions to meet multiple use and sustained yield mandates while sustaining
9 land health.

10 **2.3.1 Components of Alternatives**

11 Goals are broad statements of desired (LUP-wide and resource- or resource-use-specific)
12 outcomes and are not quantifiable or measurable. Objectives are specific measurable desired
13 conditions or outcomes intended to meet goals. Goals and objectives can vary across
14 alternatives, resulting in different allowable uses and management actions for some resources
15 and resource uses. Forest Service objectives are also time specific.

16 Management actions and allowable uses are designed to achieve objectives. Management
17 actions are measures that guide day-to-day and future activities. Allowable uses delineate
18 which uses are permitted, restricted, or prohibited, and may include stipulations or
19 restrictions. Allowable uses also identify lands where specific uses are excluded to protect
20 resource values, or where certain lands are open or closed in response to legislative,
21 regulatory, or policy requirements. Implementation decisions are site-specific on-the-ground
22 actions and are typically not addressed in LUPs.

23 On National Forest System lands, forest plans guide management activities and contain
24 desired conditions and objectives as well as standards and guidelines that provide direction
25 for project planning and design. Desired conditions are descriptions of specific social,
26 economic, and/or ecological characteristics of the plan area, or a portion of the plan area,
27 toward which management of the land and resources should be directed. Standards are
28 mandatory constraints on project and activity decision making. Not meeting a standard
29 would require a site-specific forest plan amendment. A guideline is a constraint on project
30 and activity decision making that allows for departure from its terms, so long as the purpose
31 of the guideline is met.

32 **2.3.2 Purpose of Alternatives Development**

33 Land use planning and NEPA regulations require the BLM and Forest Service to formulate
34 a reasonable range of alternatives. Alternative development is guided by established planning
35 criteria (as outlined for the BLM at 43 CFR 1610) (see **Chapter 1**).

36 The NEPA regulations at 40 CFR Part 1501.2(c) state that Federal agencies shall: “Study,
37 develop, and describe appropriate alternatives to recommended courses of action in any
38 proposal which involves unresolved conflict concerning alternatives uses of available
39 resources....”

1 The basic goal of alternative development is to produce distinct potential management
2 scenarios that:

- 3 • Address the identified major planning issues;
- 4 • Explore opportunities to enhance management of resources and
5 resource uses;
- 6 • Resolve conflicts among resources and resource uses; and
- 7 • Meet the purpose of and need for the LUP or LUPA.

8 Pursuit of this goal provides the BLM, Forest Service, and the public with an appreciation
9 for the diverse ways in which conflicts regarding resources and resource uses might be
10 resolved, and offers the decision maker a reasonable range of alternatives from which to
11 make an informed decision. The components and broad aim of each alternative considered
12 for the Idaho and Southwestern Montana GRSG LUPA/EIS are discussed below.

13 **2.4 Alternative Development Process for the Idaho and Southwestern Montana Greater** 14 **Sage-Grouse Land Use Plan Amendment**

15 The Idaho and Southwestern Montana GRSG LUPA/EIS planning team employed the
16 BLM planning process (outlined in **Section 1.4**, Planning Process) to develop a reasonable
17 range of alternatives for the LUPA/EIS. The BLM and Forest Service complied with NEPA
18 and the CEQ implementing regulations at 40 CFR Part 1500 in the development of
19 alternatives for this Proposed LUPA/EIS, including seeking public input and analyzing
20 reasonable alternatives. Where necessary to meet the planning criteria, to address issues and
21 comments from cooperating agencies and the public, or to provide a reasonable range of
22 alternatives, the alternatives include management options for the planning area that would
23 modify or amend decisions made in the applicable LUP. Since this LUPA/EIS will
24 specifically address GRSG conservation, many decisions within existing LUPs that do not
25 impact GRSG are acceptable and reasonable; in these instances, there is no need to develop
26 alternative management prescriptions.

27 Public input received during the scoping process was considered to identify significant issues
28 deserving of detailed study to help identify alternatives. The planning team developed
29 planning issues to be addressed in the LUPA/EIS, based on broad concerns or
30 controversies related to conditions, trends, needs, and existing and potential uses of planning
31 area lands and resources. All comments were reviewed to determine whether they identified
32 significant issues or unresolved conflicts.

33 **2.4.1 Develop a Reasonable Range of Alternatives**

34 Based on scoping and collaboration efforts, the BLM and Forest Service finalized their
35 planning criteria and identified 13 key planning issues to help frame the alternatives
36 development process. Following the close of the public scoping period in March 2012, the
37 BLM and the Forest Service began the alternatives development process. Between May and
38 September 2012, the planning team (BLM, Forest Service, and cooperating agencies) met to

1 develop management goals and to identify objectives and actions to address the goals. The
2 various groups met numerous times throughout this period to refine their work. As
3 outcomes of this process, the planning team:

- 4 • Developed one No Action Alternative (Alternative A) and three
5 preliminary action alternatives. The first action alternative
6 (Alternative B) is based on A Report on National Greater Sage-
7 Grouse Conservation Measures (NTT 2011), and the two
8 additional action alternatives (Alternative C and F) are based on
9 proposed alternatives submitted by various conservation groups.
- 10 • Customized the objectives and actions from the NTT-based
11 alternative (Alternative B) to develop a third action alternative
12 (Alternative D) that strives for balance among competing
13 interests.
- 14 • Incorporated proposed GRSG protection measures
15 recommended by state governments as a fifth alternative
16 (Alternative E).

17 Each of the preliminary action alternatives in the Draft LUPA/EIS was designed to:

- 18 • Address the 13 planning issues (identified in Section 1.5.3);
- 19 • Fulfill the purpose and need for the LUPA (outlined in Section
20 1.2, Purpose and Need); and
- 21 • Meet the multiple use mandates of the FLPMA (43 CFR 1716),
22 MUSYA and NFMA.

23 **2.4.2 Resulting Range of Alternatives in Draft LUPA/EIS**

24 The five resulting action alternatives (Alternatives B, C, D, E, and F) in the Draft
25 LUPA/EIS offer a range of management approaches to maintain or increase GRSG
26 abundance and distribution of GRSG by conserving, enhancing, or restoring the sagebrush
27 ecosystem upon which GRSG populations depend in collaboration with other conservation
28 partners. While the goal is the same across all the alternatives, each alternative contains a
29 discrete set of objectives and management actions constituting a separate LUPA. The goal is
30 met in varying degrees, with the potential for different long-range outcomes and conditions.

31 The relative emphasis given to particular resources and resource uses differs as well,
32 including allowable uses, restoration measures, and specific direction pertaining to individual
33 resource programs. When resources or resource uses are mandated by law or are not tied to
34 planning issues, there are typically few or no distinctions between alternatives.

35 The meaningful differences among the alternatives are described in **Section 2.9**, Summary
36 Comparison of Proposed Plan Amendment and Draft Alternatives. **Section 2.10**, Detailed
37 Description of Draft Alternatives, also provides a complete description of the proposed

1 decisions for each alternative, including the project goal and objectives, management actions,
2 and allowable uses for individual resource programs. Maps and figures in **Appendix A**
3 provide a visual representation of differences between alternatives. In some instances,
4 varying levels of management overlap a single area, or polygon, due to management
5 prescriptions from different resource programs. In instances where varying levels of
6 management prescriptions overlap a single polygon, the stricter of the management
7 prescriptions would apply.

8 **2.4.3 Selection of and Rationale for identifying the co-Preferred** 9 **Alternatives**

10 The BLM and Forest Service selected Alternatives D and E as its co-preferred alternatives,
11 which were presented in the Draft RMP/EIS, released in October 2013. The BLM and
12 Forest Service selected the co-preferred alternatives based on interdisciplinary team
13 recommendations, environmental consequences analysis of the alternatives, cooperating
14 agency input, and public input during scoping.

15 Alternative D provides LUP guidance and conservation measures to address all GRSG
16 threats for BLM- and Forest Service-managed programs that affect GRSG or their habitat. It
17 provides a consistent approach to BLM and Forest Service management within the entire
18 sub-region. It is also consistent with existing regulations and policy.

19 Alternative E provides LUP guidance focusing on the primary threats to GRSG in Idaho
20 (e.g., wildfire, invasive species and infrastructure development). It also includes LUP
21 guidance for some other secondary GRSG threats (e.g., recreation, improper livestock
22 grazing and West Nile virus) on BLM and Forest Service programs which affect GRSG or
23 their habitat. This alternative also includes four foundational elements: habitat zones;
24 conservation areas; population objectives; and adaptive triggers.

25 Alternatives D and E both categorize GRSG habitat into three delineations which
26 differentiate them from the other alternatives analyzed in the Draft LUPA/EIS. Alternative
27 D names these Priority Habitat Management Areas (PHMA), Important Habitat
28 Management Areas (IHMA), and General Habitat Management Areas (GHMA). Alternative
29 E names these categories Core Habitat Zones (CHZ), Important Habitat Zones (IHZ), and
30 General Habitat Zones (GHZ).

31 The BLM used the impact analysis, along with knowledge of specific issues raised
32 throughout the planning process; recommendations from the tribes, cooperating agencies,
33 and BLM and Forest Service resource specialists; consideration of planning criteria; and
34 anticipated resolution of resource conflicts to identify Alternatives D and E as co-Preferred
35 Alternatives from the suite of alternatives analyzed. Specifically, the selection of the co-
36 Preferred Alternatives was based on the following:

- 37 • Achievement of BLM goals and policies; and
- 38 • Consideration of cooperating agencies and BLM specialists'
39 recommendations.

1 See **Section 2.6.1**, Development of the Proposed Plan Amendment for GRSG Management,
2 for a discussion of the how the Proposed Plan Amendments were developed.

3 **2.5 BLM/Forest Service Resource Programs for Addressing GRSG Threats**

4 The action alternatives are directed towards responding to USFWS-identified issues and
5 threats to GRSG and its habitat. The USFWS threats do not necessarily align with BLM and
6 Forest Service resource program areas, and are often integrated into several different agency
7 resource program areas. **Table 2-1**, USFWS Threats to GRSG and Their Habitat, Applicable
8 BLM and Forest Service Resource Program Areas Addressing these Threats, provides a
9 cross-walk between each of the USFWS listing decision and COT identified threats and the
10 BLM and the Forest Service resource program areas and shows how those threats were
11 addressed in the BLM and the Forest Service land use plan.

Administrative Draft
Cooperating Agency Review

1 **2.6 Proposed Plan Amendment**

2 **2.6.1 Development of the Proposed Plan Amendment for GRSG**
3 **Management**

4 In developing the Proposed Plan Amendment, the BLM and Forest Service made
5 modifications to the co-Preferred Alternatives identified in the Draft LUPA/EIS. The
6 modifications are based on public comments received on the Draft LUPA/EIS, internal
7 BLM review, new information and best available science, the need for clarification in the
8 plans, and ongoing coordination with stakeholders across the range of the GRSG. As a
9 result, the Proposed Plan Amendment provides consistent GRSG habitat management
10 across the range, prioritizes development outside of GRSG habitat, and focuses on a
11 landscape-scale approach to conserving GRSG habitat.

12 As a result of public comments, best science, cooperating agency coordination, and internal
13 review of the Draft LUPA/EIS, the BLM's and Forest Service's Preferred Alternative,
14 identified as Alternatives D and E as presented in the Draft LUPA/EIS, has been modified
15 and are now considered the Proposed Plans/LUPAs for managing BLM-administered and
16 National Forest System lands within the Idaho and southwestern Montana sub-region.
17 Differences between the Proposed Plan and the co-preferred alternatives are presented in
18 **Appendix EE**. The Proposed Plans/LUPAs focus on addressing public comments, while
19 continuing to meet the BLM's and Forest Service's legal and regulatory mandates.

20 Since release of the Draft LUPA/EIS, the BLM and Forest Service have continued to work
21 closely with a broad range of governmental partners, including Governors, State Fish and
22 Game agencies, the USFWS, Indian tribes, county commissioners and many others. Through
23 this cooperation, the BLM and Forest Service have developed a Proposed Plan Amendment
24 that takes into account state, Tribal, and local plans, policies, and strategies in accordance
25 with applicable law, and contributes to the long-term conservation of the GRSG. The BLM
26 and Forest Service also received many substantive public comments on the Draft LUPA
27 (**Appendix T**), which greatly informed the BLM's and Forest Service's development of the
28 Proposed Plan Amendment.

29 On October 27, 2014, the USFWS provided the BLM and Forest Service a memorandum
30 titled "[Greater Sage-Grouse: Additional Recommendations to Refine Land Use Allocations
31 in Highly Important Landscapes](#)". The memorandum and associated maps provided by the
32 USFWS identify areas that represent recognized "strongholds" for GRSG that have been
33 noted and referenced as having the highest densities of GRSG and other criteria important
34 for the persistence of the species. Within these areas, the BLM/FS identified Sagebrush
35 Focal Areas (SFAs), which are PHMAs with the following additional management (Figure 2-
36 3):

- 37 1) Recommended for withdrawal from the Mining Law of 1872, subject to valid existing
38 rights.
- 39 2) Managed as NSO, without waiver, exception, or modification, for fluid mineral leasing.

1 3) Prioritized for management and conservation actions in these areas, including, but not
2 limited to review of livestock grazing permits/leases (see livestock grazing section for
3 additional actions).

4 The BLM's and Forest Service's Proposed Plan Amendment considers documents related to
5 the conservation of GRSG that have been released since the publication of the draft
6 LUPA/EIS. For example, this Proposed Plan Amendment considers the USFWS' October
7 27th, 2014 memorandum "*Greater Sage-Grouse: Additional Recommendations to Refine Land Use*
8 *Allocations in Highly Important Landscapes*" and the USGS' November 21st, 2014 report
9 "*Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review*" (USGS 2014). Based
10 on these documents, the BLM is proposing to designate SFAs to further protect highly
11 valuable habitat and is proposing to include lek-buffer distances when authorizing activities
12 near leks. The BLM and Forest Service also updated the Proposed Plan Amendment to
13 reflect new GRSG state conservation strategies, including recent State Executive Orders.

14 The BLM and Forest Service have refined the Proposed Plan Amendment to provide a
15 layered management approach that offers the highest level of protection for GRSG in the
16 most valuable habitat. Land use allocations in the Proposed Plan would limit or eliminate
17 new surface disturbance in PHMA, while minimizing disturbance in GHMA. In addition to
18 establishing protective land use allocations, the Proposed Plan Amendment would
19 implement a suite of management tools such as disturbance limits (**Appendix G**), GRSG
20 habitat objectives and monitoring (**Appendix E**), mitigation approaches (**Appendix J**),
21 adaptive management triggers and responses (**Appendix G**), and lek buffer-distances
22 (**Appendix B**) throughout the range. These overlapping and reinforcing conservation
23 measures will work in concert to improve GRSG habitat condition and provide clarity and
24 consistency on how the BLM/FS will manage activities in GRSG habitat.

25 For the sake of clarity, BLM and Forest Service decisions have been separated into two
26 sections (described in **Sections 2.6.2** and **2.6.3**, respectively) in the Proposed Plan
27 Amendment.

28 **2.6.2 BLM Proposed Plan Amendment**

29 The Proposed Plan represents a management strategy to address GRSG, their habitat and
30 associated threats within the Idaho and Southwestern Montana Sub-region. The Plan has
31 been developed through a coordinated partnership of BLM, Forest Service, the States of
32 Idaho and Montana and the USFWS.

33 The Plan incorporates appropriate conservation measures to conserve, enhance, and restore
34 GRSG habitat by reducing, eliminating, or minimizing threats to that habitat. The Plan is
35 also consistent with the objectives described in the USFWS Conservation Objectives Team
36 Report (USFWS 2013) to: 'Conserve sage-grouse so that it is no longer in danger of
37 extinction or likely to become in danger of extinction in the foreseeable future...' through
38 'Maintaining viable, connected, and well-distributed populations and habitats across [the
39 range of GRSG], through threat amelioration, conservation of key habitats, and restoration
40 activities?.'

1 To achieve these objectives the Plan includes a combination of: goals and objectives
2 including vegetation/habitat management objectives to be applied during project
3 development and implementation (**Table 2-3**); land allocation decisions (**Table 2-2**);
4 delineation of five Conservation Areas (**Figure 2-1**) to support evaluation of the adaptive
5 management strategy and 3 percent anthropogenic disturbance cap; delineation of PHMA,
6 IHMA, GHMA, and SFAs (**Figures 2-2 and 2-3**) with associated program management
7 direction; a mitigation framework and strategy; development of Wildfire and Invasive
8 Species Assessments; and associated monitoring to support these decisions.

9 The decisions described in this Plan apply to BLM lands in both Montana and Idaho unless
10 identified differently. Several notable differences include the Adaptive Management Strategy
11 and the Disturbance Density evaluation. In both cases Idaho and Southwestern Montana
12 have separate approaches which are described in the applicable sections. Southwestern
13 Montana's approach in both cases is the same as the approaches being applied in the rest of
14 Montana; this supports a consistent approach within the entire state that can be
15 implemented in coordination with State and Federal partners.

16 The proposed plan incorporates the following GRSG goals:

17 GOAL-1: Maintain and/or increase the abundance, distribution and connectivity of
18 GRSG by conserving, enhancing and restoring GRSG habitat to maintain
19 resilient populations by reducing, eliminating or minimizing threats to GRSG
20 habitats.

21 GOAL-2: Provide for the needs of GRSG and their habitat while also providing for
22 resource uses in accordance with the agencies' direction for multiple use and
23 sustained yield as described in FLPMA and the NFMA.

24 GOAL-3: Manage anthropogenic development and human disturbance to minimize the
25 likelihood of adverse population level effects on GRSG.

Table 2-2
Idaho and Southwestern Montana GRS G EIS – Land Allocation Decisions Summary¹

PHMA	IHMA	GHMA
Solar/Wind/Nuclear/Hydropower – Figure 2-4		
Exclusion (LR-2)	Avoidance (LR-2)	Idaho: Open (LR-2) Montana: Avoidance
Commercial Service Airports – Figure 2-6		
Exclusion (LR-3)	Avoidance (LR-1)	Open (LR-1)
Landfills – Figure 2-6		
Exclusion (LR-4)	Avoidance (LR-1)	Open (LR-1)
Utility Corridors – Figure 2-7		
Existing designated corridors which are land use plan designations (and include Section 368 Corridors), will remain “open” (subject to the ongoing settlement agreement) and can provide an opportunity to be modified with mitigation. Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment. (LR-7)	Same as PHMA (LR-7)	Same as PHMA (LR-7)
ROWs and Land Use Authorizations/Permits – High Voltage Transmission Lines and Large Pipelines – Figure 2-8		
Avoidance (LR-1)	Avoidance (LR-1)	Idaho: Open (LR-1) Montana: Avoidance
ROWs and Land Use Authorizations/Permits – Minor ROWs – Figure 2-9		
Avoidance (LR-1)	Avoidance (LR-1)	Open (LR-1)
Land Tenure Adjustments – Figure 2-10		

Note:

¹ The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

**Table 2-2
Idaho and Southwestern Montana GRSG EIS – Land Allocation Decisions Summary¹**

PHMA	IHMA	GHMA
Retention with exceptions for exchange; available for exchange with no net loss of GRSG Key habitat within PHMA and IHMA. Not available for disposal. (LR-14)	Same as PHMA (LR-14)	Available for exchange only
Fluid Mineral Resource Allocation (Includes Geothermal) – Figures 2-11 and 2-12		
Idaho and Montana: Open subject to No Surface Occupancy (NSO) without waiver, or modification. (FLM-1)	Idaho: Open subject to NSO with a limited exception. Montana: Not Applicable (FLM-1)	Idaho and Montana: Open subject to Controlled Surface Use and Timing Limitations (FLM-1)
Locatable Minerals – Figure 2-13		
Areas not previously withdrawn are open.	Same as PHMA.	Same as PHMA.
Non-Energy Leasables – Figure 2-14		
Closed to leasing. (NEL-1) There are no Known Phosphate Leasing Areas (KPLAs) in PHMA.	KPLAs are Open subject to standard leasing stipulations. Areas outside KPLAs are Open subject to standard and GRSG stipulations (required design features, seasonal timing restrictions). (NEL-1)	Open to leasing with standard and GRSG stipulations (required design features and seasonal timing restrictions) (NEL-1)
Mineral Materials (Salable Minerals) – Figure 2-15		
Closed to new site authorizations. Existing sites Open to new free use subject to RDFs, buffers and seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to Anthropogenic Disturbance Criteria (AD-4). Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)	Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions. (SAL-1)
Travel Management – Figure 2-16		
BLM Idaho: Limited to Existing (TM-1) BLM Montana: Limited to Designated (Decisions described in Dillon RMP)	BLM: Limited to Existing (TM-1)	BLM: Limited to Existing (TM-1) BLM Montana: Limited to Designated (Decisions described in Dillon RMP)

1

Note:

¹ The Idaho and Southwestern Montana Subregion includes portions of Idaho, Montana and Utah. Where differences exist between direction for Idaho and Montana or between BLM and Forest Service, those are noted in the table and within the management action section. The lands within Utah are part of the Sawtooth National Forest and are managed as such; therefore direction for these lands in Utah is the same as that described for the Sawtooth National Forest in Idaho.

1 GOAL-4: Reduce the risk of West Nile Virus or other disease outbreaks from BLM
2 and Forest Service management actions.

3 GOAL-5: Conserve, enhance, and restore the sagebrush ecosystem upon which GRSG
4 populations depend in an effort to maintain and/or increase their abundance
5 and distribution, in cooperation with other conservation partners.

6 ***Special Status Species***

7
8 *Objectives*

9 MA-OBJ-1 (Management Area – Objective): Maintain a resilient population of GRSG in
10 Idaho and Southwestern Montana.

11 MA-OBJ-2: Designate GRSG management areas and associated management to maintain
12 a resilient population and to designate strategically located adjacent areas to
13 provide a buffer from unpredictable habitat loss such as wildfire to the
14 resilient population areas.

15 MA-OBJ-3: Identify and strategically protect larger intact sagebrush areas and areas of
16 lower fragmentation to maintain GRSG population persistence.

17 HM-OBJ-1 (Habitat Management): Maintain or make progress toward at least 70 percent
18 of lands within PHMAs and IHMAs capable of producing sagebrush at 10 to
19 30 percent canopy cover and conifers absent to uncommon within 1.86 miles
20 of occupied leks.

21 HM-OBJ-2: Incorporate GRSG Seasonal Habitat Objectives (Table 2-3) into the design
22 of projects or activities, as appropriate, based on site conditions and
23 ecological potential, unless achievement of fuels management objectives
24 require additional reduction in sagebrush cover to meet strategic protection
25 of GRSG habitat and conserve habitat quality for the species or at least one
26 of the following conditions can be demonstrated and documented in the
27 NEPA analysis associated with the specific project:

- 28 • A specific objective is not applicable to the site-specific conditions of
29 the project or activity;
- 30 • An alternative objective is determined to provide equal or better
31 protection for GRSG or its habitat (based on appropriate scientific
32 findings); or
- 33 • Analysis concludes that following a specific objective would provide
34 no more protection to GRSG or its habitat than not following it, for
35 the project being proposed.

36 These habitat objectives in **Table 2-3** summarize the characteristics that research has
37 found represent the seasonal habitat needs for GRSG. The specific seasonal components
38 identified in the table were adjusted based on local science and monitoring data to define

1 the range of characteristics used in this subregion. Thus, the habitat objectives provide
2 the broad vegetative conditions we strive to obtain across the landscape that indicate the
3 seasonal habitats used by GRSG. These habitat indicators are consistent with the
4 rangeland health indicators used by the BLM.

5 The habitat objectives will be part of the GRSG habitat assessment to be used during
6 land health evaluations (see Monitoring Framework, **Appendix E**). These habitat
7 objectives are not obtainable on every acre within the designated GRSG habitat
8 management areas. Therefore, the determination on whether the objectives have been
9 met will be based on the specific site's ecological ability to meet the desired condition
10 identified in the table.

11 All BLM use authorizations will contain terms and conditions regarding the actions
12 needed to meet or progress toward meeting the habitat objectives. If monitoring data
13 show the habitat objectives have not been met nor progress being made towards meeting
14 them, there will be an evaluation and a determination made as to the cause. If it is
15 determined that the authorized use is a cause, the use will be adjusted by the response
16 specified in the instrument that authorized the use.

17
Table 2-3
Seasonal Habitat Desired Conditions for GRSG on BLM-Administered Lands

Attribute	Indicator	Desired Condition	Reference
BREEDING HABITAT (LEK AND NESTING/EARLY BROOD REARING)			
Breeding and Nesting (Seasonal Use Period March 1 – June 15)			
Lek Security	Proximity of trees	Trees (i.e., in Idaho mainly juniper, conifers, and does not include old-growth juniper, pinyon pine and mountain mahogany; in Montana mainly Douglas-fir) absent or uncommon on shrub/grassland ecological sites within 1.86 miles (3 km) of occupied leks.	Baruch-Mordo et al. 2013 ⁷ Stiver et al. <i>in press</i> ¹³
	Proximity of sagebrush to leks	Adjacent protective sagebrush cover within 328 ft. (100 m) of an occupied lek	Stiver et al. <i>in press</i> ¹³
NESTING/EARLY BROOD REARING^{5,10,12,13,14}			
Cover and Food	Seasonal habitat extent (Percent of Seasonal Habitat Meeting Desired Conditions)	>80% of the nesting habitat meets the recommended vegetation characteristics, where appropriate (relative to ecological site potential, etc.).	Connelly et al. 2000 ⁸
	Sagebrush cover ² (Canopy Cover)	15-25%	Connelly et al. 2000 ⁸ Connelly et al. 2003 ⁹ Hagen et al. 2007 ¹¹
	Sagebrush height		Connelly et al. 2000 ⁸

Table 2-3
Seasonal Habitat Desired Conditions for GRSG on BLM-Administered Lands

Attribute	Indicator	Desired Condition	Reference
	Arid sites ³ Mesic sites ⁴	12-31 inches (30-80cm) 16-31 inches (40-80cm)	
	Predominant sagebrush shape	Predominantly spreading shape ⁵	Stiver et al. <i>in press</i> ¹³
	Perennial grass cover ² Arid sites ³ Mesic sites ⁴	≥10% ≥15%	Connelly et al. 2000 ⁸ Stiver et al. <i>in press</i> ¹³
	Perennial grass (and forb) height	≥ 7 inches	Connelly et al. 2000 ⁸ Connelly et al. 2003 ⁹ Hagen et al. 2007 ¹¹ Stiver et al. <i>in press</i> ¹³
	Perennial forb (canopy) cover ² Arid sites ³ Mesic sites ⁴	≥5% ≥10%	Connelly et al. 2000 ⁸
	Perennial forb availability	Preferred forbs are common with several species present ⁶	Stiver et al. <i>in press</i> ¹³
LATE BROOD-REARING/SUMMER^{1, 15} (July-October)¹ Late brood-rearing areas, such as riparian, meadows, springs, higher elevation mesic uplands, etc. may occur within other mapped seasonal habitat areas. Apply late brood rearing/summer habitat desired conditions locally as appropriate.			
Cover and Food	Seasonal habitat extent (Percent of Seasonal Habitat Meeting Desired Condition)	>40% of the summer/brood habitat meets recommended brood habitat characteristics where appropriate (relative to ecological site potential, etc.)	Connelly et al. 2000 ⁸
	Sagebrush (canopy) cover ²	Uplands 10-25% Riparian/Meadow: Sagebrush cover within 100 m	Connelly et al. 2000 ⁸
	Sagebrush height	16 to 32 inches (40-80cm)	Connelly et al. 2000 ⁸
	Perennial grass and forb cover ²	>15%	
	Upland and riparian perennial forb availability ²	Preferred forbs are common with appropriate numbers of species present ⁶	Stiver et al. <i>in press</i> ¹³
	Riparian and/or meadow habitat condition	Proper Functioning Condition	Stiver et al. <i>in press</i> ¹³
WINTER¹ November-March¹ (Apply to areas of known or likely winter-use)			
Cover and Food	Seasonal habitat extent (Percent of Seasonal Habitat Meeting Desired Condition)	>80% of the wintering habitat meets winter habitat characteristics where appropriate (relative to ecological site, etc.).	Connelly et al. 2000 ⁸
	Sagebrush cover and	Sagebrush is at least 10 inches	Connelly et al. 2000 ⁸

Table 2-3
Seasonal Habitat Desired Conditions for GRSG on BLM-Administered Lands

Attribute	Indicator	Desired Condition	Reference
	height above snow	(25 cm) above snow and $\geq 10\%$ cover ¹⁶	Stiver et al. <i>in press</i> ¹³

NOTES AND REFERENCES

- ¹ Seasonal dates can be adjusted by local unit according to geographic region.
- ² Since plant species and/or life forms may overlap, total vegetative cover, inclusive of shrubs, forbs and grasses may exceed 100%.
- ³ Arid corresponds to the 10 – 12 inch precipitation zone; *Artemisia tridentata wyomingensis* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).
- ⁴ Mesic corresponds to the ≥ 12 inch precipitation zone; *Artemisia tridentata vaseyana* is a common big sagebrush sub-species for this type site (Stiver et al. *In Press*).
- ⁵ Collectively the indicators for sagebrush (cover, height, and shape), perennial grass and perennial forb (cover, height and/or availability) represent the desired condition range for nesting/early brood rearing habitat characteristics, consistent with the breeding habitat suitability matrix identified in Stiver et al. *In Press*. Sagebrush plants that are more tree or columnar-shaped provide less protective cover near the ground than sagebrush plants with a spreading shape (Stiver et al. *In Press*). Some sagebrush plants are naturally columnar (e.g., Great Basin big sagebrush), and a natural part of the plant community. However, a predominance of columnar shape arising from animal impacts may warrant management investigation or adjustments at site specific scales.
- ⁶ Preferred forbs are listed in Stiver et al. *In press*. Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred.

- ¹⁵ Some late brood habitat occurs at higher elevations outside of mapped nesting habitat and some is embedded within nesting landscapes especially areas such as wet meadows, riparian areas, springs and seeps.
- ¹⁶ Winter habitat metrics are a guideline but snow depths and habitat availability may vary widely depending on winter severity, topography and elevation.

- 1
2 *Coordination*
3 CC-1: Collaborate, coordinate and utilize cooperative planning efforts to implement
4 and monitor activities to achieve desired conditions and to maximize the
5 utilization of available funding opportunities. Coordination efforts could
6 include: adjacent landowners, federal and state agencies, local governments,

- 1 tribes, communities, other agencies, resource advisory groups, public lands
2 permit holders and non-governmental organizations.
- 3 CC-2: Develop a cooperative MOU between the BLM, Forest Service and State of
4 Idaho to establish the State of Idaho as a cooperating agency during
5 implementation of the final decision. The MOU would identify
6 responsibilities, role and interaction of the BLM, Forest Service and State of
7 Idaho. Montana BLM will participate as appropriate on Montana's Sage-
8 grouse Oversight Team to facilitate coordination and implementation of
9 BLM's final decision and Montana's Executive Order No. 10-2014.
- 10 CC-3: The BLM and Forest Service would consider any recommendations from the
11 Governor of Idaho as a result of evaluation completed by the Sage-Grouse
12 Implementation Task Force.
- 13 CC-4: Idaho: The BLM would coordinate with the State of Idaho and the Idaho
14 Sage-Grouse Implementation Task Force regarding proposed management
15 changes, the implementation of conservation measures, mitigation, and site-
16 specific monitoring, related to adaptive management, anthropogenic
17 disturbance and livestock grazing (**Appendix M**).
- 18 CC-5: Montana: The BLM would coordinate with the State of Montana and the
19 Montana Sage-grouse Oversight Team regarding proposed management
20 changes, the implementation of conservation measures, mitigation, and site-
21 specific monitoring, related to adaptive management and anthropogenic
22 disturbance (**Appendix M**).
- 23 CC-5: Upon completion of the Record of Decision the BLM will develop an initial
24 Implementation Guide for BLM District and Field Offices within a year of
25 issuance of the Record of Decision. This Guide would define and describe
26 consistent application of the allocations, management actions, required
27 design features, and etc. that are contained within the final plan and would be
28 updated and expanded as needed to respond to issues and concerns.
- 29 CC-6: At the state level, BLM and Forest Service would coordinate with IDFG,
30 MFWP, USFWS, and other conservation partners in collaborative efforts
31 with adjacent states (Oregon, Nevada, Utah, Montana, Wyoming) in GRSG
32 MZs IV and II to evaluate GRSG habitat and population status and trends
33 and make appropriate regional recommendations for GRSG conservation at
34 broader scales.
- 35 CC-7: At the state level, BLM and Forest Service would coordinate with the
36 appropriate WAFWA Sage-grouse Technical Committee to develop
37 consistent population and habitat monitoring approaches that facilitate
38 GRSG conservation at the MZ scale.

1 CC-8: All prescribed burning would be coordinated with state and local air quality
2 agencies to ensure that local air quality is not significantly impacted by BLM
3 and Forest Service activities.

4 *Greater Sage-Grouse Management Areas*

5 MA-1 (Management Area): Designate five GRSG Conservation Areas within the
6 sub-region to form the geographic basis for achieving population objectives;
7 evaluating the disturbance density and adaptive regulatory triggers; and tailor
8 adaptive management responses. These conservation areas are depicted in
9 **Figure 2-1**. These areas are referred to as Mountain Valleys, Desert, West
10 Owyhee, Southern and Southwestern Montana Conservation Areas.

11 Conservation Area Description:

12 Mountain Valleys Conservation Area – generally located north of the Snake
13 River Plain, including GRSG habitat in the Salmon and Challis areas, and
14 habitat in west-central population area. It extends west from Rexburg, north
15 and west of Highway 33 to Howe, north and west of Highway 33/22 to
16 Arco, north and west of Highway 26/20/93 to Carey, north and west of
17 Highway 20 west to Hill City, north and west of Highway 20 to the Dylan
18 Karas Road, west to Canyon Creek. Canyon Creek to the confluence with
19 the Snake River form the western boundary.

20 Desert Conservation Area – located north of the Snake River and south of
21 the Mountain Valleys Conservation Area. It extends from the confluence of
22 Canyon Creek and the Snake River, eastward to Idaho Falls. The Snake River
23 and Henry’s Fork form the eastern boundary.

24 West Owyhee Conservation Area – located south of the Snake River and
25 west of the Bruneau River.

26 Southern Conservation Area – located south of the Snake River and east of
27 the Bruneau River, including East Idaho uplands and Bear Lake Plateau, and
28 the Utah portion of the Sawtooth National Forest in Box Elder County.

29 Southwestern Montana – located in southwestern Montana - encompassing
30 the Dillon Butte BLM Field Office and Beaverhead-Deerlodge National
31 Forest boundaries (the Butte RMP is not being amended and since there are
32 limited GRSG federal GHMAs, management actions do not apply in the
33 Butte Field Office).

34 In general, GRSG habitats in the Desert and West Owyhee CAs are relatively
35 contiguous, while those in the Mountain Valleys and Southern CAs tend to
36 be more fragmented due to more complex topography, and elevational
37 differences and/or effects from wildfires, agriculture, urbanization or other
38 factors.

39 MA-2: Within each Conservation Area designate GRSG Habitat Management Areas:
40 Priority, Important and General Habitat Management Areas (**Figure 2-2**).

1 **Priority Habitat Management Areas (PHMAs)** focus on conserving the
2 two key meta-populations in the sub-region. These meta-populations consist
3 of a large aggregation of interconnected breeding subpopulations of GRSG
4 that have the highest likelihood of long-term persistence. Specifically, these
5 include a meta-population north of the Snake River, inclusive of the North
6 Magic Valley, Big Desert and Basin and Range areas and another south of the
7 Snake River comprised of south central Idaho, the upper Bruneau-Jarbridge
8 Plateau, and the Owyhee Uplands. PHMA encompasses areas with the
9 highest conservation value to GRSG, based on the presence of larger leks,
10 habitat extent, important movement and connectivity corridors and winter
11 habitat. PHMAs include adequate area to accommodate continuation of
12 existing land uses and landowner activities. **Important Habitat**
13 **Management Areas (IHMAs)** contain additional habitat and populations
14 that provide a management buffer for the PHMA and to connect patches of
15 PHMA. IHMA encompasses areas of generally moderate to high
16 conservation value habitat and/or populations and in some Conservation
17 Areas includes areas beyond those identified by USFWS as necessary to
18 maintain redundant, representative and resilient populations (Priority Areas
19 for Conservation (PACs)). IHMAs are typically adjacent to PHMAs but
20 generally reflect somewhat lower GRSG population status and/or reduced
21 habitat value due to disturbance, habitat fragmentation or other factors.
22 There are no IHMAs designated within the Southwestern Montana
23 Conservation Area. **General Habitat Management Areas (GHMAs)**
24 encompass habitat that is outside of PHMAs or IHMAs. GHMAs contain
25 approximately 10 percent of the occupied leks that are also of relatively low
26 male attendance compared to leks in PHMA or IHMA. GHMAs are
27 generally characterized by lower quality disturbed or patchy habitat of low lek
28 connectivity.

29 MA-3: In Idaho, Designate PHMA and IHMA to encompass 90 percent of the
30 breeding males in Idaho. In Montana, designate PHMA to encompass
31 Montana Fish, Wildlife, and Parks 2009 Greater Sage Grouse Core Area
32 designations.

33 MA-4: Annually prioritize Conservation Areas at the state scale considering results
34 of the annual adaptive regulatory trigger evaluations relative to
35 implementation of restoration and mitigation activities.

36 MA-5: Prioritize activities and mitigation to protect, enhance and restore GRSG
37 habitats (i.e., fire suppression activities, fuels management activities,
38 vegetation treatments, invasive species treatments etc.) first by Conservation
39 Area, if appropriate (Conservation Area under adaptive management or at
40 risk of engaging adaptive management), followed by PHMAs, then IHMAs
41 then GHMAs within the Conservation Areas. Local priority areas within
42 these areas will be further refined as a result of completing the GRSG
43 Wildfire and Invasive Species Habitat Assessments as described in **Appendix**

1 **D.** This could include projects outside GRSG habitat when those projects
2 would provide a benefit to GRSG habitat.

3 MA-6: The management area map and Biologically Significant Unit (BSU) baseline
4 map would be re-evaluated in conjunction with plan evaluation processes (i.e.
5 approximately every 5 years). This re-evaluation could indicate the need to
6 adjust PHMA, IHMA or GHMA or the habitat baseline. These adjustments
7 could occur upon completion of the appropriate analysis (plan amendment)
8 to review the allocation decisions based on the map. Results from the
9 Wildfire and Invasive Species Assessments, such as identified focal or
10 emphasis areas would also be used to help inform mapping adjustments
11 during this evaluation.

12 MA-7: GRSG habitat within the project area would be assessed during project-level
13 NEPA analysis within the management area designations (PHMA, IHMA,
14 GHMA). Project proposals and their effects would be evaluated based on the
15 habitat and values affected.

16 MA-8: Idaho BLM will annually update the Key Habitat map as described in
17 **Appendix F**, in order to reflect habitat changes resulting from wildfire,
18 succession, and vegetation treatments that occurred or were observed since
19 the last update. Updates to the map will also occur if it is determined that
20 mapping errors or omissions have occurred, or that radio-telemetry studies
21 indicate that GRSG are consistently utilizing an area. Updates are also
22 intended to capture recommendations by the field offices, GRSG Local
23 Working Groups, or agency partners in GRSG conservation. Project-level
24 evaluations of GRSG habitat during the NEPA process may also be used to
25 inform the annual update.

26 MA-9: Areas of habitat outside of delineated management areas identified during the
27 Key habitat update process would be evaluated during site specific NEPA for
28 project level activities and GRSG required design features (**Appendix B**),
29 seasonal timing restrictions (**Appendix C**) and buffers (**Appendix B**) would
30 be included as part of project design. These areas would be further evaluated
31 during plan evaluation and the 5-year update to the management areas, to
32 determine whether they should be included as PHMAs, IHMAs, or GHMAs.

33 MA-10: Designate Sagebrush Focal Areas (SFA) as shown on **Figure 2-3**. SFAs will
34 be managed as PHMA, with the following additional management:

- 35 • Recommended for withdrawal from the General Mining Act of 1872,
36 as amended, subject to valid existing rights.
- 37 • Managed as NSO, without waiver, exception, or modification, for
38 fluid mineral leasing.

- Prioritized for management and conservation actions in these areas, including, but not limited to review of livestock grazing permits/leases (see livestock grazing section for additional actions).

Areas of non-PHMA mapped within the SFA boundary will not be managed as SFA, except for the Donkey Hills ACEC and three Forest Service parcels in the Lost River Range, Idaho (Borah Peak, Big Flat Top Mountain, and Copper Basin Knob).

Adaptive Management

AM-1 (Adaptive Management): Idaho: Use hard and soft population and habitat triggers to determine an appropriate management response as described in AM-6 to AM-16. Hard and soft triggers are evaluated using Conservation Areas (MA-1) and BSUs (Appendix G).

AM-2: Utilize monitoring information collected through the Monitoring Framework (**Appendix E**) to determine when adaptive regulatory triggers have been met.

AM-3: Idaho: BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach. Key habitat map updates are made each winter by BLM in coordination with the Forest Service and IDFG, using the process described in **Appendix F**.

AM-4: Idaho: BLM would coordinate with the IDFG regarding population information collected and maintained by the IDFG to track and identify population changes to assess the population trigger in the adaptive management approach.

AM-5: Idaho: Twice each year the applicable monitoring information would be reviewed to determine if any adaptive management triggers have been met.

AM-6: Idaho: Adaptive habitat regulatory triggers would be individually calculated across all ownerships within the BSUs (**Appendix G**). The BSU is defined as the IDFG modeled nesting and wintering habitat (IDFG 2013, unpublished data) within PHMAs and IHMAs within a Conservation Area. The sagebrush component of the BSU is represented by the Key habitat within the BSU present during the 2011 baseline and as mapped during subsequent annual Key habitat map updates. Key habitat is defined as areas of generally intact sagebrush that provide GRSG habitat during some portion of the year (ISAC 2006).

AM-7: Adaptive Regulatory Criteria for Habitat Hard Triggers are defined as:

- 1 • A 20 percent loss of Key Habitat within the BSU of the PHMA of a
2 Conservation Area when compared to the 2011 baseline, inclusive of
3 all land ownerships or
- 4 • A 20 percent loss of Key Habitat within the BSU of the IHMA of a
5 Conservation Area when compared to the 2011 baseline.

6 AM-8: Adaptive Regulatory Criteria for Habitat Soft Triggers are defined as:

- 7 • A 10 percent loss of Key Habitat within the BSU of the PHMA of a
8 Conservation Area when compared to the 2011 baseline; or
- 9 • A 10 percent loss of Key Habitat within the BSU of the IHMA of a
10 Conservation Area when compared to the 2011 baseline.

11 AM-9: Adaptive Regulatory Criteria for Population Hard Triggers are defined as:

- 12 • A 20 percent decline in the current 3-year average of total maximum
13 number of males counted compared to the 2011 maximum male
14 baseline and a finite rate of change (λ) significantly below 1.0 within
15 PHMA within a Conservation Area over the same 3-year period; or
- 16 • A 20 percent decline in the current 3-year average of total maximum
17 number of males counted compared to the 2011 maximum male
18 baseline and a finite rate of change (λ) significantly below 1.0 within
19 IHMA within a Conservation Area over the same 3-year period.
- 20 • Significance is defined by the 90 percent confidence interval around
21 the current 3-year finite rate of change. If the 90 percent confidence
22 interval is less than, and does not include 1.0, then the finite rate of
23 change is considered significant. The finite rate of change and
24 variance will be calculated following Garton et al. (2011).

25 AM-10: Adaptive Regulatory Criteria for Population Soft Triggers are defined as:

- 26 • A 10 percent decline in the current 3-year average of total maximum
27 number of males counted compared to the 2011 maximum male
28 baseline and a finite rate of change (λ) below 1.0 within PHMA
29 within a Conservation Area over the same 3-year period; or
- 30 • A 10 percent decline in the current 3-year average of total maximum
31 number of males counted compared to the 2011 maximum male
32 baseline and a finite rate of change (λ) below 1.0 within IHMA within
33 a Conservation Area over the same 3-year period.

34 AM-11: When any of the Adaptive Regulatory Criteria for Soft Triggers have been
35 met the Implementation Team would evaluate causal factors and recommend
36 additional potential implementation level activities (**Appendix G**).

- 1 AM-12: When any of the Adaptive Regulatory Criteria for Hard Triggers have been
2 met then all PHMA management actions would be applied to the IHMA
3 within that Conservation Area and the Implementation Team would evaluate
4 causal factors and recommend additional potential implementation level
5 activities.
- 6 AM-13: If an adaptive regulatory trigger is tripped and livestock grazing is identified
7 as a probable limiting factor then adjustments would follow the Adaptive
8 Grazing Management Response described in **Appendix G**.
- 9 AM-14: Remove any adaptive management response when the habitat or population
10 information shows a return to or an exceedance of the 2011 baseline values
11 within the associated Conservation Area in accordance with the Adaptive
12 Management Strategy. In such a case, upon removal of the adaptive
13 management response, the original habitat and population triggers would
14 apply.
- 15 AM-15: Montana: Follow the NPT Adaptive Management Guidance and Sideboards.
16 When a hard trigger is hit in a BSU, the designated response will be put in
17 place in that BSU. Triggers and responses have been developed with local
18 state and USFWS experts (**Appendix I**).
- 19 AM-16: Idaho and Montana: When a hard trigger is hit in a BSU within a PAC that
20 has multiple BSUs, including those that cross state lines, the WAFWA
21 Management Zone Greater Sage-Grouse Conservation Team will convene to
22 determine the causal factor, put project-level responses in place, as
23 appropriate and discuss further appropriate actions to be applied. The team
24 will also investigate the status of the hard triggers in other BSUs within the
25 PAC and will invoke the appropriate plan response.

26 *Anthropogenic Disturbance*

27 AD-1 (Anthropogenic Disturbance): For Idaho and Montana, if the 3 percent
28 anthropogenic disturbance cap is exceeded on lands (regardless of land
29 ownership) within GRSG PHMA (or IHMA in Idaho) Habitat Management
30 Areas in any given BSU, then no further discrete anthropogenic disturbances
31 (subject to applicable laws and regulations, such as the General Mining Law
32 of 1872, as amended, valid existing rights, etc.) will be permitted by BLM
33 within GRSG PHMAs and IHMAs in any given BSU until the disturbance
34 has been reduced to less than the cap. As measured according to the
35 Monitoring Framework (**Appendix G**) for the intermediate scale.

36 For Idaho, if the 3 percent disturbance cap is exceeded on all lands
37 (regardless of land ownership) within a proposed project analysis area
38 (**Appendix G**) in a PHMA (or IHMA in Idaho), then no further
39 anthropogenic disturbance will be permitted by BLM until disturbance in the
40 proposed project analysis area has been reduced to maintain the area under

1 the cap (subject to applicable laws and regulations, such as the General
2 Mining Law of 1872, as amended, valid existing rights, etc.).

3 For Montana, if the 3 percent disturbance cap is exceeded on lands
4 (regardless of land ownership) or if anthropogenic disturbance and habitat
5 loss associated with conversion to agricultural tillage or fire exceed 5% within
6 a project analysis area in PHMAs, then no further discrete anthropogenic
7 disturbances (subject to applicable laws and regulations, such as the 1872
8 Mining Law, valid existing rights, etc.) will be permitted by BLM within
9 PHMA in a project analysis area until the disturbance has been reduced to
10 less than the cap. If the BLM determines that the State of Montana has
11 adopted a GRSG Habitat Conservation Program that contains comparable
12 components to those found in the State of Wyoming's Core Area Strategy
13 including an all lands approach for calculating anthropogenic disturbances, a
14 clear methodology for measuring the density of operations, and a fully
15 operational Density Disturbance Calculation Tool, the 3% disturbance cap
16 will be converted to a 5% cap for all sources of habitat alteration within a
17 project analysis area.

18 For Idaho the BSU (**Figure 2-3**) is defined as the currently mapped nesting
19 and wintering habitat within PHMA and IHMA within a Conservation Area,
20 inclusive of all ownerships for evaluation. For Montana the BSU is defined as
21 the PHMA in Montana. Anthropogenic disturbance excludes habitat
22 disturbance from wildfire and fuels management activities and includes
23 activities described in **Table 2-4**. For Idaho this disturbance is measured by
24 direct footprint or by ROW width for linear features (powerlines, pipelines
25 and roads). For Montana disturbance is measured similar to the Wyoming
26 Disturbance Density Calculation Tool process described in **Appendix G**.

27 Subject to applicable laws and regulations and valid existing rights, if the
28 average density of one energy and mining facility per 640 acres (the density
29 cap) is exceeded on all lands (regardless of land ownership) in the Priority
30 Habitat Management Area within a proposed project analysis area, then no
31 further disturbance from energy or mining facilities will be permitted by
32 BLM: (1) until disturbance in the proposed project analysis area has been
33 reduced to maintain the limit under the cap; or (2) unless the energy or
34 mining facility is co-located into an existing disturbed area.

35 AD-2: New anthropogenic disturbances within PHMA or IHMA within a
36 Conservation Area where the disturbance cap is already exceeded from any
37 source or where the proposed development would result in the cap being
38 exceeded would not be allowed in within that Conservation Area until
39 enough habitat has been restored within that Conservation Area to maintain
40 the area under this cap (subject to valid existing rights).

41 AD-3: PHMA (Idaho only): Anthropogenic Disturbance Exception Criteria. In
42 order to avoid surface-disturbing activities in PHMA, priority will be given to

1 development (including ROWs, fluid minerals and other mineral resources
2 subject to applicable stipulations) outside of PHMA. When authorizing
3 development in PHMA, priority will be given to development in non-habitat
4 areas first and then in the least suitable habitat for GRSG. In addition to the
5 PHMA and IHMA Anthropogenic Disturbance Development Criteria (AD-
6 4), the following criteria must all be met in the project screening and
7 assessment process:

- 8 a. The population trend for the GRSG within the associated
9 Conservation Area is stable or increasing over a three-year period and
10 the population levels are not currently engaging the adaptive
11 management triggers (this applies strictly to new authorizations;
12 renewals and amendments of existing authorizations would not be
13 subject to this criteria when it can be shown that long-term impacts
14 from those renewals or amendments would be substantially the same
15 as the existing development);
- 16 b. The development with associated mitigation would not result in a net
17 loss of GRSG Key habitat and mitigation would provide a net
18 conservation benefit to the respective PHMA;
- 19 c. The project and associated impacts would not result in a net loss of
20 GRSG Key habitat or habitat fragmentation or other impacts causing
21 a decline in the population of the species within the relevant
22 Conservation Area (the project would be outside Key habitat in areas
23 not meeting desired habitat conditions or the project would provide a
24 benefit to habitat areas that are functioning in a limited way as
25 habitat);
- 26 d. Cannot be reasonably accomplished outside of the PHMA; or can be
27 either: 1) developed pursuant to a valid existing authorization; or 2) is
28 co-located within the footprint of existing infrastructure (proposed
29 actions would not increase the 2011 authorized footprint and
30 associated impacts more than 50 percent, depending on industry
31 practice.
- 32 e. Development could be implemented adhering to the required design
33 features (RDF) described in **Appendix B**;
- 34 f. The project would not exceed the disturbance cap (AD-1).
- 35 g. The project has been reviewed by the State Implementation Team
36 and recommended for consideration by the Idaho Governor.

37 AD-4: The following Anthropogenic Disturbance Development Criteria must be
38 met in the screening and assessment process for proposals in PHMA and
39 IHMA to discourage additional disturbance in PHMAs and IHMAs (as
40 described in LR-1 and LR-2; applies to Idaho only):

- a. Through coordination with the USFWS and State of Idaho (as described in CC-1), it is determined that the project cannot be achieved, technically or economically, outside of this management area; and
- b. The project siting and/or design should best reduce cumulative impacts and/or impacts on GRSG and other high value natural, cultural, or societal resources; this may include co-location within the footprint for existing infrastructure, to the extent practicable; and
- c. The project does not result in a net loss of GRSG Key habitat or habitat fragmentation or other impacts causing a decline in the population of the species within the relevant Conservation Area; and
- d. The project design mitigates unavoidable impacts through appropriate compensatory mitigation; and
- e. Development could be implemented adhering to the RDFs described in **Appendix B**.
- f. The project would not exceed the disturbance cap (AD-1).

In Montana, the BLM would apply the project/action screen and mitigation process (**Appendix I**).

AD-5: Co-locating new infrastructure within existing ROWs and maintaining and upgrading ROWs is preferred over the creation of new ROWs or the construction of new facilities in all management area. Colocation for various activities is defined as:

- Communication Sites – The installation of new equipment/facilities on or within or adjacent to existing authorized equipment/facilities or within a communication site boundary as designated in the Communication Site Plan.
- Electrical Lines – Installation of new ROWs adjacent to current ROWs boundaries, not necessarily placed on the same power poles.
- Other Rights-of-Way – The installation of new ROWs within the existing footprint of an approved ROW boundary or adjacent to an approved ROW boundary.
- Designated Corridors – The installation of new rights-of-way within the existing corridor or adjacent to the existing corridor.

AD-6: Incorporate RDFs as described in **Appendix B** in the development of project or proposal implementation, reauthorizations or new authorizations and suppression activities, as conditions of approval (COAs) into any post-lease activities and as best management practices for locatable minerals activities, to the extent allowable by law, unless at least one of the following

- 1 conditions can be demonstrated and documented in the NEPA analysis
2 associated with the specific project:
- 3 a. A specific RDF is not applicable to the site-specific conditions of the
4 project or activity;
 - 5 b. A proposed design feature or BMP is determined to provide equal or
6 better protection for GRSG or its habitat; or
 - 7 c. Analysis concludes that following a specific RDF would provide no
8 more protection to GRSG or its habitat than not following it, for the
9 project being proposed.
- 10 AD-7: Conduct implementation and project activities, including construction and
11 short-term anthropogenic disturbances consistent with seasonal habitat
12 restrictions described in **Appendix C**.
- 13 AD-8: RDFs and seasonal habitat restrictions would not be required for emergency
14 or short-term activities necessary to protect and preserve human life or
15 property.
- 16 AD-9: In undertaking BLM management actions, and consistent with valid and
17 existing rights and applicable law in authorizing third-party actions, the BLM
18 will apply the lek buffer-distances identified in the USGS Report
19 Conservation Buffer Distance Estimates for Greater Sage-Grouse – A
20 Review (Open File Report 2014-1239) in accordance with **Appendix B**.
- 21 AD-10: Incorporate appropriate conservation measures for slickspot peppergrass
22 (*Lepidium papilliferum*) as described in the 2014 Conservation Agreement (as
23 updated, amended or reauthorized) into implementation and project design
24 within slickspot peppergrass habitat in the Jarbidge and Four Rivers Field
25 Offices to avoid and minimize impacts to slickspot peppergrass. The 2014
26 Conservation Agreement is included as **Appendix P**.

Table 2-4
Anthropogenic Disturbances and Areas of Impact

Datasets as Described in the Monitoring Framework¹
Oil and Gas Wells and Development Facilities
Coal Mines
Wind Towers
Solar Fields
Geothermal Development Facilities
Mining (Active Locatable, Leasable and Saleable Developments)
Roads
Railroads
Powerlines
Communication Towers
Other Vertical Structures

**Table 2-4
Anthropogenic Disturbances and Areas of Impact**

Datasets as Described in the Monitoring Framework¹
Additional Local Datasets
Coalbed Methane Ponds
Meteorological Towers (e.g., wind energy testing)
Nuclear Energy Facilities
Airport Facilities and Infrastructure
Military Range Facilities and Infrastructure
Hydroelectric Plants
Recreation Areas Facilities and infrastructure

Note:

Mitigation

- MIT-1 (Mitigation): BLM would establish an inter-agency State GRSG Conservation Team at the state level (both Idaho and Montana) to help guide conservation of GRSG through compensatory mitigation, within 90 days of the issuance of the Record of Decision.
- MIT-2: The BLM and Forest Service, in coordination with the GRSG Conservation Team would develop a Mitigation Strategy within one year of the issuance of the Record of Decision. In Idaho this strategy would be consistent with the Idaho Mitigation Framework (**Appendix J**).
- MIT-3: In all GRSG habitat, in undertaking BLM management actions, and consistent with valid existing rights and applicable law, in authorizing third-party actions that result in habitat loss and degradation (**Appendix G, Table G-1**), the BLM will require and ensure mitigation that provides a net conservation gain to the species including accounting for any uncertainty associated with the effectiveness of such mitigation. This will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions.
- MIT-5: Mitigate anthropogenic development (**Appendix G, Table G-1**) impacts to GRSG habitat through application of appropriate mitigation in accordance with the Mitigation Framework (**Appendix J**).
- MIT-6: Consistent with regulations for minerals activities, require a full reclamation bond specific to the site when surface disturbing activities are proposed. Ensure reclamation bonds are sufficient to cover costs to fully rehabilitate lost GRSG habitat. Base the reclamation costs on the assumption that contractors for the BLM will perform the work. Areas are considered fully rehabilitated when they meet the conditions described in **Table 2-3**.

1 *Monitoring*

2 MON-1 (Monitoring): Once FIAT Assessments are complete annually complete a
3 review of FIAT Assessment implementation efforts within GRSG habitat
4 with appropriate USFWS and state agency personnel.

5 MON-2: Monitor the effectiveness of projects (e.g., fuel breaks, fuels treatments) until
6 objectives have been met or until it is determined that objectives cannot be
7 met, according to the monitoring schedule identified for project
8 implementation.

9 MON-3: Monitor invasive vegetation post vegetation management treatment

10 MON-4: Monitor project construction areas for noxious weed and invasive species for
11 at least 3 years, unless control is achieved earlier.

12 MON-5: Use lek, nesting and winter habitat maps and key habitat map (updates) to
13 annually assess GRSG population and habitat status in the context of the
14 adaptive management triggers.

15 MON-6: Continue to support updates to the Key Habitat map to track vegetation
16 changes in relation to GRSG habitat on a yearly basis, until such a time this
17 process is replaced. The process used to update the Key Habitat Map is
18 described in **Appendix F**.

19 MON-7: Monitor GRSG habitat as described in the monitoring framework plan
20 (**Appendix E**) in coordination with IDFG and MT FWP.

21 ***Vegetation***

22 *Objectives*

23 VEG-OBJ-1 (Vegetation): Reconnect and expand areas of higher native plant community
24 integrity/rangeland health to increase the extent of high quality habitat and,
25 where possible, to accommodate the future effects of climate change.
26

27 VEG-OBJ-2: Increase the amount and functionality of seasonal habitats by:

- 28 a. Increasing or enhancing canopy cover and average patch size of
29 sagebrush.
- 30 b. Increasing the amount, condition and connectivity of seasonal
31 habitats.
- 32 c. Protecting or improving GRSG migration/movement corridors.
- 33 d. Reducing conifer encroachment within GRSG seasonal habitats.
- 34 e. Improving understory (grass, forb) and/or riparian condition within
35 breeding and late brood-rearing habitats.

f. Reducing the extent of annual grasslands within and adjacent to PHMA and IHMA.

Decadal treatment objectives by population area are identified in **Table 2-5**.

VEG-Obj-3: In all SFAs and PHMAs, the desired condition is to maintain a minimum of 70 percent of lands capable of producing sagebrush with 10 to 30 percent sagebrush canopy cover. The attributes necessary to sustain these habitats are described in Interpreting Indicators of Rangeland Health (BLM Tech Ref 1734-6).

Table 2-5
Estimated Acres of Treatment Needed within a 10-Year Period to Achieve Vegetation Objectives on BLM-Administered Lands¹

Population Area	Mechanical ²	Prescribed Fire (FM-15) ³	Grass Restoration (VEG-2) ⁴
Bear Lake Plateau	1,000	0	0
East Idaho Uplands	6,000	9,000	1,000
S Central Idaho/N Snake River and Mountain Valleys	18,000	11,000	162,000
Weiser	0	0	13,000
SW Idaho	52,000	10,000	444,000
SW Montana	0	0	0

Note:

¹ These are estimates of treatments required to achieve and/or maintain desired habitat conditions over a period of ten years. There are many dynamic and highly variable disturbances that may happen over that period of time that could have a significant effect on the amount, type, and timing of treatment needed. Those disturbances are factored into the ten-year simulation using stochastic, not predictive, techniques. Probabilities of events such as large wildfires are used in the model to make the simulation as realistic as possible, given empirical data about such events in the past, but the results of the simulation cannot be used to predict the future occurrence of such events, including their timing, size, or location, which are essentially random.

² Removal of conifers that have invaded sagebrush including phase one juniper that is 10 percent or less and reducing sagebrush cover in areas over 30 percent canopy cover

³ Acres are those that are greater than 30 percent sagebrush canopy cover and/or invaded by 10 percent or greater conifer.

⁴ Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of perennial vegetation.

Vegetation Management

VEG-1: Implement habitat rehabilitation or restoration projects in areas that have potential to improve GRSG habitat using a full array of treatment activities as appropriate, including chemical, mechanical and seeding treatments.

VEG-2: Implement vegetation rehabilitation or manipulation projects to enhance sagebrush cover or to promote diverse and healthy grass and forb understory to achieve the greatest improvement in GRSG habitat based on FIAT Assessments, HAF assessments, other vegetative assessment data and local, site specific factors that indicate sagebrush canopy cover or herbaceous

1 conditions do not meet habitat management objectives (i.e. is minimal or
2 exceeds optimal characteristics). This may necessitate the use of prescribed
3 fire as a site preparation technique to remove annual grass residual growth
4 prior to the use of herbicides in the restoration of certain lower elevation
5 sites (e.g., Wyoming big sagebrush) but such efforts will be carefully planned
6 and coordinated to minimize impacts to GRSG seasonal habitats.

7 VEG-3: Require use of native seeds for restoration based on availability, adaptation
8 (ecological site potential), and probability of success (Richards et al. 1998).
9 Non-native seeds may be used as long as they support GRSG habitat
10 objectives (Pyke 2011) to increase probability of success, when adapted seed
11 availability is low or to compete with invasive species especially on harsher
12 sites.

13 VEG-4: Implement management changes in restoration and rehabilitation areas, as
14 necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG
15 habitat and to ensure long-term persistence of improved GRSG habitat
16 (Eiswerth and Shonkwiler 2006). Management changes could be considered
17 during livestock grazing permit renewals, travel management planning, and
18 renewal or reauthorization of ROWs.

19 VEG-5: Consider establishing seed harvest areas that are managed for seed
20 production (Armstrong 2007) to provide a reliable source of locally adapted
21 seed to use during rehabilitation and restoration activities.

22 VEG-6: Allocate use of native seed to GRSG or ESA listed species habitat in years
23 when preferred native seed is in short supply. This may require reallocation
24 of native seed from ESR (BLM) and/or BAER (Forest Service) projects
25 outside of PHMA or IHMA to those inside it. Where probability of success
26 or native seed availability is low, nonnative seeds may be used as long as they
27 meet GRSG habitat conservation objectives (Pyke 2011). Re-establishment
28 of appropriate sagebrush species/subspecies and important understory
29 plants, relative to site potential, shall be the highest priority for rehabilitation
30 efforts.

31 VEG-7: During land health assessments, evaluate the relative value of existing
32 nonnative seeding within GRSG habitat as: 1) a component of a grazing
33 system allowing improvement of adjacent native vegetation, 2) development
34 of a forage reserve, 3) incorporation into a fuel break system (Davies et al.
35 2011) or 4) restoration/diversification for GRSG habitat improvement.
36 Where appropriate and feasible, diversify seedings, or restore to native
37 vegetation when potential benefits to GRSG habitat outweigh the other
38 potential uses of the non-native seeding, with emphasis on PHMA and
39 IHMA. Allow recolonization of seedings by sagebrush and other native
40 vegetation.

1 VEG-8: Remove conifers encroaching into sagebrush habitats. Prioritize treatments
2 closest to occupied GRSG habitats and near occupied leks, and where
3 juniper encroachment is phase 1 or phase 2. Use of site-specific analysis and
4 tools like VDDT and the FIAT report (Chambers et. al., 2014) will help
5 refine the location for specific areas to be treated.

6 *Invasive Species*

7 INV-1 (Invasive Species): Incorporate results of the FIAT Assessments into projects
8 and activities addressing invasive species.

9 INV-2: Implement noxious weed and invasive species control using integrated
10 vegetation management actions per national guidance and local weed
11 management plans for Cooperative Weed Management Areas in cooperation
12 with State and Federal agencies, affected counties, and adjoining private lands
13 owners.

14 INV-3: Conduct integrated weed management actions for noxious and invasive weed
15 populations that are impacting or threatening GRSG habitat quality using a
16 variety of eradication and control techniques including chemical, mechanical
17 and other appropriate means.

18 INV-4: Require project proponent (projects described in **Table 2-4** and which are
19 included in the anthropogenic disturbance cap evaluation) to ensure that
20 noxious weeds and invasive species caused as a result of the project are
21 treated to eliminate establishment on the disturbed project construction areas
22 for at least 3 years and monitored and treated during the life of the project.

23 ***Wildland Fire Management***

24 *Objectives*

25 FUEL-OBJ-1: Design fuel treatments to restore, enhance, or maintain GRSG habitat.
26

27 *Wildfire Preparedness/Prevention*

28 WFP-1 (Wildfire Preparedness): Support development and implementation of
29 Rangeland Fire Protection Associations (RFPAs) in coordination with the
30 State of Idaho.

31 WFP-2: Develop a consistent approach to fire restrictions within GRSG habitat
32 through the existing coordinated inter-agency approach to fire restrictions
33 based upon National Fire Danger Rating System thresholds (fuel conditions,
34 drought conditions, and predicted weather patterns).

35 WFP-3: Annually incorporate into existing fire management plans results and updates
36 from the Wildfire and Invasive Species Habitat Assessments (FIAT
37 Assessments) described in **Appendix D**, to communicate/explain the

- 1 resource value of GRSG habitat, including fire prevention messages and
2 actions to reduce human-caused ignitions.
- 3 WFP-4: Continue to participate with the Wildland Fire Leadership Council, a
4 cooperative, interagency organization dedicated to achieving consistent
5 implementation of the goals, actions, and policies in the National Fire Plan
6 and the Federal Wildland Fire Management Policy.
- 7 WFP-5: Continue annual coordination meetings held between cooperating agencies
8 that have fire suppression responsibilities. Incorporate Rangeland Fire
9 Protection Associations and other stakeholders into this coordination.
10 Discuss priority suppression areas and distribute maps showing priority
11 suppression areas at both the Conservation Area and the local office levels as
12 based on the adaptive management strategy and FIAT Assessments.
- 13 WFP-6: Ensure firefighter personnel receive annual orientation regarding GRSG
14 habitat and sagebrush management issues as related to wildfire suppression.
- 15 WFP-7: As part of the FIAT Assessments, identify roads, trails, and recreational use
16 areas with high frequency of human caused fires within or adjacent to the
17 PHMA or IHMA. Consider these areas during annual fire restriction
18 evaluations, and as appropriate, through site specific management.
- 19 WFP-8: Coordinate with Federal, State and local jurisdictions on fire and litter
20 prevention programs to reduce human caused ignitions.
- 21 WFP-9: Implement activities identified within the FIAT Assessments.
- 22 *Wildfire Suppression*
- 23 WFS-1: Complete Wildland Fire and Invasive Species Assessments (FIAT
24 Assessments) as described within **Appendix D** and incorporate results into
25 appropriate Fire Management Plans as they are completed. FIAT
26 Assessments are interdisciplinary evaluations of the threats posed by wildfire
27 and invasive species, as well as identification of focal and emphasis
28 habitats/treatment opportunities for fuels management, fire management,
29 and restoration. These FIAT Assessments identify focal and emphasis
30 habitats and describe strategies for fuels management, suppression and
31 restoration activities. Focal and Emphasis Habitats identified through the
32 FIAT Assessment to further refine priority areas for treatments to reduce the
33 threats posed by wildfire, invasive annual grass and conifer expansion.
- 34 WFS-2: As part of the FIAT Assessments incorporate a wildfire response time
35 analysis focusing on response time to identified priority areas within PHMA
36 and IHMA or on those fires that have the potential to impact PHMA and
37 IHMA. Incorporate findings into Unit Initial Attack program

1 WFS-3: As part of the FIAT Assessment incorporate a water capacity analysis for
2 suppression purposes, including potential private water sources. Provide
3 water availability to respond to fire in or threatening PHMA and IHMA
4 during initial attack.

5 WFS-4: During high fire danger conditions, stage initial attack and secure additional
6 resources closer to priority areas identified in the FIAT Assessments, based
7 on anticipated fires and weather conditions, with particular consideration of
8 the West Owyhee, Southern and Desert Conservation Areas to ensure
9 quicker response times in or near GRSG habitat after considerations and
10 placement of resources to protect human life and property.

11 WFS-5: Utilize a full range of fire management strategies and tactics through strategic
12 wildfire suppression planning consistent with appropriate management
13 response and within acceptable risk levels, to achieve resource objectives for
14 GRSG habitat consistent with land use plan direction. Utilizing both direct
15 and indirect attack as appropriate to limit the overall amount of GRSG
16 habitat burned. This could include suppressing fires in intact sagebrush
17 habitats; limiting fire growth in GHMA when suppression resources are
18 available or managing wildfire for resource benefit in areas of conifer
19 (juniper) encroachment.

20 WFS-6: Suppression priorities: Firefighter and public safety followed by property are
21 the highest priority for protection during suppression activities. Maintaining
22 GRSG habitat will be prioritized immediately after human life and property,
23 commensurate with threatened and endangered species habitat or other
24 critical habitats to be protected.

25 WFS-7: Ensure close coordination with federal and state firefighters including the
26 Rangeland Fire Protection Associations during suppression activities.

27 *Fuels Management*

28 FM-1: Design and implement fuels treatments that would reduce the potential start
29 and spread of unwanted wildfires and provide anchor points or control lines
30 for the containment of wildfires during suppression activities with an
31 emphasis on maintaining, protecting, and expanding sagebrush ecosystems
32 and successfully rehabilitated areas and strategically and effectively reduce
33 wildfire threats in the greatest area.

34 FM-2: Enhance (or maintain/retain) sagebrush canopy cover and community
35 structure to match expected potential for the ecological site and consistent
36 with GRSG habitat objectives unless fuels management objectives requires
37 additional reduction in sagebrush cover to meet strategic protection of
38 GRSG habitat. Closely evaluate the benefits of the fuel management
39 treatments against the additional loss of sagebrush cover on the local
40 landscape in the NEPA process.

- 1 FM-3: Apply appropriate seasonal restrictions for implementing vegetation and
2 fuels management treatments according to the type of seasonal habitats
3 present. Allow no treatments in known winter range unless the treatments
4 are designed to strategically reduce wildfire risk around and/or in the winter
5 range and would protect, maintain, increase, or enhance winter range habitat
6 quality. Ensure chemical applications are utilized where they would assist in
7 success of fuels treatments. Strategically place treatments on a landscape scale
8 to prevent fire from spreading into PHMA or WUI.
- 9 FM-4: Develop a fuels continuity and management strategy to expand, enhance,
10 maintain and protect GRSG habitat informed by the FIAT Assessments
11 completed as described in **Appendix D**.
- 12 FM-5: When developing the fuels management strategy as part of the FIAT
13 Assessment described in **Appendix D** consider up-to-date fuels profiles;
14 land use plan direction; current and potential habitat fragmentation;
15 sagebrush and GRSG ecological factors; active vegetation management steps
16 to provide critical breaks in fuel continuity where appropriate; incorporate a
17 comparative risk analysis with regard to the risk of increased habitat
18 fragmentation from a proposed action versus the risk of large scale
19 fragmentation posed by wildfires if the action is not taken.
- 20 FM-6: Fuel treatments will be designed through an interdisciplinary process to
21 expand, enhance, maintain, and protect GRSG habitat which considers a full
22 range of cost effective fuel reduction techniques, including: chemical,
23 biological (including grazing and targeted grazing), mechanical and prescribed
24 fire treatments.
- 25 FM-7: Existing and proposed linear ROWs could be considered for use and
26 maintenance as vegetated fuel breaks in appropriate areas (this activity may
27 or may not be part of the ROW permit or the responsibility of the permit
28 holder, in cases where this activity is considered part of mitigation for project
29 design then it would be appropriately included as part of the ROW permit
30 and the responsibility of the permit holder for development and
31 maintenance).
- 32 FM-8: Fuel breaks would incorporate existing vegetation treatments (seedings),
33 rocky areas or other appropriate topography or features or be located
34 adjacent to existing linear disturbance areas where appropriate. Fuel breaks
35 should be placed in areas with the greatest likelihood of compartmentalizing
36 a fire and/or to foster suppression options to protect existing intact habitat.
- 37 FM-9: Strategically pre-treat areas to reduce fine fuels consistent with areas and
38 results identified within the Wildfire and Invasive Species Assessments.

- 1 FM-10: Protect vegetation restoration and rehabilitation efforts/projects from
2 subsequent fire events.
- 3 FM-11: Targeted grazing as a fuels treatment to adjust the vegetation conditions to
4 reduce the potential start and spread of wildfires may be implemented within
5 existing grazing authorizations if feasible such as through temporary non-
6 renewable authorizations, or through contracts, agreements or other
7 appropriate means separate from existing grazing authorizations and permits.
- 8 FM-12: Targeted grazing to achieve fuels management objectives should conform to
9 the following criteria:
- 10 a. Targeted grazing should be implemented strategically on the
11 landscape, and directly involve the minimum footprint and grazing
12 intensity required to meet fuels management objectives.
- 13 b. Conform to the applicable Standards for Rangeland Health and
14 Guidelines for Livestock Grazing Management (Idaho or Montana)
15 at the assessment scale (pasture/watershed).
- 16 c. Where feasible and applicable coordinate with the grazing permittee
17 to strategically reduce fuels through livestock management within the
18 Mandatory Terms and Conditions of the applicable grazing
19 authorizations
- 20 FM-13: Prioritize the use of native seeds for fuels management treatment based on
21 availability, adaptation (site potential), and probability of success. Where
22 probability of success or native seed availability is low or non-economical,
23 nonnative seeds may be used to meet GRSG habitat objectives to trend
24 toward restoring the fire regime. When reseeding, use fire resistant native and
25 nonnative species, as appropriate, to provide for fuel breaks.
- 26 FM-14: Maintain effectiveness of fuels projects, including fuel breaks, to ensure long-
27 term success, including persistence of seeded species and/or other treatment
28 components while maintaining the integrity of adjacent vegetation.
- 29 FM-15: If prescribed fire is used in GRSG habitat, the NEPA analysis for the Burn
30 Plan will address:
- 31 • why alternative techniques were not selected as a viable options;
32 • how GRSG goals and objectives would be met by its use;
33 • how the COT Report objectives would be addressed and met;
34 • a risk assessment to address how potential threats to GRSG habitat
35 would be minimized.
- 36 a. Prescribed fire as a vegetation or fuels treatment shall only be
37 considered after the NEPA analysis for the Burn Plan has

1 addressed the four bullets outlined above. Prescribed fire
2 could be used to meet specific fuels objectives that would
3 protect GRSG habitat in PHMAs (e.g., creation of fuel breaks
4 that would disrupt the fuel continuity across the landscape in
5 stands where annual invasive grasses are a minor component
6 in the understory, burning slash piles from conifer reduction
7 treatments, used as a component with other treatment
8 methods to combat annual grasses and restore native plant
9 communities).

- 10 b. Prescribed fire in known winter range shall only be
11 considered after the NEPA analysis for the Burn Plan has
12 addressed the four bullets outlined above. Any prescribed fire
13 in winter habitat would need to be designed to strategically
14 reduce wildfire risk around and/or in the winter range and
15 designed to protect winter range habitat quality.

16 *Wildfire Restoration/Rehabilitation – Emergency Stabilization and Rehabilitation*

17 ESR-1: Utilize the findings and Restoration/Rehabilitation Strategy developed as
18 part of the FIAT Assessment process described in **Appendix D** to
19 determine if GRSG rehabilitation actions are needed, based on ecological
20 potential, and direct emergency stabilization and rehabilitation (ESR) (BLM)
21 or Burned Area Emergency Restoration (BAER) (Forest Service) actions
22 after fire.

23 ESR-2: Incorporate GRSG Habitat Management Objectives into ESR/BAER plans
24 based on site potential and in accordance with the Restoration/Rehabilitation
25 Strategy developed as a result of the FIAT Assessments.

26 ESR-3: Provide adequate rest from livestock grazing to allow natural recovery of
27 existing vegetation and successful establishment of seeded species within
28 burned/ESR areas. All new seedlings of grasses and forbs should not be
29 grazed until at least the end of the second growing season, and longer as
30 needed to allow plants to mature and develop robust root systems which will
31 stabilize the site, compete effectively against cheatgrass and other invasive
32 annuals, and remain sustainable under long-term grazing management.
33 Adjust other management activities, as appropriate, to meet ESR objectives.

34 ESR-4: Adjust, as appropriate, livestock management on adjacent unburned areas to
35 mitigate the effect of the burn on local GRSG populations.

36 ESR-5: Following seedling establishment, modify grazing management practices if
37 needed to achieve long-term vegetation and habitat objectives.

38 ***Livestock Grazing***

39 RM-1 (Range Management): Maintain existing areas designated as available or
40 unavailable for livestock grazing. Existing active AUMs for livestock grazing

1 within the planning area would not be changed at the broad scale, though the
2 number of AUMs available on an allotment may be adjusted based on site-
3 specific conditions to meet management objectives during term permit
4 renewals, AMP development, or other appropriate implementation planning.
5 Additionally, temporary adjustments can be made annually to livestock
6 numbers, the number of AUMs, and season of use in accordance with
7 applicable regulations.

8 RM-2: Prioritize BLM land health assessments and processing of BLM grazing
9 permits consistent with management area prioritization (MA-4), unless other
10 higher priority considerations exist such as threatened, endangered and
11 proposed species habitat that livestock grazing could affect. Where possible,
12 conduct land health assessments at the watershed, or other meaningful
13 landscape-scale.

14 RM-3: Where opportunities exist, coordinate with other land managers to encourage
15 livestock operations that utilize mixed federal, private and/or state land to be
16 managed at the landscape scale to benefit GRSG and their habitat across land
17 ownerships.

18 RM-4: PHMA & IHMA: During the land health assessment process, identify the
19 type(s) of seasonal habitat the assessed areas are capable of supporting.
20 Utilize the habitat assessment framework, (Stiver et al. 2014 as
21 amended/replaced) or other BLM or Forest Service approved methodology,
22 in accordance with current policy and guidance to determine whether
23 vegetation structure, condition and composition are meeting GRSG habitat
24 objectives including riparian and lentic areas (HM-OBJ-2; **Table 2-3**). Use
25 appropriate Ecological Site Descriptions, reference sheets and state and
26 transition models to inform desired habitat conditions and expected
27 responses to management changes for the land unit being assessed.

28 RM-5: When modifying grazing management, analyze indirect effects to habitat,
29 including changes in fuel loading and wildfire behavior.

30 RM-6: When livestock management practices are determined to not be compatible
31 with meeting or making progress towards achievable habitat objectives
32 following appropriate consultation, cooperating and coordination, implement
33 changes in grazing management through grazing authorization modifications,
34 or allotment management plan implementation. Potential modifications
35 include, but are not limited to, changes in:

- 36 1) Season or timing of use;
- 37 2) Numbers of livestock;
- 38 3) Distribution of livestock use;
- 39 4) Duration and/or level of use;

1 functional projects needed for management of habitat for other threatened,
2 endangered or proposed species or other sensitive resources.

3 RM-14: Prioritize removal, modification or marking of fences or other structures in
4 areas of high collision risk following appropriate cooperation, consultation
5 and coordination to reduce the incidence of GRSG mortality due to fence
6 strikes (Stevens et al. 2012).

7 RM-15: In response to weather conditions (i.e. drought) adjust grazing management
8 (i.e., delay turnout, adjust pasture rotations, adjust the amount and/or
9 duration of grazing) as appropriate to provide for adequate food and cover
10 for GRSG.

11 RM-16: The BLM will prioritize (1) the review of grazing permits/leases, in particular
12 to determine if modification is necessary prior to renewal, and (2) the
13 processing of grazing permits/leases in Sagebrush Focal Areas (SFAs)
14 followed by PHMAs outside of the SFAs. In setting workload priorities,
15 precedence will be given to existing permits/leases in these areas not meeting
16 Land Health Standards, with focus on those containing riparian areas,
17 including wet meadows. The BLM may use other criteria for prioritization to
18 respond to urgent natural resource concerns (ex., fire) and legal obligations.

19 RM-17: The NEPA analysis for renewals and modifications of livestock grazing
20 permits/leases that include lands within SFAs and PHMAs will include
21 specific management thresholds, based on GRSG Habitat Objectives Table,
22 Land Health Standards (43 CFR 4180.2) and ecological site potential, and
23 one or more defined responses that will allow the authorizing officer to make
24 adjustments to livestock grazing that have already been subjected to NEPA
25 analysis.

26 RM-18: Allotments within SFAs, followed by those within PHMAs, and focusing on
27 those containing riparian areas, including wet meadows, will be prioritized
28 for field checks to help ensure compliance with the terms and conditions of
29 the grazing permits. Field checks could include monitoring for actual use,
30 utilization, and use supervision.

31 RM-19: At the time a permittee or lessee voluntarily relinquishes a permit or lease,
32 the BLM will consider whether the public lands where that permitted use was
33 authorized should remain available for livestock grazing or be used for other
34 resource management objectives, such as grass banks or fire breaks.

35 ***Wild Horses and Burros***

36 WHB-1: Manage herd management areas (HMAs) in GRSG habitat within established
37 AML ranges to achieve and maintain GRSG habitat objectives (**Table 2-3**).

- 1 WHB- 2: Complete rangeland health assessments for HMAs containing GRSG habitat
2 using an interdisciplinary team of specialists (e.g. range, wildlife, and
3 riparian). The priorities for conducting assessments are: 1) HMAs Containing
4 SFA; 2) HMAs containing PHMA; 3) HMAs containing IHMA; 4) HMAs
5 containing GHMA; 5) HMAs containing sagebrush habitat outside of
6 PHMA, IHMA, and GHMA mapped habitat; 6) HMAs without GRSG
7 Habitat.
- 8 WHB-3: Prioritize gathers and population growth suppression techniques in HMAs in
9 GRSG habitat, unless removals are necessary in other areas to address higher
10 priority environmental issues, including herd health impacts. Place higher
11 priority on Herd Areas not allocated as HMAs and occupied by wild horses
12 and burros in SFAs followed by PHMA.
- 13 WHB-4: In SFAs and PHMA outside of SFA, assess and adjust AMLs through the
14 NEPA process within HMAs when wild horses or burros are identified as a
15 significant causal factor in not meeting land health standards, even if current
16 AML is not being exceeded.
- 17 WHB-5: In SFAs and PHMA outside of SFA, monitor the effects of wild horse and
18 burro use in relation to GRSG seasonal habitat objectives on an annual basis
19 to help determine future management actions.
- 20 WHB-6: Develop or amend herd management area plans (HMAPs) to incorporate
21 GRSG habitat objectives and management considerations for all HMAs
22 within GRSG habitat, with emphasis placed on SFAs and other PHMAs.
- 23 WHB-7: Consider removals or exclusion of wild horse and burros during or
24 immediately following emergency situations (such as fire, floods, and
25 drought) to facilitate meeting GRSG habitat objectives where HMAs overlap
26 with GRSG habitat.
- 27 WHB-8: When conducting NEPA analysis for wild horse and burro management
28 activities, water developments, or other rangeland improvements for wild
29 horses, address the direct and indirect effects to GRSG populations and
30 habitat. Implement any water developments or rangeland improvements
31 using the criteria identified for domestic livestock.
- 32 WHB-9: Coordinate with professionals from other federal and state agencies,
33 researchers at universities, and others to utilize and evaluate new
34 management tools (e.g., population growth suppression, inventory
35 techniques, and telemetry) for implementing the wild horse and burro
36 program.

1 ***Lands and Realty***

2 LR-1 (Lands and Realty): PHMA: Designate and manage PHMA as ROW
3 avoidance areas, consistent with AD-3 and subject to RDFs, buffers and
4 seasonal timing restrictions (**Appendices B and C**). IHMA: Designate and
5 manage IHMA as ROW avoidance areas, consistent with AD-4 and subject
6 to RDFs, buffers and seasonal timing restrictions. GHMA (Idaho and
7 Montana): Designate and manage GHMA as open with proposals subject to
8 RDFs, buffers and seasonal timing restrictions.

9 LR-2: PHMA: Designate and manage PHMA as exclusion areas for utility scale (20
10 MW) wind and solar testing and development, nuclear and hydropower
11 energy development. IHMA: Designate and manage IHMA as avoidance
12 areas for wind and solar testing and development, nuclear and hydropower
13 development. GHMA (Idaho): Designate and manage GHMA as open for
14 wind and solar testing and development and nuclear and hydropower
15 development subject to RDFs, buffers and seasonal timing restrictions.
16 GHMA (Montana): Designate and manage GHMA as avoidance for wind
17 and solar testing and development and nuclear and hydropower
18 development.

19 LR-3: PHMA: Development of commercial service airports and facilities (as
20 defined by FAA 2014 – publically owned airports that have at least 2,500
21 passenger boardings each calendar year and receive scheduled passenger
22 service) would not be allowed within PHMA. IHMA and GHMA are
23 Avoidance and Open respectively for these types of ROW applications as
24 described in LR-1.

25 LR-4: PHMA: Development of new or expansion of existing landfills would not be
26 allowed within PHMA. IHMA and GHMA are Avoidance and Open
27 respectively for these types of ROW applications as described in LR-1.

28 LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of
29 new or amended ROWs and land use authorizations (including permits and
30 leases) in PHMA would only be considered when consistent with the
31 Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for
32 development of new or amended ROWs and land use authorizations
33 (including permits and leases) in IHMA could be considered consistent with
34 the IHMA Anthropogenic Disturbance Development Criteria (AD-4).
35 GHMA: New ROW and land use authorizations could be considered.

36 LR-6: In PHMA, if a higher voltage transmission line is required adjacent to an
37 existing line (i.e. the project is an incremental upgrade/capacity increase of
38 existing development (i.e. powerline capacity upgrade):

- 1 • the existing transmission line must be removed and area rehabilitated
2 within a specified amount of time after the new line is installed and
3 energized; and
 - 4 • the new line must be constructed in the same alignment as the
5 existing line unless an alternate route would benefit GRSG or GRSG
6 habitat.
- 7 LR-7: Existing designated corridors, including Section 368 Corridors, will remain
8 Open in all habitat management areas (subject to the ongoing settlement
9 agreement).
- 10 LR-8: Process unauthorized use. If the use is subsequently authorized, it would be
11 authorized consistent with direction for the Management Areas within which
12 it is located and the RDFs, buffers and seasonal timing restrictions. If the use
13 is not subsequently authorized the site would be reclaimed by removing these
14 features and rehabilitating the habitat.
- 15 LR-9: Land use authorizations that are temporary (less than 3 years) in nature and
16 are not otherwise excluded or restricted would be subject to seasonal or
17 timing restrictions and mitigation requirements regarding habitat loss as
18 needed.
- 19 LR-10: New ROW applications for water facilities (ditches, canals, pipelines), or
20 amendments to existing water facilities which include additional structures to
21 improve fish passage or benefits to fisheries (new diversions, fish screens)
22 would be allowed on a case-by-case bases subject to RDFs to reduce impacts
23 to GRSG habitat and mitigation requirements regarding GRSG habitat loss
24 as needed.
- 25 LR-11: When a ROW grant expires and is not requested to be renewed, is
26 relinquished, or terminated, the lease holder would be required to reclaim the
27 site by removing overhead lines and other infrastructure and to eliminate
28 avian predator nesting opportunities provided by anthropogenic
29 development on public lands associated with the now void ROW grant (e.g.,
30 remove powerline and communication facilities no longer in service).
- 31 LR-12: As opportunities and priorities indicate work with existing ROW holders to
32 retrofit existing towers and structures consistent with RDFs described in
33 **Appendix B.**
- 34 LR-13: PHMA and IHMA (Idaho and Montana), and GHMA (Montana only) are
35 designated as avoidance areas for high voltage transmission line and large
36 pipeline ROWs, except for the transmission projects specifically identified
37 below. All authorizations in these areas, other than the excepted projects,
38 must comply with the conservation measures outlined in this proposed plan,
39 including the RDFs and avoidance criteria presented in AD-3 and AD-4 of

1 this document. The BLM is currently processing an application for Gateway
2 West and Boardman to Hemingway Transmission Projects and the NEPA
3 review for this project is well underway. The BLM is analyzing GRSG
4 mitigation measures through the projects' NEPA review process.

5 LR-14: Lands classified as PHMA, IHMA, and GHMA for GRSG will be retained in
6 federal management unless: (1) the agency can demonstrate that disposal of
7 the lands will provide a net conservation gain to the GRSG or (2) the agency
8 can demonstrate that the disposal of the lands will have no direct or indirect
9 adverse impact on conservation of the GRSG. Land tenure adjustments
10 would be subject to the following disposal, exchange, and acquisition criteria,
11 which include retaining lands with GRSG habitat. Retention of areas with
12 GRSG would reduce the likelihood of habitat conversion to agriculture,
13 urbanization, or other uses that would remove sagebrush habitat and
14 potentially impact sensitive plants. Criteria:

- 15 a. Lands within PHMA, IHMA and GHMA would only be available for
16 disposal through exchange (**Appendix K**).
- 17 b. Acquire habitat within PHMA and IHMA, when possible (i.e. willing
18 landowner), and retain ownership of habitat within all Areas, except
19 if a land exchange would allow for additional or more contiguous
20 federal ownership patterns.
- 21 c. Lands within PHMA, IHMA and GHMA would be retained unless
22 exchange of those lands would increase the extent or provide for
23 connectivity of PHMA or IHMA.
- 24 d. Evaluate potential land exchanges containing historically low-quality
25 GRSG habitat that may be too costly to restore in exchange for lands
26 of higher quality habitat, lands that connect seasonal GRSG habitats
27 or lands providing for threatened and endangered species. These
28 potential exchanges should lead to an increase in the extent or
29 continuity of or provide for improved connectivity of PHMA. Higher
30 priority will be given to exchanges for those in-tact areas of
31 sagebrush that will contribute to the expansion of sagebrush areas
32 within PHMA currently in public ownership. Lower priority would
33 be given to other lands that would promote enhancement in the
34 PHMA and IHMA (i.e., areas with fragmented or less in-tact
35 sagebrush).
- 36 e. Identify lands for acquisition that increase the extent of or provide
37 for connectivity of PHMA.

1 **Minerals**

2
3 *Fluid Minerals (Oil, Gas, and Geothermal)*

4
5 Objectives

6 FLM-OBJ-1: Priority will be given to leasing and development of fluid mineral resources,
7 including geothermal, outside of PHMA, IHMA, and GHMA. When
8 analyzing leasing and authorizing development of fluid mineral resources,
9 including geothermal, in PHMA, IHMA, and GHMA, and subject to
10 applicable stipulations for the conservation of GRSG, priority will be given
11 to development in non-habitat areas first and then in the least suitable habitat
12 for GRSG. The implementation of these priorities will be subject to valid
13 existing rights and any applicable law or regulation, including, but not limited
14 to, 30 USC 226(p) and 43 CFR 3162.3-1(h).

15 FLM-OBJ-2: Where a proposed fluid mineral development project on an existing lease
16 could adversely affect GRSG populations or habitat, the BLM will work with
17 the lessees, operators, or other project proponents to avoid, reduce and
18 mitigate adverse impacts to the extent compatible with lessees' rights to drill
19 and produce fluid mineral resources. The BLM will work with the lessee,
20 operator, or project proponent in developing an APD or Geothermal
21 Drilling Permit (GDP) for the lease to avoid and minimize impacts to GRSG
22 or its habitat and will ensure that the best information about the GRSG and
23 its habitat informs and helps to guide development of such Federal leases.

24 Management

25 FLM-1 (Fluid Minerals): Idaho and Montana: Areas within SFAs would be open to
26 fluid mineral leasing and development and geophysical exploration subject to
27 NSO without waiver, exception, or modification. Areas within PHMA and
28 IHMA would be open to mineral leasing and development and geophysical
29 exploration subject to NSO with a limited exception (FLM-3). GHMA would
30 be open to mineral leasing and development and geophysical exploration
31 subject to CSU which includes buffers, seasonal timing restrictions (see
32 Appendix C) and standard stipulations.

33 FLM-2: In Idaho, parcels nominated for lease in PHMA or IHMA would be
34 evaluated prior to lease offering to determine if development is feasible. In
35 GHMA, parcels that could not be developed when these buffers and
36 restrictions are applied would not be offered for lease.

37 FLM-3: PHMA and IHMA: No waivers or modifications to a fluid mineral lease
38 NSO stipulation will be granted. The Authorized Officer may grant an
39 exception to a fluid mineral lease NSO stipulation only where the proposed
40 action:

- 41 i. Would not have direct, indirect, or cumulative effects on GRSG or
42 its habitat; or,

- 1 ii. Is proposed to be undertaken as an alternative to a similar action
2 occurring on a nearby parcel, and would provide a clear conservation
3 gain to GRSG.

4 Exceptions based on conservation gain (ii) may only be considered in (a)
5 PHMAs of mixed ownership where federal minerals underlie less than fifty
6 percent of the total surface, or (b) areas of the public lands where the
7 proposed exception is an alternative to an action occurring on a nearby
8 parcel subject to a valid Federal fluid mineral lease existing as of the date of
9 this RMP amendment. Exceptions based on conservation gain must also
10 include measures, such as enforceable institutional controls and buffers,
11 sufficient to allow the BLM to conclude that such benefits will endure for the
12 duration of the proposed action's impacts.

13 Any exceptions to this lease stipulation may be approved by the Authorized
14 Officer only with the concurrence of the State Director. The Authorized
15 Officer may not grant an exception unless the applicable state wildlife
16 agency, the USFWS, and the BLM unanimously find that the proposed
17 action satisfies (i) or (ii). Such finding shall initially be made by a team of one
18 field biologist or other GRSG expert from each respective agency. In the
19 event the initial finding is not unanimous, the finding may be elevated to the
20 appropriate BLM State Director, USFWS State Ecological Services Director,
21 and state wildlife agency head for final resolution. In the event their finding is
22 not unanimous, the exception will not be granted. Approved exceptions will
23 be made publically available at least quarterly.

24 Waivers, Exceptions and Modifications (WEMs) (Source IM-2008-032):

- 25 • A waiver is a permanent exemption from a lease stipulation, the
26 stipulation would no longer apply anywhere within the lease. Waivers,
27 by regulation, require a 30-day public review if the authorized officer
28 has determined, prior to lease issuance, that a stipulation involves an
29 issue of major concern to the public (43 CFR 3101.4) and are
30 approved and signed by the State Director.
- 31 • An exception is a one-time exemption for a particular site within the
32 lease; exceptions are determined on a case-by-case basis; the
33 stipulation continues to apply to all other sites within the lease. An
34 exception is a limited type of waiver.
- 35 • A modification is a change to the provisions of a lease stipulation,
36 either temporarily or for the term of the lease. Depending on the
37 specific modification, the stipulation may or may not apply to all sites
38 within the lease to which the restrictive criteria are applied.

39 FLM-4: Incorporate required design features and best management practices
40 appropriate to the management area as COAs when post leasing activity is
41 proposed into any post-lease authorizations.

1 FLM-5: In Montana, prior to leasing conduct a Master Leasing Plan process when all
2 four of the following criteria are met:

- 3 • A substantial portion of the area to be analyzed in the MLP is not
4 currently leased.
- 5 • There is a majority Federal mineral interest.
- 6 • The oil and gas industry has expressed a specific interest in leasing,
7 and there is a moderate or high potential for oil and gas confirmed by
8 the discovery of oil and gas in the general area.
- 9 • Additional analysis or information is needed to address likely
10 resource or cumulative impacts if oil and gas development were to
11 occur where there are:
 - 12 ○ multiple-use or natural/cultural resource conflicts;
 - 13 ○ impacts to air quality;
 - 14 ○ impacts on the resources or values of any unit of the National
15 Park System, national wildlife refuge, or National Forest
16 wilderness area, as determined after consultation or
17 coordination with the NPS, the USFWS, or the Forest
18 Service; or
 - 19 ○ impacts on other specially designated areas. – analyzing likely
20 development scenarios and varying mitigation levels.

21 FLM-5: In Idaho, complete a Master Development Plan, consistent with plan
22 development guide on leases where a producing field is proposed to be
23 developed.

24 FLM-6: Encourage unitization when deemed necessary for proper development and
25 operation of an area (with strong oversight and monitoring). The unitization
26 must be designed in a manner to minimize adverse impacts on GRSG
27 according to the Federal Lease Form, 3100-11, Sections 4 and 6.

28 FLM-7: Issue Written Orders of the Authorized Officer (43 CFR 3161.2) requiring
29 reasonable protective measures consistent with the lease terms where
30 necessary to avoid or minimize effects to GRSG populations or habitat.

31 *Locatable Minerals*

32 LOC-1 (Locatable Minerals): Lands would remain open to locatable mineral entry
33 outside of SFAs.

34 LOC-2: Apply reasonable and appropriate RDFs and BMPs as Conditions of
35 Approval to prevent unnecessary or undue degradation of GRSG habitat
36 when a Plan of Operations is submitted for BLM or Forest Service approval,
37 in accordance with 43 CFR 3809.411(d)(2) (or 36 CFR 228.5(a)(3) on
38 National Forest System lands).

1 LOC-3: Recommend SFAs for withdrawal from the General Mining Act of 1872, as
2 amended, subject to valid existing rights.

3 *Mineral Materials (Saleable Minerals)*

4 SAL-1 (Saleable Minerals): PHMA: All PHMAs will be closed to mineral materials
5 development. However, existing free use permits and the expansion of
6 existing free use permits may be considered only if the following criteria are
7 met:

- 8 • the project area disturbance cap is not exceeded within a BSU;
- 9 • the activity is subject to the provisions set forth in the mitigation
10 framework [**Appendix J**];
- 11 • all applicable required design features are applied; and
- 12 • the activity is permissible under the Idaho exception and
13 development criteria (AD-3 and AD-4)

14 IHMA: All IHMA will be open to mineral materials development, consistent
15 with the Idaho Anthropogenic Disturbance Criteria (AD-4), and subject to
16 RDFs, buffers and seasonal timing restrictions. Sales from existing
17 community pits within IHMA would be subject to seasonal timing
18 restrictions.

19 GHMA: All GHMA will be open to mineral materials development, subject
20 to RDFs, buffers and seasonal timing restrictions. Sales from existing
21 community pits within GHMA would be subject to seasonal timing
22 restrictions.

23 SAL-2: Restore salable mineral pits no longer in use to meet GRSG habitat
24 management objectives.

25 SAL-3: Require reclamation bonding that would require restoration of GRSG habitat
26 on new site authorizations for mineral material pits in IHMA (this would not
27 apply to free use permits issued to a government entity such as a county road
28 district, but would apply to non-profit entities).

29 SAL-4: Montana: PHMAs are closed to new mineral material sales. However, these
30 areas remain “open” to free use permits and the expansion of existing active
31 pits, only if the following criteria are met:

- 32 • the activity is within the BSU and project area disturbance cap;
- 33 • the activity is subject to the provisions set forth in the mitigation
34 framework [**Appendix J**];
- 35 • all applicable required design features are applied; and

- the activity is permissible under the Montana screening criteria (AD-4) Appendix I.

Nonenergy Leasable Minerals

NEL-1 (Nonenergy Leasables): PHMAs are closed to leasing. IHMA and GHMA: Areas within Known Phosphate Leasing Areas (KPLAs) will remain open to leasing subject to standard stipulations. IHMA areas outside of KPLAs are open to prospecting and subsequent leasing provided the Anthropogenic Disturbance Development Criteria (AD-4) and the anthropogenic disturbance cap (AD-1) can be met. RDFs, buffers and seasonal timing restrictions shall be applied to prospecting permits. GHMA: Lands outside KPLAs are available for prospecting and subsequent leasing and initial mine development subject to RDFs, buffers, timing restrictions (seasonal and daily) and standard stipulations.

NEL-2: Require seasonal and daily timing restrictions in undeveloped nonenergy mineral leases when exploration activities or initial mine development is proposed (e.g. exploration drilling, timber removal, shrub clearing, etc.) as COAs.

NEL-3: Include RDFs as COAs to mine plans in undeveloped non-energy mineral leases for exploration activities or initial mine development.

Mineral Split Estate

MSE-1 (Mineral Split Estate): BLM Owns Mineral Estate – non-federal surface owner: Where the federal government owns the mineral estate in PHMAs, IHMAs, and GHMAs, and the surface is in non-federal ownership, apply the same stipulations, COAs, and/or conservation measures and RDFs applied if the mineral estate is developed on BLM-administered lands in that management area, to the maximum extent permissible under existing authorities, and in coordination with the landowner.

MSE-2: BLM owns surface – non-federal mineral estate owner: Where the federal government owns the surface and the mineral estate is in non-federal ownership in PHMA, IHMA, and GHMA, apply appropriate surface use COAs, stipulations, and mineral RDFs through ROW grants or other surface management instruments, to the maximum extent permissible under existing authorities, in coordination with the mineral estate owner/lessee.

Comprehensive Trails and Travel Management

TM-1 (Travel Management): Limit off-highway vehicle motorized travel within Idaho BLM Field Offices to existing roads, primitive roads, and trails in areas where travel management planning has not been completed or is in progress. This excludes areas previously designated as open through a land use plan decision or currently under review for designation as open, currently being analyzed in ongoing RMP revision efforts in the Four Rivers, Jarbidge and

1 Upper Snake Field Offices. Upon completion of travel management plans
2 the designation would change to limited to designated roads, primitive roads
3 and trails.

4 An off-highway vehicle is any motorized vehicle capable of, or designed for,
5 travel on or immediately over land, water, or other natural terrain, excluding:
6 (1) Any nonamphibious registered motorboat; (2) any military, fire,
7 emergency, or law enforcement vehicle while being used for emergency
8 purposes; (3) any vehicle whose use is expressly authorized by the authorized
9 officer, or otherwise officially approved; (4) Vehicles in official use where
10 official use is use by an employee, agent, or designated representative of the
11 Federal Government or one of its contractors, in the course of his
12 employment, agency, or representation.; and (5) any combat or combat
13 support vehicle when used in times of national defense emergencies (43 CFR
14 8340.0 5).

15 TM-2: In PHMA, IHMA, and GHMA, temporary closures will be considered in
16 accordance with 43 CFR subpart 8364 (Closures and Restrictions); 43 CFR
17 subpart 8351 (Designated National Area); 43 CFR subpart 6302 (Use of
18 Wilderness Areas, Prohibited Acts, and Penalties); 43 CFR subpart 8341
19 (Conditions of Use).

20 Temporary closure or restriction orders under these authorities are enacted at
21 the discretion of the authorized officer to resolve management conflicts and
22 protect persons, property, and public lands and resources. Where an
23 authorized officer determines that off-highway vehicles are causing or will
24 cause considerable adverse effects upon soil, vegetation, wildlife, wildlife
25 habitat, cultural resources, historical resources, threatened or endangered
26 species, wilderness suitability, other authorized uses, or other resources, the
27 affected areas shall be immediately closed to the type(s) of vehicle causing
28 the adverse effect until the adverse effects are eliminated and measures
29 implemented to prevent recurrence. (43 CFR 8341.2) A closure or restriction
30 order should be considered only after other management strategies and
31 alternatives have been explored. The duration of temporary closure or
32 restriction orders should be limited to 24 months or less; however, certain
33 situations may require longer closures and/or iterative temporary closures.
34 This may include closure of routes or areas.

35 TM-3: Develop Travel Management Plans for each Field Office as described in the
36 BLM Travel Management Handbook 8342.1 and according to the travel
37 management planning guidelines (**Appendix L**).

38 TM-4: During subsequent travel management planning design and designate a travel
39 system to minimize adverse effects on GRSG. Locate areas and trails to
40 minimize disturbance of GRSG and/or to have a neutral or positive effect on
41 GRSG habitat and populations. Give special attention to protect endangered
42 or threatened species and their habitats. Allow for route upgrade, closure of

1 existing routes, timing restrictions, seasonal closures, and creation of new
2 routes to help protect habitat and meet user group needs, thereby reducing
3 the potential for pioneering unauthorized routes. The emphasis of the
4 comprehensive travel and transportation planning within PHMA would be
5 placed on having a neutral or positive effect on GRSG habitat. Individual
6 route designations would occur during subsequent travel management
7 planning efforts.

8 TM-5: Conduct road construction, upgrades, and maintenance activities to avoid
9 disturbance during specific times at different seasons – see seasonal and
10 timing restrictions section.

11 ***Recreation and Visitor Services***

12 REC-1: Manage existing recreation uses and sites to minimize adverse effects on
13 GRSG or their habitat through incorporation of RDFs, buffers and seasonal
14 restrictions.

15 REC-2: In PHMA and IHMA, do not construct new recreation facilities (e.g.,
16 campgrounds, trails, trailheads, staging areas) unless the development would
17 have a net conservation gain to GRSG habitat (such as concentrating
18 recreation, diverting use away from critical areas, etc.), or unless the
19 development is required for visitor health and safety or resource protection.

20 RDFs are means, measures, or practices intended to reduce or avoid adverse environmental
21 impacts. This LUPA/EIS proposes a suite of design features that would establish the
22 minimum specifications for water developments, certain mineral development, and fire and
23 fuels management and would mitigate adverse impacts. These design features would be
24 required to provide a greater level of regulatory certainty than through implementing BMPs.

25 In general, the design features are accepted practices that are known to be effective when
26 implemented properly at the project level. However, their applicability and overall
27 effectiveness cannot be fully assessed except at the project-specific level when the project
28 location and design are known. Because of site-specific circumstances, some features may
29 not apply to some projects (e.g., when a resource is not present on a given site) or may
30 require slight variations from what is described in the LUPA/EIS (e.g., a larger or smaller
31 protective area). All variations in design features would require appropriate analysis and
32 disclosure as part of future project authorizations. Additional mitigation measures may be
33 identified and required during individual project development and environmental review.
34 The proposed RDFs are presented in **Appendix B**, Greater Sage-Grouse Habitat Required
35 Design Features and Best Management Practices.

36 **2.6.3 Forest Service Proposed Plan Amendment**

37 ***Forest Service Plan Components***

38 **Desired condition** - A description of specific social, economic, and/or ecological
39 characteristics of the plan area, or a portion of the plan area, toward which management of
40 the land and resources should be directed. Desired conditions must be described in terms

1 that are specific enough to allow progress toward their achievement to be determined, but
2 do not include completion dates. (36 CFR 219.7(e)(1)(i)) FSH 1909.12, Chapter 20)

3 **Guideline** – A constraint on project and activity decisionmaking that allows for departure
4 from its terms, so long as the purpose of the guideline is met. (§ 219.15(d)(3)). Guidelines are
5 established to help achieve or maintain a desired condition or conditions, to avoid or
6 mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR
7 219.7(e)(1)(iv); FSH 1909.12, Chapter 20)

8 **Objective** - A concise, measurable, and time-specific statement of a desired rate of progress
9 toward a desired condition or conditions. Objectives should be based on reasonably
10 foreseeable budgets. (36 CFR 219.9(e)(1)(ii)) FSH 1909.12, Chapter 20)

11 **Standard** - A mandatory constraint on project and activity decisionmaking, established to
12 help achieve or maintain the desired condition or conditions, to avoid or mitigate
13 undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1) (iii)) FSH
14 1909.12, Chapter 20)

15 ***General Greater Sage-Grouse***

16 **GRSG-GEN-DC-001-Desired Condition** – The landscape for GRSG encompasses large
17 contiguous areas, approximately 6 to 62 square miles in area, to provide for multiple aspects
18 of species life requirements. Within these landscapes, a variety of sagebrush-community
19 compositions exist, with variations in subspecies composition, co-dominant vegetation,
20 shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food,
21 cover, and nesting for GRSG.

22 **GRSG-GEN-DC-002-Desired Condition** – Anthropogenic disturbance is focused in non-
23 habitat areas outside of PHMA, IHMA, GHMA and SFAs¹. Disturbances in GHMA are
24 limited, and there is little to no disturbances in PHMA, IHMA and SFAs except for valid
25 existing rights and existing authorize uses.

26 **GRSG-GEN-DC-003-Desired Condition** – In all seasonal habitats, 70 percent of lands
27 capable of producing sagebrush have 10 to 30 percent sagebrush canopy cover and less than
28 10 percent conifer canopy cover. In addition, within breeding and nesting habitat, sufficient
29 herbaceous vegetation structure and height provides overhead and lateral concealment for
30 nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and
31 riparian areas sustain a rich diversity of perennial forb species relative to site potential.
32 Within winter habitat, sufficient sagebrush height and density provides food and cover for
33 GRSG during this seasonal period. Specific desired conditions for GRSG based on seasonal
34 habitat requirements are in **Table 2-6**.

35 **Table 2-6. Seasonal Habitat Desired Conditions for GRSG on National Forest System Lands**

ATTRIBUTE	INDICATORS	DESIRED CONDITON
-----------	------------	------------------

¹ PHMA and GHMA may contain non-habitat, but management direction would not apply to those areas of non-habitat. However, management direction would apply to all areas within SFAs including non-habitat.

ATTRIBUTE	INDICATORS	DESIRED CONDITON
BREEDING AND NESTING ^{1,2,3} (Seasonal Use Period March 1-June 15) Apply 6.2 miles from active leks. ⁴		
Lek Security	Proximity of trees ⁵	Trees or other tall structures are none to uncommon within 1.86 miles of leks ^{6,7}
	Proximity of sagebrush to leks ⁶	Adjacent protective sagebrush cover within 328 feet of lek ⁶
Cover	Seasonal habitat extent ⁷	>80% of the breeding and nesting habitat
	Sagebrush canopy cover ^{6,7,8}	15 to 25%
	Sagebrush height ⁷	
	Arid sites ^{6,7,9}	12 to 32 inches
	Mesic sites ^{6,7,10}	16 to 32 inches
	Predominant sagebrush shape ⁶	>50% in spreading ¹¹
	Perennial grass canopy cover ^{6,7}	
Arid sites ^{7,9}	≥10%	
Mesic sites ^{7,10}	≥15%	
Perennial grass height ^{6,7,8}	Provide overhead and lateral concealment from predators ^{7, 15}	
Perennial forb canopy cover ^{6,7,8}		
Arid sites ⁹	≥5% ^{6,7}	
Mesic sites ¹⁰	≥10% ^{6,7}	
BROOD-REARING/SUMMER ¹ (Seasonal Use Period June 16-October 31)		
Cover	Seasonal habitat extent ⁷	>40% of the brood-rearing/summer habitat
	Sagebrush canopy cover ^{6,7,8}	10 to 25%
	Sagebrush height ^{7,8}	16 to 32 inches
	Perennial grass canopy cover and forbs ^{7,8}	>15%
	Riparian areas/mesic meadows	Proper Functioning Condition ¹²
	Upland and riparian perennial forb availability ^{6,7}	Preferred forbs are common with several preferred species present ¹³
WINTER ¹ (Seasonal Use Period November 1-February 28)		
Cover and Food	Seasonal habitat extent ^{6,7,8}	>80% of the winter habitat
	Sagebrush canopy cover above snow ^{6,7,8}	>10%
	Sagebrush height above snow ^{6,7,8}	>10 inches ¹⁴
¹ Seasonal dates can be adjusted; that is, start and end dates may be shifted either earlier or later, but the amount of days cannot be shortened or lengthened by the local unit. ² Doherty, K. 2008. <i>Sage-grouse and Energy Development: Integrating Science with Conservation Planning to Reduce Impacts</i> . University of Montana. Missoula, MT. ³ Holloran and Anderson. 2005. <i>Spatial Distribution of Greater Sage-grouse nests in relatively contiguous sagebrush habitats</i> . Condor 107:742-752. ⁴ Buffer distance may be changed only if 3 out of 5 years of telemetry studies indicate the 6.2 miles is not appropriate. ⁵ Baruch-Mordo, S. J.S. Evans, J.P. Séverson, D.E. Naugle, J. D. Maestas, J.M. Kiesecker, M.J. Falkowski. C.A. Hagen, and K.P. Reese. . 2013. <i>Saving sage-grouse from trees: A proactive solution to reducing a key threat to a candidate species</i> . Biological Conservation 167: 233-241. ⁶ Stiver, S.J., E.T. Rinkes, D.E. Naugle, P.D. Makela, D.A. Nance, and J.W. Karl, eds. 2015. Sage-Grouse Habitat Assessment Framework: A Multiscale Assessment Tool. Technical Reference 6710-1. Bureau of Land Management and Western Association of Fish and Wildlife Agencies, Denver, Colorado. ⁷ Connelly, J. M. A. Schroweder, A.R. Sands, and C.E. Braun.2000. Guidelines to manage sage-grouse populations and their habitats. Wildlife Society Bulletin 28 (4): 967-985. ⁸ Connelly, J. K. Reese, and M. Schroder. 2003. <i>Monitoring of Greater sage-grouse habitats and populations</i> . Station Bulletin 80, Contribution 979. University of Idaho, College of Natural Resources Experiment Station. Moscow, ID. ⁹ 10–12 inch precipitation zone; <i>Artemisia tridentata wyomingensis</i> is a common big sagebrush sub-species for this type site (Stiver et al, 2015). ¹⁰ ≥12 inch precipitation zone; <i>Artemisia tridentata vaseyana</i> is a common big sagebrush sub-species for this type site (Stiver et al, 2015). ¹¹ Sagebrush plants with a spreading shape provide more protective cover than sagebrush plants that are more tree- or columnar shaped (Stiver et al. 2015). ¹² Existing land management plan desired conditions for riparian areas/wet meadows (spring seeps) may be used in place of properly functioning conditions, if appropriate for meeting greater sage-grouse habitat requirements. ¹³ Preferred forbs are listed in Table III-2 (Stiver et al. 2015). Overall total forb cover may be greater than that of preferred forb cover since not all forb species are listed as preferred in Table III-2. ¹⁴ The height of sagebrush remaining above the snow depends upon snow depth in a particular year. Intent is to manage for tall, healthy, sagebrush stands. ¹⁵ Projects will be designed to provide overhead and lateral concealment of nests on a site specific basis.		

1 **GRSG-GEN-ST-001-Standard** –In PHMA, IHMA and SFAs, do not issue new
2 discretionary written authorizations unless all existing discrete anthropogenic disturbances
3 cover less than 3 percent of the total GRSG habitat within the BSU and the proposed
4 project analysis area, regardless of ownership, and the new use will not cause exceedance of
5 the 3 percent cap (**Appendix G**).

6 **GRSG-GEN-ST-002-Standard** - In PHMA, SFAs, and IHMA, only allow new authorized
7 land uses if the residual impacts to GRSG or their habitats are fully offset by compensatory
8 mitigation projects that provide a net conservation gain to the species, which will be
9 achieved by avoiding, minimizing, and compensating for impacts by applying beneficial
10 mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to
11 what would have resulted without the compensatory mitigation, as addressed in the
12 Mitigation Framework (**Appendix J**).

13 **GRSG-GEN-GL-001-Guideline** – During lekking (March 1 to April 30) restrict surface
14 disturbing and disruptive activities, including noise at 10dB above ambient (not to exceed
15 20-24 dB) measured at the perimeter of an occupied lek, to lekking birds from 6 pm to 9 am
16 within a buffer distance² of 3.1 miles.

17 **GRSG-GEN-GL-002-Guideline** – During breeding and nesting (March 1 to June 15),
18 surface disturbing and disruptive activities to nesting birds should be avoided.

19 **GRSG-GEN-GL-003-Guideline** - When breeding and nesting habitat overlaps with other
20 seasonal habitats, habitat should be managed for breeding and nesting desired habitat
21 conditions displayed in **Table 2-6**.

22 **GRSG-GEN-GL-004-Guideline** – Development of tall structures within 2.0 miles from
23 the perimeter of occupied leks, as determined by local conditions (such as vegetation or
24 topography), with the potential to disrupt breeding or nesting by creating new
25 perching/nesting opportunities avian predators or by decreasing the use of an area, should
26 be restricted within nesting habitat.

27 *Adaptive Management*

28 **GRSG-AM-ST-001-Standard** – If a hard trigger is identified, immediate action is necessary
29 to stop a severe deviation from GRSG conservation objectives. The hard trigger response
30 will be an entire restrictive alternative, or one or more appropriate components of a more
31 restrictive alternative, such as the immediate cessation of authorizing land use authorizations.
32 An interagency team will conduct an assessment to determine the causal factor(s) and
33 recommend corrective strategies (**Appendix G**).

34 **GRSG-AM-ST-002-Standard** – If a soft trigger is identified, apply more conservative or
35 restrictive implementation measures (e.g., extending seasonal restrictions for seasonal surface
36 disturbing activities, modifying seasons of use for livestock grazing, and applying additional

² During lekking (March 1 to April 30) surface disturbing and disruptive activities, including noise at 10dB above ambient (not to exceed 20-24 dB) measured at the perimeter of an occupied lek, should be restricted to lekking birds from 6:00 pm to 9:00 am within a buffer distance of 3.1 miles.

1 restrictions on discretionary activities) for the specific causal factor in the decline of
2 populations and/or habitats, with consideration of local knowledge and conditions
3 (Appendix G).

4 ***Lands and Realty***

5 *Special Use Authorizations (Non-Recreation)*

6 **GRSG-LR-SUA-O-001-Objective** - In PHMA, IHMA and SFAs, retrofit existing tall
7 structures (e.g., power poles, cellular towers) with perch deterrents or other anti-perching
8 devices within 2 years of signing the Record of Decision.

9 **GRSG-LR-SUA-ST-001-Standard** – In PHMA, IHMA and SFAs, restrict issuance of new
10 lands special use authorizations for infrastructure, such as high-voltage transmission lines,
11 major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be
12 limited and based on rationale (e.g., monitoring, modeling, or best available science) that
13 explicitly demonstrates that adverse impacts to GRSG will be avoided by the exception.

14 **GRSG-LR-SUA-ST-002-Standard** – In GHMA, new lands special use authorizations may
15 be issued for infrastructure, such as high-voltage transmission lines, major pipelines,
16 hydropower, distribution lines, and cellular towers, if they can be located within existing
17 designated corridors and the authorization includes stipulations to protect GRSG and their
18 habitats.

19 **GRSG-LR-SUA-ST-003-Standard** – In PHMA, IHMA and SFAs, do not authorize
20 temporary lands special uses (i.e., facilities or activities) that result in loss of habitat or would
21 have long-term (greater than 5 years) negative impact on GRSG or their habitats.

22 **GRSG-LR-SUA-ST-004-Standard** – In PHMA, IHMA, GHMA and SFAs, require
23 protective stipulations (e.g., noise, tall structure, guy wire removal, perch deterrent
24 installation) when issuing new authorizations or during renewal, amendment, or reissuance
25 of existing authorizations that authorize infrastructure (e.g., high-voltage transmission lines,
26 major pipelines, roads, distribution lines, and cellular towers).

27 **GRSG-LR-SUA-ST-005-Standard** – In PHMA, IHMA, GHMA and SFAs, locate upgrades
28 to existing transmission lines within the existing designated corridors unless an alternate
29 route would benefit GRSG or their habitats.

30 **GRSG-LR-SUA-ST-006-Standard** - In PHMA, IHMA, GHMA and SFAs, when a lands
31 special use authorization is revoked or terminated and no future use is contemplated the
32 authorization holder must remove overhead lines and other infrastructure in compliance
33 with 36 CFR 251.60(i).

34 **GRSG-LR-SUA-ST-007-Standard** - In PHMA, IHMA, GHMA and SFAs, if the potential
35 long-term (greater than 5 years) impacts of mitigation (e.g., relocation or burying) to GRSG
36 or their habitats are greater than the potential impacts from new lands special use
37 authorizations, do not pursue the mitigation. If mitigation is not feasible or would result in

1 short-term (less than 5 years) or long-term impacts, incorporate additional terms and
2 conditions in the special use authorization for protection of GRSG or their habitats

3 **GRSG-LR-SUA-ST-008-Standard** – In PHMA, IHMA, GHMA and SFAs, co-locate new
4 infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines,
5 and cellular towers) with existing infrastructure to limit disturbance to the smallest footprint,
6 or where it best limits impacts to greater sage-grouse or their habitats. When co-location of
7 new infrastructure is not accomplished, locate it adjacent to existing infrastructure, roads, or
8 already disturbed areas. Consider new communication tower sites where necessary for public
9 safety.

10 **GRSG-LR-SUA-GL-001-Guideline** – In PHMA and SFAs, outside of existing designated
11 corridors, new transmission lines and pipelines should be buried to limit disturbance to the
12 smallest footprint unless explicit rationale is provided that the biological impacts to GRSG
13 and its habitat are being avoided. When new transmission lines and pipelines are not buried,
14 locate them adjacent to existing transmission lines.

15 *Land Ownership Adjustments*

16 **GRSG-LR-LOA-ST-001-Standard** – In PHMA, IHMA, GHMA and SFAs, do not
17 approve landownership adjustments unless the action results in a net conservation gain to
18 GRSG or it will not directly or indirectly adversely impact GRSG conservation.

19 **GRSG-LR-LOA-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs with minority
20 federal ownership, consider landownership adjustments to achieve a landownership pattern
21 (e.g., consolidation, reducing fragmentation) that supports improved GRSG population
22 trends and habitats.

23 *Land Withdrawal*

24 **GRSG-LR-LW-GL-001-Guideline** – In PHMA, IHMA and SFAs, utilize land withdrawals
25 as a tool, where appropriate and subject to valid existing rights, to prevent activities that will
26 be detrimental to GRSG or their habitats.

27 *Wind and Solar*

28 **GRSG-WS-ST-001-Standard** – In PHMA and SFAs, do not authorize new solar and wind
29 utility-scale and/or commercial energy development except for on-site power generation
30 associated with existing industrial infrastructure (e.g., mine site).

31 **GRSG-WS-GL-001-Guideline** – In IHMA, new wind energy utility-scale and/or
32 commercial development should be restricted. If development cannot be restricted due to
33 existing authorized use, adjacent developments, or split estate issues, then ensure that
34 stipulations are incorporated into the authorization to protect GRSG and their habitats.

35 *Greater Sage-Grouse Habitat*

36 **GRSG-GRSGH-O-001-Objective** – Every 10 years for the next 50 years, improve GRSG
37 habitat by removing invading conifers and other undesirable species in the number of acres
38 shown in **Table 2-7**.

1 **Table 2-7. Treatment Acres per Decade on National Forest System Lands**

Forest	Mechanical ¹	Prescribed Fire ²	Grass Restoration ³
Boise	1,000	2,000	0
Caribou-Targhee-Curlew	3,000	2,000	3,000
Salmon-Challis	5,000	1,000	0
Sawtooth	7,000	1,000	7,000
Beaverhead-Deerlodge	0	0	0

2 ¹ These are estimates of treatments required to achieve and/or maintain desired habitat conditions over a
3 period of ten years. There are many dynamic and highly variable disturbances that may happen over that
4 period of time that could have a significant effect on the amount, type, and timing of treatment needed.
5 Those disturbances are factored into the ten-year simulation using stochastic, not predictive, techniques.
6 Probabilities of events such as large wildfires are used in the model to make the simulation as realistic as
7 possible, given empirical data about such events in the past, but the results of the simulation cannot be used
8 to predict the future occurrence of such events, including their timing, size, or location, which are essentially
9 random.

10 ² Removal of conifers that have invaded sagebrush including phase one juniper that is 10 percent or less and
11 reducing sagebrush cover in areas over 30 percent canopy cover

12 ³ Acres are those that are greater than 30 percent sagebrush canopy cover and/or invaded by 10 percent or
13 greater conifer.

14 ⁴ Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of
15 perennial vegetation.
16

17 **GRSG-GRSGH-ST-001-Standard** – Design habitat restoration projects to move towards
18 desired conditions (**Table 2-6**) and incorporate the concepts outlined in **Appendix D** -
19 *Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on*
20 *the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.*

21 **GRSG-GRSGH-GL-001-Guideline** – Sagebrush removal in GRSG breeding and nesting
22 and wintering habitats should be avoided unless necessary to support attainment of desired
23 habitat conditions (**Table 2-6**).

24 **GRSG-GRSGH-GL-002-Guideline** – When removing conifers that are encroaching into
25 GRSG habitat, avoid persistent woodlands (old growth relative to the site or more than 100
26 years old).

27 **GRSG-GRSGH-GL-003-Guideline** – In PHMA, IHMA, GHMA and SFAs, actions and
28 authorizations should be designed to limit the spread and effect of non-native plant species.

29 **GRSG-GRSGH-GL-004-Guideline** - To facilitate safe and effective fire management
30 actions, in PHMA, IHMA, and GHMA and SFAs, fuels treatments should be designed to
31 reduce the spread and intensity of wildfire in high-risk areas (i.e., areas of increased potential
32 for ignition and in areas where there is a potential for wildfire that would be difficult for
33 suppression resources to contain and control).

34 **GRSG-GRSGH-GL-005-Guideline** - In PHMA, IHMA, GHMA and SFAs, native plant
35 species should be used, when possible, to restore, enhance, or maintain desired habitat
36 conditions (**Table 2-6**).

1 **GRSG-GRSGH-GL-006-Guideline** – In PHMA, IHMA and SFAs, vegetation treatment
2 projects should only be conducted if they restore, enhance, or maintain desired habitat
3 conditions (**Table 2-6**).

4 **Livestock Grazing**

5 **GRSG-LG-DC-001-Desired Condition** – In PHMA, IHMA and SFAs, livestock grazing is
6 managed to ensure adequate nesting cover and does not conflict with the attainment of
7 other vegetative attributes (**Table 2-6**).

8 **GRSG-LG-ST-001-Standard** – In PHMA, IHMA and SFAs, do not approve construction
9 of water developments unless beneficial to GRSG habitat.

10 **GRSG-LG-GL-001-Guideline** - Grazing guidelines should be applied in each of the
11 seasonal habitats in **Table 2-8**. If values in **Table 2-8** guidelines cannot be achieved based
12 upon a site-specific analysis using Ecological Site Descriptions, long-term ecological site
13 capability analysis, or other similar analysis, adjust grazing management to move towards
14 desired habitat conditions in **Table 2-6** consistent with the ecological site capability. Do not
15 use drought and degraded habitat condition to adjust values. Grazing guidelines in **Table 2-8**
16 would not apply to isolated parcels of National Forest System lands that have less than 200
17 acres of GRSG habitat.

18 **Table 2-8. Grazing Guidelines for GRSG Seasonal Habitat**

Seasonal Habitat	Grazing Guidelines
Breeding and nesting ¹ within 6.2 miles of occupied leks	Perennial grass height: ² When grazing occurs during breeding and nesting season (March 1 to June 15) manage for upland perennial grass height of 7 inches ^{3,4,5} When grazing occurs post breeding and nesting season (June 16 to October 30) manage for 4 inches ^{4,5,6} of perennial grass height.
Brood rearing and summer ¹	Retain an average stubble height of 4 inches for herbaceous riparian/mesic meadow vegetation ^{7,8}
Winter ¹	≤35% use of sagebrush

¹ For descriptions of Seasonal Habitat and Seasonal Periods of greater sage-grouse see table 1.
² Grass heights only apply in breeding and nesting habitat with ≥10% sagebrush cover to support nesting.
³ Holloran et al. 2005. *Greater sage-grouse nesting habitat selection and success in Wyoming*.
⁴ Average droop height, assuming current vegetation composition has the capability to achieve these heights. Heights will be measured at the end of the nesting period (Connelly, 2000).
⁵ Hagen C., J.W. Connelly, and M.A. Schroeder. 2007. *A meta-analysis of greater sage-grouse *Centrocercus urophasianus* nesting and brood-rearing habitats*. *Wildlife Biology* 13(1): 42-50.
⁶ Stubble height to be measured at the end of the growing season.
⁷ Crawford et al. 2004. *Ecology and Management of sage-grouse and sage-grouse habitat*. “In riparian brood-rearing habitat, sage-grouse prefer the lower vegetation (5-15 cm (2-6 in) vs. 30-50 cm (12-20 in); Oakleaf 1971, Neel 1980, Klebenow 1982, Evans 1986) and succulent forb growth stimulated by moderate livestock grazing (Neel 1980, Evans 1986). “Moderate use equates to a 10-cm residual stubble height for most grasses and sedges.”
⁸ Stubble height to be measured in the meadow areas used by greater sage-grouse for brood-rearing (not on the hydric greenline).

20
21 **GRSG-LG-GL-002-Guideline** – In PHMA, IHMA, GHMA and SFAs, consider closure of
22 grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage
23 reserve as opportunities arise under applicable regulations, where removal of livestock
24 grazing would enhance the ability to achieve desired habitat conditions (**Table 2-6**).

1 **GRSG-LG-GL-003-Guideline** – Bedding sheep and placing camps within 1.2 miles from
2 the perimeter of a lek during lekking (March 1 to April 30) should be restricted.

3 **GRSG-LG-GL-004-Guideline** – During breeding and nesting season (March 1 to June 15),
4 trailing livestock through breeding and nesting habitat should be minimized. Specific routes
5 should be identified, existing trails should be used, and stopovers on active leks should be
6 avoided.

7 **GRSG-LG-GL-005-Guideline** – Fences should not be constructed or reconstructed within
8 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated
9 through design features or markings (e.g., mark, laydown fences, and design).

10 **GRSG-LG-GL-006-Guideline** – New permanent livestock facilities (e.g., windmills, corrals)
11 should not be constructed within 1.2 miles from the perimeter of occupied leks.

12 ***Fire Management***

13 **GRSG-FM-ST-001-Standard** – In PHMA, IHMA, GHMA and SFAs, do not use
14 prescribed fire, except for pile burning, in 12-inch or less precipitation zones unless
15 necessary to facilitate site preparation for restoration of GRSG habitat consistent with
16 desired conditions in **Table 2-6**.

17 **GRSG-FM-ST-002-Standard** – In PHMA, SFAs, GHMA, if it is necessary to use
18 prescribed fire to facilitate site preparation for restoration of greater sage-grouse habitat
19 consistent with desired conditions in **Table 2-6**, the associated NEPA analysis must identify
20 how GRSG desired conditions would be met, why alternative techniques were not selected,
21 and how potential threats to GRSG habitat would be minimized.

22 **GRSG-FM-GL-001-Guideline** – In wintering or breeding and nesting habitat, sagebrush
23 removal or manipulation, including prescribed fire, should be restricted unless the removal
24 strategically reduces the potential impacts from wildfire.

25 **GRSG-FM-GL-002-Guideline** – In PHMA, IHMA, GHMA and SFAs, when reseeding in
26 fuel breaks, fire resistant native plant species should be used if available, or consider using
27 fire resistant non-native to meet resource objectives.

28 **GRSG-FM-GL-003-Guideline** – In PHMA, IHMA, GHMA and SFAs, treatments should
29 be designed to restore, enhance, or maintain GRSG habitat.

30 **GRSG-FM-GL-004-Guideline** – Locating temporary wildfire suppression facilities (e.g.,
31 incident command posts, spike camps, helibases, mobile retardant plants) in PHMA, SFAs,
32 and GHMA should be avoided.

33 **GRSG-FM-GL-005-Guideline** - In PHMA, IHMA, GHMA and SFAs, cross-country
34 vehicle travel during fire operations should be restricted whenever safe and practical to do
35 so, as determined by fireline leadership, incident commanders, etc.

1 **GRSG-FM-GL-006-Guideline** – In PHMA, IHMA, GHMA and SFAs, burnout operation
2 areas should be avoided by constructing direct fire lines, whenever safe and practical to do
3 so, to improve suppression effectiveness and minimize loss of existing sagebrush habitat as
4 determined by fireline leadership, incident commanders, etc.

5 **GRSG-FM-GL-007-Guideline** – In PHMA, IHMA, GHMA and SFAs, prescribed fire
6 prescriptions should minimize undesirable effects on vegetation and/or soils (e.g., minimize
7 mortality of desirable perennial plant species and reduce risk of hydrophobicity).

8 **GRSG-FM-GL-008-Guideline** - In PHMA, IHMA, GHMA and SFAs, roads and natural
9 fuel breaks should be incorporated into fuel break design to improve effectiveness and
10 minimize loss of existing sagebrush habitat.

11 **GRSG-FM-GL-009-Guideline** - In PHMA, IHMA, GHMA and SFAs, all fire associated
12 vehicles and equipment should be power-washed before entering and exiting the area to
13 minimize the introduction of undesirable invasive plant species.

14 **GRSG-FM-GL-010-Guideline** - Unit-specific GRSG fire management toolboxes
15 containing maps, lists, contact information for qualified resource advisors, local guidance,
16 and relevant information should be developed.

17 **GRSG-FM-GL-011-Guideline** – Localized maps of PHMA, IHMA, GHMA and SFAs
18 should be provided to dispatch offices and extended attack incident commanders to use
19 when prioritizing wildfire suppression resources and designing suppression tactics.

20 **GRSG-FM-GL-012-Guideline** - In or near PHMA, IHMA, GHMA and SFAs, a GRSG
21 resource advisor should be assigned to all extended attack fires.

22 **GRSG-FM-GL-013-Guideline** – On critical fire weather days, available fire suppression
23 resources should be pre-positioned to optimize a quick and efficient response into PHMA,
24 IHMA, and GHMA and SFAs.

25 **GRSG-FM-GL-014-Guideline** - During periods of multiple fires, line officers should be
26 involved in setting priorities to help protect PHMA, IHMA, GHMA and SFAs.

27 **GRSG-FM-GL-015-Guideline** – In PHMA, IHMA, GHMA and SFAs, consider using fire
28 retardant and mechanized equipment only if it is likely to result in minimizing burned
29 acreage.

30 **GRSG-FM-GL-016-Guideline** – In PHMA, IHMA GHMA, to minimize sagebrush loss,
31 mop-up should be conducted where the burned areas adjoin unburned islands, doglegs, or
32 other habitat features, as safety and available resources allows.

1 ***Wild Horse and Burro***

2 **GRSG-HB-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs, wild horse and
3 burro populations should be managed within established appropriate management levels to
4 restore, enhance, or maintain GRSG desired habitat conditions (**Table 2-6**).

5 **GRSG-HB-GL-002-Guideline** – In PHMA, IHMA, GHMA and SFAs, appropriate
6 management levels should be adjusted if GRSG management standards are not met due to
7 degradation that can be at least partially attributed to wild horse or burro populations.

8 ***Recreation***

9 **GRSG-R-DC-001-Desired Condition** – In PHMA, IHMA, GHMA and SFAs, existing and
10 new recreation special use authorizations and expansion of special use authorizations avoids
11 effects to GRSG and their habitats.

12 **GRSG-R-ST-001-Standard** – In PHMA, IHMA and SFAs, do not authorize temporary
13 recreation uses (i.e., facilities or activities) that result in loss of habitat or would have long-
14 term (greater than 5 years) negative impacts on GRSG or their habitats.

15 **GRSG-R-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs, terms and conditions
16 that protect and/or restore GRSG habitat within the permit area should be included in new
17 recreation special use authorizations. During renewal, amendment, or reauthorization, terms
18 and conditions in existing permits and operating plans should be modified to protect and/or
19 restore GRSG habitat.

20 **GRSG-R-GL-002-Guideline** – In PHMA, SFAs, and IHMA, new recreational facilities or
21 expansion of existing recreational facilities (e.g., roads, trails, campgrounds), including special
22 use authorizations for facilities and activities, should not be approved unless the
23 development results in a net conservation gain to GRSG and/or their habitats or the
24 development is required for visitor safety.

25 ***Roads/Transportation***

26 **GRSG-RT-DC-001-Desired Condition** - In PHMA, IHMA, GHMA and SFAs, within the
27 travel management system, GRSG experience minimal disturbance during breeding and
28 nesting (March 1 to June 15) and wintering periods (November 1 to February 28).

29 **GRSG-RT-ST-001-Standard** – In PHMA, IHMA, GHMA and SFAs, do not conduct or
30 allow new road or trail construction (does not apply to realignments for resource protection)
31 except when necessary for administrative access, public safety, or to access valid existing
32 rights. If necessary to construct new roads and trails for one of these purposes, construct
33 them to the minimum standard, length, and number and avoid, minimize, and mitigate
34 impacts

35 **GRSG-RT-ST-002-Standard** – Do not conduct or allow road and trail maintenance
36 activities within 2 miles from the perimeter of active leks during lekking (March 1 to April
37 30) from 6 pm to 9 am.

1 **GRSG-RT-ST-003-Standard** – In PHMA, IHMA and SFAs, prohibit public access on
2 temporary energy development roads, unless consistent with all other terms and conditions
3 included in the forest plan.

4 **GRSG-RT-GL-001-Guideline** – In PHMA, IHMA and SFAs, new roads and road
5 realignments should be designed and administered to reduce collisions with GRSG.

6 **GRSG-RT-GL-002-Guideline** – In PHMA, IHMA, and SFAs, road construction within
7 riparian areas and mesic meadows should be restricted. If not possible to restrict
8 construction within riparian areas and mesic meadows, roads should be designed and
9 constructed at right angles to ephemeral drainages and stream crossings, unless topography
10 prevents doing so.

11 **GRSG-RT-GL-003-Guideline** – In PHMA, IHMA, GHMA and SFAs, when
12 decommissioning roads and unauthorized routes, restoration activity should be designed to
13 move habitat towards desired conditions (**Table 2-6**).

14 **GRSG-RT-GL-004-Guideline** – In PHMA, IHMA, GHMA and SFAs, dust abatement
15 terms and conditions should be included in road use permits when dust has the potential to
16 impact GRSG.

17 **GRSG-RT-GL-005-Guideline** - In PHMA, IHMA, GHMA and SFAs, road and road-way
18 maintenance activities should be designed and implemented to reduce the risk of vehicle or
19 human-caused wildfires and the spread of invasive plants.

20 **Minerals**

21 *Fluid Minerals - Unleased*

22 **GRSG-M-FMUL-ST-001-Standard** - In PHMA, and IHMA any new oil and gas leases
23 must include an NSO stipulation. There will be no waivers or modifications. An exception
24 could be granted by the authorized officer with unanimous concurrence from a team of
25 agency GRSG experts from the USFWS, Forest Service, and State wildlife agency if:

- 26 • There would be no direct, indirect, or cumulative effects to
27 GRSG or their habitats or
- 28 • Granting the exception provides an alternative to a similar action
29 occurring on a nearby parcel and
- 30 • The exception provides a clear net conservation gain to GRSG.

31 **GRSG-M-FMUL-ST-002-Standard** – In GHMA, any new leases must include appropriate
32 CSU and TL stipulations to protect GRSG and their habitat.

33 **GRSG-M-FMUL-ST-003-Standard** – In SFAs, there will be NSO and no waivers,
34 exceptions, or modifications for fluid mineral leasing.

1 ***Fluid Minerals - Leased***

2 **GRSG-M-FML-ST-001-Standard** – In PHMA, IHMA, and SFAs, when approving the
3 Surface Use Plan of Operation portion of the Application for Permit to Drill on existing
4 leases that are not yet developed, require that leaseholders avoid and minimize surface
5 disturbing and disruptive activities consistent with the rights granted in the lease.

6 **GRSG-M-FML-ST-002-Standard** – In PHMA, IHMA, and SFAs, when facilities are no
7 longer needed or leases are relinquished, require reclamation plans to include terms and
8 conditions to restore habitat to desired conditions as described in **Table 2-6**.

9 **GRSG-M-FML-ST-003-Standard** – In GHMA, authorize new transmission line corridors,
10 transmission line ROWs, transmission line construction, or transmission line-facility
11 construction associated with fluid mineral leases with stipulations necessary to protect
12 GRSG and their habitats, consistent with the terms and conditions of the permit.

13 **GRSG-M-FML-ST-004-Standard** – Locate compressor stations on portions of a lease that
14 are non-habitat and are not used by GRSG, and if there would be no direct, indirect, or
15 cumulative effects on GRSG or their habitat. If this is not possible, work with the operator
16 to use mufflers, sound insulation, or other features to reduce noise.

17 **GRSG-M-FML-ST-005-Standard** – In PHMA, GHMA and SFAs, when authorizing
18 development of fluid mineral resources, work with the operator to minimize impacts to
19 GRSG and their habitat, such as locating facilities in non-habitat areas first and then in the
20 least suitable habitat, subject to valid existing rights, law, and regulations.

21 **GRSG-M-FML-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs, operators
22 should be encouraged to reduce disturbance to GRSG habitat. At the time of approval of
23 the Surface Use Plan of Operation portion of the Application for Permit to Drill, terms and
24 conditions should be included to reduce disturbance to GRSG habitat, where appropriate
25 and feasible and consistent with the rights granted to the lessee.

26 **GRSG-M-FML-GL-002-Guideline** – On federal leases in PHMA, IHMA, and SFAs, when
27 surface occupancy cannot be restricted due to valid existing rights or development
28 requirements, disturbance and surface occupancy should be limited to areas least harmful to
29 GRSG based on vegetation, topography, or other habitat features.

30 **GRSG-M-FML-GL-003-Guideline** - In PHMA, SFAs, and GHMA, where the federal
31 government owns the surface and the mineral estate is in non-federal ownership, coordinate
32 with the mineral estate owner/lessee to apply appropriate stipulations, conditions of
33 approval, conservation measures and RDFs to the appropriate surface management
34 instruments to the maximum extent permissible under existing authorities.

35 ***Fluid Minerals - Operations***

36 **GRSG-M-FMO-ST-001-Standard** – In PHMA, IHMA and SFAs, do not authorize
37 employee camps.

1 **GRSG-M-FMO-ST-002-Standard** – In PHMA, IHMA and SFAs, when feasible, do not
2 locate tanks or other structures that may be used as raptor perches. If this is not feasible, use
3 perch deterrents.

4 **GRSG-M-FMO-GL-001-Guideline** – In PHMA, IHMA and SFAs, closed-loop systems
5 should be used for drilling operations with no reserve pits, where feasible.

6 **GRSG-M-FMO-GL-002-Guideline** – In PHMA, IHMA, GHMA and SFAs, during drilling
7 operations, soil compaction should be reduced and soil structure should be maintained using
8 the best available techniques to improve vegetation reestablishment.

9 **GRSG-M-FMO-GL-003-Guideline** – In PHMA, IHMA, GHMA and SFAs, dams,
10 impoundments and ponds for mineral development should be constructed to reduce
11 potential for West Nile virus. Examples of methods to accomplish this include:

- 12 • Increase the depth of ponds to accommodate a greater volume
13 of water than is discharged.
- 14 • Build steep shorelines (greater than 2 feet) to reduce shallow
15 water and aquatic vegetation around the perimeter of
16 impoundments to reduce breeding habitat for mosquitoes.
- 17 • Maintain the water level below that of rooted aquatic and upland
18 vegetation. Avoid flooding terrestrial vegetation in flat terrain or
19 low-lying areas.
- 20 • Construct dams or impoundments that restrict down-slope
21 seepage or overflow by digging ponds in flat areas rather than
22 damming natural draws for effluent water storage or lining
23 constructed ponds in areas where seepage is anticipated.
- 24 • Line the channel where discharge water flows into the pond with
25 crushed rock or use a horizontal pipe to discharge inflow directly
26 into existing open water.
- 27 • Line the overflow spillway with crushed rock and construct the
28 spillway with steep sides.
- 29 • Fence pond sites to restrict access by livestock and other wild
30 ungulates.
- 31 • Remove or re-inject produced water.
- 32 • Treat waters with larvicides to reduce mosquito production
33 where water occurs on the surface.

34 **GRSG-M-FMO-GL-004-Guideline** – In PHMA, IHMA, GHMA and SFAs to keep
35 habitat disturbance at a minimum, a phased development approach should be applied to
36 fluid mineral operations, wherever possible, consistent with the rights granted under the

1 lease. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral
2 operations.

3 ***Coal Mines - Unleased***

4 **GRSG-M-CMUL-ST-001-Standard** – In PHMA, IHMA and SFAs, do not authorize
5 surface disturbances (e.g., appurtenant facilities) for new underground coal mines.

6 ***Coal Mines - Leased***

7 **GRSG-M-CML-ST-001-Standard** – In PHMA, IHMA and SFAs, do not authorize new
8 appurtenant facilities for existing underground mines unless no technically feasible
9 alternative exists. If new appurtenant facilities associated with existing mine leases cannot be
10 located outside of PHMA, IHMA and SFAs, co-locate them with any existing disturbed
11 areas, if possible. If co-location is not possible, then construct new facilities to minimize
12 disturbed areas while meeting mine safety standards and requirements, as identified by Mine
13 Safety and Health Administration mine-plan approval process, and locate the facilities in an
14 area least harmful to GRSG habitats based on vegetation, topography, or other habitat
15 features.

16 **GRSG-M-CML-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs, when coal
17 leases are subject to readjustment, additional requirements should be included in the
18 readjusted lease to protect and reduce threats to GRSG and their habitats to conserve,
19 enhance, and restore habitat for long-term viability.

20 ***Locatable Minerals***

21 **GRSG-M-LM-ST-001-Standard** – In PHMA, IHMA and SFAs, approve Plans of
22 Operation with mitigation to protect GRSG and their habitats, consistent with the rights of
23 the mining claimant as granted by the General Mining Act of 1872, as amended.

24 **GRSG-M-LM-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs to keep habitat
25 disturbance at a minimum, a phased development approach should be applied to operations
26 consistent with the rights granted under the General Mining Act of 1872, as amended.
27 Disturbed areas should be reclaimed as soon as they are no longer needed for mineral
28 operations.

29 **GRSG-M-LM-GL-002-Guideline** - In PHMA, IHMA, GHMA and SFAs, abandoned mine
30 sites should be closed or mitigated, subject to valid or existing rights, to reduce predation of
31 GRSG by eliminating tall structures that could provide nesting opportunities and perching
32 sites for predators.

33 ***Nonenergy Leasable Minerals***

34 **GRSG-M-NEL-GL-001-Guideline** – In PHMA, IHMA, GHMA and SFAs, at the time of
35 issuance of prospecting permits, exploration licenses and leases, or readjustment of leases,
36 the Forest Service should provide recommendations to the BLM for the protection of
37 GRSG and their habitats.

1 **GRSG-M-NEL-GL-002-Guideline** - In PHMA, SFAs, GHMA, the Forest Service should
2 recommend to the BLM that expansion or readjustment of existing leases avoid, minimize,
3 or mitigate the effects to GRSG and their habitat.

4 ***Mineral Materials***

5 **GRSG-M-MM-ST-001-Standard** – In PHMA and SFAs, do not allow new mineral material
6 disposal or development.

7 **GRSG-M-MM-ST-002-Standard** – In PHMA, IHMA and SFAs, free-use mineral material
8 collection permits may be issued and expansion of existing active pits may be allowed,
9 except from March 1 to April 30 between 6 pm and 9 am within 2 miles from the perimeter
10 of occupied leks, if doing so is within the BSU and does not exceed the disturbance cap.

11 **GRSG-M-MM-ST-003-Standard** - In PHMA, IHMA, GHMA and SFAs, any permit for
12 existing mineral material operations must include appropriate requirements for operation
13 and reclamation of the site to restore or maintain desired habitat conditions (Table 2-6).

14 **2.7 Adaptive Management, Monitoring, and Mitigation**

15 The adaptive management, monitoring, and mitigation descriptions below apply to
16 Alternatives D, E, and the Proposed Plan. In making amendments to this plan, the BLM will
17 coordinate with the USFWS as BLM continues to meet its objective of conserving,
18 enhancing and restoring GRSG habitat by reducing, minimizing or eliminating threats to that
19 habitat.

20 If the BLM finds that the State of Montana is implementing a GRSG Habitat Conservation
21 Program that is effectively conserving the GRSG, the BLM will review the management
22 goals and objectives to determine if they are being met and whether amendment of the BLM
23 plan is appropriate to achieve consistent and effective conservation and GRSG management
24 across all lands regardless of ownership.

25 **2.7.1 Adaptive Management Plan**

26 Adaptive management is a decision process that promotes flexible resource management
27 decision making that can be adjusted in the face of uncertainties as outcomes from
28 management actions and other events become better understood. Careful monitoring of
29 these outcomes both advances scientific understanding and helps with adjusting resource
30 management directions as part of an iterative learning process. Adaptive management also
31 recognizes the importance of natural variability in contributing to ecological resilience and
32 productivity. It is not a ‘trial and error’ process, but rather emphasizes learning while doing.
33 Adaptive management does not represent an end in itself, but rather a means to more
34 effective decisions and enhanced benefits.

35 In relation to the BLM/Forest Services’ National Greater Sage-grouse Planning Strategy,
36 adaptive management will help identify if GRSG conservation measures presented in this
37 EIS contain the needed level of certainty for effectiveness. Principles of adaptive
38 management are incorporated into the conservation measures in the plan to ameliorate

1 threats to a species, thereby increasing the likelihood that the conservation measure and plan
2 will be effective in reducing threats to that species. The following provides the BLM/Forest
3 Service's adaptive management strategy for the Idaho and southwestern Montana sub-
4 region.

5 ***Adaptive Management and Monitoring***

6 This EIS contains a monitoring framework plan (**Appendix E**) that includes an
7 effectiveness monitoring component. The agencies intend to use the data collected from the
8 effectiveness monitoring to identify any changes in habitat conditions related to the goals
9 and objectives of the plan and other range-wide conservation strategies (US Department of
10 the Interior 2004; Stiver et al. 2006; USFWS 2013). The information collected through the
11 Monitoring Framework Plan outlined in **Appendix E** will be used by the BLM/Forest
12 Service to determine when adaptive management hard and soft triggers (discussed below) are
13 met.

14 The State of Idaho adaptive management plan is presented in **Appendix Q**. The Montana
15 Sage Grouse habitat Conservation Program established by Governor's Executive Order #
16 10-2014, states under the General Provisions heading, item # 22 "Montana Sage Grouse
17 Oversight Team (MSGOT) shall regularly reevaluate the effectiveness of the Conservation
18 Strategy, at a minimum annually, as new science, information and data emerge regarding the
19 habitats and behavior of sage grouse, and shall recommend such changes as are
20 appropriate."

21 ***Adaptive Management Triggers***

22 *Soft Triggers*

23 Soft triggers represent an intermediate threshold indicating that management changes are
24 needed at the project/implementation level to address habitat and population losses. If a soft
25 trigger is identified, the BLM/Forest Service will apply more conservative or restrictive
26 implementation conservation measures to mitigate for the specific causal factor in the
27 decline of populations and/or habitats, with consideration of local knowledge and
28 conditions. For example, monitoring data within an already federally authorized project area
29 within a given GRSG population area indicates that there has been a slight decrease in
30 GRSG numbers in this area. Data also suggests the decline may be attributed to GRSG
31 collisions with monitoring tower guy-wires from this federally authorized project. BLM then
32 receives an application for a new tower within the same GRSG population area. The
33 response would be to require the new authorization's tower guy-wires to be flagged.
34 Monitoring data then shows the decline is curtailed. The adaptive management soft trigger
35 response is to require future applications to flag for guy-wires. These types of adjustments
36 will be made to preclude tripping a "hard" trigger (which signals more severe habitat loss or
37 population declines). While there should be no expectation of hitting a hard trigger, if
38 unforeseen circumstances occur that trip either a habitat or population hard trigger, more
39 restrictive management will be required.
40

1 *Hard Triggers*

2 Hard triggers represent a threshold indicating that immediate action is necessary to stop a
3 severe deviation from GRSG conservation objectives as set forth in the BLM and Forest
4 Service plans. The hard trigger and the proposed management response to this trigger are
5 presented in **Section 2.6.2**, AM-7, AM-9, AM-12, AM-15, and AM-16.

6 **2.7.2 Monitoring for the Greater Sage-grouse Planning Strategy**

7 The BLM's planning regulations, specifically 43 CFR 1610.4-9, require that land use plans
8 establish intervals and standards for monitoring based on the sensitivity of the resource
9 decisions. Land use plan monitoring is the process of tracking the implementation of land
10 use plan decisions (implementation monitoring) and collecting data/information necessary
11 to evaluate the effectiveness of land use plan decisions (effectiveness monitoring). For
12 GRSG, these types of monitoring are also described in the criteria found in the Policy for
13 Evaluation of Conservation Efforts When Making Listing Decisions (50 CFR Vol. 68, No.
14 60). One of the Policy for Evaluation of Conservation Efforts When Making Listing
15 Decisions criteria evaluates whether provisions for monitoring and reporting progress on
16 implementation (based on compliance with the implementation schedule) and effectiveness
17 (based on evaluation of quantifiable parameters) of the conservation effort are provided.

18 A guiding principle in the BLM National Sage-grouse Conservation Strategy (US
19 Department of the Interior 2004) is that "the Bureau is committed to sage-grouse and
20 sagebrush conservation and will continue to adjust and adapt our National Sage-grouse
21 Strategy as new information, science, and monitoring results evaluate effectiveness over
22 time." In keeping with the WAFWA Sage-grouse Comprehensive Conservation Strategy
23 (Stiver et al. 2006) and the Greater Sage-grouse Conservation Objectives: Final Report
24 (USFWS 2013), the BLM and Forest Service will monitor implementation and effectiveness
25 of conservation measures in GRSG habitats.

26 On March 5, 2010, USFWS' 12-Month Findings for Petitions to List the Greater Sage-
27 Grouse (*Centrocercus urophasianus*) as Threatened or Endangered were posted as a Federal
28 Register notice (75 Federal Register 13910-14014, March 23, 2010). This notice stated:

29 "...the information collected by BLM could not be used to make broad generalizations
30 about the status of rangelands and management actions. There was a lack of consistency
31 across the range in how questions were interpreted and answered for the data call, which
32 limited our ability to use the results to understand habitat conditions for sage-grouse on
33 BLM lands."

34 Standardization of monitoring methods and implementation of a defensible monitoring
35 approach (within and across jurisdictions) will resolve this situation. The BLM, Forest
36 Service, and other conservation partners use the resulting information to guide
37 implementation of conservation activities.

38 Monitoring strategies for GRSG habitat and populations must be collaborative, as habitat
39 occurs across jurisdictional boundaries (52 percent on BLM-administered lands, 31 percent

1 on private lands, 8 percent on National Forest System lands, 5 percent on state lands, 4
2 percent on tribal and other federal lands) (75 *Federal Register* 13910, March 23, 2010), and
3 state fish and wildlife agencies have primary responsibility for population level wildlife
4 management, including population monitoring. Therefore, population efforts will continue
5 to be conducted in partnership with state fish and wildlife agencies. The BLM and Forest
6 Service have finalized a monitoring framework, which can be found in **Appendix E**. This
7 framework describes the process that the BLM and Forest Service will use to monitor
8 implementation and effectiveness of RMP/LUP decisions. The monitoring framework
9 includes methods, data standards, and intervals of monitoring at broad and mid scales;
10 consistent indicators to measure and metric descriptions for each of the scales; analysis and
11 reporting methods; and the incorporation of monitoring results into adaptive management.
12 The need for fine-scale and site-specific habitat monitoring may vary by area depending on
13 existing conditions, habitat variability, threats, and land health. Indicators at the fine and site
14 scales will be consistent with the Habitat Assessment Framework; however, the values for
15 the indicators could be adjusted for regional conditions.

16 More specifically, the framework discusses how the BLM and Forest Service will monitor
17 and track implementation and effectiveness of planning decisions (e.g., tracking of waivers,
18 modifications, site-level actions). The two agencies will monitor the effectiveness of
19 RMP/LUP decisions in meeting management and conservation objectives. Effectiveness
20 monitoring will include monitoring disturbance in habitats, as well as landscape habitat
21 attributes. To monitor habitats, the BLM and Forest Service will measure and track
22 attributes of occupied habitat, PHMA, IHMA, and GHMA at the broad scale, and attributes
23 of habitat availability, patch size, connectivity, linkage/connectivity habitat, edge effect, and
24 anthropogenic disturbances at the mid-scale. Disturbance monitoring will measure and track
25 changes in the amount of sagebrush in the landscape and changes in the anthropogenic
26 footprint, including change energy development density. The framework also includes
27 methodology for analysis and reporting for field offices, states, ranger districts, BLM
28 districts, National Forests, and Forest regions, including geospatial and tabular data for
29 disturbance mapping (e.g., geospatial footprint of new permitted disturbances) and
30 management actions effectiveness.

31 **2.7.3 Regional Mitigation**

32 Consistent with the Proposed Plan's goal outlined in **Section 2.6.2**, the intent of the Idaho
33 and southwestern Montana GRSG LUPA/EIS is to provide a net conservation gain to the
34 species. To do so, in undertaking BLM and Forest Service management actions, and,
35 consistent with valid existing rights and applicable law, in authorizing third party actions that
36 result in habitat loss and degradation, the BLM will require and ensure mitigation that
37 provides a net conservation gain to the species including accounting for any uncertainty
38 associated with the effectiveness of such mitigation. This will be achieved by avoiding,
39 minimizing, and compensating for impacts by applying beneficial mitigation actions. This is
40 also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B,
41 which states “to initiate proactive conservation measures that reduce or eliminate threats to
42 Bureau sensitive species to minimize the likelihood of the need for listing of these species
43 under the ESA.”

1 **Mitigation**

2 *Mitigation Standards.* In undertaking BLM and Forest Service management actions, and
3 consistent with valid existing rights and applicable law, in authorizing third party actions that
4 result in habitat loss and degradation, the BLM will require and ensure mitigation that
5 provides a net conservation gain to the species including accounting for any uncertainty
6 associated with the effectiveness of such mitigation. Actions which result in habitat loss and
7 degradation include those identified as threats which contribute to GRSG disturbance as
8 identified by the USFWS in its 2010 listing decision (75 FR 13910) and shown in Table 1 in
9 **Appendix G**. This will be achieved by avoiding, minimizing, and compensating for impacts
10 by applying beneficial mitigation actions. Mitigation will follow the regulations from the
11 White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid,
12 minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from
13 BLM and Forest Service management actions and authorized third party actions that result
14 in habitat loss and degradation remain after applying avoidance and minimization measures
15 (i.e. residual impacts), then compensatory mitigation projects will be used to provide a net
16 conservation gain to the species. Any compensatory mitigation will be durable, timely, and in
17 addition to that which would have resulted without the compensatory mitigation (see the
18 concepts of durability, timeliness, and additionality as described further in **Appendix J**).

19 *Greater Sage-Grouse Conservation Team.* The BLM and Forest Service will establish a WAFWA
20 Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide
21 the conservation of GRSG, within 90 days of the issuance of the Record of Decision. This
22 Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter,
23 Regional Mitigation Strategy). The Team will also compile and report on monitoring data
24 (including data on habitat condition, population trends, and mitigation effectiveness) from
25 States across the WAFWA Management Zone (see MON-1 through MON-7 and **Appendix**
26 **E**). Subsequently, the Team will use these data to either modify the appropriate Regional
27 Mitigation Strategy or recommend adaptive management actions (see AM-1 through AM-16
28 and **Appendix G**).

29 The BLM and Forest Service will invite governmental and Tribal partners to participate in
30 this Team, including the State Wildlife Agencies and USFWS, in compliance with the
31 exemptions provided for committees defined in the Federal Advisory Committee Act and
32 the regulations that implement that act. The BLM and Forest Service will strive for a
33 collaborative and unified approach between Federal agencies (e.g. USFWS, BLM, and Forest
34 Service), Tribal governments, state and local government(s), and other stakeholders for
35 GRSG conservation. The Team will provide advice, and will not make any decisions that
36 impact Federal lands. The BLM and Forest Service will remain responsible for making
37 decisions that affect Federal lands.

38 *Developing a Regional Mitigation Strategy.* The Team will develop a Regional Mitigation Strategy
39 to inform the mitigation components of NEPA analyses for BLM and Forest Service
40 management actions and third party actions that result in habitat loss and degradation. The
41 Strategy will be developed within one year of the issuance of the Record of Decision. The
42 BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the

1 Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the
2 States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

3 Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This
4 involves anticipating future mitigation needs and strategically identifying mitigation sites and
5 measures that can provide a net conservation gain to the species. The Regional Mitigation
6 Strategy developed by the Team will elaborate on the components identified above (i.e.
7 avoidance, minimization, and compensation; additionality, timeliness, and durability) and
8 further explained in **Appendix J**.

9 In the time period before the Strategy is developed, BLM will consider regional conditions,
10 trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and
11 will ensure that mitigation is consistent with the standards set forth in the first paragraph of
12 this section.

13 *Incorporating the Regional Mitigation Strategy into NEPA Analyses.* The BLM and Forest Service
14 will include the avoidance, minimization, and compensatory recommendations from the
15 Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for BLM and
16 Forest Service management actions and third party actions that result in habitat loss and
17 degradation and the appropriate mitigation actions will be carried forward into the decision.

18 *Implementing a Compensatory Mitigation Program.* Consistent with the principles identified above,
19 the BLM and Forest Service need to ensure that compensatory mitigation is strategically
20 implemented to provide a net conservation gain to the species, as identified in the Regional
21 Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this
22 compensatory mitigation program will be implemented at a State-level (as opposed to a
23 WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners
24 (e.g. Federal, Tribal, and State agencies).

25 To ensure transparent and effective management of the compensatory mitigation funds, the
26 BLM and Forest Service will enter into a contract or agreement with a third-party to help
27 manage the State-level compensatory mitigation funds, within one year of the issuance of the
28 Record of Decision. The selection of the third-party compensatory mitigation administrator
29 will conform to all relevant laws, regulations, and policies. The BLM and Forest Service will
30 remain responsible for making decisions that affect Federal lands.

31 **2.8 Draft LUPA/EIS Alternatives**

32 The following are alternatives to the Proposed Plan and were presented and analyzed in the
33 Draft LUPA/EIS. Alternative F has been refined based on public comment to clarify
34 grazing and ACEC management.

35 **2.8.1 Alternative A (No Action)**

36 The No Action Alternative (Alternative A) represents the continuation of current
37 management direction in the 21 BLM Field Office LUPs and 8 Forest Service LUPs, and
38 proposes no new plan or management actions. Existing GRSG-related management

1 direction is provided in BLM WO IM 2012-043, Greater Sage-Grouse Interim Management
2 Policies and Procedures; Forest Service WO 2600 Memo, Interim Conservation
3 Recommendations for Greater Sage-Grouse and Greater Sage-Grouse Habitat; BLM WO
4 IM 2013-128, Sage-Grouse Conservation in Fire Operations and Fuels Management; Forest
5 Service WO letter 5100, Sage-Grouse Conservation Methods 2013; Idaho BLM IM 2013-
6 036, Greater Sage-Grouse Habitat and Wildland Fire Objectives; and Idaho BLM
7 Information Bulletin (IB) 2013-036, Interim Framework for Evaluating Proposed Activities
8 Within Greater Sage-Grouse Preliminary Priority and Preliminary General Habitats on
9 Bureau of Land Management (BLM) Land in Idaho). A no action alternative is required by
10 CEQ regulations and provides a baseline for comparison of the other alternatives (CEQ
11 1981).

12 **2.8.2 Management Common to Action Alternatives**

13 The following would be common to all action alternatives:

- 14 • Allowable uses and management actions from the existing LUPs
15 that remain valid and do not require amending are carried
16 forward
- 17 • Where more restrictive land use allocations or decisions are
18 made in existing RMPs, those more restrictive land use
19 allocations or decisions will remain in effect and will not be
20 amended by this LUPA.
- 21 • Existing requirements regarding site-specific environmental
22 analysis, public involvement, consultation with tribes and other
23 agencies, or compliance with applicable laws without waiver are
24 maintained
- 25 • Appropriate, site-specific analysis as described in NEPA and any
26 requisite site-specific decision making (i.e., 43 CFR Subpart
27 4160, or 36 CFR Part 251) would be conducted prior to
28 approving proposed management actions
- 29 • Impacts analysis on other sagebrush steppe species and impacts
30 on state endowment trust lands managed by the Idaho
31 Department of Lands would be analyzed during site-specific
32 project NEPA review
- 33 • Activities not specifically addressed by the alternative would still
34 be subject to the allowances and restrictions of the applicable
35 resource management plans
- 36 • Information in the Management Plan and Conservation
37 Strategies for Sage-Grouse in Montana would be considered
38 when designing projects that may affect sensitive species or
39 federally listed species in Montana

- An oil and gas leasing decision would be made and would be consistent with the BLM and Forest Service requirements for a leasing decision as found in 43 CFR Part 3101 and 36 CFR 228.102, respectively.

Habitat boundary adjustments are described in **Appendix F**.

2.8.3 Alternative B

BLM and Forest Service management actions, in concert with other state and federal agencies and private landowners, play a critical role in the future trends of GRSG populations. The BLM National Policy Team, as part of the National Greater Sage-Grouse Planning Strategy, established the NTT in August 2011. The NTT's mission was to develop and describe conservation measures to be considered while new or revised range-wide and long term regulatory mechanisms were developed through LUPAs to conserve, enhance, and restore the portions of GRSG habitat on BLM- and Forest Service-administered lands. The BLM and Forest Service used GRSG conservation measures in A Report on National Greater Sage-Grouse Conservation Measures (Sage-Grouse National Technical Team 2011, also referred as to the NTT Report) to form management direction under Alternative B.

Conservation measures under Alternative B are focused on PHMAs (areas that have the highest conservation value to maintaining or increasing GRSG populations) and on Great Basin-wide concerns for GRSG. GRSG GHMAs are also identified, encompassing seasonal or year-round habitat. Acreages of each management area are shown in **Table 2-9**. The BLM and Forest Service would apply a three percent surface disturbance cap on anthropogenic disturbances (not including fire) in PHMAs.

2.8.4 Alternative C

During scoping for this LUPA/EIS, individuals and conservation groups submitted management direction recommendations for protecting and conserving GRSG and habitat range-wide. The recommendations, in conjunction with resource allocation opportunities and internal sub-regional BLM and Forest Service input, were reviewed in order to develop BLM and Forest Service management direction for GRSG under Alternative C. Management actions in Alternative C are applied to all occupied habitat (PHMA) and focus on the removal of livestock grazing from the landscape to alleviate threats to GRSG. The acreage of PHMA is shown in **Table 2-9**. Similar to Alternative B, the BLM and Forest Service would apply a three percent surface disturbance cap on anthropogenic disturbances (not including fire) in PHMAs. The BLM would designate 4 new ACECs.

2.8.5 Alternative D

This is the Idaho and Southwestern Montana Sub-region alternative. It describes conservation measures to conserve, enhance, and restore GRSG habitat on BLM- and Forest Service-administered lands, while balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, and sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. This alternative incorporates the NTT strategy and includes

1 local adjustments to A Report on National Greater Sage-Grouse Conservation Measures
2 (NTT 2011) and habitat boundaries to provide a balanced level of protection, restoration,
3 enhancement, and use of resources and services to meet ongoing programs and land uses.

4 Conservation measures under Alternative D apply to three GRSG management areas –
5 preliminary priority management area, GHMA, and IHMA. PHMAs contain the most
6 important and relatively intact habitats and potential restoration areas for conserving GRSG,
7 IHMAs have some level of development or disturbance that reduces the effective character
8 for GRSG but still provides better quality habitat than GHMAs. GHMAs represent the
9 remaining occupied or potentially occupied habitat outside of PHMAs and IHMAs.
10 Acreages of each management area are shown in **Table 2-9**. Under Alternative D, the BLM
11 and Forest Service would require no net unmitigated loss of PHMAs instead of a
12 disturbance cap.

13 **2.8.6 Alternative E**

14 The Idaho Governor's Alternative (Governor's Alternative), which provides the basis for
15 Alternative E in this EIS, was developed from recommendations by the State of Idaho's
16 GRSG Task Force and provides recommendations and policies to aid the State of Idaho in
17 developing a conservation plan specifically adapted to Idaho GRSG populations with the
18 objective of precluding the need to list the species under the ESA (Idaho Governor's Sage-
19 grouse Task Force 2012). Conservation measures under Alternative E for lands in Idaho
20 would apply to three GRSG management areas: CHZ, IHZ, and GHZ. Acreages of each
21 habitat zone are shown in **Table 2-9**. The three proposed habitat zones represent a
22 management continuum that includes at one end, a relatively restrictive approach aimed at
23 providing a high level of protection to the most important CHZ. On the other end is a
24 relatively flexible approach for GHZ, allowing for more multiple-use activities. Management
25 under IHZ contemplates greater flexibility than in CHZ, but the overall quality and
26 ecological importance of most of the habitat within this theme is more closely aligned with
27 the habitat in CHZ than in GHZ. Alternative E includes a three percent disturbance cap on
28 fluid mineral development in CHZ in Idaho and a five percent disturbance cap for IHZ.
29 Since the sub-regional planning boundary extends into southwestern Montana and the
30 Sawtooth National Forest portion of Utah, management for these areas in this alternative
31 reflect the approaches described through coordination with Montana Fish Wildlife and Parks
32 (as part of previous planning) and the State of Utah. Lands in Montana would be managed
33 under Alternative A. For the portion of the sub-region within Utah, PHMA and GHMA
34 would be delineated, with the same definitions as under Alternative B.

35 **2.8.7 Alternative F**

36 Similar to Alternative C, Alternative F was derived from individual and conservation group
37 scoping comments. This alternative contains a mixture of management actions from *A*
38 *Report on National Greater Sage-Grouse Conservation Measures* as well as additional restrictions on
39 resource uses and increased resource protection. As such, Alternative F provides greater
40 restrictions on allowable uses and less resource management flexibility than Alternative B.
41 Conservation measures in Alternative F are focused on PHMAs, GHMAs, and RHMAs.
42 Acreages of each management area are shown in **Table 2-9**. The BLM and Forest Service

1 would apply a three percent disturbance cap on surface disturbances (including fire) in
2 PHMAs.

3 **2.9 Summary Comparison of Proposed Plan Amendment and Draft Alternatives**

4 This section summarizes and compares Alternatives A through F and the BLM and Forest
5 Service Proposed Plans considered in the Final EIS. Combined with the appendices and
6 maps, **Table 2-9**, Comparative Summary of Allocation Decisions of the Proposed Plan
7 Amendment and Draft Alternatives, provides the differences among the alternatives relative
8 to what they establish and where they occur. The table compares the differences with the
9 most potential to affect resources among the alternatives.

Administrative Draft
Cooperating Agency Review

¹Table presents acres of allocations within GRSG habitat. Acres outside occupied GRSG habitat are noted where applicable.

²Priority Habitat under Alternative A is managed on BLM-administered lands in Montana only. This row also includes Core Habitat Zones under Alternative E.

³General Habitat under Alternative A is managed on BLM-administered lands in Montana only. This row also includes General Habitat Zones under Alternative E.

⁴All acres in Restoration Habitat under Alternative F are outside occupied GRSG habitat and are presented separately in this table.

⁵Travel management decisions under Alternative D in Idaho would apply to BLM-administered lands within the entire state of Idaho regardless of GRSG habitat; travel management decisions under Alternative D in southwestern Montana would apply to only GRSG habitat in the Dillon Field Office.

Table 2-9
Comparative Summary of Alternatives by Acres Allotted¹ (Within GRSG Habitat)

Resource or Resource Use	Total Planning Area ⁶	Alternative A ⁷	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
--------------------------	----------------------------------	----------------------------	---------------	---------------	---------------	---------------	---------------	---------------

⁶The planning area includes acres within both GRSG habitat and nonhabitat.

⁷Acres under Alternative A represent an overlay with PPH/PGH as well as the inclusion of several Forest Service GRSG management areas that are outside of PPH/PGH.

⁸This row also includes Important Habitat Zones under Alternative E.

Note: Figures referenced in this table are presented in **Appendix A**.

Administrative Draft
Cooperating Agency Review

2.10 Detailed Description of Draft Alternatives

2.10.1 How to Read Tables 2-10 and 2-11

The following describes how **Table 2-10**, Goals and Objectives by Alternative and **Table 2-11**, Management Actions by Alternative, below, are written and formatted to show the land use plan decisions proposed for each alternative.

In accordance with Appendix C of the BLM's *Land Use Planning Handbook* (H-1601-1), land use plan and plan amendment decisions are broad-scale decisions that guide future land management actions and subsequent site-specific implementation decisions (BLM 2005). Land use plan decisions fall into two categories, which establish the base structure for desired outcomes (goals and objectives), and allowable uses and actions to achieve outcomes.

- Goals are broad statements of desired outcomes that usually are not quantifiable.
- Objectives identify specific desired outcomes for resources. They may be quantifiable and measurable and may have established timeframes for achievement, as appropriate.
- Allowable uses identify uses, or allocations, that are allowable, restricted, or prohibited on BLM-administered lands and mineral estate.
- Actions identify measures or criteria to achieve desired objectives, including actions to maintain, restore, or improve land health.

Stipulations (NSO and CSU, which fall under the allowable uses category) are also applied to surface-disturbing activities to achieve desired outcomes (i.e., objectives).

In general, only those resources and resource uses that have been identified as planning issues have notable differences between the alternatives.

Actions that are applicable to all alternatives are shown in one cell across a row. These particular objectives and actions would be implemented regardless of which alternative is ultimately selected.

Actions that are applicable to more than one but not all alternatives are indicated by either combining cells for the same alternatives, or by denoting those objectives or actions as the "same as Alternative A," for example.

In some cells, "No Similar Action" is used to indicate that there is no similar goal, objective or action to the other alternatives, or that the similar goal, objective or action is reflected in another management action in the alternative.

2.10.2 Goals and Objectives

Table 2-10
Goals and Objectives by Alternative

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Goals					
A-GOAL-1: No common goal across LUPs within the sub-region	B-GOAL-1: Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.	C-GOAL-1: Same as Alternative A.	D-GOAL-1: Maintain and/or increase GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.	E-GOAL-1: Conserve the GRSG and its habitat to avoid a listing under the ESA (see NTT 2011).	F-GOAL -1: Maintain and increase current GRSG abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem
Objectives					
A-OBJ-1: No common objective across LUPs within the sub-region.	B-OBJ-1: Protect priority GRSG habitats from anthropogenic disturbances that will reduce distribution or abundance of GRSG.	C-OBJ-1: —	D-OBJ-1: Manage anthropogenic development and human disturbance in priority habitat to minimize the likelihood of adverse local population-level effects on GRSG.	E-OBJ-1: CHZ: Provide a level of protection sufficient to conserve at least 65% of the current known leks occurring in the State within CHZ through implementation of regulatory mechanisms. IHZ: Provide a population buffer to CHZ to minimize the risk of habitat loss from wildfire, invasive species while providing the opportunity to consider limited high-value infrastructure development.	F-OBJ-1: —
A-OBJ-2: No common objective across LUPs within the sub-region.	B-OBJ-2: Manage land uses, habitat treatments, and anthropogenic disturbances below thresholds necessary to conserve local GRSG populations, sagebrush communities and landscapes	C-OBJ-2: —	D-OBJ-2: —	E-OBJ-2: CHZ and IHZ: Limit habitat loss in CHZ and IHZ during the first three-year period of implementation (2014-2017) to no more than 10% loss due to fire and/or infrastructure development resulting in a proportionate reduction of males counted on leks within a particular CA.	F-OBJ-2: —
A-OBJ-3: No common objective across LUPs within the sub-region.	B-OBJ-3: Sub-objective: Manage priority GRSG habitats so that discrete anthropogenic disturbances cover less than 3% of the total GRSG habitat regardless of ownership. Anthropogenic features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, homes, and mines. In priority habitats where	C-OBJ-3: —	D-OBJ-3: —	E-OBJ-3: —	F-OBJ-3: —

	the 3% disturbance threshold is already exceeded from any source, no further anthropogenic disturbances will be permitted by BLM or Forest Service until enough habitat has been restored to maintain the area under this threshold (subject to valid existing rights). In this instance, an additional objective will be designated for the priority area to prioritize and reclaim/restore areas affected by anthropogenic disturbances so that 3% or less of the total priority habitat area is disturbed within 10 years.				
A-OBJ-4: No common objective across LUPs within the sub-region.	B-OBJ-4: Maintain or increase current distribution and abundance of GRSG on BLM administered lands in support of the range-wide goals	C-OBJ-4: —	D-OBJ-4: —	E-OBJ-4: —	F-OBJ-4: —
A-OBJ-5: No common objective across LUPs within the sub-region.	B-OBJ-5: Sub-objective: Develop quantifiable habitat and population objectives with WAFWA and other conservation partners at the management zone and/or other appropriate scales. Develop a monitoring and adaptive management strategy to track whether these objectives are being met, and allow for revisions to management approaches if they are not.	C-OBJ-5: —	D-OBJ-5: —	E-OBJ-5: —	F-OBJ-5: —
A-OBJ-6: No common objective across LUPs within the sub-region.	B-OBJ-6: Sub-objective: Designate priority GRSG habitats for each WAFWA management zone (Stiver et al. 2006) across the current geographic range of GRSG that are large enough to stabilize populations in the short term and enhance populations over the long term.	C-OBJ-6: —	D-OBJ-6: Sub-objective: Designate priority GRSG habitats for each WAFWA management zone (Stiver et al. 2006) across the current geographic range of GRSG that are large enough to stabilize populations in the short term and enhance populations over the long term.	E-OBJ-6: CHZ: Focus management by Federal and State agencies on the maintenance and enhancement of habitats, populations and connectivity in areas within this management zone. IHZ: Focus management by Federal and State agencies on areas within this zone that have the best opportunities for conserving, enhancing or restoring habitat for GRSG. Provide management flexibility to permit high-value infrastructure projects.	F-OBJ-6: —

A-OBJ-7: No common objective across LUPs within the sub-region.	B-OBJ-7: Sub-objective: To maintain or increase current populations, manage or restore priority areas so that at least 70% of the land cover provides adequate sagebrush habitat to meet GRSG needs.	C-OBJ-7: —	D-OBJ-7: Identify and expand sagebrush areas to increase the extent and condition of available habitat on the landscape.	E-OBJ-7: —	F-OBJ-7: —
A-OBJ-8: No common objective across LUPs within the sub-region.	B-OBJ-8: —	C-OBJ-8: —	D-OBJ-8: Manage GHMAs in a way that buffers adjoining PHMAs from disturbances.	E-OBJ-8: —	F-OBJ-8: —
A-OBJ-9: No common objective across LUPs within the sub-region.	B-OBJ-9: —	C-OBJ-9: —	D-OBJ-10: Reconnect and expand areas of higher native plant community integrity/rangeland health to increase the extent of high quality habitat and, where possible, to accommodate the future effects of climate change.	E-OBJ-9: —	F-OBJ-9: —
A-OBJ-10: No common objective across LUPs within the sub-region.	B-OBJ-10: —	C-OBJ-10: —	D-OBJ-10: Increase the amount and functionality of seasonal habitats. a. Increase canopy cover and average patch size of sagebrush in perennial grasslands. b. Increase the amount, condition and connectivity of seasonal habitats. c. Protect or improve GRSG migration/movement corridors. d. Reduce conifer encroachment within GRSG seasonal habitats. e. Improve understory (grass, forb) and/or riparian condition within breeding and late brood-rearing habitats. f. Reduce the extent of annual grasslands adjacent to priority habitat.	E-OBJ-10: —	F-OBJ-10: —
A-OBJ-11: No common objective across LUPs within the sub-region.	B-OBJ-11: —	C-OBJ-11: —	D-OBJ-11: Minimize the loss of existing priority sagebrush habitat. In particular, identify and strategically protect larger in-tact sagebrush areas and areas of lower fragmentation to maintain GRSG population persistence.	E-OBJ-11: CHZ: Implement the regulatory mechanisms to maintain and enhance GRSG habitats, populations and connectivity in areas within CHZ, buffered by strategic areas within IHZ, dominated by sagebrush. IHZ: Provide strategic buffers in areas dominated by sagebrush to CHZ where regulatory mechanisms maintain and enhance GRSG habitats, populations and connectivity in areas within CHZ.	F-OBJ-11: Establish a system of sagebrush reserves to anchor recovery efforts by protecting the highest quality habitats.

2.10.3 Management Actions

Table 2-11
Management Actions by Alternative

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
SSS – GRSG					
<p>A-SSS-1: There is no consistent mapping representation of GRSG habitat across the sub-region, nor is there any consistent designation of habitat within the sub-region (see Table 2-9).</p> <p>Idaho BLM, in coordination with IDFG and LWGs, has developed and maintained a Key Sage-Grouse map over the last 12 years which depicts areas important to GRSG (Key areas) and areas where restoration could potentially occur to restore habitat conditions (R1 perennial grass dominated areas; R2 – annual grass dominated areas; and R3 – conifer encroachment areas) Montana BLM in coordination with MFWP has developed a Core Habitat map that depicts important areas for GRSG (Core areas). These maps (the Idaho Key Habitat and Montana Core Habitat) do not represent any habitat designation with associated management direction, but instead are used as an information tool to help prioritize site specific management, suppression and rehabilitation efforts.</p> <p>Several National Forests have designated GRSG habitat with associated management guidance. These include the Beaverhead-Deerlodge, Caribou-Targhee and Sawtooth NFs. The habitat designations were typically define as buffers around existing leks and adjusted managed within those areas.</p>	<p>B-SSS-1: PHMA: Designate PHMAs on 8,235,900 acres (see Table 2-9).</p> <p>PHMA includes areas that have the highest conservation value to maintaining or increasing GRSG populations. These areas include breeding, late brood-rearing, winter concentration areas, and where known, migration or connectivity corridors.</p> <p>GHMA: Designate GHMAs on 3,102,400 acres (see Table 2-9).</p> <p>GHMA is occupied (seasonal or year-round) habitat outside of PHMA.</p>	<p>C-SSS-1: PHMA: Designate PHMA on 11,106,900 acres (see Table 2-9).</p> <p>PHMA is all occupied (seasonal or year-round) GRSG habitat.</p>	<p>D-SSS-1: PHMA: Designate PHMA on 6,849,200 acres (see Table 2-9).</p> <p>PHMA includes areas that have the highest conservation value to GRSG. Key characteristics include areas of higher lek attendance and lek connectivity, lower habitat fragmentation, important movement corridors and winter habitat.</p> <p>IHMA: Designate Important Habitat Management Areas (IHMA) on 1,386,800 acres (see Table 2-9).</p> <p>IHMA includes areas of moderate to high conservation value to GRSG that are generally adjacent to PHMAs but reflect reduced GRSG population and/or habitat characteristics.</p> <p>GHMA: Designate GHMA on 2,934,100 acres (see Table 2-9).</p> <p>GHMA is occupied (seasonal or year-round) habitat outside of PHMA and IHMA.</p>	<p>E-SSS-1: Idaho – CHZ: Designate CHZ on 4,908,100 acres (see Table 2-9).</p> <p>CHZ focuses on conserving each of the two key meta-populations in the State. These meta-populations consist of a large aggregation of interconnected breeding subpopulations of GRSG that have the highest likelihood of long-term persistence. One meta-population is located north of the Snake River and includes the Mountain Valley and Desert CAs; the other is located south of the Snake River and includes the West Owyhee and Southern CAs.</p> <p>Idaho – IHZ: Designate IHZ on 2,743,800 acres (see Table 2-9).</p> <p>IHZ, while permitting more management flexibility, also contains important habitat for the species and is an important buffer against the threat of wildfire. IHZ captures high quality habitat and populations that provide a management buffer for CHZ, connect patches of CHZ, and support important populations and habitat independent of CHZ.</p> <p>Idaho – GHZ: Designate GHZ on 4,908,100 acres (see Table 2-9).</p> <p>GHZ generally includes few active leks, and fragmented or marginal habitat. It includes habitat for two isolated populations of GRSG in the East Idaho Uplands and West Central Idaho.</p> <p>Montana Habitat: All goals, objectives</p>	<p>F-SSS-1: PHMA: Designate PHMA on 8,235,900 acres (see Table 2-9).</p> <p>PHMA conserves large expanses of sagebrush steppe and all active GRSG leks, and brood-rearing, transitional, and winter habitats.</p> <p>GHMA: Designate GHMA on 2,870,900 acres (see Table 2-9).</p> <p>GHMA is occupied (seasonal or year-round) habitat outside of PHMA.</p> <p>RHMA: Designate Restoration Habitat Management Areas (RHMA) on 500,300 acres (see Table 2-9).</p> <p>RHMA is degraded or fragmented habitat that is currently unoccupied by GRSG but might be useful to the species if restored to its potential natural community.</p>

Table 2-11
Management Actions by Alternative

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
				<p>and management actions are the same as Alternative A and are summarized in Appendix U.</p> <p>Utah Habitat: Designate PHMA on 71,800 acres. All lands with GRSG habitat in the portion of the Sawtooth National Forest sub-region in Utah are PHMA (see Table 2-9).</p>	
<p>A-SSS-2: —.</p>	<p>B-SSS-2: PHMA: —.</p> <p>GHMA: —.</p>	<p>C-SSS-2: PHMA: —.</p>	<p>D-SSS-2: PHMA: —.</p> <p>IHMA: —.</p> <p>GHMA: —.</p>	<p>E-SSS-2: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: Limit or ameliorate impacts from activities as identified in this matrix through the use of the following stipulations:</p> <ul style="list-style-type: none"> • New permanent disturbance, including structures, fences, and buildings, should not be located within the occupied lek itself. • No permanent disturbance within 1 mile of an occupied lek, unless it is not visible to the GRSG using the lek. • New permanent tall structures should not be located within one mile of the lek, if visible by the birds within the lek. • A disturbance outside the lek should not produce noise more than 10 dBs above the ambient (background) level at the edge of the lek during breeding season. • Apply time-of-day stipulations when the lek is active (e.g., no activity from 2-hours before sunrise to 2-hours after sunrise). • Avoid activities (construction, vehicle noise, etc.) in the following seasons and habitats: <ul style="list-style-type: none"> ○ On leks from February 15 – May 15 to avoid activities that will disturb lek attendance or breeding. 	<p>F-SSS-2: PHMA: —.</p> <p>GHMA: —.</p> <p>RHMA: —.</p>

Table 2-11
Management Actions by Alternative

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
				<ul style="list-style-type: none"> ○ In nesting and brood-rearing areas from April 1 – August 15. ○ In winter habitat from November 15 – March 15. • Specific time and distance determinations for seasonal stipulations would be based on site-specific conditions, in coordination with the local Utah Department of Wildlife Resources biologist. • Avoid disturbance within PHMA (nesting and brood-rearing areas, winter habitat, other habitat), if possible. Project proponents must demonstrate why avoidance is not possible. If avoidance in PHMA is not possible, minimize as appropriate to the area (e.g., try to minimize effects by locating development in habitat of the least importance, take advantage of topographic to screen the disturbance, or maintaining and enhancing wet meadow and riparian vegetation). • After minimization, mitigation is required (see mitigation section). • Cumulative new permanent disturbance should not exceed 5% of surface area of nesting, winter, or other habitat, within the population area's PHMA. • Manage PHMA to avoid barriers to migration, if applicable. 	
A-SSS-3: No disturbance cap is managed across the sub-region.	B-SSS-3: PHMA: Apply a three percent surface disturbance cap on anthropogenic disturbances (not including fire). GHMA: —.	C-SSS-3: Same as Alternative B.	D-SSS-3: PHMA: Require no net unmitigated loss of PHMAs. IHMA: —. GHMA: —.	E-SSS-3: Idaho – CHZ: Apply a three percent surface disturbance cap on fluid mineral development. Idaho – IHZ: Apply a five percent surface disturbance cap on fluid mineral development. Idaho – GHZ: —.	F-SSS-3: PHMA: Apply a three percent disturbance cap on surface disturbances, including fire.

**Table 2-11
Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
				Utah Habitat: —.	
Monitoring					
A-SSS-4: —.	B-SSS-4: Develop a Monitoring Framework to include: methods, data standards, and intervals of monitoring at broad and mid scales; consistent indicators to measure and metric descriptions for each of the scales [see Habitat Assessment Framework (HAF) and Assessment, Inventory and Monitoring core indicators]; analysis and reporting methods; and the incorporation of monitoring results into adaptive management.	C-SSS-4: Same as Alternative B.	D-SSS-4: Same as Alternative B.	E-SSS-4: Utilize lek monitoring and habitat monitoring to annually assess adaptive management triggers.	F-SSS-4: Same as Alternative B.
Adaptive Management					
A-SSS-5: —.	B-SSS-5: Develop an adaptive management strategy to provide certainty that unintended negative impacts on GRSG will be addressed before consequences become severe or irreversible and to provide regulatory certainty to the USFWS that appropriate action will be taken by the BLM and Forest Service.	C-SSS-5: Same as Alternative B.	D-SSS-5: Use habitat and population triggers to adjust management in IHMA. All management identified for PHMAs would apply to IHMAs in response to triggers. See Section 2.6.4 for details.	E-SSS-5: Use hard and soft population and habitat triggers to adjust management in IHZ. Management from CHZs, primarily for infrastructure, would apply to IHZ in response to triggers. Develop the following: <ul style="list-style-type: none"> • Fuel Break Strategy • Response Time Analysis • Water Availability Analysis • Restoration Strategy (see Appendix Q)	F-SSS-5: Same as Alternative B.
Vegetation					
A-VG-1: —.	B-VG-1: PHMA: --. GHMA: —.	C-VG-1: PHMA: —	D-VG-1: PHMA: —. IHMA: —. GHMA: —.	E-VG-1: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-VG-1: PHMA: In PHMA, ensure that soil cover and native herbaceous plants are at their Ecological Site Description potential to help protect against invasive plants. In areas without Ecological Site Descriptions, reference sites would be utilized to identify appropriate vegetation communities and soil cover. GHMA: —. RHMA: —.

Table 2-11
Management Actions by Alternative

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Habitat Restoration					
<p>A-VG-2: In most LUPs, either no priorities are established or prioritization is given to projects that benefit multiple resources (e.g., livestock, wildlife, wild horses and burros, special status species).</p> <p>All LUPs which recognize conifer expansion and its effects on sagebrush steppe habitat uniformly identify the need for controlling conifer expansion through various methods including: hand cutting, wood cutting, mechanical, prescribed fire, chemical treatments, and through the use of wildfire where feasible.</p> <p>Montana BLM: Restore vegetation to benefit multiple uses. Promote the use of native species where possible (See ROD pg. 51 Actions 3, 12, 14 and Appendix X of Dillon ROD/RMP). Restore and maintain desired ecological conditions and fuel loadings. Evaluate benefits against loss of sagebrush in NEPA process. Do not burn Wyoming sagebrush.</p>	<p>B-VG-2: PHMA: Prioritize implementation of restoration projects based on environmental variables that improve chances for project success in areas most likely to benefit GRSG (Meinke et al. 2009). Prioritize restoration in seasonal habitats that are thought to be limiting GRSG distribution and/or abundance.</p> <p>GHMA: —.</p>	<p>C-VG-2: PHMA: Same as Alternative B.</p>	<p>D-VG-2: PHMA: Prioritize implementation of vegetation rehabilitation projects to achieve the greatest improvement in GRSG habitat. Factors contributing to higher emphasis for implementation include:</p> <ul style="list-style-type: none"> Sites where environmental variables contribute to improved chances for project success (Meinke et al. 2009). Improvement of seasonal habitats that are thought to be limiting GRSG distribution and/or abundance (wintering areas, wet meadows and riparian areas, nesting areas, leks, etc.). Re-establishment of sagebrush cover in otherwise suitable GRSG with consideration to local needs and conditions using the general priorities in the following order: <ul style="list-style-type: none"> Native grassland with suitable forb component Nonnative grassland with suitable forb component Recently burned native areas Native grassland Nonnative grassland Where desirable perennial bunchgrasses and/or forbs are deficient in existing sagebrush stands, use appropriate mechanical, aerial or other techniques to re-establish them. Examples include but are not limited to, use of a Lawson aerator with seeding, harrow or chain with seeding, drill seeding, hand planting plugs, aerial seeding or other appropriate technique. Cooperative efforts that may improve GRSG habitat quality 	<p>E-VG-2: Idaho – CHZ: Prioritize the removal of conifers through methods appropriate for the terrain and most likely to facilitate expeditious GRSG population and habitat recovery. To the extent possible, utilize removal methods creating the least amount of disturbance.</p> <p>a. Efforts should focus on areas with highest restoration potential typically evidenced by low canopy cover, existing sagebrush understory, and adjacent current populations.</p> <p>b. Refrain from using prescribed fire and conducting removal projects in juniper stands older than one hundred years.</p> <p>c. Maximize the use of Natural Resource Conservation Service funding through permittee grants under the Environmental Quality Incentives Program and Wildlife Habitat Improvement programs.</p> <p>Idaho – IHZ: Prioritize the removal of conifers through methods appropriate for the terrain and most likely to facilitate expeditious GRSG habitat recovery. Especially prioritize and target removal treatments adjacent to CHZ. To the extent possible, utilize methods creating the least amount of disturbance.</p> <p>a. Areas with highest restoration potential will typically have low canopy cover, existing sagebrush understory, and adjacent current populations.</p> <p>b. Refrain from using prescribed fire and conducting removal projects in juniper stands older than one-hundred years.</p> <p>c. Maximize the use of Natural Resource Conservation Service funding</p>	<p>F-VG-2: PHMA: Prioritize implementation of restoration projects based on environmental variables that improve chances for project success in areas most likely to benefit GRSG (Meinke et al. 2009).</p> <p>Prioritize restoration in seasonal habitats that are thought to be limiting GRSG distribution and/or abundance and where factors causing degradation have already been addressed (e.g., changes in livestock management).</p> <p>GHMA: —.</p> <p>RHMA: —.</p>

**Table 2-11
Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
			<p>over multiple ownerships.</p> <ul style="list-style-type: none"> Projects in GHMA that may provide connectivity between suitable habitats or expand existing good quality habitats. Projects that address conifer encroachment into important GRSG habitats. In general the priority for treatment is 1) Phase 1 (≤10% conifer cover), 2) Phase 2 (10-30%), and 3) Phase 3 (>30%). Replacing stands of annual grasses within otherwise good quality habitats with desirable perennial species. Other factors that contribute to the importance of the restoration project in maintaining or improving GRSG habitat. <p>IHMA: Same as PHMA. GHMA: Same as PHMA.</p>	<p>through permittee grants under the Environmental Quality Incentives Program and Wildlife Habitat Improvement programs.</p> <p>Idaho – GHZ: —.</p> <p>Montana Habitat: Same as Alternative A.</p> <p>Utah Habitat: Protection of GRSG habitat is the primary focus of conservation efforts, but many locations can be reclaimed or restored by active vegetation management actions. For example:</p> <ul style="list-style-type: none"> removal of encroaching conifers may create new habitat or increase the carrying capacity of habitat and thereby expand GRSG populations, or the distribution of water into wet meadow areas may improve seasonal brood-rearing range and enhance GRSG recruitment. <p>Aggressively remove encroaching conifers and other plant species to expand GRSG habitat where possible.</p> <p>Sagebrush treatment projects within nesting and winter habitat should be limited and require pre-approval by the appropriate regulatory agency in discussions with DWR. Sagebrush treatment projects should maintain 80% of the available habitat as sagebrush within the project area; 20% of the habitat can be managed for younger age classes of sagebrush, if appropriate. These treatments are generally recommended only to improve brood-rearing habitat, but need to be carefully considered before use in winter and other habitat.</p>	

**Table 2-11
Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
<p>A-VG-3: Guidance and management direction for general vegetation is fairly broad and trends toward maintaining the components of the vegetative community in the same relative proportion as those which would have historically occurred in the area. Some LUPs contain objectives for maintaining, improving, or restoring sagebrush plant communities. The level of detail varies depending on the age of the land use plan.</p>	<p>B-VG-3: PHMA: —.</p> <p>GHMA: —.</p>	<p>C-VG-3: PHMA: Composition, function, and structure of native vegetation communities will be consistent with the reference state of the appropriate Ecological Site Description and will be maximized to provide for healthy, resilient, and recovering GRSG habitat components.</p>	<p>D-VG-3: PHMA: —.</p> <p>IHMA: —.</p> <p>GHMA: —.</p>	<p>E-VG-3: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: —.</p>	<p>F-VG-3: PHMA: —.</p> <p>GHMA: —.</p> <p>RHMA: —.</p>
<p>A-VG-4: All recent LUPs include management actions that promote use of native species where possible, acknowledging that in some instances, vegetative treatments may not be successful without the use of nonnative desired species.</p> <p>Older plans typically do not include a similar management action.</p>	<p>B-VG-4: PHMA: Require use of native seeds for restoration based on availability, adaptation (ecological site potential), and probability of success (Richards et al. 1998). Where probability of success or adapted seed availability is low, nonnative seeds may be used as long as they support GRSG habitat objectives (Pyke 2011).</p> <p>GHMA: —.</p>	<p>C-VG-4: PHMA: Same as Alternative B.</p>	<p>D-VG-4: PHMA: Same as Alternative B.</p> <p>IHMA: Same as PHMA.</p> <p>GHMA: Same as PHMA.</p>	<p>E-VG-4: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: —.</p>	<p>F-VG-4: PHMA: Same as Alternative B.</p> <p>GHMA: —.</p> <p>RHMA: —.</p>
<p>A-VG-5: All LUPs, which are written in accordance with applicable program direction, include management actions that allow the administrating agency to make adjustments to livestock grazing, wild horse and burro management, and travel management on a case-by case basis following restoration activities.</p>	<p>B-VG-5: PHMA: Design post restoration management to ensure long term persistence. This could include changes in livestock grazing management, wild horse and burro management and travel management, etc., to achieve and maintain the desired condition of the restoration effort that benefits GRSG (Eiswerth and Shonkwiler 2006).</p> <p>GHMA: —.</p>	<p>C-VG-5: PHMA: Same as Alternative B.</p>	<p>D-VG-5: PHMA: Implement management changes, as necessary, to maintain suitable GRSG habitat, improve unsuitable GRSG habitat and to ensure long-term persistence of improved GRSG habitat achieved through restoration efforts (Eiswerth and Shonkwiler 2006). Management changes could be considered for livestock grazing, wild horse and burros, travel planning, and other resources.</p> <p>IHMA: Same as PHMA.</p> <p>GHMA: Same as PHMA.</p>	<p>E-VG-5: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: —.</p>	<p>F-VG-5: PHMA: Same as Alternative B.</p> <p>GHMA: —.</p> <p>RHMA: —.</p>
<p>A-VG-6: —.</p>	<p>B-VG-6: PHMA: Consider potential changes in climate (Miller et al. 2011) when proposing restoration seedings when using native plants. Consider collection from the warmer component</p>	<p>C-VG-6: PHMA: Same as Alternative B.</p>	<p>D-VG-6: PHMA: —.</p> <p>IHMA: —.</p> <p>GHMA: —.</p>	<p>E-VG-6: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: —.</p>	<p>F-VG-6: PHMA: Same as Alternative B.</p> <p>GHMA: —.</p>

	of the species current range when selecting native species (Kramer and Havens 2009). GHMA: —.				RHMA: —.
A-VG-7: Most LUPs do not include specific management actions related to seedings. Plans do include generic decisions that allow maintenance of existing range improvements, which includes maintenance of historical seedings. Recently completed LUPs promote use of native species when conducting restoration activities. This would include restoration projects conducted in areas that have perennial grass cover. Older plans do not include a similar management action.	B-VG-7: PHMA: Restore native (or desirable) plants and create landscape patterns which most benefit GRSG. GHMA: —.	C-VG-7: PHMA: Exotic seedings will be rehabbed, interseeded, restored to recover sagebrush in areas to expand occupied habitats.	D-VG-7: PHMA: —. IHMA: —. GHMA: —.	E-VG-7: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-VG-7: PHMA: —. GHMA: —. RHMA: —.
A-VG-8: Some LUPs contain objectives for maintaining improving, or restoring sagebrush plant communities. The level of detail varies depending on the age of the land use plan. All LUPs address vegetation treatments for improvement of wildlife habitat overall or to provide increased forage for wildlife, livestock, and wild horses and burros. Recent LUPs may include management actions that purposely restore or enhance GRSG habitat.	B-VG-8: PHMA: Make re-establishment of sagebrush cover and desirable understory plants (relative to ecological site potential) the highest priority for restoration efforts. GHMA: —.	C-VG-8: PHMA: Same as Alternative B.	D-VG-8: PHMA: —. IHMA: —. GHMA: —.	E-VG-8: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-VG-8: PHMA: —. GHMA: —. RHMA: —.
A-VG-9: —.	B-VG-9: PHMA: In fire prone areas where sagebrush seed is required for GRSG habitat restoration, consider establishing seed harvest areas that are managed for seed production (Armstrong 2007) and are a priority for protection from outside disturbances.	C-VG-9: PHMA: Same as Alternative B.	D-VG-9: PHMA: In fire prone areas where sagebrush seed is required for GRSG habitat restoration, consider establishing seed harvest areas that are managed for seed production (Armstrong 2007).	E-VG-9: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-VG-9: PHMA: Same as Alternative B. GHMA: —. RHMA: —.

Fuels Management					
<p>A-FM-1: Under current management, there is no designated GRSG habitat.</p> <p>Design projects to minimize the size of wildfire and prevent the further loss of sagebrush.</p> <p>Existing LUPs typically do not include specific management decisions regarding implementation of fuels treatments in sagebrush habitat. In general, both prescribed fire and non-fire fuels treatments are allowed.</p> <p>Montana BLM: Restore and maintain desired ecological conditions and fuel loadings. Evaluate benefits against loss of sagebrush in EA process. Do not burn Wyoming sagebrush.</p>	<p>B-FM-1: PHMA: Design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems. Do not reduce sagebrush canopy cover to less than 15% (Connelly et al. 2000, Hagen et al. 2007) unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of PHMA and conserve habitat quality for the species. Closely evaluate the benefits of the fuel break against the additional loss of sagebrush cover in future NEPA documents. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in PHMA. Allow no fuels treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around or in the winter range and will maintain winter range habitat quality. Do not use fire to treat sagebrush in less than 12-inch precipitation zones (e.g., Wyoming big sagebrush or other xeric sagebrush species; Connelly et al. 2000, Hagen et al. 2007, Beck et al. 2009). However, if as a last resort and after all other treatment opportunities have been explored and site specific variables allow, the use of prescribed fire for fuel breaks that would disrupt the fuel continuity across the landscape could be considered, in stands where cheatgrass is a very minor component</p>	<p>C-FM-1: PHMA: Same as Alternative B.</p>	<p>D-FM-1: PHMA: Design and implement fuels treatments with an emphasis on maintaining, protecting, and expanding sagebrush ecosystems and successfully rehabilitated areas and strategically and effectively reduce wildfire threats in the greatest area. Enhance (or maintain/retain) sagebrush canopy cover and community structure to match expected potential for the ecological site and consistent with GRSG habitat objectives unless fuels management objectives requires additional reduction in sagebrush cover to meet strategic protection of GRSG habitat. Closely evaluate the benefits of the fuel management treatments against the additional loss of sagebrush cover on the local landscape in the NEPA process. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in PHMA. Allow no treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around and/or in the winter range and will maintain, increase, or enhance winter range habitat quality. Ensure chemical applications are utilized where they would assist in success of fuels treatments. Strategically place treatments on a landscape scale to prevent fire from spreading into PHMA or WUI.</p> <p>IHMA: Same as PHMA.</p>	<p>E-FM-1: Idaho – CHZ: Implementation of specific, more aggressive wildlife and invasive species management practices to prevent further encroachment into CHZ should be driven by local planning efforts at the field office and ranger district level.</p> <p>Idaho – IHZ: Same as Idaho - CHZ.</p> <p>Idaho – GHZ: —.</p> <p>Montana Habitat: Same as Alternative A.</p> <p>Utah Habitat: Habitat loss due to fire and replacement of (burned) native vegetation by invasive plants is the single greatest threat to GRSG in Utah. While unscheduled fires may occur, response to fire can have a large impact on the severity of the effects, especially over time as rehabilitation or restoration continues. Implement the following:</p> <ul style="list-style-type: none"> • Create and implement a statewide fire agency agreement(s) that will eliminate jurisdictional boundaries and allow for immediate response to natural fire in PHMA. • Allow use of fire-retardant vegetation that will buffer areas of high quality GRSG habitat from catastrophic fire. • Use prescriptive fire with caution in sagebrush habitat. The WAFWA has prepared 	<p>F-FM-1: PHMA: Design and implement fuels treatments with an emphasis on protecting existing sagebrush ecosystems. Do not reduce sagebrush canopy cover to less than 15% (Connelly et al. 2000, Hagen et al. 2007) unless a fuels management objective requires additional reduction in sagebrush cover to meet strategic protection of PHMA and conserve habitat quality for the species. Closely evaluate the benefits of the fuel break against the additional loss of sagebrush cover in the EA process. Apply appropriate seasonal restrictions for implementing fuels management treatments according to the type of seasonal habitats present in PHMA. Allow no fuels treatments in known winter range unless the treatments are designed to strategically reduce wildfire risk around or in the winter range and will maintain winter range habitat quality. Do not use fire to treat sagebrush in less than 12-inch precipitation zones (e.g., Wyoming big sagebrush or other xeric sagebrush species; Connelly et al. 2000, Hagen et al. 2007, Beck et al. 2009). However, if as a last resort and after all other treatment opportunities have been explored and site specific variables allow, the use of prescribed fire for fuel breaks that would disrupt the fuel continuity across the landscape could be considered, in stands where cheatgrass is a very minor component</p>

	<p>in the understory (Brown 1982). Monitor and control invasive vegetation post-treatment. Rest treated areas from grazing for two full growing seasons unless vegetation recovery dictates otherwise (WGFD 2011). Require use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success (Richards et al. 1998). Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat objectives (Pyke 2011). Design post fuels management projects to ensure long term persistence of seeded or pre-treatment native plants. This may require temporary or long-term changes in livestock grazing management, wild horse and burro management, travel management, or other activities to achieve and maintain the desired condition of the fuels management project (Eiswerth and Shonkwiler 2006).</p> <p>GHMA: —.</p>		<p>GHMA: Same as PHMA.</p>	<p>information that explains the risks from using prescribed fire in xeric sagebrush habitats.</p> <ul style="list-style-type: none"> • Prescribed fire should only be used at higher elevations and in a manner designed prescriptively to benefit GRSG. • Conduct effective research into controlling fire size and protecting remaining GRSG areas that are adjacent to high-risk cheatgrass areas. • Focus research efforts on effective reclamation and restoration of landscapes altered by wildfire. • Within winter habitat, manage to maintain maximum amount of sagebrush, especially tall sagebrush, which would be available to GRSG above snow during a severe winter. Tall sagebrush is capable of standing above heavier than normal snowfall. • Sagebrush treatment projects within winter habitat need pre-approval by the appropriate regulatory agency in coordination with the Utah Department of Wildlife Resources. Sagebrush treatment projects within winter habitat should maintain 80% of the available habitat as tall sagebrush; 20% of the habitat can be managed for younger age classes, if appropriate. • Coordinate the needs and efforts related to GRSG with the State of Utah committee that was formed to develop a collaborative process to protect the health and welfare by reducing the size and frequency of catastrophic fires. 	<p>in the understory (Brown 1982). Monitor and control invasive vegetation post-treatment. Rest treated areas from grazing for two full growing seasons unless vegetation recovery dictates otherwise (WGFD 2011). Require use of native seeds for fuels management treatment based on availability, adaptation (site potential), and probability of success (Richards et al. 1998). Where probability of success or native seed availability is low, nonnative seeds may be used as long as they meet GRSG habitat objectives (Pyke 2011). Design post fuels management projects to ensure long term persistence of seeded or pre-treatment native plants, including sagebrush. This may require temporary or long-term changes in livestock grazing management, wild horse and burro management, travel management, or other activities to achieve and maintain the desired condition of the fuels management project (Eiswerth and Shonkwiler 2006).</p> <p>GHMA: —.</p> <p>RHMA: —.</p>

				<p>“intensity” of grazing in sagebrush/GRSG habitats to provide for the seasonal needs of GRSG. Specific prescriptions can be applied through more intensive management to address special needs or weak links in the biological year of GRSG production. Where time-controlled grazing is not an option, moderate use of occupied GRSG habitats will usually leave mosaic or patchy areas where some plants are ungrazed. Managing for moderate utilization levels (40%) after the period of rapid vegetation growth may provide enough residual cover for GRSG nesting and early brood-rearing the subsequent spring. Evaluation of GRSG nesting and escape cover must be determined on a site-specific basis. Livestock operations with a small amount of nesting habitat should consider special management activities to protect nesting and early brood-rearing areas. Lighter use of areas may be warranted. In areas with large tracts of contiguous habitat, livestock producers should manage the vegetation on a rotational grazing basis, which may leave 10 - 20 % of the area ungrazed periodically in combination with deferring or altering timing of grazing in other areas. In areas where GRSG nesting is common, managing for moderate use of plant growth across the landscape would be appropriate. Well-managed ranches with comprehensive grazing strategies that include short-term or duration grazing, higher levels of use may be acceptable, provided these higher levels of use include rested vegetation in nearby areas.</p>

Lands and Realty					
Wind and Solar Energy					
A-LR-1: ROW grants are issued for wind and solar energy development on a case-by-case basis.	B-LR-1: PHMA: —. GHMA: —.	C-LR-1: PHMA: —.	D-LR-1: PHMA: Solar and wind energy development is not allowed. IHMA: Wind and solar energy development would be restricted where adverse effects could not be mitigated. Ancillary facilities such as roads, electric lines, etc. could potentially be authorized provided there is no net loss of GRSG habitat through mitigation. GHMA: Lands shall be considered avoidance areas for wind and solar development.	E-LR-1: Idaho – Common to All Habitats: See Action E-LR-3. Utah Habitat: —.	F-LR-1: PHMA: Do not site wind energy development in PHMA (Jones 2012). GHMA: —. RHMA: —.
A-LR-2: —.	B-LR-2: PHMA: —. GHMA: —.	C-LR-2: PHMA: —.	D-LR-2: PHMA: —. IHMA: —. GHMA: —.	E-LR-2: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-LR-2: PHMA: Site wind energy development at least five miles from active GRSG leks. GHMA: —. RHMA: —.
Rights-of-way					
A-LR-3: Continue to manage existing ROW avoidance and exclusion areas (see Table 2-9). Montana BLM: Manage designated ROW avoidance areas on 123,300 acres and ROW exclusion areas on 6,470 acres	B-LR-3: PHMA: Make PHMA an exclusion area for new BLM ROW or Forest Service SUA permits (see Table 2-9). Consider the following exceptions: <ul style="list-style-type: none"> • Within designated ROW or SUA corridors encumbered by existing ROW or SUA authorizations: new ROWs or SUAs may be co-located only if the entire footprint of the proposed project (including construction and staging), can be completed within the existing disturbance associated with the authorized ROWs or SUAs. • Subject to valid existing rights: where new ROWs or SUAs associated with valid existing rights 	C-LR-3: PHMA: New corridors/ facilities will be sited in non-habitat and bundled with existing corridors to the maximum extent possible (see Table 2-9).	D-LR-3: PHMA: Designate PHMA as ROW Avoidance areas and exclusion areas for wind and solar development (see Table 2-9). New authorizations for the following uses are not allowed: Transmission facilities (greater than 50kV in size), wind energy testing and development, commercial solar development, nuclear development, airports, and ancillary facilities associated with any of the aforementioned development; paved roads and graded gravel roads, landfills, airports, and hydroelectric projects. Communication sites would be allowed. IHMA: Designate IHMA as ROW	E-LR-3: Idaho – CHZ: Designate CHZ as ROW avoidance areas with limited exceptions permissible and subject to BMPs. Compensatory mitigation would be required (see Table 2-9). Idaho – IHZ: Designate IHZ as ROW avoidance areas. New ROWs and infrastructure are permissible subject to certain criteria and BMPs similar to those required for habitat in Utah. Mitigate unavoidable impacts. Idaho – GHZ: Manage new ROWs consistent with local resource management plans.	F-LR-3: PHMA: PHMA shall be an exclusion area for new ROWs permits (see Table 2-9). Consider the following exceptions: <ul style="list-style-type: none"> • Within designated ROW corridors encumbered by existing ROW authorizations: new ROWs may be co-located only if the entire footprint of the proposed project (including construction and staging), can be completed within the existing disturbance associated with the authorized ROWs. • Subject to valid existing rights: where new ROWs associated with valid existing rights are required, co-locate new ROWs within

Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
	<p>are required, co-locate new ROWs or SUAs within existing ROWs or SUAs or where it best minimizes GRSG impacts. Use existing roads, or realignments as described above, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in PHMA. If that disturbance exceeds 3% for that area, then evaluate and implement additional effective mitigation on a case-by-case basis to offset the resulting loss of GRSG habitat.</p> <p>GHMA: Make GHMA an avoidance area for new ROWs or SUAs.</p>		<p>Avoidance areas. Access roads or loop roads would be addressed during the ROW authorization processing and on a case-by-case basis.</p> <p>GHMA: Same as IHMA.</p>	<p>There are no special conservation measures for GRSG in addition to those measures contained within existing land use plans regarding infrastructure development within GHZ.</p> <p>Montana Habitat: Same as Alternative A.</p> <p>Utah Habitat: Management stipulations and conditions should focus on mitigating direct disturbance during construction for all ROWs in PHMA. Should new research demonstrate indirect impacts on GRSG production, additional mitigation measures may be required. PHMA would be designated as an avoidance area for new ROWs.</p> <p>Limit or ameliorate impacts from ROW location, including from wind and solar energy development, through the use of the general stipulations identified in the GRSG section, as well as best management practices accepted by industry and state and federal agencies.</p> <p>For electrical transmission lines, and where feasible and consistent with federally required electrical separation standards, site new linear transmission features in existing corridors, or at a minimum, in concert with existing linear features in GRSG habitat. Siting linear features accordingly shall be deemed to be mitigation for the siting of that linear feature. Mitigation for the direct effects of construction is still required. PHMA would be available for wind energy development, though it would be designated as an avoidance area for wind energy development.</p>	<p>existing ROWs or where it best minimizes GRSG impacts. Use existing roads, or realignments as described above, to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary, and add the surface disturbance to the total disturbance in PHMA. If that disturbance exceeds 3% for that area, then make additional effective mitigation necessary that has been demonstrated to be effective to offset the resulting loss of GRSG habitat.</p> <p>GHMA: Same as Alternative A.</p> <p>RHMA: Same as Alternative A.</p>

Table 2-11
Management Actions by Alternative

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
A-LR-4: The presence of sensitive resources, such as sagebrush habitat, is typically examined before a ROW grant is issued.	B-LR-4: PHMA: —. GHMA: —.	C-LR-4: PHMA: ROWs will be amended to require features that enhance GRSG habitat security.	D-LR-4: PHMA: —. IHMA: —. GHMA: —.	E-LR-4: Idaho – CHZ: Maintain and improve GRSG populations within CHZ, while allowing, and mitigating, for new and limited infrastructure development identified by the Implementation Commission as high value and where the proposed action can meet certain criteria. Idaho – IHZ: Infrastructure is generally permissible, but requires analysis of whether it can be reasonably accomplished outside IHZ. Idaho – GHZ: —. Utah Habitat: —.	F-LR-4: PHMA: —. GHMA: —. RHMA: —.
A-LR-5: —.	B-LR-5: PHMA: —. GHMA: —.	C-LR-5: PHMA: —.	D-LR-5: PHMA: New ROW and land use authorizations, unless otherwise excluded, would be avoided whenever possible. Any new ROW and land use authorizations would not result in a net loss of GRSG habitat of the respective PHMA. IHMA: Same as PHMA. GHMA: New ROW and land use authorizations would be avoided whenever possible.	E-LR-5: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-LR-5: PHMA: —. GHMA: —. RHMA: —.
A-LR-6: —.	B-LR-6: PHMA: —. GHMA: —.	C-LR-6: PHMA: —.	D-LR-6: PHMA: New authorizations and amendments to existing ROW and land use authorizations would be subject to siting prescriptions and design features considered on a case-by-case basis, in subsequent NEPA analysis. This could include amendments to the types of uses that are excluded from consideration as new authorizations. For example upgrade of an existing 50-kV power line to a 115-kV power line, to eliminate the need for an additional line could be considered.	E-LR-6: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-LR-6: PHMA: —. GHMA: —. RHMA: —.

Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
			PHMA and GHMA areas. IHMA: Same as PHMA. GHMA: Same as PHMA.		
A-LR-22: Most LUPs include a management action that allows for acquisition of lands that have important resource values including crucial wildlife habitat and land tenure adjustments to improve the manageability of BLM- and Forest Service-administered lands. In order to be considered for any form of land tenure adjustment, all lands not specifically identified for disposal must meet criteria included in the LUPs.	B-LR-22: PHMA: Where suitable conservation actions cannot be achieved in PHMA, seek to acquire state and private lands with intact subsurface mineral estate by donation, purchase or exchange in order to best conserve, enhance or restore GRSG habitat. GHMA: —.	C-LR-22: PHMA: Acquisition will be prioritized over easements.	D-LR-22: PHMA: —. IHMA: Identify lands for acquisition that increase the extent of or provide for connectivity of PHMA. Acquisition of GRSG PHMA will have priority over the acquisition of land for other program purposes subject to the approval of the Authorized officer. GHMA: —.	E-LR-22: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-LR-22: PHMA: —. GHMA: —. RHMA: —.
A-LR-23: Most LUPs include a management action that allows for acquisition of lands that have important resource values including crucial wildlife habitat and land tenure adjustments to improve the manageability of BLM- and Forest Service-administered lands. In order to be considered for any form of land tenure adjustment, all lands not specifically identified for disposal must meet criteria included in the LUPs.	B-LR-23: PHMA: Conservation Measure: Identify areas where acquisitions (including subsurface mineral rights) or conservation easements, would benefit GRSG habitat. GHMA: —.	C-LR-23: PHMA: Conservation Measure: Same as Alternative B.	D-LR-23: PHMA: —. IHMA: —. GHMA: —.	E-LR-23: Idaho – Common to All Habitats: —. Utah Habitat: —.	F-LR-23: PHMA: Conservation Measure: Same as Alternative B. GHMA: —. RHMA: —.
Withdrawal					
A-LR-24: —.	B-LR-24: PHMA: Recommend lands within PHMA for mineral withdrawal. GHMA: —.	C-LR-24: PHMA: Same as Alternative B.	D-LR-24: PHMA: —. IHMA: —. GHMA: —.	E-LR-24: Idaho – CHZ: —. Idaho – IHZ: —. Idaho – GHZ: —. Utah Habitat: Do not propose additional federal lands or non-federal lands with federal mineral interests within PHMA for locatable mineral withdrawal. PHMA that is not already withdrawn or recommended for withdrawal would be available for	F-LR-24: PHMA: Same as Alternative B. GHMA: —. RHMA: —.

**Table 2-11
Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
				locatable mineral entry. To the extent allowable by laws and regulations and to the extent the claimant would be willing to apply the standards, limit or ameliorate impacts through the use of the general stipulations identified in the GRSG section. Recognize that surface vents associated with underground mining are essential for human safety, and must be permitted under the provisions of this alternative.	
A-LR-25: —.	B-LR-25: PHMA: In PHMA, do not recommend withdrawal proposals not associated with mineral activity unless the land management is consistent with GRSG conservation measures (e.g., in a recommended withdrawal for a military training range buffer area, manage the buffer area with GRSG conservation measures). GHMA: —.	C-LR-25: PHMA: Same as Alternative B.	D-LR-25: PHMA: —. IHMA: —. GHMA: —.	E-LR-25: Idaho – CHZ: —. Idaho – IHZ: —. Idaho – GHZ: —. Utah Habitat: —.	F-LR-25: PHMA: Do not approve withdrawal proposals not associated with mineral activity unless the land management is consistent with GRSG conservation measures (e.g., in a recommended withdrawal for a military training range buffer area, manage the buffer area with GRSG conservation measures that have been demonstrated to be effective). GHMA: —. RHMA: —.
Utility Corridors					
A-LR-26: Continue to manage 85,600 acres of utility corridors, including 64,200 acres of West-Wide Energy Corridors.	B-LR-26: PHMA: Same as Alternative A. GHMA: Manage 39,200 acres of utility corridors.	C-LR-26: PHMA: Manage 83,800 acres of utility corridors.	D-LR-26: PHMA: Manage 39,800 acres of utility corridors. IHMA: Manage 4,750 acres of utility corridors. GHMA: Same as Alternative A.	E-LR-26: Idaho – CHZ: Manage 31,000 acres of utility corridors. Idaho – IHZ: Manage 12,800 acres of utility corridors. Non-Energy Leasable Minerals					
<p>A-MNL-1: Manage non-energy leasable minerals on federal lands and non-federal lands with federal mineral interests within GRSG habitat as shown in Table 2-9.</p> <p>Montana BLM: All BLM-administered lands in Dillon Field Office are available for development of leasable solid minerals except 124,200 acres of Bear Trap Wilderness and 9 WSA's (see ROD/RMP pg. 44).</p>	<p>B-MNL-1: PHMA: Close PHMA to non-energy leasable mineral leasing (see Table 2-9). This includes not permitting any new leases to expand an existing mine.</p> <p>GHMA: Same as Alternative A.</p>	<p>C-MNL-1: PHMA: Same as Alternative B (see Table 2-9).</p>	<p>D-MNL-1: PHMA: Future leasing and prospecting of non-energy minerals in PHMA is closed (see Table 2-9). Exceptions may be made for lease modifications and fringe leases where valid existing rights may be affected. Consider offsite mitigation, CSU and timing restrictions, as appropriate.</p> <p>IHMA: Same as PHMA.</p> <p>GHMA: Lands are available for leasing subject to applicable timing restrictions (seasonal and daily) for exploration</p>	<p>E-MNL-1: Idaho – Common to All Habitats: Same as Alternative A (see Table 2-9).</p> <p>Montana Habitat: Same as Alternative A.</p> <p>Utah Habitat: Manage non-energy leasable minerals on federal lands and non-federal lands with federal mineral interests within GRSG habitat as shown in Table 2-9.</p> <p>Consider leasing federal lands and non-</p>	<p>F-MNL-1: PHMA: Same as Alternative B (see Table 2-9).</p> <p>GHMA: Same as Alternative A.</p> <p>RHMA: Same as Alternative A.</p>

**Table 2-11
Management Actions by Alternative**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
			activities and initial mine development, subject to mandatory lease stipulations, timing restrictions and CSU. Consider offsite mitigation opportunities.	federal lands with federal mineral interests within PHMA for non-energy leasable minerals. Limit or ameliorate impacts from mineral leasing and development through the use of the general stipulations identified in the GRSG section. Recognize that surface vents associated with underground mining are essential for human safety, and must be permitted under the provisions of this alternative. Commercial prospecting activities associated with non-energy leasable minerals would be required to comply with the same stipulations identified for leasing and development, above.	
<p>A-MNL-2: Individual land use plans may contain an appendix that outlines BMPs that are applied on a case-by-case basis.</p> <p>The 2011 Pocatello RMP establishes operational standards and guidelines for reclamation plans; identifies interagency standards for contaminant levels in vegetation, surface, and groundwater; and implements best management practices to control sedimentation and contaminant release.</p>	<p>B-MNL-2: PHMA: For existing non-energy leasable mineral leases in PHMA, in addition to the solid minerals BMPs (Appendix B), follow the same BMPs applied to Fluid Minerals (Appendix B), when wells are used for solution mining.</p> <p>GHMA: —.</p>	<p>C-MNL-2: PHMA: Same as Alternative B.</p>	<p>D-MNL-2: PHMA: For existing undeveloped non-energy mineral leases, require timing restrictions (seasonal and daily) when exploration activities or initial mine development is proposed, as appropriate. Also require appropriate BMPs (Appendix B) as COAs to the mine plan, and require restoration of habitat or off-site mitigation, if on-site restoration is not feasible.</p> <p>IHMA: Same as PHMA.</p> <p>GHMA: Same as PHMA.</p>	<p>E-MNL-2: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: —.</p>	<p>F-MNL-2: PHMA: Same as Alternative B.</p> <p>GHMA: —.</p> <p>RHMA: —.</p>
Mineral Split Estate					
<p>A-MSE-1: Under current management, there is no designated GRSG habitat. Decisions included in current management plans apply to both federal surface and mineral estate.</p>	<p>B-MSE-1: PHMA: Where the federal government owns the mineral estate in PHMA, and the surface is in non-federal ownership, apply the conservation measures applied on BLM- and Forest Service-administered lands.</p> <p>GHMA: —.</p>	<p>C-MSE-1: PHMA: Same as Alternative B.</p>	<p>D-MSE-1: PHMA: Where the federal government owns the mineral estate in PHMA and the surface is in non-federal ownership, apply stipulations, conservation measures, and design features consistent with those applied to BLM- and Forest Service-administered lands in PHMA in the area.</p> <p>IHMA: Same as PHMA.</p>	<p>E-MSE-1: Idaho – Common to All Habitats: —.</p> <p>Utah Habitat: Because the surface estate is the key to conservation of habitat, the GRSG habitat has been mapped according to surface ownership. However, implementation of his alternative will have to accommodate the dominant nature of the mineral estate, and react accordingly.</p>	<p>F-MSE-1: PHMA: Same as Alternative B.</p> <p>GHMA: —.</p> <p>RHMA: —.</p>

**Table 2-11
Management Actions by Alternative**

Administrative Draft
Cooperating Agency Review

1 **2.11 Issues and/or Alternatives Eliminated from Detailed Analysis**

2 The following alternatives were considered but were not carried forward for detailed analysis
3 because (1) they would not fulfill the requirements of FLPMA, NFMA or other existing laws
4 or regulations, (2) they did not meet the purpose and need, (3) they were already part of an
5 existing plan, policy, or administrative function, or (4) they did not fall within the limits of
6 the planning criteria. FLPMA requires the BLM and Forest Service to manage the public
7 lands and resources in accordance with the principles of multiple use and sustained yield.

8 **2.11.1 USFWS-Listing Alternative**

9 Comments provided through scoping requested analysis of an alternative based on the
10 assumption that GRSG become listed under the ESA. This is outside the scope; the purpose
11 and need of this plan amendment is to address inadequacy of regulatory mechanisms that
12 were identified as one of the listing factors for GRSG in the USFWS finding on the petition
13 to list GRSG. The USFWS identified the principal regulatory mechanism for the BLM and
14 Forest Service as conservation measures in LUPs. In response to the USFWS findings, as
15 well as the BLM and Forest Service's requirement to manage sensitive species, the BLM and
16 Forest Service are preparing plan amendments with associated EISs to evaluate the
17 incorporation of conservation measures in LUPs for GRSG. Because the purpose of the
18 LUP amendments is to identify and potentially incorporate appropriate conservation
19 measures in LUPs to conserve, enhance and/or restore GRSG habitat by reducing,
20 eliminating, or minimizing threats to that habitat, the alternatives in this EIS, therefore,
21 focus on those conservation measures that can be incorporated into the LUPs. Although the
22 potential listing of GRSG would also include conservation measures identified by the
23 USFWS, those conservation measures are not known at this time. Therefore, an alternative
24 that includes USFWS-listing with associated conservation measures for GRSG is not being
25 analyzed in detail.

26 **2.11.2 Elimination of Recreational Hunting**

27 Neither the BLM nor the Forest Service regulate hunting activities on federal lands; this
28 responsibility resides with IDFG, MFWP, and Utah Division of Wildlife Resources. IDFG,
29 MFWP, and the Utah Division of Wildlife Resources manage wildlife within Idaho,
30 Montana, and Utah, respectively, while the BLM and Forest Service manage wildlife habitat.
31 Recreational hunting of GRSG, including hunting seasons, is directed by the relevant state
32 conservation plans for GRSG and criteria therein.

33 **2.11.3 Predation**

34 Commenters stated that predator control was needed to protect GRSG from predation.
35 IDFG and MFWP possess primary responsibility for managing the wildlife within Idaho and
36 Montana, respectively, while the BLM and Forest Service are responsible for managing
37 habitat. Consistent with an MOU between the BLM and the USDA, APHIS-Wildlife
38 Services, the BLM and Forest Service would continue to work with IDFG and MFWP to
39 meet state wildlife population objectives. Predator control is allowed on BLM-administered
40 lands and is regulated by IDFG and MFWP. Avian predators such as ravens and birds of
41 prey are protected under the Migratory Bird Treaty Act; eagles are protected under the Bald

1 and Golden Eagle Act. Control of these avian predators is under the jurisdiction of the
2 USFWS. Therefore, these comments relate to state- and federal-regulated actions that are
3 outside of BLM or Forest Service authority and are outside the scope of the LUPA/EIS.
4 The BLM and Forest Service will continue to work with agencies to address current
5 predation of GRSG. The BLM and Forest Service-administered lands in the planning area
6 will remain open to predator control under state laws.

7 **2.11.4 Close All or Portions of PHMA or GHMA to Off-Highway Vehicle**
8 **Use**

9 Through this LUPA/EIS, the BLM has identified, but has not studied in detail, an
10 alternative to designate new area closures for OHV use within PHMA and GHMA. The
11 BLM has analyzed alternatives to designate all areas within PHMAs and GHMAs as
12 “limited” to existing roads and trails for OHV use, if not already closed by existing planning
13 efforts. Subsequent Travel Management Plans will be developed to identify specific routes
14 within limited areas that will be closed in order to protect and conserve GRSG and its
15 habitat. The BLM and Forest Service have analyzed existing OHV area closures within
16 PHMAs and GHMAs as part of the No Action alternative and as a decision common to all
17 alternatives. The following provides the BLM and Forest Service’s rationale:

- 18 1. There are areas within PHMAs and GHMAs that are currently closed to OHV
19 use (e.g., Wilderness Areas). While these areas were closed to OHV use for
20 purposes other than GRSG conservation, the BLM and Forest Service will
21 analyze the impacts that these closures have on protection of GRSG and GRSG
22 habitat. These closures are analyzed in the No Action alternative and will be
23 carried forward across all alternatives in this EIS/Amendment.
- 24 2. This GRSG Amendment is considering eliminating cross-country travel by
25 analyzing limiting travel to existing roads and trails, as no new areas will be
26 designated as open to OHV use. In at least one alternative, all existing areas that
27 are designated as open will become limited to existing roads and trails.
- 28 3. Route inventories in PPH and PGH are currently underway based on
29 coordinated efforts between the BLM, Forest Service, and USFWS staff. Once
30 the inventories are complete, the BLM and Forest Service will initiate travel and
31 transportation planning, which will undergo a NEPA analysis and will include
32 public involvement. Through subsequent Travel and Transportation planning,
33 the BLM will identify and consider closing specific existing routes that may be
34 affecting GRSG habitat. Any decision to close routes to OHV use in the Travel
35 and Transportation plans would be based on consideration of the habitat
36 objectives and the overall goal of conserving, enhancing, or restoring sagebrush
37 ecosystems upon which GRSG populations depend.

38 In addition, during the District or Field Office plan revision/amendment
39 process, travel and transportation area decisions (open, limited or closed) would
40 be revisited at the local level based on existing inventory information associated
41 with a myriad of resources and resource uses.

- 1 4. During the public scoping period for this LUPA, there were no specific areas
2 identified for closure to carry forward for detailed analysis.

3 **2.11.5 Consideration of Coal Mining**

4 According to 43 CFR 3420.1-4(e), the BLM can only lease coal in areas identified as having
5 development potential. While there are several historic coal developments, including Teton
6 Basin and Goose Creek, to date, no areas have been identified with economic reserves to
7 support future leasing analysis. Under all alternatives, the BLM would consider proposals for
8 coal and oil shale leasing on a case-by-case basis for minerals resources under the
9 administration of the federal government. Site-specific environmental analysis and a plan
10 amendment would be required to lease for coal or oil shale. There are currently no
11 regulations governing the leasing of oil shale. Any leases would be issued under the authority
12 of 30 USC 241, which authorizes the Secretary of the Interior to lease deposits of oil shale.
13 For these reasons, coal leasing and oil shale development are not addressed in this planning
14 effort.

15 **2.12 Incorporated in Whole or In Part**

16 **2.12.1 Custer County and Owyhee County Sage-Grouse Plans**

17 Both Custer and Owyhee Counties prepared and submitted county approved GRSG
18 Management Plans to the BLM and Forest Service for consideration and inclusion in the
19 Sub-Regional EIS Amendment effort. These plans were developed and approved in 2013.
20 Custer County consulted several sage-grouse plans during the development of the Custer
21 County Sage-Grouse Comprehensive Plan, including the Challis Local Working Group Plan
22 (2007). During the initial development of the range of alternatives considered in detail the
23 BLM and Forest Service considered the Challis (2007) and Owyhee (2004; revised 2013)
24 Local Working Group Plans. Both Counties' Plans are limited in scope to the specific county
25 areas they address and do not represent a complete management scenario for all of the
26 BLM-administered and National Forest System areas within the sub-region. The plans, their
27 objectives, GRSG habitat mapping and management actions were each evaluated to
28 determine whether the components included in those plans augmented or provided direction
29 outside of the range of detailed alternatives. The results of this analysis showed the Custer
30 County plan objectives and management actions to be consistent with Alternative A. The
31 Custer County mapping is similar to the mapping of Alternative C, with only one habitat
32 category. The extent of identified habitat, based on the LWG Key Habitat map, is most
33 similar to Alternative E and, while within the range of alternatives, it is not exactly reflected
34 within any of the alternatives. The Owyhee County Plan is consistent with Alternative A for
35 mapping, objectives and most management actions. Several management actions identified
36 in the Owyhee County plan are included as parts of Alternatives B, C, D, E and F. Since the
37 direction in these plans is already included within the existing range of alternatives these
38 county plans were not included as additional unique alternatives for detailed analysis.
39 **Appendix R** contains an evaluation of each of these plans and the management actions
40 within those plans in relation to the existing Custer and Owyhee land use plans and the
41 alternatives analyzed in detail.

1 **2.12.2 Greater Yellowstone Coalition ACECs and Audubon Suggested**
2 **Management Actions**

3 During the scoping period the Greater Yellowstone Coalition and Audubon Society
4 provided management actions that were considered for analysis. The Greater Yellowstone
5 Coalition proposed several new areas of critical environmental concern that overlap other,
6 broader ACEC proposals that are included for analysis within Alternative F. The Audubon
7 Society also provided management actions that were similar or effectively the same as
8 proposals and management actions included in Alternative B, C or F. These submissions are
9 contained within the existing range of alternatives and will be considered in detail.

10 **2.12.3 Broad-scale Increased Grazing**

11 During scoping and the alternatives development process, a number of individuals and
12 cooperating agencies requested that the BLM and Forest Service consider an alternative that
13 would increase the amount of livestock grazing across all GRSG habitat. This
14 recommendation was based on the supposition that there is a correlation between declines in
15 GRSG and declines in the amount of livestock grazing on public BLM-administered and
16 National Forest System lands. While this alternative was considered but eliminated from
17 detailed analysis for the following reasons, site specific, targeted grazing opportunities are
18 included as parts of Alternatives D and E:

- 19 • Alternatives being considered in this LUPA/EIS are science-
20 based conservation measures that would meet the purpose and
21 need for the project, which is to identify and incorporate
22 appropriate conservation measures in LUPs to conserve,
23 enhance, and restore GRSG habitat by reducing, eliminating, or
24 minimizing threats to that habitat. There are currently no
25 science-based studies that demonstrate that increased livestock
26 grazing on public lands would enhance or restore GRSG habitat
27 or maintain or increase GRSG abundance and distribution.
- 28 • Actual livestock use within GRSG habitat on BLM-administered
29 lands in the Idaho and Southwestern Montana Sub-region is
30 generally less than permitted use. Actual livestock use in many
31 areas is below permitted use due to restrictions placed on
32 permittees and annual fluctuations in permittee operations.
33 Although no alternative specifically considers an increase in
34 livestock grazing, under all alternatives except Alternative C, the
35 BLM and Forest Service would retain flexibility to consider
36 increases in livestock grazing on a case-by-case basis. Increases
37 would be dependent on permittee interest and rangeland
38 conditions. Increases in livestock grazing may be facilitated in
39 GRSG habitat if there are changes in management, such as
40 changes to existing grazing management systems, that optimize
41 range conditions.

1 **2.13 Summary Comparison of Environmental Consequences**
2 **Table 2-12**, Comparison of Alleviated Threats to GRSG in the Idaho and Southwestern
3 Montana Sub-region and **Table 2-13**, Summary Comparison of Environmental
4 Consequences, present a comparison summary of impacts from management actions
5 proposed for the management alternatives. **Chapter 4** provides a more detailed impact
6 analysis.

7
8

Administrative Draft
Cooperating Agency Review

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
Fire, Fuels Treatments including Prescribed Fire						
Varied treatment options – no standard.	In PPMA, there would be no treatments in winter habitat, no prescribed fire in areas with less than 12 inches precipitation, and all projects would use native seeds. GRSG habitat would be a high priority for wildfire suppression efforts and BMPs in IM 2013-128 would be followed. Use of native seed would be required and fuels treatments would be designed for long-term success. Development of a wildfire suppression strategy with regard to GRSG habitat would occur post-decision.	Some actions similar to Alternative B, though provides less guidance on fire suppression and fuels management. Relies on passive restoration efforts to indirectly reduce the risk of wildfires. Restores areas affected by anthropogenic disturbance outside the historic range of viability, such as nonnative seeding, fences, livestock grazing.	Similar to Alternative B with additional fuels management and suppression guidance.	Idaho – Provides guidance to reduce wildfire effects through development of a response time and water availability analysis, along with a consistent wildfire suppression plan and a fuels break strategy. Utah - Prescribed fire would only be considered at high elevations. Statewide fire agency agreements would be implemented. Loss of winter habitat would be limited to approximately 20 percent.	Same as Alternative B.	Similar to Alternatives B and D. In addition, recommendations from the Wildfire, Invasive Annual Grasses and Conifer Expansion Assessment (Appendix D) will direct field offices to prioritize landscapes for fire prevention and fuels management within GRSG habitat to minimize the risk of wildfire in PHMA and IHMA. Prescribed fire in GRSG habitat could be permitted if analysis showed a net benefit to GRSG. Adaptive management would be used to improve management in GRSG habitat.
Summary	All action alternatives will decrease habitat loss from prescribed fire and wildfire by limiting prescribed fire and prioritizing wildfire suppression efforts in the sub-region, which respond to the Conservation Objectives Team report objectives. Alternatives B, D, E, F and the Proposed Plan would also try to lessen the future probability of large fires in GRSG by putting in fire breaks which would further benefit GRSG. Alternatives B, C, D, F and the Proposed Plan all move to lessen habitat loss from treatments within winter habitat to varying degrees, which is consistent with the objective to retain sagebrush. Alternative C is passive toward fire and fuels management emphasizing natural restorative processes following a reduction in anthropogenic disturbance. In Alternative C, reduction in the threat of wildfire would occur over the long term from overall improvement of habitat. The Proposed Plan would allow prescribed fire if net benefit for GRSG, and would use an adaptive management approach.					
Invasive Species						
Various control measures – no standard. Emergency Stabilization and Rehabilitation plans and strategic wildland fire suppression would be implemented. Invasive annuals would continue to be introduced and spread as a result of ongoing vehicle traffic in and	Invasive weeds would be controlled, suppressed, and eradicated. Limits anthropogenic disturbance to 3 percent. This alternative would also require native seed for restoration efforts, the use of BMPs for fire and fuels treatments, and invasive species prevention measures.	Relies on passive restoration efforts to indirectly reduce the risk of invasive annuals. Minimizes use of herbicides and emphasizes mechanical treatment methods. Reduces spread of invasive annuals by eliminating livestock grazing.	Similar to Alternative B with the additional requirement that noxious weeds and invasive species would be treated and monitored for at least 3 years after project construction.	Idaho - Similar to Alternative D with the additional requirement to treat and monitor invasive species associated with existing range improvements. Utah – Guidance to aggressively respond to new infestations and prevent invasive spread after wildfire.	Similar to Alternative B. Would also prioritize restoring sagebrush steppe invaded by nonnative plants. Limits anthropogenic disturbance to one instance per section and a cumulative 3 percent disturbance cap.	Similar to Alternative D with an adaptive management approach, enhanced monitoring and mitigation.

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
	out of the planning area, recreational activities, wildlife, improper livestock grazing, fire, and surface-disturbing activities (energy and infrastructure).						
Summary	All action alternatives respond to the COT report objectives by implementing actions to maintain and restore healthy sagebrush communities. Alternative D provides the lowest surface disturbance threshold (no unmitigated loss of habitat), which would reduce opportunities for incursion of nonnative species. Alternatives B, C, F and the Proposed Plan propose 3 percent thresholds in PPMA. Alternatives B, D, E, F and the Proposed Plan prioritize restoration of areas with invasive weed infestations and emphasize restoration, which would further reduce habitat degradation. Alternative C prioritizes restoration of invasive infestations but limits restoration to natural processes following a reduction in anthropogenic uses (livestock removal, fencing and roads infrastructure removal).						
Pinyon-Juniper Encroachment							
	Varying degrees of habitat objectives identified for maintenance, improvement, and restoration of sagebrush communities – no standard.	Does not provide specific guidance regarding pinyon-juniper encroachment. Would prioritize restoration in seasonal habitats.	Alternative C prioritizes restoration in seasonal habitats as in Alternative B; however, local native plant ecotype seeds and seedlings would be used to restore treated habitats. It could take longer for these habitats to recover and could be a loss of habitat for a certain amount of time. In addition, passive restoration is preferred for restoring these areas over active restoration methods.	Would prioritize projects that address conifer encroachment into important GRSG habitats. Conifer encroachment areas would be considered as areas to manage wildfire for resource benefit.	Idaho - Would prioritize conifer removal in CHZ and IHZ. Utah – Would aggressively remove encroaching conifers and other plant species to expand GRSG habitat where possible.	Same as Alternative B.	Similar to Alternative D with an adaptive management approach, enhanced monitoring and mitigation.
Summary	All action alternatives except Alternative C would respond to the pinyon-juniper objective in the Conservation Objectives Team report. The objective is to remove pinyon-juniper from areas of sagebrush that are most likely to support GRSG at a rate that is at least equal to rate of pinyon-juniper incursion. Alternatives D and E directly address juniper removal and prioritization and the Proposed Plan includes enhanced monitoring and mitigation. Alternatives B, C, and F talk more generally about restoration and thus may not provide the greatest assurance for improvement of GRSG habitat.						
Livestock Grazing, Structure Range Improvements and Wild Horses							
	There is no set direction to specifically consider GRSG in grazing decisions. Structural range improvements are considered on a case-by-case basis while maintaining rangeland	Same open/closed acreages as Alternative A. Rangeland would be managed for vegetation composition and structure consistent with ecological site potential and within the reference state to achieve GRSG seasonal habitat	Alternative C would make public lands unavailable to livestock grazing. This could benefit GSRG by improving ground cover, leaving more grass and forbs. However, there could be possible increases in wildfire and invasive species risks. Wild horse and burro	Same open/closed acreages as Alternative A. PPMA would be the highest priority for BLM land health assessments. Desired cover percentages and heights for sagebrush, grasses, and forbs in seasonal habitats will follow habitat	Idaho - Same open/closed acreages as Alternative A. Similar to Alternative D with emphasis on adaptive management. Wild horse and burro management would be the same as Alternative A. Utah - Livestock grazing would continue using BMPs. Repeated,	Alternative F requires a 25% reduction in livestock grazing. Other management would be similar to Alternative B. Wild horse and burro management would be the same as Alternative B.	Similar to Alternative D with enhanced monitoring and mitigation. In SFAs, grazing permit review, rangeland health assessment and HMA review would be prioritized in GRSG habitat.

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
	health. Wild horses would be managed within appropriate management levels.	objectives in Connelly et al. 2000 and Hagen et al. 2007. GRSG would benefit by having the structural components needed for all of their life cycle needs. Structural range improvements must conserve, maintain, enhance or restore GRSG habitat through improved grazing management system. Water development would need to be neutral or beneficial to GRSG. Wild horses would be managed within appropriate management levels and the evaluation of AMLs would be prioritized in PPMA. Herd Management Area Plans would be developed for all HMAs.	management would be the same as Alternative A.	guidelines in the habitat assessment framework (Stiver et al. 2010). Any new structural range improvements would be designed to maintain, enhance, or restore GRSG habitat through an improved grazing management system relative to GRSG objectives. Existing structural range improvements and supplements would be reevaluated in PPMA and PMMA. New water developments within PPMA would be limited and need have a neutral effect or be beneficial to PPMA. Wild horse and burro management would be the same as Alternative B with the additional requirement that HMAs would not be expanded in PPMA.	annual heavy use during critical growing seasons and of season-long grazing on wet meadows and riparian areas would be avoided. Water developments would enhance or maintain GRSG mesic habitat. Range improvement structures would avoid leks. Wild horse and burro management would be the same as Alternative A.		
Summary	All action alternatives would manage grazing to better meet the ecological conditions that maintain or restore healthy sagebrush shrub and native perennial grass and forb communities and conserve the essential habitat components for GRSG (e.g., shrub cover, nesting cover), which responds to the Conservation Objectives Team report objective. All action alternatives emphasize GRSG in decision making for livestock grazing; however, Alternative C would remove grazing from PPMA and Alternative F would reduce grazing. Grazing management would be similar between Alternatives B, D, E, and the Proposed Plan with slightly different guidance or priorities. For wild horses there would be a focus on GRSG habitat and priority for gathers in GRSG habitat for Alternatives B, D, F and the Proposed Plan. These alternatives include evaluation of HMAs and Wild Horse Territories to consider adjustments in AML to meet GRSG habitat standards. Alternatives C and E do not directly address WHB.						
Infrastructure - Right-of-way							
	Various areas managed as ROW avoidance and exclusion, but most are not specific to protect GRSG and GRSG habitat.	In addition to exclusion and avoidance in Alternative A, all PPMA would be managed as ROW exclusion and all PGMA as ROW avoidance. Emphasizes opportunities for co-location within designated corridors and	All GRSG habitat would be managed as ROW exclusion. Provides for review of all existing transmission lines to amend ROWs to require features that enhance GRSG habitat security.	In addition to exclusion and avoidance in Alternative A, all GRSG habitat would be managed as ROW avoidance. New authorizations would not be allowed in PPMA for transmission facilities greater than 50 kV, mineral and energy development, roads, airports, and associated	CHZ (Idaho) and PPMA (Utah) would be ROW avoidance with limited exceptions.	Same as Alternative B.	Similar to Alternative D, with PHMA and IHMA managed as avoidance areas for ROWs, and GHMA open (avoidance for high-voltage ROWs in Montana).

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
	within the footprint of existing disturbance. Recommends removing, burying, or modifying existing power lines within priority habitat		ancillary facilities.			
Summary	All alternatives respond to the conservation objective for infrastructure identified in the Conservation Objectives Team report, which is to avoid development within priority areas for conservation. Alternatives B, C, D, and F all close certain areas to new ROWs. The difference between these alternatives is the amount of GRSG habitat that would be closed and the type of ROWs that would be prohibited or restricted. Alternative C closes all occupied GRSG habitat to new ROWs and is the most restrictive. Alternatives B and F include the same restrictions as Alternative C; however, these restrictions would be applied to a smaller geographic area. Alternative D and the Proposed Plan would provide fewer restrictions, as all GRSG habitat would be ROW avoidance with exclusions for certain ROWs in PPMA. Also under Alternative E, some GRSG habitat would be managed as ROW avoidance. This may eliminate habitat loss, degradation, and fragmentation in important seasonal habitats. However, because there are few if any exclusions under this alternative, there is less assurance of protection for GRSG on federal land. All alternatives seek to avoid conflict with GRSG habitat, to utilize existing corridors, and to co-locate within existing development footprints.					
Infrastructure – Roads						
Some GRSG habitat on BLM-administered land is open to cross-country motorized travel. All Forest Service-administered lands are limited to designated routes. Road ROWs would be issued on a case-by-case basis.	In addition to current limited and closed designations in the No Action alternative, all PPMA would be designated as limited to existing roads pending travel management planning and roads designation. PPMA would be ROW exclusion areas for road ROWs and PGMA would be ROW exclusion areas for road ROWs. Provides guidance for restricting new road construction and mitigation where roads are allowed under prior existing rights. Provides for road closure and rehabilitation. Provides for seasonal road closures. PGMA would be designated as per the travel management plan	Same as Alternative B. PPMA would be ROW exclusion areas for road ROWs.	All GRSG habitat would be limited to existing roads pending travel management planning and roads designation. PPMA would be ROW exclusion areas for road ROWs. All other GRSG management areas would be ROW avoidance areas for road ROWs. The emphasis of the comprehensive travel and transportation planning would be placed on having a neutral or positive effect on GRSG habitat. Would prioritize restoration of linear disturbances.	Idaho - All GRSG habitat would be limited to existing roads pending travel management planning and roads designation. CHZ (Idaho) and PPMA (Utah) would be ROW avoidance with limited exceptions for road ROWs. Utah: PPMA with nesting and winter habitat that do not have designated routes in a Travel Management Plan would be managed at least as limited to existing routes.	Same as Alternative B, except decisions would be applied to all occupied GRSG habitat. Also no new routes would be allowed within 4 miles of a lek.	Similar to Alternative E, and would prioritize travel planning to designate open and closed areas, similar to Alternative D.

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
	in the current planning document.					
Summary	All alternatives respond to the Conservation Objectives Team report objective to varying degrees. All alternatives would limit motorized travel to existing or designated routes in certain areas, which would eliminate unauthorized route creation. The difference between alternatives is the amount of GRSG habitat that would be changed from an open to a limited category. Alternative A would have the fewest acres limited to existing roads and trails, followed by Alternatives B and F. Under Alternatives C, D, E, and the Proposed Plan all GRSG habitat would be limited to existing roads and trails.					
Infrastructure - Fences						
No decisions	Fences would be removed, modified, or marked in high risk areas within PPMA.	No decisions	Fences would be designed and located to minimize the potential for GRSG strikes. Fences would be priorities for removal, modification, or marking in PPMA and PMMA in areas of moderate or high collision risk.	Idaho – Fences would be marked in areas of moderate to high fence densities. Utah – Fences would not be located on or adjacent to leks where bird collisions would be expected to occur.	Same as Alternative B.	Same as Alternative D.
Summary	Some of the alternatives respond to the intent of the Conservation Objectives Team report objectives, which is to minimize impacts from fences on GRSG. Alternatives B, D, and F would consider more of the conservation options identified in the Conservation Objectives Team report. For example, marking fences would decrease bird/fence collisions, and removal of unneeded fences would decrease collisions and opportunities for avian predation. Alternative E in Idaho would only include marking fences.					
Energy Development (Non-renewable)						
Most areas would be open to energy development. Various stipulations apply, with a range of protective buffers around leks. In general, recently completed plans include a larger protective buffer. Recently completed plans also include a management action that prohibits surface disturbing activities or disruptive activities during certain dates in seasonal habitats.	PPMA would be closed to new leasing, though development of existing leases in PPMA would still cause fragmentation, direct and indirect habitat loss, disruption of GRSG, and degradation of habitat. Required design features would reduce the effects of development. Disturbance would be clustered on the landscape and would be limited to 3 percent per section on average. Seasonal restrictions would decrease seasonal disruption to GRSG populations.	Same as Alternative B, except a larger geographic area would be closed to leasing.	Low potential and no known potential areas would be closed to leasing in PPMA and PMMA. Moderate and high potential areas in PPMA and PMMA would be open to leasing subject to CSU, timing restrictions in breeding and winter habitat, disturbance density not to exceed 1/640 acres, maximum 3% disturbance/section, NSO within 0.6 mile of occupied or undetermined status leks. PGMA would be open to leasing subject to timing limitations in breeding and winter habitat, 0.6 mile NSO near occupied and undetermined status leks, and implementation of appropriate BMPs.	Idaho – Same as Alternative A. Utah – PPMA would be open to leasing subject to CSU and TL stipulations.	Same as Alternative B.	Similar to Alternative D, but BMPS/RDFs would be required on new leases. In SFAs, habitat would be NSO without waiver or exception. A three percent disturbance cap would apply in PHMA to minimize harm to GRSG populations.

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
Summary	<p>To varying degrees all action alternatives respond to the Conservation Objectives Team report objective for energy, which is that energy development should be designed to ensure that it will not impinge on stable or increasing GRSG population trends. Alternatives B, C, and F close areas to new leasing. The difference between these alternatives is the amount of GRSG habitat that would be closed. Alternative C closes all occupied GRSG habitat to new leasing and is the most restrictive. Alternatives B and F include the same restrictions as Alternative C; however, these restrictions would be applied to a smaller geographic area. Management under Alternative D and the Proposed Plan would be less restrictive than Alternatives B, C, and F. Stipulations such as NSO, CSU, and TL would restrict the amount, location, and timing of development. These restrictions would reduce habitat loss, degradation, and fragmentation in seasonal habitats. Alternative E would provide the fewest restrictions on fluid mineral leasing and development.</p> <p>Under Alternatives B, C, F and the Proposed Plan RDFs would be attached to new and existing leases. Applying required design features to existing leases may eliminate habitat loss, degradation, and fragmentation. However, the effectiveness of these measures would be limited in areas where there is already extensive development. Under Alternative D, design features would not be required, but would be discretionary. There would be no restrictions on existing leases under Alternative E.</p>						
Mining – Solid Minerals, Non-energy Leasables, Locatables, and Mineral Materials							
	<p>Various areas recommended for withdrawal/currently withdrawn and closed to mineral material disposal and non-energy mineral leasing.</p> <p>There is no surface disturbance limitation recommendation included in this alternative.</p>	<p>PPMA would be withdrawn from locatable mineral entry, closed to mineral material disposal, and closed to non-energy mineral leasing.</p> <p>Development of existing leases would result in habitat loss and fragmentation. A 3 percent surface disturbance threshold and RDFs would be applied.</p>	<p>Same as Alternative B except decisions would be applied to a larger geographic area (all occupied habitat).</p>	<p>Same as Alternative A for locatable minerals.</p> <p>No new salable mineral authorizations would be approved within 3 km of an occupied lek in all GRSG habitat. Seasonal timing restrictions would be applied in all GRSG habitat. BMPs would be applied in PPMA and PMMA.</p> <p>Future leasing and prospecting of non-energy minerals in PPMA and PMMA is closed</p>	<p>Idaho - Same as Alternative A for locatable, salable, and non-energy leasable minerals.</p> <p>Utah - Same as Alternative A for locatable minerals.</p> <p>PPMA would be open to salable and non-energy leasable minerals; impacts would be reduced through the application of stipulations.</p>	<p>Same as Alternative B.</p>	<p>Similar to Alternative D but would require BMPs and RDFs on new leases. In SFAs, habitat would be recommended for withdrawal.</p>
Summary	<p>To varying degrees all action alternative respond to the COT report objectives, which is to maintain GRSG population and no net loss of GRSG habitat in in areas affected by mining. Alternatives B, C and F would be closed or withdrawn to other minerals. Therefore, future impacts on GRSG would not occur, which address the objectives in the COT report.</p> <p>Under Alternative D and the Proposed Plan, surface use restrictions would be placed on development to protect breeding, and some nesting and early brood-rearing habitat, which would provide opportunities for nest success and chick survival. Additional stipulations (CSU and TL) would restrict the type, amount, location, and timing of development. These restrictions would reduce habitat loss, degradation and fragmentation.</p> <p>Under Alternative E in Idaho, impacts would continue, as management would be the same as Alternative A. Some impacts would be reduced in Utah through the application of stipulations. As such, there is less assurance of protection for nesting GRSG.</p> <p>Alternatives B, C, F and the Proposed Plan would require RDEs along with other conservation measures to reduce habitat loss, fragmentation, degradation, and disturbance to the extent possible on valid rights. Under Alternative D, design features would not be required, but would be discretionary. There would be no restrictions on existing leases under Alternative E.</p>						
Renewable Energy Sources – Wind Energy							
	<p>Most GRSG habitat is open to wind development.</p> <p>There is no surface disturbance limitation recommendation included in this</p>	<p>Wind development would be excluded in PPMA under this alternative. There are no restrictions for PGMA under this alternative.</p>	<p>Same as Alternative B; however, under this alternative, all GRSG habitat would be excluded from wind development.</p>	<p>PPMA would be excluded from wind development. Other GRSG habitat would be avoidance areas.</p>	<p>Idaho – CHZ would be avoidance areas for wind development.</p> <p>Utah – PPMA would be avoidance areas for wind development.</p>	<p>Same as Alternative B</p>	<p>Similar to Alternative D, PHMA would be excluded from wind development while IHMA would be avoidance and GHMA open (avoidance in Montana).</p>

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
	alternative.						
Summary	To varying degrees all alternatives respond to the conservation objective for energy, which is to ensure that development will not impinge upon stable or increasing population trends. Alternatives B, C, D, F and the Proposed Plan provide protection from wind development to GSRG and their habitat since all four stipulate that wind development is excluded from PPMA. Population declines could occur under Alternatives A and E, as wind development would be allowed. Stipulations on development would reduce habitat loss, fragmentation, degradation, and disturbance.						
Recreation/Travel Management							
	<p>Cross-country motorized travel is generally allowed on BLM-administered lands.</p> <p>Forest Service-administered lands are limited to designated routes.</p>	<p>In addition to current limited and closed designations in the No Action alternative, all PPMA would be designated as limited to existing roads pending travel management planning and roads designation.</p> <p>Provides guidance for restricting new road construction and mitigation where roads are allowed under prior existing rights.</p> <p>Provides for road closure and rehabilitation.</p> <p>Provides for seasonal road closures.</p> <p>Recreational permits would only be issued in GRSG priority habitats that have neutral or beneficial effects.</p>	<p>Alternative lacks specificity regarding travel management but states that all lands will be closed to cross-country travel and some roads that intrude into lek or winter habitats will be removed or seasonally closed.</p>	<p>All GRSG habitat would be limited to existing roads pending travel management planning and roads designation.</p> <p>The emphasis of the comprehensive travel and transportation planning would be placed on having a neutral or positive effect on GRSG habitat.</p> <p>Would prioritize restoration of linear disturbances.</p> <p>Recreation would be managed to minimize impacts on GRSG or their habitat.</p>	<p>Idaho - All GRSG habitat would be limited to existing roads pending travel management planning and roads designation.</p> <p>No guidance is provided regarding recreation management.</p> <p>Utah: PPMA with nesting and winter habitat that do not have designated routes in a Travel Management Plan would be managed at least as limited to existing routes.</p> <p>Stipulations would be used to reduce impacts from recreation.</p>	<p>Management would be similar to Alternative B except specifies in priority habitat camping and other non-motorized recreation would be prohibited during certain seasons within 4 miles of a lek. In addition, there would be no new route construction within 4 miles of a lek.</p>	<p>Same as Alternative D.</p>
Summary	To varying degrees, all action alternatives respond to the COT report objective, which is that areas subject to recreation activities should maintain healthy native sagebrush communities based on local ecological conditions and with consideration of drought conditions, and managed direct and indirect human disturbance (including noise) to avoid interruption of normal GRSG behavior. PPMA would be limited to existing roads under Alternatives B and F. Under Alternatives C, D, E, and the Proposed Plan all GRSG habitat would be limited to existing roads. Once travel management planning is completed, this would be changed to a limited to designated routes category. These alternatives would prevent proliferation of new routes, and would include direction for seasonal closures, route realignment, and provisions for valid existing rights. Recreation management under all action alternatives would aim to reduce impacts on GRSG and habitat.						
Agriculture/Urbanization							
	<p>Most LUPs include a management action that allows for acquisition of lands that have important</p>	<p>Retains public ownership of PPMA with exceptions for considering which improve ownership patterns in a manner</p>	<p>Same as Alternative B.</p>	<p>Land tenure actions would be similar to Alternative B.</p>	<p>Idaho and Utah – Same as Alternative A.</p>	<p>Same as Alternative B.</p>	<p>Same as Alternative D.</p>

Table 2-12
Comparison of Alleviated Threats to GRSG in the Idaho and Southwest Montana Sub-Region

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E ¹	Alternative F	Proposed Plan
resource values including GRSG. Land tenure adjustments could result in consistent management across the landscape.	which enhances GRSG habitat management. Takes advantage of opportunities to remove or bury existing infrastructure associated with urban/ex-urban development and to collocate infrastructure to consolidate impacts. (See Infrastructure)					
Summary	To varying degrees, all action alternatives respond to the COT report objective to limit urban and exurban development in GRSG habitats and maintain intact native sagebrush communities by managing land tenure, consolidating and otherwise minimizing the impacts of infrastructure supporting adjacent development, and burial/removal of infrastructure. Alternatives B, C, D, F and the Proposed Plan favor land acquisition as a tool for conserving important habitat on private lands. All alternatives prescribe ROW exclusion or avoidance (see Infrastructure) and collocation of infrastructure to minimize footprint. Alternatives B, D, and F contain specific actions directed at burial or removal of existing infrastructure such as power lines. Alternatives B, C, D, F and the Proposed Plan call for retention of all GRSG habitats in public ownership. Impacts would continue to occur under Alternative E, which is the same as Alternative A.					

1
2

Table 2-6
Summary of Environmental Consequences

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
Vegetation (Including Noxious Weeds; Riparian and Wetlands)						
In general, Alternative A would rely on management guidance that would not reflect the most up-to-date science regarding GRSG, and older land use plans would be implemented that often would lack a landscape-level approach to land planning. However, several LUPs do contain guidance for specific areas that address GRSG (e.g., Dillon, Pocatello, and Beaverhead-Deerlodge). There is no consistently applied vegetation management across all land use plans, though many incorporate objectives for maintaining, improving, or restoring vegetation communities, particularly	The BLM and Forest Service would manage lands to conserve, enhance, and restore sagebrush ecosystems. Direct protection of sagebrush habitat to support GRSG would limit or modify uses in this habitat type, improving the acreage and condition of desired vegetation communities. Use restrictions would reduce damage to native vegetation communities and individual native plant species in areas that are important for regional vegetation diversity and quality. Likewise, use restrictions would minimize loss of connectivity and	The BLM and Forest Service would manage lands to conserve, enhance, and restore sagebrush ecosystems. Management actions would be applied to all occupied GRSG habitats, a larger area than covered by Alternative B. Management would focus on removing livestock grazing from occupied habitats, with most other management similar to Alternative B.	The BLM and Forest Service would manage lands to conserve, enhance and restore sagebrush ecosystems. Management and impacts would be similar to Alternative B, though Alternative D would incorporate more flexibility and adaptive management to account for sub-regional conditions. PHMA, IHMA, and GHMA would be designated and the BLM and Forest Service would require a no net unmitigated loss of PHMA and IHMA and would implement conservation measures to reduce impacts from human activities in PHMA, which would reduce the likelihood for vegetation removal,	The BLM and Forest Service would manage lands to protect, maintain, improve and enhance sagebrush ecosystems. CHZ, IHZ and GHZ would be designated. CHZ would restrict further infrastructure development with narrow exceptions to permit high value infrastructure. This alternative would designate fewer acres of CHZ as compared to Alternatives B, C, D & F designations of PHMA, resulting in fewer acres of sagebrush vegetation preserved from removal, degradation, or fragmentation.	Management under Alternative F would be largely similar to that described for Alternative B, though with more stringent guidance and restrictive management in sagebrush ecosystems. PHMA and GHMA would be the same as for Alternative B. Under Alternative F, RHMA would also be designated. Impacts from implementing the three percent disturbance cap would be similar to those described for Alternative B, but under Alternative F all surface disturbances would count towards the disturbance cap. This would further reduce the acreage of	Management under the Proposed Plan would be similar to that described for Alternative D. Under the Proposed Plan, SFAs would be managed where additional restrictions on resource uses would be applied. Additional measures, such as management to attain vegetation objectives; specified vegetation treatment acres; and a comprehensive mitigation strategy would be implemented and would reduce the likelihood for vegetation removal, degradation, or fragmentation.

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
sagebrush and riparian and wetland habitats. As a result, there is general direction to preserve and improve vegetation communities; however, discrete anthropogenic disturbances to vegetation, such as road construction, mineral development, and development of ROWs, would continue.	would be more likely to retain existing age class distribution within these specific areas. Use restrictions could also minimize the spread of invasive species by limiting human activities that cause soil disturbance or seed introductions. PHMA and GHMA would be designated and the BLM and Forest Service would apply a three percent anthropogenic disturbance cap on discrete activities in PHMA and would implement numerous conservation measures to reduce impacts from human activities, which would reduce the likelihood for vegetation removal, degradation, or fragmentation, and maintain the acreage and condition of sagebrush vegetation.		degradation, or fragmentation.		vegetation that would be removed or fragmented within all occupied habitat over the long term.	
Wild Horse and Burro Management						
All HMAs would continue to be managed for AML and all adjustments would be based on site-specific conditions as reported in monitoring data. Wild horse management would not be based on GRSG habitat needs. Levels of resource conflict with wild horse would depend on management under individual RMPs. Restrictions on energy and mineral development would be least restrictive under Alternative A, which would result in the greatest impact to horses from	Under Alternative B vegetation restoration projects to benefit GRSG would likely improve forage conditions and water quality for wild horses in the long term. Restrictions placed on mineral development could also benefit wild horses and burros by reducing disturbance. GRSG management requiring increased fences or prohibiting new water development could limit wild horse access to water.	Vegetation restoration impacts would be similar under Alternative C to those under Alternative B, but would also remove water developments, which could reduce water availability and result in the need to reduce AML within HMAs in occupied habitat. Livestock grazing would be eliminated under this alternative, resulting in additional forage for wild horses. However, this could also result in reduced water availability through the	Vegetation management under this alternative would likely improve wild horse forage in the long term. AMLs in some HMAs would be reduced if wild horse management was found to conflict with GRSG objectives. HMA expansion would be prohibited in PHMA, potentially limiting the ability to sustainably manage for increasing horse populations and increasing the need for gathers and cost of the program. Eliminating livestock watering	Impacts from vegetation management, wild horse management, and mineral and energy development would be the same as those under Alternative A. Livestock grazing management changes would be applied on a site-specific level and would result in limited impacts to wild horse management. Limitations on new water development could result in a need to reduce AMLs in HMAs where alternative	Under this alternative, AMLs would be directly reduced by 25 percent for all HMAs within PHMA and GHMA, resulting in increased costs for wild horse management due to a need for additional horse gathers and population growth suppression treatments. Under Alternative F, 25 percent of the areas in PHMA and GHMA open to livestock grazing would be rested each year as well, which could reduce the availability of water to wild horses and impact the ability to manage	Under the Proposed Plan restrictions on disturbance would be greatest in SFAs, followed by PHMAs, and IHMAs. This would result in reduced disturbance and additional protections of wild horse forage and water supplies in SFAs, and could result in increased disturbance to wild horses in HMAs within GHMA. Vegetation management would likely improve forage conditions in the long term. Wildland fire management would also be expected to benefit wild horses, though fencing to protect post-

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
energy and mineral development under this alternative.	Restrictions on transportation would be greater under this alternative than under Alternative A, which could increase the time and costs required to conduct gathers for population control. AMLs and wild horse management could be impacted if found to not align with GRSG management objectives. However, in general, efforts to improve GRSG habitat would also improve wild horse rangeland conditions.	elimination of livestock watering sites. Restrictions on travel management and energy development would result in impacts similar to those described under Alternative B. Lands and realty management under this alternative would reduce disturbance to wild horses. In general, efforts to improve GRSG habitat would also improve wild horse rangeland conditions.	sites could reduce water availability for wild horses and could result in the need to reduce wild horse numbers. Restrictions on transportation, lands and realty, and minerals would result in reduced disturbance to wild horses as compared to Alternative A, but greater disturbance than would be experienced under some of the other action alternatives.	water sources are not available. Restrictions on recreation and lands and realty management could limit disturbance to wild horses.	for AML, particularly for HMAs with no alternative water source. Vegetation, wildland fire, and recreation management would have impacts similar to those under Alternative B. Impacts from energy and minerals management would be the same as those under Alternative A.	burn areas could impact the ability of horses to roam freely and access water. Changes to livestock watering could impact water availability for wild horses and result in the need to reduce wild horse numbers or develop alternative water sources within HMAs. AMLs may be required to change to meet GRSG habitat objectives. The number of gathers needed may need to be increased along with other intensive management actions to maintain AML, potentially increasing disturbance to populations and the cost of the program.
Wildland Fire Ecology and Management						
Current impacts would continue and there would continue to be a high risk of human-caused ignitions associated with human uses. Vegetation management and weed treatments would continue to decrease fuels across the planning area, which would decrease the intensity of wildland fires and allow fires to be more easily controlled. Similarly, treatments for habitat improvement and forage would reduce fuels and reduce the likelihood for stand-replacing fire. The wildland fire management program would continue to be impacted by the spread of invasive annuals, which results in a longer fire season and the need for more resources to respond to wildfire. There would	Long-term frequency and intensity of wildland fire would be similar to historic conditions because post fuel and restoration management would be designed to ensure long-term persistence of seeded or pre-burn native plants. GRSG management in PHMA would focus on fire suppression and limitations on fuels treatments, resulting in higher level of protection from wildland fire, but reduced wildland fire and fuels management options. Managing PHMA so that discrete anthropogenic disturbances cover less than 3 percent of the total PHMA regardless of ownership would decrease	Under Alternative C, no livestock grazing would be permitted within occupied GRSG habitat. As a result, fine fuels would increase throughout occupied habitat and size, intensity, and occurrence of fire would potentially increase. However, because the prohibition on grazing could reduce weed spread, some areas may experience a shorter fire season and less frequent and/or intense wildfires.	Alternative D contains a defined set of tools for wildland fire management. Alternative D would allow for management flexibility in designing fuels treatments and response to wildland fire. Strategic wildfire suppression planning would help return PHMA to natural fire intensities and intervals. Impacts from limiting motorized travel to existing roads would be the same as those described for Alternative B.	Developing a fuels break strategy, response time analysis and water availability analysis would help focus suppression activities in areas with the greatest likelihood of reducing wildfire spread. Use of native vegetation for restoration and controlling invasive species for three years after wildfire treatments would reduce the likelihood for weed invasion in burned or treated areas, thus reducing the frequency and intensity of wildland fires. This alternative promotes active and aggressive control of invasive species, which would likely result in a reduced likelihood of large-scale wildland fires.	Impacts from fire management would be the same as those described under Alternative B.	Impacts from fire management would be similar to those under Alternatives B and D. Because anthropogenic disturbance excludes habitat disturbance from wildfire and fuels management activities, the wildland fire and fuels program will retain management flexibility and a greater chance to meet goals and objectives over the life of the plan. The 3 percent anthropogenic disturbance cap should limit human-caused ignitions in GRSG habitat over the long-term and decrease the probability of wildfire occurrence and the need for fire-suppression activities. Coordination with other land management agencies and landowners may promote improved habitat conditions across land management boundaries, thus improving the efficiency and effectiveness of fire

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
also be a continued decrease in the capability of the proactive hazardous fuels reduction program to maintain reactive suppression and rehabilitation efforts in the wildland-urban interface (WUI).	the chance of human-caused ignition in PHMA. In addition, managing or restoring PHMA so that at least 70 percent of the land cover provides adequate sagebrush habitat to meet GRSG needs would promote a shift towards historic fire regimes in sagebrush ecosystems. Limiting motorized travel in PHMA to existing roads and trails until travel management planning is complete, as well as limiting road upgrades or new roads in this area, would reduce the risk of human-caused ignition in PHMA on BLM-administered and Forest Service-administered lands.			Targeted grazing would be allowed to reduce fine fuels, resulting less need for mechanical or chemical fuels treatments.		and fuels treatments across the landscape. Additionally, implementation of the Wildfire, Invasive Annual Grasses and Conifer Expansion Assessment will improve wildland fire management across the landscape via improved coordination across agencies.
Wilderness Characteristics						
Management actions to protect other resources and special designation areas offer some protection of wilderness characteristics. Alternative A includes the fewest GRSG protections and is least restrictive of surface-disturbing activities that have the potential to alter the natural setting, as well as reduce opportunities for solitude or primitive recreation, of lands with wilderness characteristics. Therefore, degradation of wilderness characteristics is most likely under this alternative.	Under Alternative B, restrictions on resource uses, such as ROW exclusion and closure to mineral exploration and development, would offer more protection of lands with wilderness characteristics compared to Alternative A.	Impacts from Alternative C would be similar those described for Alternative B, but would be applied across a larger geographic area. As such, Alternative C would provide greater protection from surface-disturbing activities on lands with wilderness characteristics. In addition, livestock grazing would be prohibited in PHMA (i.e., all occupied habitat). This would eliminate the need for livestock developments (e.g., fences, cattle guards, guzzlers, stock ponds, and access roads) and would enhance wilderness characteristics.	Under Alternative D, the BLM and Forest Service would apply restrictions on resource uses similar to, though less than, Alternative B. Restrictions would include ROW avoidance areas and stipulations on mineral leasing. Such restrictions would provide more protection to lands with wilderness characteristics compared to Alternative A.	Under Alternative E, impacts from restrictions on resource uses would be similar to Alternative B, though restrictions would apply to a smaller area of lands with wilderness characteristics.	Impacts would be the same as those described for Alternative B.	Under the Proposed Plan, wilderness characteristics would receive indirect, incidental protections from the restrictions placed on management actions. Areas in PHMA and IHMA would remain open to fluid mineral leasing, with fewer acres closed leasing than any other alternative, including Alternative A. Any indirect protections wilderness characteristics might experience from closing acres to fluid mineral leasing would be experienced the least under the Proposed Plan.
Livestock Grazing/Range Management						
In general, Alternative A would be the least restrictive on	Acres open to grazing and permitted AUMs would be	Under Alternative C, grazing would be eliminated from all	Acres open to grazing and permitted AUMs would be the	Under Alternative E, allotment renewal in CHZ	In areas where grazing is permitted, management would	Acres open to grazing and permitted AUMs would be the

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
<p>livestock grazing.</p> <p>Under Alternative A, livestock grazing would continue to be managed under current guidance, with AUMs and acres open to grazing remaining at current levels. Grazing allotments would continue to be subject to permit renewals and assessments of rangeland health.</p>	<p>the same as for Alternative A.</p> <p>PHMA would be managed so that at least 70 percent of the land cover provides adequate sagebrush habitat to meet GRSG needs. Where cover requirements do not meet forage objectives for livestock grazing, this would result in the need to modify grazing practices with increased costs for permittees.</p> <p>Consideration of GRSG habitat objectives and management would be required in grazing management in PHMA and incorporated into grazing allotments through BLM AMPs or permit renewals or BLM and Forest Service NEPA processes. As a result, impacts would occur over time at a site-specific level as measures are incorporated into individual allotments.</p> <p>Land Health assessment and permit renewals would be prioritized in PHMA, but there is potential for further degradation of lands outside of PHMA that are not meeting land health standards or desired conditions.</p>	<p>allotments completely or partially within occupied habitat. Closures would impact permittees' current seasonal rotations or other management strategies that utilize both federal and private lands. The elimination of permitted grazing in PHMA under Alternative C may result in permittees' going out of business, with impacts on both individual permittees as well as local communities as a whole. Additional details of the economic impacts are discussed in Section 4.14, Social and Economic Conditions.</p> <p>Beneficial or adverse impacts on range management from other resource uses (e.g., ROW or fluid mineral development) would be diminished in scale and intensity because of the elimination of grazing in all allotments intersecting occupied habitat.</p>	<p>same as for Alternative A. Impacts from management actions would be similar to those described under Alternative B.</p> <p>A moderate decline in permitted grazing would be anticipated over time as grazing permits are modified to incorporate GRSG objectives at renewal or allotment analysis. Coordination with the state should decrease conflicts in standards and provide a location appropriate framework, assisting permittees' ability to adopt these standards and reducing impacts.</p> <p>Reconnection and expansion of native plant communities would be an objective across all GRSG habitat types and restoration of seasonal habitats would be emphasized in both priority and medial habitats. Should treatments in this habitat not match with vegetation objectives for livestock grazing, forage quality would decrease. However, in most cases, treatment (e.g., conifer removal) would improve forage conditions in the long term.</p>	<p>and IHZ would be prioritized where populations are declining.</p> <p>Alternative E would allow for greater flexibility in management options, limiting impacts on range management.</p> <p>Changes could be required to grazing timing and intensity to meet GRSG habitat requirements, with the potential for some increased time and costs to permittees as compared to Alternative A. However, due to the increased flexibility in management actions under this alternative, permittees would have more options to address GRSG habitat requirements, and impacts on range management would be limited.</p>	<p>be similar to that described in Alternative B but increased in intensity due to increased restrictions on prohibitions to grazing after fire and the prohibition on all new range improvements. These actions are likely to further limit the abilities of permittees/lessees to fully utilize permitted AUMs and result in increased time and cost for management.</p>	<p>same as for Alternative A.</p> <p>Grazing management actions and impacts are similar to those described in Alternatives B and D. GRSG habitat objectives would be incorporated into grazing allotments through allotment management plans or permit renewals, or Forest Service NEPA processes, a moderate decline in permitted grazing is anticipated over time as permits are modified to meet objectives. In the proposed plan, specific guideline for GRSG seasonal habitat with impacts determined at implementation level for BLM lands.</p> <p>Priority for land health assessment and permit renewal would include SFAs first followed by PHMAs outside the SFAs. Changes in management would follow this priority order.</p> <p>The Proposed Plan would also include additional vegetation treatment measures such as conifer removal, and annual grass treatment, with specific vegetation objectives in PHMA. FIAT assessments will also be used at implementation to determine site specific fire management measures. Where vegetation and fire management objectives do not meet forage objectives for livestock grazing, this would result in the need to modify grazing practices. However, in most cases, treatments (e.g., conifer removal) would improve forage conditions in the long term.</p> <p>Disturbance of livestock grazing</p>

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
						and livestock forage from development activities would be minimized in the Proposed Plan due to the inclusion of a cap on anthropogenic disturbance, mitigation for conservation gain to GRSG, and conservation measures such as adaptive management and defined monitoring, RDFs, and lek buffers.
Travel Management						
<p>Areas currently designated as open to cross-country OHV use would continue to be managed as such. There would be no new restrictions related to GRSG habitat management and no change in current levels of access under Alternative A.</p> <p>All Forest Service-administered lands would be limited to designated routes.</p>	<p>The BLM and Forest Service would limit motorized travel to existing roads and trails in PHMA. This would reduce cross-country access in those portions of PHMA that were previously managed as open for cross-country travel. Applications for the upgrading or realignment of existing routes would be required to meet certain design, location, and mitigation criteria intended to protect GRSG habitat. These requirements may preclude the construction of some new routes, but would be unlikely to reduce access across the decision area.</p> <p>Impacts on Forest Service-administered lands would be the same as for Alternative A.</p>	<p>The BLM and Forest Service would limit motorized travel to existing roads and trails in PHMA. Additionally, in PHMA, new road construction within 4 miles of active leks would be prohibited. Upgrading of existing routes in occupied habitat where such action would damage GRSG habitat would also be precluded. Together, these actions would result in site-specific losses of opportunity for motorized travel and future route construction and improved access.</p> <p>Impacts on Forest Service-administered lands would be the same as for Alternative A.</p>	<p>All BLM lands in Field Offices containing GRSG habitat would be limited to existing routes and off-road motorized travel prohibited with the exception of specific areas managed as open for recreation purposes.</p> <p>Impacts on Forest Service-administered lands would be the same as for Alternative A.</p>	<p>Impacts under Alternative E would be similar to Alternative D, with fewer acres identified as limited to existing routes in GRSG habitat.</p>	<p>Impacts under Alternative F on BLM-administered lands would be the same as Alternative B.</p> <p>Impacts on Forest Service-administered lands would be the same as for Alternative A.</p>	<p>Impacts under the Proposed Plan would be the same as Alternative D</p>
Lands and Realty						
<p>ROW avoidance and exclusion restrictions would not be applied in GRSG habitat, thus, not preventing the BLM or Forest Service from accommodating future demand for ROW</p>	<p>Managing PHMA as ROW exclusion would prevent the BLM and Forest Service from accommodating new ROW development in those areas. With a continuing</p>	<p>The BLM would not authorize new ROWs in exclusion areas unless the infrastructure could be located in an existing ROW authorization footprint. Impacts under Alternative C would be</p>	<p>Lands and Realty management under Alternative D would establish avoidance areas in GRSG habitat, impacting the BLM- and Forest Service-administered lands and realty</p>	<p>Stipulations associated with ROW avoidance areas under Alternative E would limit the BLM's ability to accommodate the demand for new infrastructure</p>	<p>With establishment of ROW exclusion areas, neither the BLM nor Forest Service would authorize new ROW development in occupied habitat. Therefore, Alternative</p>	<p>Similar to Alternative D, the Proposed Plan would reduce the amount of land within GRSG habitat available to ROW/SUA development without restrictions, compared to Alternative A.</p>

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
<p>development within the planning area.</p> <p>Existing transportation routes would continue to provide motorized access to ROW infrastructure and communication sites for construction and maintenance with no additional impacts on lands and realty from travel and transportation management.</p> <p>GRSG habitat would remain available for withdrawal or disposal as needed to serve BLM or other agency objectives.</p>	<p>demand for new ROWs in the planning area, including major inter- and intra-state electrical transmission and pipeline ROW developments would be prevented or diverted to adjacent non-federal lands. Development on adjacent lands could result in more extensive direct and indirect impacts on GRSG populations and habitat (e.g., vehicle traffic on roads crossing public lands), especially if the development is within close proximity to GRSG habitat on BLM-administered or Forest Service-administered lands, or the ROW route is longer to avoid federal lands.</p> <p>Within exclusion areas, BLM and Forest Service would only consider new ROW authorizations where the proposed infrastructure could be co-located entirely within the footprint of an existing ROW. BLM and Forest Service would require co-location in GHMAs where possible. Impacts on the lands and realty program under Alternative B would include the need to locate proposed facilities outside exclusion areas or within existing ROWs, which limits the BLM's ability to accommodate the demand for new infrastructure development, including wind energy development.</p>	<p>similar to Alternative B, but over a greater area.</p> <p>Alternative C would further limit opportunities for communication facilities, pipelines, fiber optic cables, electrical transmission lines, and similar ROW development in response to ongoing needs.</p> <p>Impacts on land tenure would be the same as Alternative B but cover a wider area (all occupied habitat).</p>	<p>programs by reducing the BLM and Forest Service's ability to authorize above-ground linear ROWs, such as electrical transmission lines in PHMA.</p> <p>Within avoidance areas, additional stipulations for the development of electrical transmission lines could result in the denial of projects that cannot meet ROW grant requirements for the protection of GRSG habitat. Limitations on electrical transmission line development, renewable energy development, and new roadways under Alternative D would be less than Alternative C which creates exclusion areas.</p> <p>Impacts from travel management would be the same as those described above under Alternative B.</p> <p>Impacts on land tenure would be the same as Alternative B.</p>	<p>development in GRSG habitat, but less than establishing exclusion areas. With demand for new ROWs in the planning area, including major inter- and intra-state electrical transmission and pipeline ROW developments, expected to continue and increase over time, new ROW development would be diverted to adjacent non-federal lands or blocked. If new ROW development could not be feasibly developed, the result would be reduced energy and communication opportunities to meet growing needs.</p> <p>Impacts from travel management would be the same as those described under Alternative A.</p> <p>Impacts on land tenure would be the same as Alternative A.</p>	<p>F would further reduce opportunities for renewable energy, communication facilities, pipelines, fiber optic cables, electrical transmission lines, and similar ROW development from occurring in the planning area, to meet growing energy and communication needs, similar to Alternative B.</p> <p>Impacts from Travel and Transportation Management under Alternative F would be the same as Alternative A.</p> <p>Impacts on land tenure would be the same as Alternative B.</p>	<p>Within avoidance areas, additional stipulations for the development of electrical transmission lines could result in the denial of projects that cannot meet ROW/SUA grant requirements for the protection of GRSG habitat. Limitations on electrical transmission line development, renewable energy development, and new roadways under the Proposed Plan would be less than other alternatives, such as Alternative C, which creates exclusion areas. GRSG conservation measures under the Proposed Plan, such as the requirement for activities to promote net conservation gain for GRSG, RDFs, buffers, and tall structure limitations, would likely discourage limit future development PHMA and IHMA. Projects that are proposed in PHMA or IHMA would incur added costs and more complex and lengthy review periods.</p> <p>Restrictions on surface activities for fluid minerals, closure of PHMA to mineral materials, and the proposed withdrawal of SFAs for locatable minerals would reduce the short- and long-term demand for ROWs/SUAs to support mineral development.</p> <p>By allowing land tenure actions that result in the net conservation gain of GRSG habitat, the BLM and Forest Service could carry out actions that consolidate land ownership or acquire lands with higher quality GRSG habitat.</p>

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
	PHMA lands would not be available for disposal or withdrawal, limiting BLM's ability to accommodate other management objectives with land tenure changes.					
Minerals						
Fluid Minerals (Oil and Gas)						
<p>Under Alternative A, 289,500 unleased medium potential acres would continue to be closed to fluid mineral leasing.</p> <p>New leases in most BLM field offices and Forest Service districts within the decision area would continue to be subject to TLs, and NSO buffers would be applied for varying distances around leks.</p> <p>Acres closed have the greatest impact on the fluid minerals program by prohibiting oil and gas development on portions of federal mineral estate with high potential for such development.</p> <p>In areas closed to leasing, oil and gas operations would be restricted in their choice of project locations and may be forced to develop in areas that are challenging to access or have less economic resources because more ideal areas could be closed to leasing. This could raise the cost of fluid mineral development in the planning area and could result in operators moving to nearby private or state minerals that are open to leasing.</p>	<p>All federal mineral estate within PHMA, including 496,300 unleased medium potential acres, would be closed to oil and gas leasing. Closure of these acres would directly impact the fluid minerals program as described under Alternative A. However, because the acreage closed would increase under Alternative B, the magnitude of these impacts would also increase.</p> <p>Existing leases would remain valid through their term but could not be renewed, resulting in further long-term restrictions on the development of fluid mineral resources.</p> <p>Conservation measures in addition to RDFs would be applied as COAs to existing leases on PHMA overlying federal mineral estate. Application of these requirements would impact fluid mineral operations by increasing costs if it resulted in the application of additional requirements and/or use of more expensive technology. To avoid these costs, operators</p>	<p>All federal mineral estate in the decision area, including 601,000 unleased medium potential acres, would be closed to oil and gas leasing. Closure of these acres would directly impact the fluid minerals program as described under Alternative A; however, because Alternative C would close the most acres out of any alternative, the magnitude of these impacts would also increase.</p> <p>Management actions applicable to existing leases under Alternative C would be similar to those under Alternative B, but they would apply to all existing leases in the decision area. Alternative C would also call for COAs implementing seasonal restrictions on vehicle traffic and human presence associated with exploratory drilling. This alternative also would limit new surface disturbance on existing leases to 3 percent per section, with some exceptions. Impacts of these operating and siting restrictions would be the same type as those described under Alternative B, although the magnitude of the impacts would increase.</p>	<p>Fluid mineral allocations in PHMA and IHMA would vary depending on oil and gas development potential. 289,500 unleased medium potential acres would be closed to oil and gas leasing. An NSO stipulation would apply within 0.6 mile of leks to 176,900 acres.</p> <p>New leases within PHMA and IHMA would be subject to density limitations and a 3-percent disturbance cap for each section.</p> <p>Management of existing fluid mineral leases under Alternative D would be the same as that under Alternative B except that all management actions other than RDFs would apply to all 101 existing leases within GRSG habitat.</p>	<p>Within the planning area, 289,500 unleased medium potential acres would be closed to fluid mineral leasing under this alternative.</p> <p>Management existing leases in the decision area would be similar to that under Alternative A. Unleased areas in CHZ and IHZ would be open to leasing subject to an NSO stipulation.</p>	<p>Impacts of closures under Alternative F would be the same as under Alternative B.</p> <p>Management actions applicable to existing leases under Alternative F would be similar to those under Alternative C. However, under Alternative F, TLs would prohibit human presence as well as surface-disturbing activities during the nesting and brood-rearing season. This management would be the most restrictive management out of all the alternatives.</p>	<p>Within the planning area, 257,400 unleased medium potential acres would be closed to oil and gas leasing. Closure of these acres would directly impact the fluid minerals program as described under Alternative A; however, because more acres would be closed under the proposed plan, the magnitude of these impacts would increase.</p> <p>The same RDFs would be applied to the same acreage as under Alternative B. However, the only conservation measures applied would relate to master development plans and unitization.</p> <p>Application of the three percent disturbance cap in PHMA and IHMA and lek buffers in GHMA could impact both new and existing fluid mineral activities by preventing or restricting new surface development.</p> <p>Management of existing fluid mineral leases under the Proposed Plan would be the same as that under Alternative B with the same impacts.</p>

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
	may move to nearby state or private minerals, resulting in lost royalties for the BLM and Forest Service.					
Fluid Minerals (Geothermal)						
<p>Under Alternative A, 12,513,900 acres of the planning area would be closed to geothermal leasing. This includes 2,939,400 acres of available moderate to high potential areas and 9,574,600 acres of available low to no potential areas.</p> <p>New leases in most BLM field offices and Forest Service districts within the decision area would continue to be subject to TLs, CSUs, and NSO buffers would be applied for varying distances around leks.</p>	<p>Under Alternative B, 19,598,800 acres of the planning area would be closed to geothermal leasing. This includes 5,287,800 acres of available moderate to high potential areas and 14,311,000 of available low to no potential areas.</p> <p>Existing leases would remain valid through their term but could not be renewed, resulting in further long-term restrictions on the development of fluid mineral resources.</p> <p>Conservation measures in addition to RDFs would be applied as COAs to existing leases on PHMA overlying federal mineral estate. Application of these requirements would impact fluid mineral operations by increasing costs if it resulted in the application of additional requirements and/or use of more expensive technology. To avoid these costs, operators may move to nearby state or private minerals, resulting in lost royalties for the BLM and Forest Service.</p>	<p>Under Alternative C, 21,901,100 acres of the planning area would be closed to geothermal leasing. This includes 6,137,200 acres of available moderate to high potential areas and 15,763,900 acres of available low to no potential areas.</p> <p>Management actions applicable to existing leases under Alternative C would be similar to those under Alternative B, but they would apply to all existing leases in the decision area. Alternative C would also call for COAs implementing seasonal restrictions on vehicle traffic and human presence associated with exploratory drilling. This alternative also would limit new surface disturbance on existing leases to 3 percent per section, with some exceptions. Impacts of these operating and siting restrictions would be the same type as those described under Alternative B, although the magnitude of the impacts would increase.</p>	<p>Under Alternative D, 17,526,500 acres of the planning area would be closed to geothermal leasing. This includes 3,215,600 acres of available moderate to high potential areas and 14,311,000 acres of available low to no potential areas.</p> <p>New leases within PHMA and IHMA would be subject to density limitations and a 3-percent disturbance cap for each section.</p> <p>Management of existing fluid mineral leases under Alternative D would be the same as that under Alternative B except that all management actions other than RDFs would apply to all 101 existing leases within GRSG habitat.</p>	<p>Acres of moderate to high and low to no potential areas closed to geothermal leasing would be the same as Alternative A. Acres subject to types of stipulations would differ; more acres would be open subject to NSO stipulations, less acres would be open subject to CSU/TL stipulations, and less acres would be open subject to standard terms and conditions.</p> <p>Unleased areas in CHZ and IHZ would be open to leasing subject to an NSO stipulation.</p>	<p>Under Alternative F, 12,513,900 acres of the planning area would be closed to geothermal leasing. This includes 2,939,400 acres of available moderate to high potential areas and 9,574,600 acres of available low to no potential areas.</p> <p>Management actions applicable to existing leases under Alternative F would be similar to those under Alternative C. However, under Alternative F, TLs would prohibit human presence as well as surface-disturbing activities during the nesting and brood-rearing season.</p>	<p>Under the Proposed Plan 11,296,800 acres of the planning area would be closed to geothermal leasing. This includes 2,832,800 acres of available moderate to high potential areas and 8,464,000 acres of available low to no potential areas.</p> <p>Under the proposed plan, RDFs and BMPs would be applied as COAs when a geothermal drilling permit or other post-lease activity is approved. In addition to affecting new leases, the COAs would be applied to the 25,571 acres of existing leases within GRSG habitat, consistent with existing lease terms and special stipulations. These RDFs and conservation measures would include such requirements as noise restrictions, structure height limitations, design requirements, water development standards, remote monitoring requirements, and reclamation standards as described in Appendix A. This alternative also would limit new surface disturbance on existing leases to 3 percent per section, with some exceptions.</p>
Nonenergy Leasables						
Under Alternative A, no changes	Under Alternative B, PHMA	Impacts under Alternative C	Under Alternative D, PHMA	Non-energy leasable mineral	Impacts under Alternative F	Impacts under the Proposed Plan

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
<p>would be made to the acres open and closed to leasing consideration. Currently, 11,799,500 acres are closed to non-energy mineral leasing.</p> <p>Existing federal non-energy leasable mineral leases in the decision area would continue to be subject to any stipulations or BMPs contained in those leases. Application of BMPs could alter how mineral resources are accessed and extracted and result in the use of different technology than would otherwise have been used.</p> <p>Non-energy leasable mineral development operations may also move to nearby private or state minerals containing non-energy leasable mineral resources within GRSG habitat. This change would result in lost royalties for the BLM and Forest Service.</p>	<p>would be closed to prospecting and leasing (19,167,400 acres). Management under this alternative would close more federal mineral estate to non-energy leasable mineral prospecting and leasing than management under Alternative A. Closing areas to non-energy mineral prospecting and leasing would result in the same type of impacts as under Alternative A, but over a larger area.</p> <p>However, the majority of acres in unleased KPLAs, where interest in non-energy leasable mineral development is most likely, would remain open to leasing. Therefore, impacts would be mitigated.</p> <p>Existing federal non-energy leasable mineral leases in PHMA would be subject to RDFs. Application of RDFs would increase costs of non-energy leasable development if it delayed resource development or resulted in the use of more expensive technology or less efficient development than would otherwise have been used.</p>	<p>would be the same as those described under Alternative B except that more acres would be closed (21,629,700 acres). As a result, the magnitude of impacts under this alternative would increase.</p> <p>However, similar to Alternative B, the majority of unleased acres in KPLAs would remain open to leasing. Therefore, impacts would be mitigated.</p>	<p>and IHMA would be closed to prospecting and leasing. Management under this alternative would close more federal mineral estate (8,308,600 acres) to non-energy leasable mineral prospecting and leasing than management under Alternative A.</p> <p>Impacts in unleased KPLAs would be similar to those under Alternative A except that CSUs and seasonal and daily TLs would be applied to all lands available for leasing in GHMA. Additionally, TLs would be applied to the ten federal phosphate leases within GRSG habitat.</p> <p>Applying BMPs as Conditions of Approval on any new mine plan and requiring restoration of habitat or off-site mitigation could alter how mineral resources are accessed and extracted and result in the use of different (potentially more expensive) technology than would otherwise have been used.</p>	<p>allocations under Alternative E would be the same as those under Alternative A and would result in the same impacts.</p> <p>Impacts in unleased KPLAs would be similar to those under Alternative A except that lands open to leasing would be subject to several stipulations that include prohibiting permanent structures within occupied leks, prohibiting tall structures within one mile of leks, restrictions on noise disturbances, and various TLs specific to protecting leks. Stipulations would restrict the ability of mineral resources to be developed or extracted.</p>	<p>would be the same as those described under Alternative C, but would impact a smaller area (19,167,400 acres).</p> <p>However, similar to Alternative B, the majority of unleased acres in KPLAs would remain open to leasing. Therefore, impacts would be mitigated.</p>	<p>would be similar to those described under Alternative B except that fewer acres would be closed (16,270,500 acres) and the disturbance cap and lek buffers would apply. Because more acres would be closed compared to Alternative A and additional restrictions would be added, impacts would increase under the Proposed Plan.</p> <p>Because KPLAs would remain open to nonenergy solid mineral leasing, impacts on federal nonenergy solid leasable mineral development would be mitigated.</p> <p>Application of RDFs and TLs to existing phosphate leases in GRSG habitat would result in the same impacts described under Alternative D.</p>
Locatable Minerals						
<p>Under Alternative A, no change would be made to the acres of federal mineral estate with high potential that are withdrawn or petitioned for withdrawal (currently 5,380,200 acres). Withdrawal or closure of an area</p>	<p>Under Alternative B, PHMA (7,928,700 acres) would be recommended for withdrawal in addition to the 5,380,200 acres currently withdrawn. The large increase in areas petitioned</p>	<p>Impacts under Alternative C would be the same as those described under Alternative B except that more acres (11,555,000 acres) would be recommended for withdrawal. The magnitude of impacts</p>	<p>Impacts under Alternative D would be the same as those described under Alternative A, except that additional measures to avoid or minimize adverse effects on GRSG and their habitat would be required for</p>	<p>Impacts under Alternative E would be the same as those described under Alternative A.</p>	<p>Impacts under Alternative F would be the same as those described under Alternative B.</p>	<p>Under the Proposed Plan 2,968,200 acres would be recommended for withdrawal. The increase in areas petitioned for withdrawal compared with Alternative A would result in the types of impacts described under</p>

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
<p>to mining development eliminates the ability to access and extract the mineral resources in that area under new claims. This represents an impact on the potential discovery, development, and use of those resources by decreasing the availability of mineral resources. In addition, validity exams must be completed on all existing claims in withdrawn areas. The need for these exams adds costs and delays for the BLM, Forest Service, and claimant.</p> <p>This alternative would be the least restrictive to locatable minerals because a larger percentage of the decision area would be open to locatable mineral entry and no additional restrictions would be applied to mining operations.</p>	<p>for withdrawal under this alternative compared with Alternative A would increase the development delays and costs of validity exams on the BLM, Forest Service, or claimant. Accessing and extracting locatable minerals of federal mineral estate would not be impacted by applying BMPs; however, mining operations and practices could be affected and costs increased if an operator agrees to apply any of the BMPs on a project-specific basis.</p>	<p>under this alternative would increase since more acreage would be affected.</p> <p>Impacts from applying BMPs would be the same as those described under Alternative B.</p>	<p>3809 notices and plans of operations in all habitat types. A total of 11,555,000 acres would be recommended for withdrawal under this alternative. Impacts from these additional measures would be highly variable depending on the extent of the additional requirements. If these measures resulted in the mineral resource not being able to be accessed or extracted, an impact on the potential discovery, development, and use of those resources would occur because the availability of mineral resource would decrease.</p> <p>Impacts from applying BMPs would be the same as those described under Alternative B.</p>			<p>Alternative B.</p> <p>Impacts from applying BMPs would be the same as those described under Alternative B.</p>
Salable Minerals (Mineral Materials)						
<p>Under Alternative A, no change would be made to the acres that would open or closed (currently 10,707,600 acres closed) to mineral material disposal.</p>	<p>Under Alternative B, all PHMA would be closed to mineral material disposal (18,589,300 acres). Closing these acres would prevent access to the mineral resources underlying them and reduce mineral material development in the decision area.</p> <p>Management of mineral materials on federal mineral estate outside of PHMA would be the same as that under Alternative A.</p>	<p>Under Alternative C, all GRSG habitat would be closed to mineral material disposal (21,174,000 acres). This alternative would close the most acres to mineral material disposal of all the alternatives. Therefore, impacts on mineral materials would be the highest under Alternative C.</p>	<p>Under Alternative D, areas within 3 km of occupied leks would be closed to mineral materials disposal (13,211,100 acres).</p> <p>All other areas in GRSG habitat would be subject to TLs.</p>	<p>Alternative E would close the same acres as under Alternative A (10,707,600 acres).</p> <p>Under Alternative E, mineral materials management would differ between portions of the decision area in Idaho and Montana and portions in Utah.</p> <p>Within Idaho and southwest Montana, CHZ would be closed to mineral material disposal. Closure of the 114 existing community pits in CHZ (23 percent of existing community pits in GRSG</p>	<p>Under Alternative F, 18,589,300 acres would be closed to mineral materials disposal. Impacts of these closures would be the same type as those described under Alternative B. Because more acres would be closed under Alternative F than under Alternative A, impacts on the mineral materials programs would increase.</p>	<p>Under the Proposed Plan, all PHMA would be closed to mineral material disposal (15,529,000 acres). The impacts described under Alternative B would be mitigated in the Montana portion of the decision area because new free use permits would still be allowed and existing pits would be able to expand. Because 45 percent more acres of federal mineral estate would be closed under the Proposed Plan compared with Alternative A, the magnitude of these impacts would increase.</p> <p>Application of the disturbance threshold in IHMA and RDFs, buffers, and timing restrictions in</p>

**Table 2-6
Summary of Environmental Consequences**

Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F	Proposed Plan
				habitat) would also be recommended. Within Utah, mineral material operations within PHMA would be subject to TLs and other restrictions.		IHMA and GHMA would increase restrictions on mineral material activities compared with Alternative A, thereby increasing impacts.
Special Designations						
Areas of Critical Environmental Concern						
The BLM would continue managing the 53 existing ACECs containing 325,000 acres of occupied GRSG habitat to protect the identified relevant and important values. Sagebrush habitat is not identified as a relevant and important value in any of these existing ACECs.	No new ACECs would be designated. Impacts would be similar to those described under Alternative A, however existing ACECs and the identified relevant and important values for which they were designated could experience indirect, beneficial impacts from restrictions placed on GRSG habitat within or adjacent to ACECs.	Under Alternative C, 39 new BLM ACECs encompassing approximately 4,200,000 acres of occupied GRSG habitat would be designated as sagebrush reserves, for the relevant and important value of conserving GRSG.	No new ACECs would be designated. Impacts would be the same as those described under Alternative B.	No new ACECs would be designated. Impacts would be the same as those described under Alternative B.	Under Alternative F, up to 18 new BLM ACECs and Forest Service GRSG Zoological Areas encompassing up to 8.3 million acres of occupied GRSG habitat would be designated as sagebrush reserves for the relevant and important value of conserving GRSG.	No new ACECs would be designated. Impacts would be the same as those described under Alternative B.
Socioeconomic Impacts						
Under Alternative A, current management would continue for grazing, mineral leasing and development, and other activities in GRSG habitat areas. The economic benefits of these activities would be maintained, and communities would not suffer losses in income or jobs associated with GRSG conservation efforts.	Under Alternative B, grazing would not be restricted on GRSG habitat, so permittees would not suffer economic losses. Under Alternative B, mineral leasing for fluid minerals, salable minerals and mineral materials would be closed or restricted in PHMA. These restrictions would reduce the opportunity to develop minerals on federal land and reduce the revenue and jobs to local communities.	Alternative C would eliminate grazing from all allotments in occupied habitat. The elimination of permitted grazing in PHMA under Alternative C may result in permittees' going out of business, with impacts on both individual permittees as well as local communities as a whole. Socioeconomic impacts from reduced mineral leasing and development would be similar to Alternative B but would cover a wider area, all occupied habitat.	Under Alternative D, grazing would be maintained at current levels, maintaining the economic benefits of grazing to permittees and communities. Mineral leasing acreage would not be reduced under Alternative D, but would be subject to stipulations regarding timing and proximity to GRSG lek sites. Maintaining current acreage open to leasing would minimize economic harm to workers and communities from GRSG conservation measures.	Under Alternative E, grazing would be maintained at current levels, maintaining the economic benefits of grazing to permittees and communities. Mineral leasing acreage would not be reduced under Alternative E, but limited areas would be subject to stipulations regarding timing and proximity to GRSG lek sites. Maintaining current acreage open to leasing would minimize economic harm to workers and communities from GRSG conservation measures.	Alternative F restrictions on grazing could also harm permittees' economic well-being and may drive some out of business, causing harm to individuals and communities in GRSG habitat areas. Socioeconomic impacts from reduced mineral leasing and development would be similar to Alternative B.	Under the Proposed Plan, grazing would be maintained at current levels, maintaining the economic benefits of grazing to permittees and communities. Mineral leasing acreage would not be reduced under the Proposed Plan, but would be subject to stipulations regarding timing and proximity to GRSG lek sites. Maintaining current acreage open to leasing would minimize economic harm to workers and communities from GRSG conservation measures.

Section 2.6: Proposed Plan **Amendment**/ Proposed Management of GRSG Habitat

Section 2.6.1: Development of the Proposed Plan **Amendment** for Greater Sage-Grouse Management

In developing the Proposed Plan **Amendment**, the BLM/FS made modifications to the Preferred Alternative identified in the Draft LUPA/EIS. The modifications are based on public comments received on the Draft LUPA/EIS, internal BLM review, new information and best available science, the need for clarification in the plans, and ongoing coordination with stakeholders across the range of the GRSG. As a result, the Proposed Plan **Amendment** provides consistent GRSG habitat management across the range, prioritizes development outside of GRSG habitat, and focuses on a landscape-scale approach to conserving GRSG habitat.

The BLM/FS . . .

[Note: select one of the following two options depending on how the sub-region's proposed plan was developed. Also, remove references to "Forest Service," "SFAs," and "LUPAs" if not applicable to your sub-region]

Option 1: did not carry forward Alternative **X** (the Preferred Alternative) from the Draft LUPA/EIS. Rather the LUPA/proposed plan consists of a combination of all the alternatives and is now considered the Proposed LUPA for managing BLM-administered and National Forest System lands within the **X** *[NOTE: insert sub-regional planning area]*.

Option 2: modified the Preferred Alternative, identified as Alternative X as presented in the Draft LUPA/EIS, which is now considered the LUPA/proposed plan for managing BLM-administered and National Forest System lands within the **X** *[NOTE: insert sub-regional planning area]*.

Since release of the Draft LUPA/EIS, the BLM/FS have continued to work closely with a broad range of governmental partners, including Governors, State Fish and Game agencies, the USFWS, Indian tribes, county commissioners and many others. Through this coordination, the BLM/FS have developed a Proposed Plan **Amendment** that is consistent with state, Tribal, and local strategies to the maximum extent possible and ensures the long-term conservation of the GRSG. The BLM/FS also received many substantive public comments on the Draft LUPA (see **Appendix X**), which greatly informed the BLM/FS's development of the Proposed Plan **Amendment**.

The BLM/FS's Proposed Plan **Amendment** incorporates documents related to the conservation of GRSG that have been released since the publication of the draft LUPA/EIS. For example, this Proposed Plan **Amendment** considers the USFWS' October 27th, 2014 memorandum "*Greater Sage-Grouse: Additional Recommendations to Refine Land Use Allocations in Highly Important Landscapes*" (see X) and the USGS' November 21st, 2014 report "*Conservation Buffer Distance Estimates for Greater Sage-Grouse—A Review*" (USGS 2014). Based on these documents, the

BLM is proposing to designate Sagebrush Focal Areas (SFAs) to further protect highly valuable habitat and is proposing to include lek-buffer distances when authorizing activities near leks. The BLM/FS also updated the Proposed Plan **Amendment** to reflect new GRSG state conservation strategies, including **recent State Executive Orders**.

The BLM/FS has refined the Proposed Plan **Amendment** to provide a layered management approach that offers the highest level of protection for GRSG in the most valuable habitat. Land use allocations in the Proposed Plan would limit or eliminate new surface disturbance in PHMA, while minimizing disturbance in GHMA. In addition to establishing protective land use allocations, the Proposed Plan **Amendment** would implement a suite of management tools such as disturbance limits (see **X**), GRSG habitat objectives and monitoring (see **X**), mitigation approaches (see **X**), adaptive management triggers and responses (see **X**), and lek buffer-distances (see **X**) throughout the range. These overlapping and reinforcing conservation measures will work in concert to improve GRSG habitat condition and provide clarity and consistency on how the BLM/FS will manage activities in GRSG habitat.

For the sake of clarity, BLM and FS decisions have been separated into two sections (described in Section **X** and **Y**, respectively) in the Proposed Plan **Amendment**.

**Table 2-X
USFWS Threats to GRSG and Their Habitat, Applicable BLM and Forest Service Proposed Plan Resource Program Areas
Addressing these Threats**

USFWS-Identified Threats to GRSG and Its Habitat (2010 warranted but precluded finding)	COT Report-Identified Threats to GRSG and Its Habitat (2013)	Applicable BLM/Forest Service Proposed Plan Resource Program Addressing Threat
Wildland Fire	Fire	<p><u>BLM</u>: Wildland Fire Management (see section X)</p> <p><u>Forest Service</u>: Fire Management (see section X)</p>
Invasive Species	Nonnative, Invasive Plants Species	<p><u>BLM</u>: Vegetation Management(see section X), Range Management (see section X), Wildland Fire Management (see section X), and Recreation (see section X)</p> <p><u>Forest Service</u>: GRSG Habitat (see section X), Fire Management (see section X), and Roads and Transportation (see section X)</p>
Oil and Gas For wind energy development, see <i>Infrastructure – power lines/pipelines, roads (below)</i>	Energy Development	<p><u>BLM</u>: Lands and Realty (see section X) and Fluid Minerals (see section X)</p> <p><u>Forest Service</u>: Lands and Realty (see section X) and Fluid Minerals (see sections X)</p>
Prescribed Fire	Sagebrush Removal	<p><u>BLM</u>: Vegetation Management (see section X) and Wildland Fire Management (see section X)</p> <p><u>Forest Service</u>: GRSG Habitat (see section X) and Fire Management (see section X)</p>

Grazing	Grazing	<p><u>BLM</u>: Range Management (see section X), Wild Horse and Burro Management (see section X), Special Status Species (see section X), and Vegetation Management (see section X)</p> <p><u>Forest Service</u>: Livestock Grazing (see section X) and Wild Horse and Burro Management (see section X),</p>
See <i>Grazing Management (above)</i>	Range Management Structures	<p><u>BLM</u>: Range Management (see section X)</p> <p><u>Forest Service</u>: Livestock Grazing (see section X)</p>
<i>No similar threat identified</i>	Free-Roaming Equid Management	<p><u>BLM</u>: Wild Horse and Burro Management (see section X)</p> <p><u>Forest Service</u>: Wild Horse and Burro Management (see section X)</p>
Conifer Encroachment	Pinyon and/or Juniper Expansion	<p><u>BLM</u>: Wildland Fire Management (see section X) and Vegetation Management (see section X)</p> <p><u>Forest Service</u>: Fire Management (see section X) and GRS Habitat (see section X)</p>
Agriculture & Urbanization	Agricultural Conversion and Ex-Urban Development	<p><u>BLM</u>: Lands and Realty (see section X)</p> <p><u>Forest Service</u>: Lands and Realty/Land Ownership Adjustments (see section X)</p>
Hard Rock Mining	Mining	<p><u>BLM</u>: Lands and Realty (see section X), Locatable Minerals (see section X), Salable Minerals (see section X), and Non-energy Leasable Minerals (see section X)</p> <p><u>Forest Service</u>: Coal Mines (see section X), Locatable Minerals (see section X), Non-energy Leasable Minerals (see sections X), and Mineral</p>

		Materials (see section X)
<i>See Infrastructure, Roads</i>	Recreation	BLM: Recreation (see section X) and Trails and Travel Management (see section X) Forest Service: Recreation (see section X) and Roads/ Transportation (see section X)
Infrastructure - Power lines/ pipelines - Roads - Communication sites - Railroads Range improvements (see below)	Infrastructure	BLM: Lands and Realty (see section X) and Trails and Travel Management (see section X) Forest Service: Lands and Realty (see section X) and Roads/ Transportation (see section X)
Infrastructure – Range Improvements	Range Management Structures	BLM: Range Management (see section X) Forest Service: Livestock Grazing (see section X)
Water Developments	No similar threat identified	All applicable programs
Climate Change	No similar threat identified	<i>There is no BLM or Forest Service resource program in the proposed plan addressing this threat.</i>
Weather	No similar threat identified	<i>There is no BLM or Forest Service resource program in the proposed plan</i>

		<i>addressing this threat.</i>
Predation	No similar threat identified	<u>BLM</u> : All applicable programs <u>Forest Service</u> : GRSG Habitat (see section X), Land and Realty (see section X), and Minerals (see section X)
Disease	No similar threat identified	<u>BLM</u> : All applicable programs <u>Forest Service</u> : Minerals/Fluid Mineral Operations
Hunting	No similar threat identified	<i>There is no BLM or Forest Service resource program in the proposed plan addressing this threat.</i>
Contaminants	No similar threat identified	<u>BLM</u> : Public Health and Safety (see section X) <u>Forest Service</u> : Mineral (see section X)

To: Brent Ralston <bralston@blm.gov>, Jonathan Beck <jmbeck@blm.gov>

Cc: Christopher Robbins <clrobbins@blm.gov>, Paul Makela <pmakela@blm.gov>, Steven Jirik <sjirik@blm.gov>, Ethan Ellsworth <eellsworth@blm.gov>, Jason Wright <jswright@blm.gov>

Jon and Brent,

Since I'm out next week, I thought I would just send back my responses to the comments I was assigned. Jon and I will discuss use of the REA when I'm back in the office on 11/17.

62 - I am not sure what the conflict is. What was previously 10.12 bullet 3, it says targeted grazing can be accomplished in the confines of existing permits where feasible. 10.11 says targeted grazing can be within existing permits, or other mechanisms, which are listed, so I think these are compatible unless I'm missing something.

63 - We had extensive discussion about this, and by definition, targeted grazing is limited in scope, and may be appropriate in both annual and perennial grasslands (particularly crested seedings). If targeted grazing was used in a sagebrush area, which I think is unlikely because fuels models will show very little effect from modifying the herbaceous component, the spatial extent would be similar to other sorts of fuel-break treatments. This is addressed by the first bullet of 10.12 "directly involve the minimum footprint..."

64 - Taking the idea that targeted grazing has a small footprint, the idea of "allowing conformance with S&Gs at the assessment scale" means that the targeted fuel break area may not meet S&Gs, but the larger landscape still would. However, I don't think that the targeted grazing can ensure that broader S&Gs are met at the pasture or allotment scale, because the targeted grazing should not be occurring at that scale. This action was put in there to remind proponents of targeted grazing again that it is done using the minimum footprint, and that we are not exempted from Fundamentals of Range Health nor S&Gs. The targeted grazing approach should not impede the pasture or allotment-scale attainment of the S&Gs.

65- I will defer to Steve Jirik on this one.. Maybe a case could be made for grazing vigorous crested 1 year after fire to open up niches for flow-on sagebrush seed? I'd be hesitant to turn livestock out onto new seedling plantings, due to the cost of investment and risk of damage to the new plants, but that's just my gut level reaction, not anything I have info to back up with.

66 - I agree that Paul's language would be appropriate to add to 11.4.

68 - I think the new language addressed Paul's concern. Paul, please let me know if it doesn't.

69 - Agree with Paul - maybe this could be reworded to something along the lines of "retain old-growth trees in old-growth stands" Kind of redundant, but clarifies that we might want to remove the odd lone tree in a sagebrush community, but on the other hand, might want to take younger trees out of old-growth stands in the fire safe sites.

84 - I would argue that it is inappropriate to set one-size-fits-all utilization levels or seasons of use at this planning scale. It seems arbitrary and capricious to me to apply these use levels without site-specific analysis. I would also argue that for many lower-productivity sites, these herbaceous utilization values are too high. For instance, I believe use levels closer to 20% were deemed appropriate on the Garat allotment to allow for improvement. Without BLM capability to monitor, it is more effective to build mandatory T&Cs into the permit (livestock number, kind, season of use, pasture rotations) that make progress towards our desired conditions. We still have the habitat objectives that will apply under Standard 8, and require grazing changes if not met.

85 - we had a management action for adjustments during drought - I don't know when or why it was deleted.

However, I would not recommend including it under MA 16.5 because that action is specific to making changes to the term grazing permit as a result of RLH determinations. Drought would be on a more temporary, as-needed basis.

86 - That can be added if needed. At least within Idaho, we are analyzing a No Grazing alternative in all permit renewal NEPA.

87 - a forage reserve is an area that is set aside for use as needed by various permittees who might be displaced by wildfire, ESR, restoration efforts, etc. rather than having a term permit issued for grazing like a regular allotment. These would likely be lower-quality areas - most likely crested seedings.

88 - I think Jim's suggested addition is fine for RM-12

Great Basin Region Greater Sage-grouse Federal Family Meeting

August 19-21, 2014

BLM Oregon State Office, Portland, Oregon

1 - Informational Packet Navigation Tool

Each Informational Packet contains the following materials:

Ref #	Document Title	Packet Page Number
1	Informational Packet Navigation Tool	Pages 1-2
2	Great Basin Federal Family Meeting Agenda	Pages 3-9
3	Great Basin ADPP Map Packet (30 11X17 Total)	<i>Separate 11”X17” Packet</i>
4	Population Summary Tables (7 total)	Pages 11-32
5	Acronyms and Abbreviations List	Page 32
6	Land Use Plan Allocations Cheat Sheet	Pages 33-34

Great Basin Administrative Draft Proposed Plan (ADPP) Map Packet

- ✓ Map 1 in the separate Great Basin ADPP Map Packet is a reference map that depicts GRSG populations, sub-regional boundaries, and surface management.
- ✓ Map 2 is also a reference map depicting where the Priority Areas for Conservation (PACs), Preliminary Priority Habitat (PPH), and Preliminary General Habitat (PGH) (or other management area/habitat classifications) are located in the Great Basin Region.
- ✓ The following 28 maps display two sets of 14 ADPP land use plan allocations being applied to PPH and PGH in the Great Basin Region. The sets include one map highlighting the allocation decisions being applied in the PACs (maps on the left), and the other displaying the specific allocation being proposed for all PPH and PGH (maps on the right).

Population Summary Tables

- ✓ There are a total of seven population summary tables that are part of this informational packet. The tables are organized in two different ways: 1) by populations fully within a sub-region (a total of five tables), and 2) by populations that span across more than one sub-region (such as the Western Great Basin and Northern Great Basin Populations).
- ✓ Population Statistics: At the top of each table, there is a list of statistics relative to the population (or multiple populations that are solely within a sub-region). In order to provide context as to how the PACs correlate with the populations, this table provides the land status acre figures split by PPMA, PGMA, and Non-habitat for lands within the PACs and lands not within the PAC.
- ✓ Threats: The threats posed to each population are presented in the left-hand column of each table. The threats identified in this column are those threats cited as “present and widespread” in Table 2 of the USFWS’s 2013 Conservation Objectives Team (COT) Report. Although not identified as “present and widespread”, additional threats were addressed as they relate to the National Policy Team (NPT) allocation guidance.

Draft Internal Deliberative Document – Not for Distribution

- ✓ **Red text:** The red text indicates areas where the sub-regional ADPP allocation deviates from the NPT guidance provided to the sub-regional teams in April 2014. Rational as to why there is a deviation from the NPT guidance is also provided in red text in the right hand column of the table.
- ✓ **Green text:** The green text indicates areas where the Forest Service is deviating from the BLM's allocation or management direction to address that threat.
- ✓ **Purple text:** The purple text is only displayed in the Montana population for the Idaho/SW Montana ADDP and depicts where the BLM has different management decisions in Idaho and Montana.

Acronyms and Abbreviations List & BLM Land Use Plan (LUP) Allocations Cheat Sheet

Throughout the population summary tables, many sub-regional titles, allocation types, agency names, and other terms have been abbreviated. This list provides a description for all acronyms and abbreviations presented in the population summary tables. The BLM LUP Allocation Cheat Sheet lists all of the BLM LUP allocations specific to BLM program areas and provides a brief definition for each of these allocations (per BLM's Lands Use Planning Handbook H-1601-1).

Draft Internal Deliberative Document – Not for Distribution

Great Basin Region Federal Family Meeting Agenda

August 19-21, 2014 – BLM Oregon State Office, Portland, OR

Objectives of this Meeting

- Identify threats to Greater Sage-grouse (GRSG) for each PAC/population within the BLM/FS planning area as identified in the COT Report
- Determine how each BLM and FS plan addresses these threats through land use allocations and other conservation actions
- Discuss the adequacy of the land use allocation decisions and other conservation measures to address these threats and any changes in plans required to address inadequacies and/or inconsistencies in response
- Provide clear and specific guidance to develop draft final administrative plans that are adequate to address the threats to each GRSG population identified in the COT Report

DAY ONE – TUESDAY AUGUST 19, 2014

- 8:00 am **Welcome**
Jerry Perez, BLM Oregon State Director
- 8:05 am **Introductions**
Penny Mabie, Meeting Facilitator
- 8:10 am **Opening Remarks**
Neil Kornze, BLM Director
Noreen Walsh, USFWS Regional Director, Mountain-Prairie Region
Chris Iverson, USFS Deputy Regional Forester
Amy Lueders, BLM Nevada State Director
- 8:30 am **Process, Expectations, and Outcomes**
Jim Lyons, Deputy Assistant Secretary for Land and Minerals Management, DOI
Michael Bean, Counselor for Fish, Wildlife, and Parks, DOI
- 9:00 am **Agenda Review (Logistics)**
Penny Mabie, Meeting Facilitator
- 9:15 am **BLM Approach to Developing ADPP's**
Ed Roberson, BLM Assistant Director for Resources and Planning
- 9:25 am **Forest Service Approach to Developing their DPPA's**
Chris Iverson, USFS
- 9:40 am **Major Changes between BLM/FS DEIS' and ADPPs in Great Basin**
Lauren Mermejo, Great Basin Regional Project Manager
- 10:00 am 15 Minute Break**

Draft Internal Deliberative Document – Not for Distribution

10:15 am **5-Minute ADDP Overview by BLM State Directors**
NV - Amy Lueders, BLM NV State Director
CA - Jim Kenna, BLM CA State Director
OR - Jerry Perez, BLM OR State Director
UT - Juan Palma, BLM UT State Director
ID - Tim Murphy, BLM Acting ID State Director
MT - Jamie Connell, BLM MT State Director

11:00 am **Information Packet Orientation**
Frank Quamen, BLM-NOC Wildlife Biologist
Matt Mageletti, BLM- WO Planning

WAFWA Management Zone V

Review of Conservation Strategies for Populations solely within OR

11:15 am

- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**
Jim Lyons - ASLM
- ✓ **Review of present threats to this population**
Frank Quamen/Matt Mageletti
- ✓ **Discuss proposed responses to each threat and rationale**
Matt Mageletti, State Directors, and Project Leads
- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

12:00 pm 1 Hour Lunch

Review of Conservation Strategies for the Western Great Basin Population (NV/NE CA and OR)

1: 00 pm

- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**
Jim Lyons - ASLM
- ✓ **Review of present threats to this population**
Frank Quamen/Matt Mageletti
- ✓ **Discuss proposed responses to each threat and rationale**
Matt Mageletti, State Directors, and Project Leads
- ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- ✓ **Finalize changes (if any) in plans to address identified threats to each**

Draft Internal Deliberative Document – Not for Distribution

PAC/population and remaining issues in question

- ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

3:00 pm **Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie

3:30 pm 15 Minute Break

WAFWA Management Zone III

Review of Conservation Strategies for Populations solely within Utah

- 3:45 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone**
Jim Lyons - ASLM
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

5:45 pm **Close-out**
Penny Mabie, Meeting Facilitator

DAY TWO – WEDNSDAY AUGUST 20, 2014

8:00 am **Recap from day 1**
Penny Mabie, Meeting Facilitator

Continuation of WAFWA Management Zone III

Review of Conservation Strategies for Populations solely within Nevada

- 8:15 am
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

9:15 **Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie

9:45 am 15 Minute Break

WAFWA Management Zone IV

Review of Conservation Strategies for Populations solely within Idaho

- 10:00 am
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

12:00pm 1 Hour Lunch

Draft Internal Deliberative Document – Not for Distribution

Review of Conservation Strategies for Northern Great Basin Population (ID, NV/CA, and OR)

- 1:00 pm
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
- 2:30 pm** **15 Minute Break**
- 2:45 pm
- ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)
- 4:00 pm
- Validate outcomes for the entire WAFWA Management Zone**
Penny Mabie
- 5:00 pm
- Close-out**
Penny Mabie, Meeting Facilitator

DAY THREE – THURSDAY AUGUST 21, 2014

8:00 am **Recap from day 2**
Penny Mabie, Meeting Facilitator

Continuation of WAFWA Management Zone IV

Review of Conservation Strategies for Populations solely within Southwest Montana

- 8:15 am
- ✓ **Review of Threats to GRSG and Identified Treats to Populations in the Zone** *Jim Lyons - ASLM*
 - ✓ **Review of present threats to this population**
Frank Quamen/Matt Magaletti
 - ✓ **Discuss proposed responses to each threat and rationale**
Matt Magaletti, State Directors, and Project Leads
 - ✓ **Discuss adequacy of conservation actions to address threats, inconsistencies and/or other concerns**
Meeting Principals (Facilitated by Penny Mabie)
 - ✓ **Finalize changes (if any) in plans to address identified threats to each PAC/population and remaining issues in question**
 - ✓ **Identify and record specific change to relevant plans**
Meeting Principals (Facilitated by Penny Mabie)

9:15 am **Validate outcomes for the entire WAFWA Management Zone IV**
Penny Mabie, Meeting Facilitator

9:45 am 15 Minute Break

10:00 am **Adaptive Management, Mitigation and Monitoring**
Status by BLM State Directors Facilitated by Penny Mabie

11:00 am **Update on Coordination with States**
Status by BLM State Directors Facilitated by Penny Mabie

12:00 pm 1 Hour Lunch

1:00 pm **Next Steps with the States**
Jim Lyons, ASLM

1:45 pm **NRCS Sage Grouse Initiative Update with the States/Private Landowners**
Tim Griffiths, NRCS Sage Grouse Initiative Coordinator

2:15 pm **Schedule Discussion**
Ed Roberson, BLM
Noreen Walsh, USFWS

Draft Internal Deliberative Document – Not for Distribution

- 2:45 pm** **15 Minute Break**
- 3:00 pm **Outcome Summary and Follow-up Actions**
Penny Mabie, Meeting Facilitator
- 4:00 pm **Closing Remarks**
Jim Lyons, DOI
Ed Roberson, BLM
Noreen Walsh, USFWS
Chris Iverson, USFS

Great Basin Region Roll-Up Attendees:

- BLM States (12): State Directors: **Amy Lueders, Jerry Perez, Juan Palma, Jim Kenna, Tim Murphy and Jamie Connell**
Project Managers: Joe Tague, Joan Suther, Mike Haske, Quincy Bahr, Brent Ralston, John Carlson
 - BLM Regional (2): Lauren Mermejo and Johanna Munson
 - BLM WO/NOC (8): **Neil Kornze, Steve Ellis, Ed Roberson, Kathy Stangl, Frank Quamen, Joe Stout, Steve Small, and Matt Magaletti**
 - DOI (3) **Jim Lyons, Michael Bean, and Sarah Greenberger**
 - SOL (3): **Bret Birdsong, Ted Boling, and Sarah Shattuck**
 - USFS National (5): **Chris Iverson, Glen Stein and Madelyn Dillon**
Project Managers: Ron Rodriguez, Rob Mickelson
 - OGC (1): Kathryn Guillou Bergenholtz
 - FWS (11): **Noreen Walsh, Pat Deibert, Nicole Alt, Paul Henson, Dennis Mackey, Ted Koch, Mary Grim, Michael Fris, Terry Rabot, Larry Crist and Jesse Delia**
 - NRCS National (1): Tim Griffiths
 - Facilitator (1): Penny Mabie
 - EMPSI Rep (1): David Batts
- TOTAL: 48 (16 Principals at the table)**

Page intentionally left blank, please refer to
3 - Great Basin ADPP Map Packet (30 11" X 17" Maps)

4 – Population Summary Tables

- 4a – Oregon Sub-region (Populations 17 and 18)
- 4b – Population 31: Western Great Basin (Sub-regions NV/NE CA & OR)
- 4c – Utah Sub-region (Populations 9b 9c 10a 10b 11 12 13a 13b 13c 15a 15b and 26b)
- 4d – Nevada/Northeast California Sub-region (Populations 14, 15c, and 30)
- 4e – Idaho Portion of the Idaho/Southwestern Montana Sub-region (Populations 18, 23, 25, and 27)
- 4f – Population 26a: Northern Great Basin (Sub-regions Nevada/NE California, Idaho, and Oregon)
- 4g – Southwest Montana Portion of the Idaho/Southwestern Montana Sub-region (Populations 19-22)

Draft Internal Deliberative Document – Not for Distribution

6 - BLM LAND USE PLANNING PROGRAM AREA

ALLOCATIONS/DESIGNATIONS CHEAT SHEET

(Per H-1601-1 BLM Land Use Planning Handbook)

Livestock Grazing

- **Available:** areas where livestock grazing would be permitted under the criteria set forth in 43 CFR 4130.2(a).
- **Not Available:** areas where livestock grazing would not be permitted due (but not limited to) conflicts with other land uses, terrain/soil/vegetation/watershed characteristics, the presence of undesirable vegetation, and the presence of resources that require special management.

Recreation and Visitor Services

- **Recreation Management Areas (RMAs):** areas where Recreation and Visitor Services (R&VS) objectives are recognized as a primary resource management consideration and specific management is required to protect the recreation opportunities.
- **Special Recreation Management Areas (SRMAs):** RMAs managed to protect and enhance a targeted set of activities, experiences, benefits, and desired recreation setting characteristics. The SRMAs may be subdivided into recreation management zones (RMZ) to further delineate specific recreation opportunities.
- **Extensive Recreation Management Areas (ERMAs):** areas managed to support and sustain the principal recreation activities and the associated qualities and conditions of the ERMA. Management of ERMA areas is commensurate with the management of other resources and resource uses.
- **Public Lands Not Designated as RMAs:** area not designated as RMAs are managed to meet basic R&VS and resource stewardship needs. Recreation is not emphasized however recreation activities may occur. The R&VS are managed to allow recreation uses that are not in conflict with the primary uses of these lands.

Travel and Transportation

- **Open areas:** intensive OHV use areas where there are no special restrictions or where there are no compelling resource protection needs, user conflicts, or public safety issues to warrant limiting cross-country travel (see 43 CFR 8340.05).
- **Limited areas:** areas where OHV use must be restricted to meet specific resource management objectives. Examples of limitations include: number or type of vehicles; time or season of use; permitted or licensed use only; use limited to designated roads and trails; or other limitations if restrictions are necessary to meet resource management objectives, including certain competitive or intensive use areas that have special limitations (see 43 CFR 8340.05).
- **Closed areas:** areas closed to all vehicular use to protect resources, promote visitor safety, or reduce use conflicts (see 43 CFR 8340.05).

Lands and Realty (Land Tenure, ROWs, Solar and Wind)

- **Lands identified for disposal:** land or interest in lands that are available for disposal under a variety of disposal authorities, provided they meet the criteria outlined in FLPMA (Sales, Section 203, 43 U.S.C. 1713(a); Exchanges, Section 206, 43 U.S.C. 1716(a); and Reservation and Conveyance of Minerals, Section 209, 43 U.S.C. 1719(a)) or other statutes and regulations.
- **Lands identified for retention:** lands or interest in lands that will be retained under Federal ownership.
- **Lands identified for acquisition:** land or interest in lands that are suitable for acquisition under Federal ownership, based on acquisition criteria identified in the land use plan; FLPMA Section 205(b)).
- **Withdrawals (non-discretionary):** areas that have been transferred in total or partial jurisdiction to another Federal agency and/or areas closed (segregated) to operation of all or some of the public land laws and/or mineral laws. Withdrawals are only made by the President, the Secretary of the Interior, or other authorized officer of the Executive branch of the Federal government. BLM land use plans can only “recommend” areas for the Secretary of Interior to consider pursuing for withdrawal.
- **Utility corridors:** linear areas with the potential for at least one additional facility and thus can be considered a corridor (if not already designated) to minimize adverse environmental impacts and the proliferation of separate right-of-ways.
- **ROW Avoidance areas:** areas to be avoided but may be available for location of right-of-ways with special stipulations.
- **ROW Exclusion areas:** areas which are not available for location of right-of-ways under any conditions.

Coal

- **Unsuitable areas:** areas where coal leasing would not be permitted under the criteria set forth in 43 CFR 3461.5
- **Suitable areas:** areas found to be suitable for development by all mining methods or by only certain stipulated mining methods, such as surface or underground mining (see 43 CFR 3461).

Fluids (oil and gas, tar sands, and geothermal resources)

- **Open:** areas open to leasing with minor to no constraints, subject to existing laws, regulations, and formal orders; and the terms and conditions of the standard lease form.
- **Open with moderate constraints:** areas open to leasing, subject to moderate constraints. These are areas where it has been determined that moderately restrictive lease stipulations may be required to mitigate impacts. These stipulation include:
 - **Timing limitations (TL):** areas open to leasing but would be closed to surface disturbing activities during identified time frames. This stipulation

Draft Internal Deliberative Document – Not for Distribution

would not apply to operation and maintenance activities, including associated vehicle travel, unless otherwise specified.

- **Controlled Surface Use (CSU):** areas that are open to leasing but would require proposals for surface disturbing activities to be authorized only according to the controls or constraints specified.
- **Open with major constraints:** areas open to leasing, subject to major constraints. These are areas where it has been determined that highly restrictive lease stipulations are required to mitigate impacts.
 - **No Surface Occupancy (NSO):** areas open to leasing but surface disturbing activities cannot be conducted on the surface of the land. Access to oil and gas deposits would require horizontal drilling from outside the boundaries of the NSO areas. The NSO areas are avoidance areas for rights-of-way; no rights-of-ways would be granted in NSO areas unless there are no feasible alternatives.
- **Closed:** areas where it has been determined that other land uses or resource values cannot be adequately protected with even the most restrictive lease stipulations; appropriate protection can be ensured only by closing the lands to leasing.

Locatable Minerals

RMPs can only recommend areas for closure related to locatable exploration or development. Withdrawals are managed under the Lands and Realty program.

Mineral Materials

- **Open areas:** areas open to mineral material disposal (these areas are still subject to mitigation and RMP objectives).
- **Closed areas:** areas closed to mineral material disposal due to protection of natural resources within the planning area.

Non-energy Leasables

- **Open areas:** areas open to non-energy leasables (these areas are still subject to mitigation and RMP objectives).
- **Closed areas:** areas closed to non-energy leasables due to protection of natural resources within the planning area.

Wild Horse and Burro Management

- **Herd Areas (HAs) (non-discretionary):** areas of the public lands identified as being habitat used by wild horses and burros at the time of the passage of the Wild Horse and Burro Act, as amended (16 USC 1331).
- **Herd Management Areas (HMAs):** established only in HAs, within which wild horses and/or burros can be managed for the long term.
- **Herd Areas Not Designated as Herd Management Areas:** areas where horses/burros will be removed from all or part of a HA due to intermingled and unfenced lands within HAs where private landowners do not want to make them

available for wild horse or burro use; or essential habitat components are not available for wild horse or burro use within a HA.

- **Wild Horse and Burro Ranges:** all or portions of an HMA where there is a significant public value present, such as unique characteristics in a herd or an opportunity for public viewing.

Wilderness Characteristics

- **Lands with Wilderness Characteristics:** areas to be managed to protect or preserve wilderness characteristics (naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive recreation).

Special Designations

- **Areas of Critical Environmental Concern (ACECs):** areas that require special management to prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems. To qualify, the resources at risk must have substantial significance or values beyond local concerns.
- **Wilderness Study Areas (non-discretionary):** roadless areas of five thousand acres, identified during the inventory required by section 201(a) of the Wilderness Act as having wilderness characteristics. These areas are required to be managed to maintain their wilderness characteristics until Congress decides whether it should either be designated as wilderness or should be released for other purposes.
- **Eligible wild and scenic river segments:** river segments that are free flowing and, with its adjacent land area, possess one or more outstandingly remarkable values.
- **Scenic and Back Country Byways (non-discretionary):** byways that traverse remote country, providing solitude and spectacular scenery in landscape settings.
- **National Scenic, Historic, and Recreation Trails (non-discretionary):** trail segments established and designated by either the Secretary of the Interior or the Secretary of Agriculture, subject to the consent of the Federal agency, State, political subdivision, or other appropriate administering agency having jurisdiction over the lands involved.

Visual Resource Management (VRM)

- **VRM Class I:** areas that preserve the existing character of the landscape.
- **VRM Class II:** areas that retain the existing character of the landscape. The level of change should be low.
- **VRM Class III:** areas that partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate
- **VRM Class IV:** areas that provide for management activities which require major modifications of the existing character of the landscape. The level of change to the characteristic landscape can be high.

EMS TRANSMISSION
Information Bulletin No. ID-2014-⁵

To: Idaho Bureau of Land Management (BLM) Leadership Team, ~~Western Montana District Manager and Dillon Field Office Manager~~ *cc's Nav*

From: Idaho State Director

Subject: Idaho Southwestern Montana Greater Sage-Grouse (GRSG) Administrative Draft Proposed Plan (ADPP)

DD: 10/24/2014

Since December 2011, the BLM has been leading an effort to incorporate conservation measures as regulatory mechanisms into existing BLM and United States Forest Service (USFS) land use plans in response to the US Fish and Wildlife Service (USFWS) March 2010 finding on GRSG. The Idaho and Southwestern Montana sub region amendments are an integral component of the BLM National GRSG Planning Strategy and encompass the relevant BLM district and field offices and the National Forests which manage GRSG habitat within the sub region. Each BLM district has provided technical and specialist support to the Sub Regional Interdisciplinary Team (Team). This Team is composed of staff from the BLM, USFS, USFWS, Natural Resource Conservation Service, Idaho Department of Fish and Game, Montana Fish, Wildlife and Parks, and the Idaho Office of Species Conservation. Together this Team has worked collaboratively to develop a Draft Environmental Impact Statement with five (5) alternatives analyzed in detail, which identified two (2) alternatives as co-preferred – one developed by the Team and one developed by the State of Idaho for lands within the State of Idaho.

This Team has continued on to develop the attached Administrative Draft Proposed Plan (ADPP). The ADPP is the result of significant collaboration between the Federal, state and local partners, augmentation and refinement to respond to the USFWS Conservation Objectives Team Report (March 2013), coordination and direction with the BLM, Forest Service and USFWS National Policy Team, regional coordination involving the Department of the Interior, Western Association of Fish and Wildlife Agencies and the Western Association of Governors. The ADPP represents the culmination of this coordination. It contains direction that is consistent with the USFWS Conservation Objectives Team Report and the National Policy Team Guidance. Many of the management actions reflect direction that is national or regional in scope with

limited or no flexibility for local or sub regional adjustment; other management actions are more specific to the Idaho and Southwestern Montana effort with a greater flexibility for refinement. Representatives of your staff have been involved throughout the development of this ADPP and their input has served to identify issues and concerns, as well as provide suggestions and solutions to resolve many of those concerns.

The ADPP reflects a shift of management in GRSG habitats and will lead to changes in the way the BLM does business in those areas. As the amendment effort moves closer to conclusion the Team is focusing more energy on implementation consideration and direction. A preliminary Implementation Guide is being developed, a draft of which will be included in the Final Environmental Impact Statement and is intended to be finalized after release of the final amendment decision(s). To help develop this guide a series of BLM and USFS staff workshops are contemplated and will likely occur early in calendar year 2015 for each BLM district office area. These workshops will step through the potential planning decisions and discuss approaches and processes for implementation that will be used to develop the final guide. We encourage your review and understanding of the ADPP, in preparation for those meetings. If you, or your staff, have questions or substantive comments on the ADPP, please contact Brent Ralston, Greater Sage-Grouse Planning Lead, prior to October 24, 2014.

The participation and involvement of your staff has been a significant factor in success of this effort thus far. Revision of 29 land use plans across 11 million Federal acres within the sub region has been a massive undertaking, and the contributions of your staff have come at the expense of other work on the district. The amendment effort is nearing completion and the even more important job of implementation is looming. Your continued support and attention to helping develop the Implementation Guide will be instrumental to ensure the success of on-the-ground actions to conserve GRSG into the future.

Timothy M. Murphy

The Idaho and Southwestern Montana sub region amendments are an integral component of the BLM National GRSG Planning Strategy and encompass the relevant BLM district and field offices and the National Forests which manage GRSG habitat within the sub region. Each BLM district has provided technical and specialist support to the Sub Regional Interdisciplinary Team (Team). This Team is composed of staff from the BLM, USFS, USFWS, Natural Resource Conservation Service, Idaho Department of Fish and Game, Montana Fish, Wildlife and Parks, and the Idaho Office of Species Conservation. Together this Team has worked collaboratively to develop a Draft Environmental Impact Statement with five (5) alternatives analyzed in detail, which identified two (2) alternatives as co-preferred – one developed by the Team and one developed by the State of Idaho for lands within the State of Idaho.

This Team has continued on to develop the attached Administrative Draft Proposed Plan (ADPP). The ADPP is the result of significant collaboration between the Federal, state and local partners, augmentation and refinement to respond to the USFWS Conservation Objectives Team Report (March 2013), coordination and direction with the BLM, Forest Service and USFWS National Policy Team, regional coordination involving the Department of the Interior, Western Association of Fish and Wildlife Agencies and the Western Association of Governors. The ADPP represents the culmination of this coordination. It contains direction that is consistent with the USFWS Conservation Objectives Team Report and the National Policy Team Guidance. Many of the management actions reflect direction that is national or regional in scope with limited or no flexibility for local or sub regional adjustment; other management actions are more specific to the Idaho and Southwestern Montana effort with a greater flexibility for refinement.

Representatives of your staff have been involved throughout the development of this ADPP and their input has served to identify issues and concerns, as well as provide suggestions and solutions to resolve many of those concerns.

The ADPP reflects a shift of management in GRSG habitats and will lead to changes in the way the BLM does business in those areas. As the amendment effort moves closer to conclusion the Team is focusing more energy on implementation consideration and direction. A preliminary Implementation Guide is being developed, a draft of which will be included in the Final Environmental Impact Statement and is intended to be finalized after release of the final amendment decision(s). To help develop this guide a series of BLM and USFS staff workshops are contemplated and will likely occur early in calendar year 2015 for each BLM district office area. These workshops will step through the potential planning decisions and discuss approaches and processes for implementation that will be used to develop the final guide. We encourage your review and understanding of the ADPP, in preparation for those meetings. If you, or your staff, have questions or substantive comments on the ADPP, please contact Brent Ralston, Greater Sage-Grouse Planning Lead, prior to October 24, 2014.

The participation and involvement of your staff has been a significant factor in success of this effort thus far. Revision of 29 land use plans across 11 million Federal acres within the sub region has been a massive undertaking, and the contributions of your staff have come at the expense of other work on the district. The amendment effort is nearing completion and the even more important job of implementation is looming. Your continued support and attention to helping develop the Implementation Guide will be instrumental to ensure the success of on-the-ground actions to conserve GRSG into the future.

Idaho/sw Montana FEIS Maps: Rationale for Differences between Alternative D (BLM/FS), E (State of Idaho) and G (Proposed Plan) Maps

Overview: The preparation of the Alternative D (BLM/FS Alternative) GRSG map involved modeling of Preliminary Priority and Preliminary General Habitat (PPH/PGH) by Idaho BLM using available GRSG lek data, Breeding Bird Density and Lek Connectivity Models, available winter habitat and additional refinements using available land use or vegetation data (e.g., agriculture, timber), and as well as expert opinion and additional local data. The Southwest Montana GRSG areas were refined by Montana BLM based on modeling and map refinements previously completed by Montana Fish, Wildlife and Parks, based on their Core area designations. For the Utah portion of the Sawtooth National Forest, BLM/FS adopted Utah BLM's designation for that area.

For Alternative E, the Idaho Governor's Sage-Grouse Task Force re-configured the initial BLM PPH/PGH data to create three categories of Management Zones (Core, Important, General), using additional information, in order to provide a map with greater management flexibility and decision space both for GRSG conservation and land use opportunities.

During review of the DEIS, concerns were expressed by agency personnel and others that due to the broad scale nature of the initial analysis, certain portions of the Alt D and/or E maps still encompassed some areas of non-habitat, such as timber or farm lands; or they were missing some areas of potential restoration or other locally definable areas or habitat; or were designated inappropriately as Core and/or Important.

In preparation for the Proposed Plan, BLM and FS adopted the State of Idaho's suggestion to incorporate the three GRSG Management Zone concept for Idaho. To resolve map disparities between Alternatives D and E, and to provide more recognizable boundaries of Management Zones on the ground, BLM and FS worked closely with field personnel in December 2013, using the State's Alternative E map as a starting point, but informed with Alt D as well as local expertise. This process had not occurred during preparation of either the Alt D or E maps for the DEIS, due to time limitations. During the winter and spring of 2014 BLM and FS also worked closely with the State of Idaho and U.S. Fish and Wildlife Service (Idaho Fish and Wildlife Office, Boise) in re-evaluating the Core, Important or General Management Zone designations of Alt E, in order to move forward with a mutually agreeable map for the Proposed Plan (Alternative G). The final Proposed Plan map product, arose from a number of adjustments to Alt E, summarized as follows:

- Some additional areas in south-central Idaho, Mountain Home and the Weiser area were added as General Management Zones, that were not reflected in the Alt D or E maps in the DEIS. These generally were annual grassland areas, from the Idaho "Key Habitat Map" that had been previously excluded from the initial PPH/PGH model; or were based on additional imagery. These areas have restoration potential to GRSG habitat, or involve past or ongoing restoration efforts therefore were incorporated into the Alt G map, based on recommendations from the field.
- "Donut holes" of habitat inside of a larger matrix were classified the same as the surrounding matrix.

- Snapping of Core, Important, or General Management Zones to meaningful edges or features (canyons, allotment/pasture boundaries, roads etc.) was completed at the field level to facilitate use of the map designations at the field level.
- Changes in Management Zone designations for portions of certain Core, Important or General zones from Alternative E. This led to some minor changes from the original GRSG Priority Areas for Conservation (PAC) boundaries.

Specific Details by Geographic Area:

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
WEST OWYHEE				
	Mountain tops in the Owyhee Mtns.	Field recommended including the top of mountains, previously mapped as non-habitat, as General. Some local records of bird use; likely some summer use	Left mountain tops as <u>non-habitat</u> . Difficult to justify as General based on nominal bird use and limited other information. No known lek or winter habitat.	A = 127,468 acres Is the total of non-habitat mountain tops
	Juniper encroachment surrounding Owyhee mountains	Field recommended classifying as Important due to potential for juniper control efforts and habitat improvement. No leks or winter habitat in vicinity.	Kept as <u>General</u> . Difficult to justify as "Important" due to general lack of leks/nest habitat or winter habitat in that zone. Juniper work should probably focus on juniper encroachment in adjacent Core areas. General designation does not preclude restoration work, if otherwise justified.	B = 228,840 acres Is the total number of General Habitat in this area
	Owyhee front	This was a large oblong area recommended by the field to be changed from Important (as in Alt E) to Core, along the Owyhee Front. The majority of the area is overlain by recently modeled winter habitat and also encompasses a	Multiple discussions with the State and US FWS led to a delineation where much of the Owyhee Front remained as Important, with an additional area of Core (~25,000 ac) identified that	C = 550,109 acres Area of Important in the Owyhee Front

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
		number of occupied and undetermined status leks and nesting habitat. BLM also had concerns with protecting connectivity.	overlaid a cluster of leks and nesting/winter habitat. Area maintained as Important has fewer and smaller leks.	
SOUTHERN				
	Jarbidge FO	Field recommended removal of General habitat at north end of FO that burns repeatedly and modification of some Core to Important in southern 1/3 of the area.	Adopted recommendation for final map.	D = 232,331 acres Habitat Removed
	Burley FO-South Hills	Field recommended changing Core in west half or so of the South Hills to Important, based on existing infrastructure, recreation activity. Also included and important area of winter habitat west of Oakley as Core and added some General to Middle Mountain area.	Adopted recommendations a noted. Also retained Goose Creek area as <u>Important</u> as in Alt E.	E1 = 39,260 acres SouthHills E2 = 5,283 acres Core E3 = 26,174 acres Goose Creek Area as General
	Burley FO-Jim Sage	Field recommended making part of Jim Sage Core; additional edits to Important and General.	Majority of Jim Sage mapped as Important. Proposed Core was small area not readily implementable.	F = 47,629 acres Important in Jim Sage
	Burley FO-	Field added some	Adopted	G = 14,279

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
	Cotterel	Important patches to top of Cotterels.	recommendation.	acres Important on Cotterel Mountains
	Burley FO-No Mans/Basalt; North of Interstate area.	Field recommended removing the General habitat that extends from the north end of the Cotterels to Lake Walcott. There has been no known GRSG use for many years.	Adopted recommendation.	H = 137,827 acres Total of non-habitat
	Pocatello FO-Bear Lake	Field cleaned up slivers and added some Core. Recommended dropping the larger "U" shaped area of General. Recommended two smaller polygons of I and G north of Bear Lake be Core.	Retained the U shaped area as General habitat as there are two leks just to south. The polygons north of Bear Lake were designated "Important".	I1 = 23,448 acres I2 = 39,249 acres Important N of bear lake
	Pocatello FO-Curlew area	Some additions/revisions to I and G.	Adopted recommendations.	J = 74,820 Habitat change from G to I
MOUNTAIN VALLEY				
	Weiser	Field recommended adding substantial areas of Core and Important as well as additional, previously unmapped General based on additional scrutiny of imagery and lek information.	Keep <u>entire</u> area as <u>General</u> as shown in Alt E. Added in some additional General in SW portion based on imagery and adjacency to existing habitat. Size and number of leks did not justify proposed	K = 176,838 acres General added in the South

Conservation Area	Geographic Area	Initial Recommendation (BLM/FS field)	Final Decision and Rationale	Location and Acres
			designation.	
	Challis	Field did extensive, detailed work edge snapping. Added some new General; changed a large area from Important (Alt E) to Core, per leks, uniqueness/isolated nature of area and connectivity with Moyer Basin to north.	Adopted the edge snapping and addition of General. Uniqueness and isolated nature is not a characteristic considered in the classification.	L = 163,012 acres General habitat
DESERT				
	Mountain Home	Field recommended certain "Restoration Type 2" (cheatgrass) areas shown on the "Key Habitat Map" be classified as Important. No leks. Adjacent to Interstate. Nesting habitat and winter habitat (in north half).	Adopted the addition of the R2 but classified as <u>General</u> . Since it is R2 (cheatgrass), it was difficult to justify as Important without more compelling information.	M = 40,485 acres General added
	Wild Horse	Large area not on Alt D or E maps, but currently mapped as R2 (annual grassland) per the Key habitat map has ongoing restoration focus by Shoshone Field Office. Field recommended this area be added as Important. No significant lek presence (only one, small to south); majority is in between mapped winter areas.	Adopted addition of the R2 areas, but classified as <u>General</u> . Could be upgraded in future if restoration efforts show progress and GRSG use, but not justified as Important at this time.	N = 39,000 acres General Added
	Core area in Shoshone FO	Some additional Core added by edge snapping exercise.	Adopted recommendation.	O = 78,604 acres
	Southern Big Desert area	Field recommended adding southern Big Desert area as Core due to leks, connectivity with Craters Nat. Monument core to the	Adopted S. Big Desert area as Important, adding to the overall area of PACs. Number and size of leks did not	P1 = 328,796 acres Important South Desert

Round #2
Made the changes JWight recommended.

Does any of the "removed" habitat in the Salmon-Challis NF need to be re-designated?

Let me know if anyone notices anything that needs to be changed

On Wed, Oct 8, 2014 at 1:10 PM, Cooper, Travis <tcooper@blm.gov> wrote:
Take a look at the PDF. I changed all "removed" habitat in Upper Snake to General, weather it was priority, Medial, or general in Alternative D.
Using the mark up tools on the PDF, circle areas that need to be changed, edited or re-designated on the PDF. Indicate which areas in Salmon and Challis also, if any.

Also per DMajor, make sure areas that were designated as Non-Habitat in Alt G stay Non-Habitat in Alt G.

We can do this 2 or 3 time and hopefully get to where we think it needs to be

Hello Everyone,

Attached are the responses to the questions we received on the original GRSG Proposed Plan Amendment Ch. 2 Template, as well as the updated Ch. 2 Template (reflecting changes based on the questions we received). Please use this version of the template.

Thank you all for your questions. If you have any further questions, please let me know.

Thanks,

CHAPTER 2

PROPOSED ACTION AND ALTERNATIVES

NOTE: This template includes all applicable references to Forest Service. Any reference to Forest Service will need to be removed from sub-regional plans that do not have a Forest Service component. This template is also written under the direction of having two (2) Proposed Plans (one for BLM and one for Forest Service). The template will need to be revised accordingly if including only one Proposed Plan (BLM).

This template also includes placeholders and notes highlighted in yellow for sub-regions to complete/address.

2.1 SUBSTANTIAL CHANGES BETWEEN THE DRAFT EIS AND FINAL EIS

[NOTE: select one of the following two options depending on how sub-region proposed plan was developed]

[OPTION 1: Proposed Plan = new alternative] As a result of public comments, best science, cooperating agency coordination, and internal review of the Draft LUPA/EIS, the BLM and Forest Service have developed the Proposed Plan/LUPA for managing BLM-administered and National Forest System lands within the XX [NOTE: insert sub-regional planning area]. Alternative X (the Preferred Alternative) from the Draft LUPA/EIS has not been selected. Rather the Proposed Plan/LUPA consists of a combination of various management actions from all the alternatives and is now considered the Proposed LUPA for managing BLM-administered and National Forest System lands within the X [NOTE: insert sub-regional planning area]. The Proposed Plan/LUPA focuses on addressing public comments, while continuing to meet the BLM's and Forest Service's legal and regulatory mandates.

[OPTION 2: Proposed Plan = modified Preferred Alternative] As a result of public comments, best science, cooperating agency coordination, and internal review of the Draft LUPA/EIS, the BLM's and Forest Service's Preferred Alternative, identified as Alternative X in the Draft LUPA/EIS, has been modified and is now the Proposed Plan/LUPA for managing BLM-administered and National Forest

System lands within the **XX** [NOTE: insert sub-regional planning area]. The Proposed Plan/LUPA focuses on addressing public comments, while continuing to meet the BLM's and Forest Service's legal and regulatory mandates.

[BOTH OPTIONS include the following] Changes to the alternatives between the Draft EIS and Final EIS are [NOTE: include bulleted summary list of substantial changes to Chapter 2 between DEIS and FEIS]:

- **Chapter 2** has been reorganized for consistency between all sub-regional GRSG LUPAs/EISs.
- The GRSG adaptive management plan has been further defined in **Section 2.6.1**, Adaptive Management.
- The GRSG monitoring strategy has been further defined in **Section 2.6.2**, Monitoring for the Greater Sage-grouse Planning Strategy, and **Appendix X** of the Final EIS.
- The GRSG mitigation strategy has been further defined in **Section 2.6.3**, Regional Mitigation, and **Appendix X** of the Final EIS.
- Disturbance [NOTE: describe changes related to disturbance]
- The Forest Service Proposed Plan is now a stand-alone Proposed Plan in the FEIS.
- [NOTE: provide a summary of the difference in PPMA, PGMA, PHMA and GHMA nomenclature between draft and final and compare to your state plan nomenclature. i.e. Core]
- Others? [NOTE: include other major changes]

2.2 INTRODUCTION

The LUPA/EIS complies with NEPA, which directs the BLM and Forest Service to “study, develop, and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources...” (NEPA Section 102[2][e]). At the heart of the alternative development process is the required development of a reasonable range of alternatives. Public and internal (within BLM and Forest Service) scoping (see **Section I.X**, Scoping and Identification of Issues for Development of the Proposed Plan and Draft Alternatives) identified issues that present opportunities for alternative courses of action, while the purpose and need for action described in **Section I.X**, Purpose and Need, provides sideboards for determining “reasonableness.”

This chapter introduces and details the Proposed Plan. The Proposed Plan is a mix of management actions selected from the range of alternatives in the Draft LUPA/EIS and is based on best science, public scoping comments, public comments on the Draft LUPA/EIS and internal agency discussion. The alternatives that were in the Draft LUPA/EIS are also included in this chapter. These include the No Action Alternative, which would continue the existing

policies of the BLM and Forest Service; X [NOTE: insert # of alternatives accordingly] action alternatives; and the alternatives considered but eliminated from detailed analysis.

The identification of the Preferred Alternative in the Draft LUPA/EIS did not constitute a commitment or decision in principle, and there is no requirement to select the Preferred Alternative or any of the separate alternatives presented in the Draft LUPA/EIS in the Final LUPA/EIS as the Proposed Plan. The BLM and Forest Service have the discretion to select any of the alternatives as their Preferred Alternative in the Draft LUPA/EIS. The agencies also have the discretion to modify the Preferred Alternative between the Draft EIS and the Final EIS into the Proposed Plan. The modifications are allowable as long as the actions presented in the Proposed Plan within the Proposed LUPA/Final EIS were analyzed somewhere in the Draft EIS. The various parts of the separate alternatives that were analyzed in the Draft EIS can be “mixed and matched” to develop an alternative – known as the Proposed Plan - in the Final EIS, as long as the reasons for doing so are explained (40 CFR 1506.2(b)).

2.3 INTRODUCTION TO DRAFT ALTERNATIVES

LUP decisions consist of identifying and clearly defining goals and objectives (desired outcomes) for resources and resource uses, followed by developing allowable uses and management actions necessary for achieving the goals and objectives. These critical determinations guide future land management actions and subsequent site-specific implementation actions to meet multiple use and sustained yield mandates while sustaining land health.

2.3.1 Components of Alternatives

Goals are broad statements of desired (LUP-wide and resource- or resource-use-specific) outcomes and are not quantifiable or measurable. Objectives are specific measurable desired conditions or outcomes intended to meet goals. Goals and objectives can vary across alternatives, resulting in different allowable uses and management actions for some resources and resource uses. Forest Service objectives are also time specific.

Management actions and allowable uses are designed to achieve objectives. Management actions are measures that guide day-to-day and future activities. Allowable uses delineate which uses are permitted, restricted, or prohibited, and may include stipulations or restrictions. Allowable uses also identify lands where specific uses are excluded to protect resource values, or where certain lands are open or closed in response to legislative, regulatory, or policy requirements. Implementation decisions are site-specific on-the-ground actions and are typically not addressed in LUPs.

On National Forest System lands, forest plans guide management activities and contain desired conditions and objectives as well as standards and guidelines that provide direction for project planning and design. Desired conditions are descriptions of specific social, economic, and/or ecological characteristics of the

plan area, or a portion of the plan area, toward which management of the land and resources should be directed. Standards are mandatory constraints on project and activity decision making. Not meeting a standard would require a site-specific forest plan amendment. A guideline is a constraint on project and activity decision making that allows for departure from its terms, so long as the purpose of the guideline is met.

2.3.2 Purpose of Alternatives Development

Land use planning and NEPA regulations require the BLM and Forest Service to formulate a reasonable range of alternatives. Alternative development is guided by established planning criteria (as outlined for the BLM at 43 CFR 1610) (see **Chapter I**).

The NEPA regulations at 40 CFR Part 1501.2(c) state that Federal agencies shall: “Study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflict concerning alternatives uses of available resources....”

The basic goal of alternative development is to produce distinct potential management scenarios that:

- Address the identified major planning issues;
- Explore opportunities to enhance management of resources and resource uses;
- Resolve conflicts among resources and resource uses; and
- Meet the purpose of and need for the LUP or LUPA.

Pursuit of this goal provides the BLM, Forest Service, and the public with an appreciation for the diverse ways in which conflicts regarding resources and resource uses might be resolved, and offers the decision maker a reasonable range of alternatives from which to make an informed decision. The components and broad aim of each alternative considered for the X [NOTE: insert sub-regional plan name] are discussed below.

2.4 ALTERNATIVE DEVELOPMENT PROCESS FOR THE X [NOTE: INSERT SUB-REGION NAME] GREATER SAGE-GROUSE LAND USE PLAN AMENDMENT

The X [NOTE: insert sub-regional plan name] planning team employed the BLM planning process (outlined in **Section I.X**, Planning Process) to develop a reasonable range of alternatives for the LUPA/EIS. The BLM and Forest Service complied with NEPA and the CEQ implementing regulations at 40 CFR Part 1500 in the development of alternatives for this Proposed LUPA/EIS, including seeking public input and analyzing reasonable alternatives. Where necessary to meet the planning criteria, to address issues and comments from cooperating agencies and the public, or to provide a reasonable range of alternatives, the alternatives include management options for the planning area that would

modify or amend decisions made in the applicable LUP. Since this LUPA/EIS will specifically address GRSG conservation, many decisions within existing LUPs that do not impact GRSG are acceptable and reasonable; in these instances, there is no need to develop alternative management prescriptions.

Public input received during the scoping process was considered to identify significant issues deserving of detailed study to help identify alternatives. The planning team developed planning issues to be addressed in the LUPA/EIS, based on broad concerns or controversies related to conditions, trends, needs, and existing and potential uses of planning area lands and resources. All comments were reviewed to determine whether they identified significant issues or unresolved conflicts.

2.4.1 Develop a Reasonable Range of Alternatives

Based on scoping and collaboration efforts, the BLM and Forest Service finalized their planning criteria and identified X [NOTE: insert #] key planning issues to help frame the alternatives development process. Following the close of the public scoping period in X [NOTE: insert date], the BLM and the Forest Service began the alternatives development process. Between X and X 2012 [NOTE: insert date range], the planning team (BLM, Forest Service, and cooperating agencies) met to develop management goals and to identify objectives and actions to address the goals. The various groups met numerous times throughout this period to refine their work. As outcomes of this process, the planning team [NOTE: bullets below provide examples, revise bullets accordingly to match sub-regional alternatives]:

- Developed one No Action Alternative (Alternative A) and X [NOTE: insert #] preliminary action alternatives. The first action alternative (Alternative B) is based on *A Report on National Greater Sage-Grouse Conservation Measures* (NTT 2011).
- Two alternatives (Alternatives C and F) are based on a proposed alternatives submitted by conservation groups.
- Customized the goals, objectives, and actions from the NTT-based alternative (Alternative B) to develop a third action alternative (Alternative D) that strives for balance among competing interests.
- Incorporated proposed GRSG protection measures recommended by state governments as a fifth alternative (Alternative E).

Each of the preliminary action alternatives in the Draft LUPA/EIS was designed to:

- Address the X [NOTE: insert #] planning issues (identified in **Section I.X.X**);
- Fulfill the purpose and need for the LUPA (outlined in **Section I.X**, Purpose and Need); and

- Meet the multiple use mandates of the FLPMA (43 CFR 1716), MUSYA and NFMA.

2.4.2 Resulting Range of Alternatives in Draft LUPA/EIS

The X [NOTE: insert #] resulting action alternatives (Alternatives X, X, X, X, X, and X) [NOTE: insert alternative IDs] in the Draft LUPA/EIS offer a range of management approaches to maintain or increase GRSG abundance and distribution of GRSG by conserving, enhancing, or restoring the sagebrush ecosystem upon which GRSG populations depend in collaboration with other conservation partners. While the goal is the same across all the alternatives, each alternative contains a discrete set of objectives and management actions constituting a separate LUPA. The goal is met in varying degrees, with the potential for different long-range outcomes and conditions.

The relative emphasis given to particular resources and resource uses differs as well, including allowable uses, restoration measures, and specific direction pertaining to individual resource programs. When resources or resource uses are mandated by law or are not tied to planning issues, there are typically few or no distinctions between alternatives.

The meaningful differences among the alternatives are described in **Section 2.8**, Comparison of Proposed Plan Amendment and Draft Alternatives. **Section 2.9**, Detailed Description of Draft Alternatives, also provides a complete description of the proposed decisions for each alternative, including the project goal and objectives, management actions, and allowable uses for individual resource programs. Maps and figures in **Appendix X** provide a visual representation of differences between alternatives. In some instances, varying levels of management overlap a single area, or polygon, due to management prescriptions from different resource programs. In instances where varying levels of management prescriptions overlap a single polygon, the stricter of the management prescriptions would apply.

2.4.3 Selection of and Rationale for Identifying the Preferred Alternative

The BLM and Forest Service selected Alternative X as its preferred alternative, which was presented in the Draft RMP/EIS, released in X [NOTE: insert date]. The BLM and Forest Service selected the preferred alternative based on interdisciplinary team recommendations, environmental consequences analysis of the alternatives, cooperating agency input, and public input during scoping.

[NOTE: provide narrative discussion why specific alternatives **were not** selected as the preferred alternative]

[NOTE: provide narrative discussion why specific alternatives **were** selected as the preferred alternative]

See **Section 2.6.1**, Development of Proposed LUPA, for a discussion of the how the Proposed Plan Amendments were developed.

2.5 BLM/FOREST SERVICE RESOURCE PROGRAMS FOR ADDRESSING GRSG THREATS

The action alternatives are directed towards responding to USFWS-identified issues and threats to GRSG and its habitat. The USFWS threats do not necessarily align with BLM and Forest Service resource program areas, and are often integrated into several different agency resource program areas. **Table 2-X**, USFWS and COT Report Identified Threats to GRSG and Their Habitat and Applicable BLM and Forest Service Resource Program Areas, provides a cross-walk between each of the USFWS listing decision and COT identified threats and the BLM and the Forest Service resource program areas and shows how those threats were addressed in the BLM and the Forest Service land use plan.

2.6 PROPOSED PLAN AMENDMENT

2.6.1 Development of Proposed LUPA

[NOTE: select one of the following two options depending on how sub-region proposed plan was developed]

[OPTION 1: Proposed Plan = new alternative] As a result of public comments, best science, cooperating agency coordination, and internal review of the Draft LUPA/EIS, the BLM and Forest Service have developed the Proposed Plans/LUPAs in the Proposed LUPA/Final EIS. The Proposed Plans/LUPAs do not carry forward Alternative **X** (the Preferred Alternative) from the Draft LUPA/EIS. Rather the Proposed Plans/LUPAs consist of a combination of all the alternatives and are now considered the Proposed LUPAs for managing BLM-administered and National Forest System lands within the **X** *[NOTE: insert sub-regional planning area]*. The Proposed Plans/LUPAs focus on addressing public comments, while continuing to meet the BLM's and Forest Service's legal and regulatory mandates.

[OPTION 2: Proposed Plan = modified Preferred Alternative] As a result of public comments, best science, cooperating agency coordination, and internal review of the Draft LUPA/EIS, the BLM's and Forest Service's Preferred Alternative, identified as Alternative **X** as presented in the Draft LUPA/EIS, has been modified and are now considered the Proposed Plans/LUPAs for managing BLM-administered and National Forest System lands within the **XX** *[NOTE: insert sub-regional planning area]*. The Proposed Plans/LUPAs focus on addressing public comments, while

continuing to meet the BLM's and Forest Service's legal and regulatory mandates.

2.6.2 BLM Proposed Plan Amendment

The proposed plan incorporates the following GRSG goals:

- Conserve, enhance, and restore the sagebrush ecosystem upon which Greater Sage-Grouse populations depend in an effort to maintain and/or increase their abundance and distribution, in cooperation with other conservation partners.
- **ADD OTHERS FROM EACH SUBREGION**

[NOTE: Provide a full description or table of the BLM proposed plan. Use the following headings (can have subheadings). These headings meet GRSG3 and LUP Handbook, Appendix C.]

- **Special Status Species**
 - GRSG
 - Objectives
 - Actions (predation if applicable)
 - T&E and other SSS, if applicable
- **Vegetation**
 - Sagebrush-steppe
 - Conifer encroachment
 - Invasive Species (e.g., cheat grass)
 - Riparian and Wetlands
 - Climate Change
- **Wildland Fire Management**
 - Pre-suppression
 - Suppression
 - Fuels Management
 - Post Fire Management
- **Livestock Grazing**
 - Grazing actions
 - Facilities
- **Wild Horses and Burros**
- **Lands and Realty**

- Land Tenure
- Solar and Wind
- Major Transmission Line and Pipeline ROWs
- Other ROWs
- Withdrawals (*no withdrawals are being proposed – use standard language*)
- **Minerals** (*NOTE: address direction for fee lands and split estate as appropriate*)
 - Fluid Minerals (oil, gas, and geothermal)
 - Unleased fluid mineral estate
 - Leased fluid mineral estate
 - Locatable Minerals
 - Mineral Materials (Saleable Minerals)
 - Non-energy Leasable Minerals
- **Coal (if applicable to the Sub-region)**
- **Comprehensive Trails and Travel Management**
- **Recreation and Visitor Services**
- **Special Designations**
- **OTHER DIRECTIONS; e.g., Tribal Interests**

RDFs are means, measures, or practices intended to reduce or avoid adverse environmental impacts. This LUPA/EIS proposes a suite of design features that would establish the minimum specifications for water developments, certain mineral development, and fire and fuels management and would mitigate adverse impacts. These design features would be required to provide a greater level of regulatory certainty than through implementing BMPs.

In general, the design features are accepted practices that are known to be effective when implemented properly at the project level. However, their applicability and overall effectiveness cannot be fully assessed except at the project-specific level when the project location and design are known. Because of site-specific circumstances, some features may not apply to some projects (e.g., when a resource is not present on a given site) or may require slight variations from what is described in the LUPA/EIS (e.g., a larger or smaller protective area). All variations in design features would require appropriate analysis and disclosure as part of future project authorizations. Additional mitigation measures may be identified and required during individual project development and environmental review. The proposed RDFs are presented in

Appendix X, Greater Sage-Grouse Habitat Required Design Features and Best Management Practices.

2.6.3 Forest Service Proposed Plan Amendment

[NOTE: Provide a full description or table of the Forest Service proposed plan]

2.7 ADAPTIVE MANAGEMENT, MONITORING, AND MITIGATION

[NOTE: provide description of what alternatives each of these apply towards]

2.7.1 Adaptive Management Plan

Adaptive management is a decision process that promotes flexible resource management decision making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood. Careful monitoring of these outcomes both advances scientific understanding and helps with adjusting resource management directions as part of an iterative learning process. Adaptive management also recognizes the importance of natural variability in contributing to ecological resilience and productivity. It is not a 'trial and error' process, but rather emphasizes learning while doing. Adaptive management does not represent an end in itself, but rather a means to more effective decisions and enhanced benefits.

In relation to the BLM/Forest Services' National Greater Sage-grouse Planning Strategy, adaptive management will help identify if sage grouse conservation measures presented in this EIS contain the needed level of certainty for effectiveness. Principles of adaptive management are incorporated into the conservation measures in the plan to ameliorate threats to a species, thereby increasing the likelihood that the conservation measure and plan will be effective in reducing threats to that species. The following provides the BLM/Forest Service's adaptive management strategy for the **X** [NOTE: insert name of sub-regional/amendment].

Adaptive Management and Monitoring

This EIS contains a monitoring framework plan (**Appendix X**) that includes an effectiveness monitoring component. The agencies intend to use the data collected from the effectiveness monitoring to identify any changes in habitat conditions related to the goals and objectives of the plan and other range-wide conservation strategies (US Department of the Interior 2004; Stiver et al. 2006; U.S. Fish and Wildlife Service 2013). The information collected through the Monitoring Framework Plan outlined in **Appendix X** will be used by the BLM/Forest Service to determine when adaptive management hard and soft triggers (discussed below) are met.

[NOTE: If a state adaptive management strategy exists or is in the process of being developed, insert a summary here explaining this state (s) strategy and how it corresponds with what is proposed in this plan. If the strategy is complex, simply place the information into an appendix and reference that appendix here.]

If a state adaptive management strategy has not been established, describe this planning area's commitment to work with state partners to create a group that is responsible for recommending adaptive management trigger responses to the appropriate Federal agency and for identifying what the causal factors are that have led to hitting the hard trigger. This group should at a minimum, contain membership from BLM, USFWS, Forest Service, and state representatives. If necessary, this group can reach out to the USGS, NRCS, and other Federal/state/tribal agencies for added information.]

Adaptive Management Triggers

Soft Triggers

Soft triggers represent an intermediate threshold indicating that management changes are needed at the project/implementation level to address habitat and population losses. If a soft trigger is identified, the BLM/Forest Service will apply more conservative or restrictive implementation conservation measures to mitigate for the specific causal factor in the decline of populations and/or habitats, with consideration of local knowledge and conditions. For example, monitoring data within an already federally authorized project area within a given GRSG population area indicates that there has been a slight decrease in GRSG numbers in this area. Data also suggests the decline may be attributed to GRSG collisions with monitoring tower guy-wires from this federally authorized project. BLM then receives an application for a new tower within the same GRSG population area. The response would be to require the new authorization's tower guy-wires to be flagged. Monitoring data then shows the decline is curtailed. The adaptive management soft trigger response is to require future applications to flag for guy-wires. These types of adjustments will be made to preclude tripping a "hard" trigger (which signals more severe habitat loss or population declines). While there should be no expectation of hitting a hard trigger, if unforeseen circumstances occur that trip either a habitat or population hard trigger, more restrictive management will be required.

Hard Triggers

Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from GRSG conservation objectives as set forth in the BLM and Forest Service plans. The hard trigger and the proposed management response to this trigger are presented in [NOTE: reference the appropriate management action here].

2.7.2 Monitoring for the Greater Sage-grouse Planning Strategy

The BLM's planning regulations, specifically 43 CFR 1610.4-9, require that land use plans establish intervals and standards for monitoring based on the sensitivity of the resource decisions. Land use plan monitoring is the process of tracking the implementation of land use plan decisions (implementation monitoring) and collecting data/information necessary to evaluate the effectiveness of land use plan decisions (effectiveness monitoring). For GRSG, these types of monitoring are also described in the criteria found in the Policy

for Evaluation of Conservation Efforts When Making Listing Decisions (50 CFR Vol. 68, No. 60). One of the Policy for Evaluation of Conservation Efforts When Making Listing Decisions criteria evaluates whether provisions for monitoring and reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort are provided.

A guiding principle in the BLM National Sage-grouse Conservation Strategy (US Department of the Interior 2004) is that “the Bureau is committed to sage-grouse and sagebrush conservation and will continue to adjust and adapt our National Sage-grouse Strategy as new information, science, and monitoring results evaluate effectiveness over time.” In keeping with the WAFWA Sage-grouse Comprehensive Conservation Strategy (Stiver et al. 2006) and the Greater Sage-grouse Conservation Objectives: Final Report (USFWS 2013), the BLM and Forest Service will monitor implementation and effectiveness of conservation measures in GRSG habitats.

On March 5, 2010, USFWS’ 12-Month Findings for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered were posted as a Federal Register notice (75 Federal Register 13910-14014, March 23, 2010). This notice stated:

“...the information collected by BLM could not be used to make broad generalizations about the status of rangelands and management actions. There was a lack of consistency across the range in how questions were interpreted and answered for the data call, which limited our ability to use the results to understand habitat conditions for sage-grouse on BLM lands.”

Standardization of monitoring methods and implementation of a defensible monitoring approach (within and across jurisdictions) will resolve this situation. The BLM, Forest Service, and other conservation partners use the resulting information to guide implementation of conservation activities.

Monitoring strategies for GRSG habitat and populations must be collaborative, as habitat occurs across jurisdictional boundaries (52 percent on BLM-administered lands, 31 percent on private lands, 8 percent on National Forest System lands, 5 percent on state lands, 4 percent on tribal and other federal lands) (75 *Federal Register* 13910, March 23, 2010), and state fish and wildlife agencies have primary responsibility for population level wildlife management, including population monitoring. Therefore, population efforts will continue to be conducted in partnership with state fish and wildlife agencies. The BLM and Forest Service have finalized a monitoring framework, which can be found in **Appendix X**. This framework describes the process that the BLM and Forest Service will use to monitor implementation and effectiveness of RMP/LUP decisions. The monitoring framework includes methods, data standards, and intervals of monitoring at broad and mid scales; consistent indicators to measure and metric descriptions for each of the scales; analysis and reporting

methods; and the incorporation of monitoring results into adaptive management. The need for fine-scale and site-specific habitat monitoring may vary by area depending on existing conditions, habitat variability, threats, and land health. Indicators at the fine and site scales will be consistent with the Habitat Assessment Framework; however, the values for the indicators could be adjusted for regional conditions.

More specifically, the framework discusses how the BLM and Forest Service will monitor and track implementation and effectiveness of planning decisions (e.g., tracking of waivers, modifications, site-level actions). The two agencies will monitor the effectiveness of RMP/LUP decisions in meeting management and conservation objectives. Effectiveness monitoring will include monitoring disturbance in habitats, as well as landscape habitat attributes. To monitor habitats, the BLM and Forest Service will measure and track attributes of occupied habitat, priority habitat, and general habitat at the broad scale, and attributes of habitat availability, patch size, connectivity, linkage/connectivity habitat, edge effect, and anthropogenic disturbances at the mid-scale. Disturbance monitoring will measure and track changes in the amount of sagebrush in the landscape and changes in the anthropogenic footprint, including change energy development density. The framework also includes methodology for analysis and reporting for field offices, states, ranger districts, BLM districts, National Forests, and Forest regions, including geospatial and tabular data for disturbance mapping (e.g., geospatial footprint of new permitted disturbances) and management actions effectiveness.

2.7.3 Regional Mitigation

Consistent with the proposed plan's goals outlined in X and X [NOTE: insert section numbers or table numbers that describes the BLM and Forest Service proposed plan goals], the intent of the Proposed Plan Amendment is to achieve a net conservation gain to the GRSG by implementing conservation actions (e.g. Federal restoration efforts), applying a no net unmitigated loss standard for authorized land uses in GRSG habitat, and, strategically siting compensatory mitigation actions, via a WAFWA Management Zone Regional Mitigation Strategy as part of a mitigation program in order to achieve cumulative benefits to the GRSG. This is also consistent with BLM Manual 6840 – Special Status Species Management, Section .02B, which states “to initiate protective conservation measures that reduce or eliminate threats to Bureau sensitive species to minimize the likelihood of the need for listing of these species under the ESA.

Mitigation Standards

The BLM/Forest Service will achieve no net unmitigated loss for authorized land uses within GRSG PHMA and GHMA. No net unmitigated loss means that impacts from authorized land uses will be fully offset to benefit the species. Mitigation will follow the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; e.g. avoid, minimize,

compensate), hereafter referred to as the mitigation hierarchy. If impacts to GRSG or its habitat from authorized land uses remain after applying avoidance and minimization measures (i.e. residual impacts), then compensatory mitigation projects will be used to fully offset those residual impacts in order to achieve the no net unmitigated loss standard. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation (see the concepts of durability, timeliness, and additionally as described further in **Appendix X**).

Greater Sage-Grouse Conservation Team

The BLM/Forest Service will establish a WAFWA Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of GRSG, within 90 days of the issuance of the ROD. This Team will develop a WAFWA Management Zone Regional Mitigation Strategy (hereafter, Regional Mitigation Strategy). The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the WAFWA Management Zone (see Monitoring section). Subsequently, the Team will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions (see Adaptive Management section).

The BLM/Forest Service will invite governmental and Tribal partners to participate in this Team, in compliance with the exemptions provided for committees defined in the Federal Advisory Committee Act and the regulations that implement that act. The BLM/Forest Service will strive for a collaborative and unified approach between Federal agencies (e.g. USFWS, BLM, Forest Service), Tribal governments, state and local government(s), and other stakeholders for GRSG conservation. The Team will provide advice, and will not make any decisions that impact federal lands. The BLM/Forest Service will remain responsible for making decisions that affect federal lands.

Developing a Regional Mitigation Strategy

The Team will develop a Regional Mitigation Strategy to inform the mitigation components of NEPA analyses for authorized land uses associated with impacts to GRSG and its habitat. The Strategy will be developed within one year of the issuance of the ROD. The BLM's Regional Mitigation Manual MS-1794 will serve as a framework for developing the Regional Mitigation Strategy. The Regional Mitigation Strategy will be applicable to the States/Field Offices/Forests within the WAFWA Management Zone's boundaries.

Regional mitigation is a landscape-scale approach to mitigating impacts to resources. This involves anticipating future mitigation needs and strategically identifying mitigation sites and measures that can help achieve the greatest conservation benefit for GRSG and its habitat. The Regional Mitigation Strategy developed by the Team will elaborate on the components identified above (i.e.

avoidance, minimization, compensation; additionally, timeliness, and durability) and further explained in **Appendix X**.

In the time period before the Strategy is developed, BLM will consider regional conditions, trends, and sites, to the greatest extent possible, when applying the mitigation hierarchy and will ensure that mitigation is consistent with the standards set forth in the first paragraph of this section.

Incorporating the Regional Mitigation Strategy into Land Use Authorization Analyses

The BLM/Forest Service will include the avoidance, minimization, and compensatory recommendations from the Regional Mitigation Strategy in one or more of the NEPA analysis' alternatives for authorized land uses that may impact GRSG or its habitat and the appropriate mitigation actions are carried forward into the decision.

Implementing a Compensatory Mitigation Program

The BLM/Forest Service need to ensure that compensatory mitigation is strategically implemented to achieve the greatest conservation benefit, as identified in the Regional Mitigation Strategy. In order to align with existing compensatory mitigation efforts, this compensatory mitigation program will be implemented at a State-level (as opposed to a WAFWA Management Zone, a Field Office, or a Forest), in collaboration with our partners (e.g. Federal, Tribal, and State agencies).

To ensure transparent and effective management of the compensatory mitigation funds, the BLM/Forest Service will enter into a contract or agreement with a third-party to help manage the State-level compensatory mitigation funds, within one year of the issuance of the ROD. The selection of the third-party compensatory mitigation administrator will conform to all relevant laws, regulations, and policies. The BLM/Forest Service will remain responsible for making decisions that affect federal lands.

2.8 DRAFT LUPA/EIS ALTERNATIVES

The following are alternatives to the Proposed Plan and were presented and analyzed in the Draft LUPA/EIS. Some alternatives have been refined based on public comment.

[NOTE: Generally describe any changes to alternatives based on public comments]

2.8.1 Alternative A (No Action)

[NOTE: provide a summary description of Alternative A]

2.8.2 Management Common to Action Alternatives [this section is optional]

[NOTE: if applicable, provide bulleted summary list of management actions common to all action alternatives (e.g., delineating PH and GH and RDFs)]

[NOTE: discuss process for habitat boundary adjustments]

2.8.3 Alternative B

[NOTE: provide a summary description of Alternative B]

2.8.4 Alternative C

[NOTE: provide a summary description of Alternative C]

2.8.5 Alternative D

[NOTE: provide a summary description of Alternative D]

2.9 SUMMARY COMPARISON OF PROPOSED PLAN AMENDMENT AND DRAFT ALTERNATIVES

This section summarizes and compares Alternatives A through X and the BLM and Forest Service Proposed Plans considered in the Final EIS. Combined with the appendices and maps, **Table 2-X**, Comparative Summary of Allocation Decisions of the Proposed Plan Amendment and Draft Alternatives, provides the differences among the alternatives relative to what they establish and where they occur. The table compares the differences with the most potential to affect resources among the alternatives.

2.10 DETAILED DESCRIPTION OF DRAFT ALTERNATIVES

2.10.1 How to Read Table 2-X

The following describes how **Table 2-X**, Description of Draft Alternatives, below, is written and formatted to show the land use plan decisions proposed for each alternative.

In accordance with Appendix C of the BLM’s *Land Use Planning Handbook* (H-1601-1), land use plan and plan amendment decisions are broad-scale decisions that guide future land management actions and subsequent site-specific implementation decisions (BLM 2005). Land use plan decisions fall into two categories, which establish the base structure for desired outcomes (goals and objectives), and allowable uses and actions to achieve outcomes.

- Goals are broad statements of desired outcomes that usually are not quantifiable.
- Objectives identify specific desired outcomes for resources. They may be quantifiable and measurable and may have established timeframes for achievement, as appropriate.
- Allowable uses identify uses, or allocations, that are allowable, restricted, or prohibited on BLM-administered lands and mineral estate.
- Actions identify measures or criteria to achieve desired objectives, including actions to maintain, restore, or improve land health.

Stipulations (NSO and CSU, which fall under the allowable uses category) are also applied to surface-disturbing activities to achieve desired outcomes (i.e., objectives).

In general, only those resources and resource uses that have been identified as planning issues have notable differences between the alternatives.

Actions that are applicable to all alternatives are shown in one cell across a row. These particular objectives and actions would be implemented regardless of which alternative is ultimately selected.

Actions that are applicable to more than one but not all alternatives are indicated by either combining cells for the same alternatives, or by denoting those objectives or actions as the “same as Alternative A,” for example.

In some cells, “No Similar Action” is used to indicate that there is no similar goal, objective or action to the other alternatives, or that the similar goal, objective or action is reflected in another management action in the alternative.

2.11 ALTERNATIVES ELIMINATED FROM DETAILED ANALYSIS

The following alternatives were considered but were not carried forward for detailed analysis because (1) they would not fulfill the requirements of FLPMA, NFMA or other existing laws or regulations, (2) they did not meet the purpose and need, (3) they were already part of an existing plan, policy, or administrative function, or (4) they did not fall within the limits of the planning criteria. FLPMA requires the BLM and Forest Service to manage the public lands and resources in accordance with the principles of multiple use and sustained yield.

- 2.11.1 **[NOTE: insert dismissed alternative name]**
[NOTE: provide description of alternative and why dismissed]

2.12 SUMMARY COMPARISON OF ENVIRONMENTAL CONSEQUENCES

Table 2-X, Summary Comparison of Environmental Consequences, presents a comparison summary of impacts from management actions proposed for the management alternatives. **Chapter 4** provides a more detailed impact analysis.

[NOTE: order of resources in table follows order in Chapter 4]

Questions on Ch. 2 Template

BLM Wyoming

1) Is the text not marked with yellow highlight suggested text that can be refined to match with the rest of the document, or must it be used verbatim?

The text not marked with yellow highlight should be used verbatim unless there is a compelling reason to modify the language to meet your sub-region's specific needs.

2) For the table beginning on page 8 (threats and COT report) do the BLM and Forest Service actions addressing each threat and COT analysis have to be listed verbatim and repeated for each threat or COT review, or can the actions be summarized in a generic way?

The decisions/actions can certainly be summarized in a generic way, especially if the populated information in the table is not an accurate depiction of the direction proposed in the sub-regional PRMPA. The contractors attempted to generically summarize the decisions here without getting into the weeds, so hopefully there will not be many changes.

3) The headings provided on page 15 will require the BLM and Forest Service actions be reordered from the draft. Does the analysis in Chapter 4, which mirrored the original Chapter 2 order, need to be reorganized (a significant workload) to follow the new order, or can Chapter 4 be left in the original order?

The order of chapter 4 can remain the same. The outline provided on page 15 is only for the narrative of the proposed plans. The table on page 25 of the template should reflect the order of your existing Chapter 4. The analysis for the proposed plan can also follow this order.

4) Is the text on page 20 referencing "no net unmitigated loss" required? This term was not used in the 9-Plan DEIS released to the public and may be a significant change requiring a Supplemental EIS.

At this point, the National Policy Team has agreed to apply the "no net unmitigated loss" concept to all sub-regions, so I would recommend keeping this language in.

5) The table on page 25 does not include columns for the BLM and Forest Service proposed plans as do the other tables in the template. Are the BLM and Forest Service proposed plans not to be included in this table, and will appear only as standalone versions in sections 2.6.2 and 2.6.3?

Correct. The table on page 25 would only include the alternatives analyzed in the DEIS.

6) Why is it necessary to provide rationale for the preferred alternative (section 2.4.3) when it is no longer under consideration and has been replaced with the proposed plan? This section does not appear in the planning handbook for a FEIS, and has not traditionally been a part of FEISs in Wyoming. It seems redundant with section 2.6.1, development of the proposed plan.

It is still important to note why we selected the preferred in the DEIS. Including this section here helps tell our story as to how we got to a proposed plan and that it is one of the draft alternatives that was used to pull actions from for the proposed plan.

7) Sections 2.8.1 and 2.8.3 are redundant with common actions depicted in the table on page 25. Can these sections be deleted and common actions just shown, in one place, in the table on page 25?

Yes. This is repetitive and I see no problem with removing section 2.8.1. Section 2.8.3 (now section 2.8.2) is optional. **CHANGE TO TEMPLATE**

8) In the table on page 25, how do we show actions that support more than one goal/objective? Are the goals/objectives to be repeated for supporting actions in the different resource areas (e.g., repeat the same goal/objective in the livestock, lands, minerals and travel management actions)?

Here you have flexibility to populate table 2-X in any fashion that corresponds to how the alternatives were depicted in your DEIS. For example, for the WY 9 Plan DEIS, you had goals and objectives pulled into a different section before Detailed Comparison of Alternatives Table in the DEIS. I'd suggest doing the same here and simply create a new section (2.10.2) that lists all of the goals and objectives by alternative.

BLM Nevada

1) Will the proposed plan be identified as an alternative (i.e. G) or will it be its own proposed plan (i.e. Proposed Plan)?

Please refer to it as the Proposed Plan, not Alternative G.

2) 2.6.2 second bullet: "ADD OTHERS FROM EACH SUBREGION" What does this mean? Will there be multiple goals for GRSG and goals for each resource area? Will each resource have identified Objective(s)

The only goals we will have in the amendments are those for GRSG. If other resources have measurable objectives for other programs, that is ok.

3) Forest Service reference- Since Forest Service is going to have its own plan amendment section, should we take out reference to forest service in the BLM plan amendment?

Yes. Remove reference to FS in the BLM Proposed Plan in Chapter 2.

4) 2.6.2. In the current NVCA plan amendment we have a "general" objective and action section that covers coordination and direction on application of RDF's. Can we add this before SSS?

No, because we need to make the ROD development an easy and consistent process. RDF's should go into an appendix.

5) 2.6.2. "OTHER DIRECTIONS; e.g., Tribal Interests" Can we add a predation section (NV/NECA has objectives and actions for coordination on predation)?

No – it is not a resource that BLM manages for. If they are relevant to BLM management, insert them into the SSS-GRSG section. Tribal Interests should be covered under Cultural Resources.

6) 2.7.1. Adaptive management- Where do we display objectives and actions? (NV/NECA has a suite of objectives and actions for adaptive management). Would these be added in the proposed plan section or this section? This would be the same question for the subregion specific mitigation actions (specifically incorporation of the NV conservation credit system)?

There should be no objectives for adaptive management in the Proposed Plan. If the objective is part of a statewide adaptive management strategy, you can reference the objective and strategy in the area provided for in section 2.7.1. If the adaptive strategy is complex, please consider incorporating the information as an appendix to the document. As articulated in the April 2014 NPT Adaptive Management Sideboards, please ensure the numeric hard trigger, hard trigger response, and the scale in which we will be implementing the responses are presented as a management action in the proposed plan. This management action can also reference the adaptive management appendix if one is present.

7) 2.9. Allocation table. The table appears to only display total acres? Are we not splitting it up by PPMA/PGMA (PHMA/GHMA)?

It is appropriate to display PHMA and GHMA in the table – **CHANGE TO TEMPLATE**

8) PHMA/PGMA- Will this language only be used in the proposed plan amendment or will the PPMA/PGMA throughout the document need to be revised?

Recommended throughout the entire document.

9) 2.10. Draft Alternative Table. This appears to be the matrix from the draft, however the matrix contained goals and objectives for each resource. Will these be removed or kept the same in this table?

If you have goals and objectives in the draft they should be displayed in the same fashion. It can be in the Draft Alternative Table or in a separate table/text as described for each alternative above.

BLM Montana

1) The Proposed Plan Amendment/FEIS is still a NEPA document where all alternatives should be given 'equal treatment.' The planning handbook states that "The proposed RMP (amendment) and final EIS builds on the draft RMP and draft EIS to include appropriate responses to public comments... as well as description... of the comments received. The proposed RMP and final EIS may also contain modification to the alternatives and the accompanying impacts analysis... however, substantial changes... or significant new information would require supplements to the either the draft or final EIS. My concern is we've pulled the 'proposed plan' out from the alternatives in the final EIS... it certainly gives the appearance of 'substantial changes' or the creation of a new alternative. My preference in final EISs is that we modify the alternative itself to show that Alternative D, for instance, is identified as the proposed plan. This new Chapter 2 format has pages and pages of descriptions of the proposed plan - like what we normally do in the ROD/Approved RMP (Amendment) - where we do pull it out from the

alternatives and make it the plan that will be implemented vs. still an alternative for a final EIS and 'proposed' plan available for protest period.

Under Section 2.6 you would use the Option 2 text to describe how you modified Alt. D and made it into the Proposed Plan. Alternative D should be carried forward as a standalone alternative as presented in the DEIS in order to show how it was changed.

2) There also needs to be clarification on the Adaptive Management, Mitigation, and Monitoring sections in Chapter 2 on what they pertain to - i.e., just the proposed plan?

Below the heading of section 2.7, there is a highlighted yellow area where sub-regions are able to articulate which alternatives these standards apply.

Hi Jon –
Attached is the FS Proposed Plan for drop into Chapter 2.
Lauren

Idaho and SW Montana Forest Service Proposed Plan Amendment

Forest Service Plan Components

Desired conditions - A description of specific social, economic, and/or ecological characteristics of the plan area, or a portion of the plan area, toward which management of the land and resources should be directed. Desired conditions must be described in terms that are specific enough to allow progress toward their achievement to be determined, but do not include completion dates. (36 CFR 219.7(e)(1)(i)) FSH 1909.12, Chapter 20)

Guideline – A constraint on project and activity decisionmaking that allows for departure from its terms, so long as the purpose of the guideline is met. (§ 219.15(d)(3)). Guidelines are established to help achieve or maintain a desired condition or conditions, to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1)(iv); FSH 1909.12, Chapter 20)

Objective - A concise, measurable, and time-specific statement of a desired rate of progress toward a desired condition or conditions. Objectives should be based on reasonably foreseeable budgets. (36 CFR 219.9(e)(1)(ii)) FSH 1909.12, Chapter 20)

Standard - A mandatory constraint on project and activity decisionmaking, established to help achieve or maintain the desired condition or conditions, to avoid or mitigate undesirable effects, or to meet applicable legal requirements. (36 CFR 219.7(e)(1) (iii)) FSH 1909.12, Chapter 20)

General Greater Sage-grouse

GRSG-GEN-DC-001-Desired Condition – The landscape for greater sage-grouse encompasses large contiguous areas, approximately 6 to 62 square miles in area, to provide for multiple aspects of species life requirements. Within these landscapes, a variety of sagebrush-community compositions exist, with variations in subspecies composition, co-dominant vegetation, shrub cover, herbaceous cover, and stand structure, to meet seasonal requirements for food, cover, and nesting for greater sage-grouse.

GRSG-GEN-DC-002-Desired Condition – Anthropogenic disturbance is focused in non-habitat areas outside of priority, sagebrush focal, important, and general habitat management areas¹. Disturbances in general habitat management areas are limited, and there is little to no disturbances in priority, sagebrush focal, and important habitat management areas except for valid existing rights and existing authorize uses.

GRSG-GEN-DC-003-Desired Condition – In all seasonal habitats, 70% of lands capable of producing sagebrush have 10 to 30% sagebrush canopy cover and less than 10% conifer canopy cover. In addition, within breeding and nesting habitat, sufficient herbaceous vegetation structure and height provides overhead and lateral concealment for nesting and early brood rearing life stages. Within brood rearing habitat, wet meadows and riparian areas sustain a rich diversity of perennial forb species relative to site potential. Within winter habitat, sufficient sagebrush height

¹ Suitable greater sage-grouse habitat within polygons identified as priority or general habitat management areas. Areas of non-habitat within a polygon are not included as part of any priority or general habitat management areas. Sagebrush focal areas may include areas of non-habitat.

and density provides food and cover for greater sage-grouse during this seasonal period. Specific desired conditions for greater sage-grouse based on seasonal habitat requirements are in table 1.

Table 1. Seasonal Habitat Desired Conditions for Greater Sage-grouse.

ATTRIBUTE	INDICATORS	DESIRED CONDITON
BREEDING AND NESTING^{1,2,3} (Seasonal Use Period March 1-June 15) Apply 6.2 miles from active leks.⁴		
Lek Security	Proximity of trees ⁵	Trees or other tall structures are none to uncommon within 1.86 miles of leks ^{6,7}
	Proximity of sagebrush to leks ⁶	Adjacent protective sagebrush cover within 328 feet of lek ⁶
Cover	Seasonal habitat extent ⁷	>80% of the breeding and nesting habitat
	Sagebrush canopy cover ^{6,7,8}	15 to 25%
	Sagebrush height ⁷ Arid sites ^{6,7,9} Mesic sites ^{6,7,10}	12 to 32 inches 16 to 32 inches
	Predominant sagebrush shape ⁶	>50% in spreading ¹¹
	Perennial grass canopy cover ^{6,7} Arid sites ^{7,9} Mesic sites ^{7,10}	≥10% ≥15%
	Perennial grass height ^{6,7,8}	Provide overhead and lateral concealment from predators ⁷
	Perennial forb canopy cover ^{6,7,8} Arid sites ⁹ Mesic sites ¹⁰	≥5% ^{6,7} ≥10% ^{6,7}
BROOD-REARING/SUMMER¹ (Seasonal Use Period June 16-October 31)		
Cover	Seasonal habitat extent ⁷	>40% of the brood-rearing/summer habitat
	Sagebrush canopy cover ^{6,7,8}	10 to 25%
	Sagebrush height ^{7,8}	16 to 32 inches
	Perennial grass canopy cover and forbs ^{7,8}	>15%
	Riparian areas/mesic meadows	Proper Functioning Condition ¹²
	Upland and riparian perennial forb availability ^{6,7}	Preferred forbs are common with several preferred species present ¹³
WINTER¹ (Seasonal Use Period November 1-February 28)		
Cover and Food	Seasonal habitat extent ^{6,7,8}	>80% of the winter habitat
	Sagebrush canopy cover above snow ^{6,7,8}	>10%
	Sagebrush height above snow ^{6,7,8}	>10 inches ¹⁴

Intent is to manage for tall, healthy, sagebrush stands.</p>		

GRSG-GEN-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, do not permit new lands or recreation special use authorizations unless all existing discrete anthropogenic disturbances cover less than 3% of the total greater sage-grouse habitat within the Biologically Significant Unit and the proposed project analysis area, regardless of ownership (Appendix Z – Disturbance Cap Guidance).

GRSG-GEN-ST-002-Standard - In priority, sagebrush focal, and important management areas, only allow new authorized land uses if the residual impacts to greater sage-grouse or their habitats are fully offset by compensatory mitigation projects that provide a net conservation gain to the species, which will be achieved by avoiding, minimizing, and compensating for impacts by applying beneficial mitigation actions. Any compensatory mitigation will be durable, timely, and in addition to what would have resulted without the compensatory mitigation, as addressed in the Mitigation Framework (Appendix X).

GRSG-GEN-GL-001-Guideline - During lekking (March 1 to April 30) surface disturbing and disruptive activities, including noise at 10dB above ambient (not to exceed 20-24 dB) to lekking birds should be restricted from 6 pm to 9 am at a distance of 3.1 miles from the perimeter of an occupied lek.

GRSG-GEN-GL-002-Guideline – During breeding and nesting (March 1 to June 15), surface disturbing and disruptive activities to nesting birds should be restricted.

GRSG-GEN-GL-003-Guideline - When breeding and nesting habitat overlaps with other seasonal habitats, habitat should be managed for breeding and nesting desired habitat conditions displayed in table 1.

GRSG-GEN-GL-004-Guideline – Development of tall structures within 2.0 miles from the perimeter of occupied leks, as determined by local conditions (such as vegetation or topography), with the potential to disrupt breeding or nesting by creating new perching/nesting opportunities avian predators or by decreasing the use of an area, should be restricted in nesting habitat.

Adaptive Management

GRSG-AM-ST-001-Standard – If a hard trigger is identified, immediate action is necessary to stop a severe deviation from greater sage-grouse conservation objectives. The hard trigger response will be an entire restrictive alternative, or one or more appropriate components of a more restrictive alternative, such as the immediate cessation of authorizing land use authorizations. An interagency team will conduct an assessment to determine the causal factor(s) and recommend corrective strategies (Appendix Z - Adaptive Management Guidance and Sideboards).

GRSG-AM-ST-002-Standard – If a soft trigger is identified, apply more conservative or restrictive implementation measures (e.g., extending seasonal restrictions for seasonal surface disturbing activities, modifying seasons of use for livestock grazing, and applying additional restrictions on discretionary activities) for the specific causal factor in the decline of populations and/or habitats, with consideration of local knowledge and conditions (Appendix Z - Adaptive Management Guidance and Sideboards).

Lands and Realty

Special Use Authorizations (non recreation)

GRSG-LR-SUA-O-001-Objective - In priority, sagebrush focal, and important habitat management areas, retrofit existing tall structures (e.g., power poles, cellular towers) with perch deterrents or other anti-perching devices within 2 years of signing the Record of Decision.

GRSG-LR-SUA-ST-001-Standard – In priority and sagebrush focal habitat management areas, restrict issuance of new lands special use authorizations for infrastructure, such as high-voltage transmission lines, major pipelines, hydropower, distribution lines, and cellular towers. Exceptions must be limited and based on rationale (e.g., monitoring, modeling, or best available science) that explicitly demonstrates that adverse impacts to greater sage-grouse will be avoided by the exception.

GRSG-LR-SUA-ST-002-Standard – In general habitat management areas, new lands special use authorizations may be authorized for infrastructure, such as high-voltage transmission lines and major pipelines, if they can be located within existing designated corridors and the authorization includes stipulations to protect greater sage-grouse and their habitats.

GRSG-LR-SUA-ST-003-Standard – In priority, sagebrush focal, and important habitat management areas, do not authorize temporary lands special uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (greater than 5 years) negative impact on greater sage-grouse or their habitats.

GRSG-LR-SUA-ST-004-Standard – In priority, sagebrush focal, important, and general habitat management areas, require protective stipulations (e.g., noise, tall structure, guy wire removal, perch deterrent installation) when issuing new authorizations or during renewal, amendment, or reissuance of existing authorizations that authorize infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers).

GRSG-LR-SUA-ST-005-Standard – In priority, sagebrush focal, important, and general habitat management areas, locate upgrades to existing transmission lines within the existing designated corridors unless an alternate route would benefit greater sage-grouse or their habitats.

GRSG-LR-SUA-ST-006-Standard - In priority, sagebrush focal, important, and general habitat management areas, when a lands special use authorization is revoked or terminated and no future use is contemplated the authorization holder must remove overhead lines and other infrastructure in compliance with 36 CFR 251.60(i).

GRSG-LR-SUA-ST-007-Standard - In priority, sagebrush focal, important, and general habitat management areas, if the potential long-term (greater than 5 years) impacts of mitigation (e.g., relocation or burying) to greater sage-grouse or their habitats are greater than the potential impacts from new lands special use authorizations, do not pursue the mitigation. If mitigation is not feasible or would result in short-term (less than 5 years) or long-term impacts, incorporate additional terms and conditions in the special use authorization for protection of greater sage-grouse or their habitats

GRSG-LR-SUA-ST-008-Standard – In priority, sagebrush focal, important, and general habitat management areas, co-locate new infrastructure (e.g., high-voltage transmission lines, major pipelines, roads, distribution lines, and cellular towers) with existing infrastructure to limit disturbance to the smallest footprint, or where it best limits impacts to greater sage-grouse or their habitats. When co-location of new infrastructure is not accomplished,

locate it adjacent to existing infrastructure, roads, or already disturbed areas. Consider new communication tower sites where necessary for public safety.

GRSG-LR-SUA-GL-001-Guideline – In priority and sagebrush focal management areas, outside of existing designated corridors, new transmission lines and pipelines should be buried to limit disturbance to the smallest footprint unless explicit rationale is provided that the biological impacts to greater sage-grouse and its habitat are being avoided. When new transmission lines and pipelines are not buried, locate them adjacent to existing transmission lines.

Land Ownership Adjustments

GRSG-LR-LOA-ST-001-Standard – In priority, sagebrush focal, important, and general habitat management areas, do not approve land ownership adjustments unless the action results in a net conservation gain to greater sage-grouse or they will not directly or indirectly adversely impact greater sage-grouse conservation.

GRSG-LR-LOA-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas with minority federal ownership, consider land ownership adjustments to achieve a landownership pattern (e.g., consolidation, reducing fragmentation) that supports improved greater sage-grouse population trends and habitats.

Land Withdrawal

GRSG-LR-LW-GL-001-Guideline – In priority, sagebrush focal, and important habitat management areas, utilize land withdrawals as a tool, where appropriate and subject to valid existing rights, to prevent activities that will be detrimental to greater sage-grouse or their habitats.

Wind and Solar

GRSG-WS-ST-001-Standard – In priority and sagebrush focal management areas, do not authorize new solar and wind utility-scale and/or commercial energy development except for on-site power generation associated with existing industrial infrastructure (e.g., mine site).

GRSG-WS-GL-001-Guideline – In important habitat management areas, new wind energy utility-scale and/or commercial development should be restricted. If development cannot be restricted due to existing authorized use, adjacent developments, or split estate issues, then ensure that stipulations are incorporated into the authorization to protect greater sage-grouse and their habitats.

Greater Sage-grouse Habitat

GRSG-GRSGH-O-001-Objective – Every 10 years for the next 50 years, improve greater sage-grouse habitat by removing invading conifers and other undesirable species in the number of acres shown in table 2.

Table 2. Treatment Acres per Decade.

FOREST	ACRES		
	MECHANICAL ¹	PRESCRIBED FIRE ²	GRASS RESTORATION ³
Boise	1000	2000	0
Caribou-Targhee-Curlew	3000	2000	3000
Salmon-Challis	5000	1000	0
Sawtooth	7000	1000	7000
Beaverhead-Deerlodge	0	0	0

¹Removal of conifers that have invaded sagebrush including phase one juniper that is 10% or less and reducing sagebrush cover in areas over 30% canopy cover

²Acres are those that are greater than 30% sagebrush canopy cover and/or invaded by 10% or greater conifer.

³Acres presently dominated by annual grasses that could be improved by herbicide application and seeding of perennial vegetation.

GRSG-GRSGH-ST-001-Standard – Design habitat restoration projects to move towards desired conditions (table 1) and incorporate the concepts outlined in Appendix X - *Using resistance and resilience concepts to reduce impacts of invasive annual grasses and altered fire regimes on the sagebrush ecosystem and greater sage-grouse: A strategic multi-scale approach.*

GRSG-GRSGH-GL-001-Guideline – Sagebrush removal in greater sage-grouse breeding and nesting and wintering habitats should be restricted unless necessary to support attainment of desired habitat conditions (table 1).

GRSG-GRSGH-GL-002-Guideline – When removing conifers that are encroaching into greater sage-grouse habitat, avoid persistent woodlands (old growth relative to the site or more than 100 years old).

GRSG-GRSGH-GL-003-Guideline – In priority, sagebrush focal, important, and general habitat management areas, actions and authorizations should be designed to limit the spread and effect of non-native plant species.

GRSG-GRSGH-GL-004-Guideline - To facilitate safe and effective fire management actions, in priority, sagebrush focal, important, and general habitat management areas, fuels treatments should be designed to reduce the spread and intensity of wildfire in high-risk areas (i.e., areas of increased potential for ignition and in areas where there is a potential for wildfire that would be difficult for suppression resources to contain and control).

GRSG-GRSGH-GL-005-Guideline - In priority, sagebrush focal, important, and general habitat management areas, native plant species should be used, when possible, to restore, enhance, or maintain desired habitat conditions (table 1).

GRSG-GRSGH-GL-006-Guideline – In priority, sagebrush focal, and important habitat management areas, vegetation treatment projects should only be conducted if they restore, enhance, or maintain desired habitat conditions (table 1).

Livestock Grazing

GRSG-LG-DC-001-Desired Condition – In priority, sagebrush focal, and important habitat management areas, livestock grazing is managed to ensure adequate nesting cover and does not conflict with the attainment of other vegetative attributes (table 1).

GRSG-LG-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, do not authorize construction of water developments unless beneficial to greater sage-grouse habitat.

GRSG-LG-GL-001-Guideline - Grazing guidelines should be applied in each of the seasonal habitats in table 3. If values in table 3 guidelines cannot be achieved based upon a site-specific analysis using Ecological Site Descriptions, long-term ecological site capability analysis, or other similar analysis, adjust grazing management to move towards desired habitat conditions in table 1 consistent with the ecological site capability. Do not use drought and degraded habitat condition to adjust values. Grazing guidelines in table 3 would not apply to isolated parcels of National Forest System lands that have less than 200 acres of greater sage-grouse habitat.

Table 3. Grazing Guidelines for Greater Sage-grouse Seasonal Habitat.

Seasonal Habitat	Grazing Guidelines
Breeding and nesting ¹ within 6.2 miles of occupied leks	Perennial grass height: ² When grazing occurs during breeding and nesting season (March 1 to June 15) manage for upland perennial grass height of 7 inches ^{3,4,5} When grazing occurs post breeding and nesting season (June 16 to October 30) manage for 4 inches ^{4,5,6} of perennial grass height.
Brood rearing and summer ¹	Retain an average stubble height of 4 inches for herbaceous riparian/mesic meadow vegetation ^{7,8}
Winter ¹	≤35% use of sagebrush

¹ For descriptions of Seasonal Habitat and Seasonal Periods of greater sage-grouse see table 1.

² Grass heights only apply in breeding and nesting habitat with ≥10% sagebrush cover to support nesting.

³ Holloran et al. 2005. *Greater sage-grouse nesting habitat selection and success in Wyoming*.

⁴ Average droop height, assuming current vegetation composition has the capability to achieve these heights. Heights will be measured at the end of the nesting period (Connelly, 2000).

⁵ Hagen C., J.W. Connelly, and M.A. Schroeder. 2007. *A meta-analysis of greater sage-grouse *Centrocercus urophasianus* nesting and brood-rearing habitats*. *Wildlife Biology* 13(1): 42-50.

⁶ Stubble height to be measured at the end of the growing season.

⁷ Crawford et al. 2004. Ecology and Management of sage-grouse and sage-grouse habitat. "In riparian brood-rearing habitat, sage-grouse prefer the lower vegetation (5-15 cm (2-6 in) vs. 30-50 cm (12-20 in); Oakleaf 1971, Neel 1980, Klebenow 1982, Evans 1986) and succulent forb growth stimulated by moderate livestock grazing (Neel 1980, Evans 1986). "Moderate use equates to a 10-cm residual stubble height for most grasses and sedges."

⁸ Stubble height to be measured in the meadow areas used by greater sage-grouse for brood-rearing (not on the hydric greenline).

GRSG-LG-GL-002-Guideline – In priority, sagebrush focal, important, and general habitat management areas, consider closure of grazing allotments, pastures, or portions of pastures, or managing the allotment as a forage reserve as opportunities arise under applicable regulations, where removal of livestock grazing would enhance the ability to achieve desired habitat conditions (table 1).

GRSG-LG-GL-003-Guideline – Bedding sheep and placing camps within 1.2 miles from the perimeter of a lek during lekking (March 1 to April 30) should be restricted.

GRSG-LG-GL-004-Guideline – During breeding and nesting season (March 1 to June 15), trailing livestock through breeding and nesting habitat should be minimized. Specific routes should be identified, existing trails should be used, and stopovers on active leks should be restricted.

GRSG-LG-GL-005-Guideline – Fences should not be constructed or reconstructed within 1.2 miles from the perimeter of occupied leks, unless the collision risk can be mitigated through design features or markings (e.g., mark, laydown fences, and design).

GRSG-LG-GL-006-Guideline – New permanent livestock facilities (e.g., windmills, corrals) should not be constructed within 1.2 miles from the perimeter of occupied leks.

Fire Management

GRSG-FM-ST-001-Standard – In priority, sagebrush focal, important, and general habitat management areas, do not use prescribed fire, except for pile burning, in 12-inch or less precipitation zones unless necessary to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in table 1.

GRSG-FM-ST-002-Standard – In priority, sagebrush focal, and general management areas, if it is necessary to use prescribed fire to facilitate site preparation for restoration of greater sage-grouse habitat consistent with desired conditions in table 1, the associated NEPA analysis must identify how greater sage-grouse desired conditions would

be met, why alternative techniques were not selected, and how potential threats to greater sage-grouse habitat would be minimized.

GRSG-FM-GL-001-Guideline – In wintering or breeding and nesting habitat, sagebrush removal or manipulation, including prescribed fire, should be restricted unless the removal strategically reduces the potential impacts from wildfire.

GRSG-FM-GL-002-Guideline – In priority, sagebrush focal, important, and general habitat management areas, when reseeding in fuel breaks, fire resistant native plant species should be used if available, or consider using fire resistant non-native to meet resource objectives.

GRSG-FM-GL-003-Guideline – In priority, sagebrush focal, important, and general habitat management areas, treatments should be designed to restore, enhance, or maintain greater sage-grouse habitat.

GRSG-FM-GL-004-Guideline – Locating temporary wildfire suppression facilities (e.g., incident command posts, spike camps, helibases, mobile retardant plants) in priority, sagebrush focal, and general habitat management areas should be restricted.

GRSG-FM-GL-005-Guideline - In priority, sagebrush focal, important, and general habitat management areas, cross-country vehicle travel during fire operations should be restricted whenever safe and practical to do so, as determined by fireline leadership, incident commanders, etc.

GRSG-FM-GL-006-Guideline – In priority, sagebrush focal, important, and general habitat management areas, burnout operation areas should be avoided by constructing direct fire lines, whenever safe and practical to do so, to improve suppression effectiveness and minimize loss of existing sagebrush habitat as determined by fireline leadership, incident commanders, etc.

GRSG-FM-GL-007-Guideline – In priority, sagebrush focal, important, and general habitat management areas, prescribed fire prescriptions should minimize undesirable effects on vegetation and/or soils (e.g., minimize mortality of desirable perennial plant species and reduce risk of hydrophobicity).

GRSG-FM-GL-008-Guideline - In priority, sagebrush focal, important, and general habitat management areas, roads and natural fuel breaks should be incorporated into fuel break design to improve effectiveness and minimize loss of existing sagebrush habitat.

GRSG-FM-GL-009-Guideline - In priority, sagebrush focal, important, and general habitat management areas, all fire associated vehicles and equipment should be power-washed before entering and exiting the area to minimize the introduction of undesirable invasive plant species.

GRSG-FM-GL-010-Guideline - Unit-specific greater sage-grouse fire management toolboxes containing maps, lists, contact information for qualified resource advisors, local guidance, and relevant information should be developed.

GRSG-FM-GL-011-Guideline – Localized maps of priority, sagebrush focal, important, and general habitat management areas should be provided to dispatch offices and extended attack incident commanders to use when prioritizing wildfire suppression resources and designing suppression tactics.

GRSG-FM-GL-012-Guideline - In or near priority, sagebrush focal, important, and general habitat management areas, a greater sage-grouse resource advisor should be assigned to all extended attack fires.

GRSG-FM-GL-013-Guideline – On critical fire weather days, available fire suppression resources should be pre-positioned to optimize a quick and efficient response into priority, sagebrush focal, important, and general habitat management areas.

GRSG-FM-GL-014-Guideline - During periods of multiple fires, line officers should be involved in setting priorities to help protect priority, sagebrush focal, important, and general habitat management areas.

GRSG-FM-GL-015-Guideline – In priority, sagebrush focal, important, and general habitat management areas, consider using fire retardant and mechanized equipment only if it is likely to result in minimizing burned acreage.

GRSG-FM-GL-016-Guideline – In priority, important and general habitat management areas, to minimize sagebrush loss, mop-up should be conducted where the burned areas adjoin unburned islands, doglegs, or other habitat features, as safety and available resources allows.

Wild Horse and Burro

GRSG-HB-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas, wild horse and burro populations should be managed within established appropriate management levels to restore, enhance, or maintain greater sage-grouse desired habitat conditions (table 1).

GRSG-HB-GL-002-Guideline – In priority, sagebrush focal, important, and general habitat management areas, appropriate management levels should be adjusted if greater sage-grouse management standards are not met due to degradation that can be at least partially attributed to wild horse or burro populations.

Recreation

GRSG-R-DC-001-Desired Condition – In priority, sagebrush focal, important, and general habitat management areas, existing and new recreation special use authorizations and expansion of special use authorizations restrict effects to greater sage-grouse and their habitats.

GRSG-R-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, do not authorize temporary recreation uses (i.e., facilities or activities) that result in loss of habitat or would have long-term (greater than 5 years) negative impacts on greater sage-grouse or their habitats.

GRSG-R-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas, terms and conditions that protect and/or restore greater sage-grouse habitat within the permit area should be included in new recreation special use authorizations. During renewal, amendment, or reauthorization, terms and conditions in existing permits and operating plans should be modified to protect and/or restore greater sage-grouse habitat.

GRSG-R-GL-002-Guideline – In priority, sagebrush focal, and important habitat management area, new recreational facilities or expansion of existing recreational facilities (e.g., roads, trails, campgrounds), including special use authorizations for facilities and activities, should not be approved unless the development results in a net conservation gain to greater sage-grouse and/or their habitats or the development is required for visitor safety.

Roads/Transportation

GRSG-RT-DC-001-Desired Condition - In priority, sagebrush focal, important, and general habitat management areas, within the travel management system, greater sage-grouse experience minimal disturbance during breeding and nesting (March 1 to June 15) and wintering periods (November 1 to February 28).

GRSG-RT-ST-001-Standard – In priority, sagebrush focal, important, and general habitat management areas, do not construct or allow new road or trail construction (does not apply to realignments for resource protection) except when necessary for administrative access, public safety, or to access valid existing rights. If necessary to construct new roads and trails for one of these purposes, construct them to the minimum standard, length, and number and avoid, minimize, and mitigate impacts

GRSG-RT-ST-002-Standard – Do not conduct or allow road and trail maintenance activities within 2 miles from the perimeter of active leks during lekking (March 1 to April 30) from 6 pm to 9 am.

GRSG-RT-ST-003-Standard – In priority, sagebrush focal, and important habitat management areas, do not grant public access on temporary energy development roads, unless consistent with all other terms and conditions included in the land use management plan.

GRSG-RT-GL-001-Guideline – In priority, sagebrush focal, and important habitat management areas, new roads and road realignments should be designed and administered to reduce collisions with greater sage-grouse.

GRSG-RT-GL-002-Guideline – In priority, sagebrush focal, and important habitat management areas, road construction within riparian areas and mesic meadows should be restricted. If not possible to restrict construction within riparian areas and mesic meadows, roads should be designed and constructed at right angles to ephemeral drainages and stream crossings, unless topography prevents doing so.

GRSG-RT-GL-003-Guideline – In priority, sagebrush focal, important, and general habitat management areas, when decommissioning roads and unauthorized routes, restoration activity should be designed to move habitat towards desired conditions (table 1).

GRSG-RT-GL-004-Guideline – In priority, sagebrush focal, important, and general habitat management areas, dust abatement terms and conditions should be included in road use permits when dust has the potential to impact greater sage-grouse.

GRSG-RT-GL-005-Guideline - In priority, sagebrush focal, important, and general habitat management areas, road and road-way maintenance activities should be designed and implemented to reduce the risk of vehicle or human-caused wildfires and the spread of invasive plants.

Minerals

Fluid Minerals – Unleased

GRSG-M-FMUL-ST-001-Standard - In priority, sagebrush focal, and important habitat management areas, any new oil and gas leases must include a no surface occupancy stipulation. There will be no waivers, exceptions, or modifications. An exception could be granted by the authorized officer with unanimous concurrence from a team of agency greater sage-grouse experts from the Fish and Wildlife Service, Forest Service, and State wildlife agency if:

- There would be no direct, indirect, or cumulative effects to greater sage-grouse or their habitats or
- Granting the exception provides an alternative to a similar action occurring on a nearby parcel and
- The exception provides a clear net conservation gain to greater sage-grouse.

GRSG-M-FMUL-ST-002-Standard – In general habitat management areas, any new leases must include appropriate controlled surface use and timing limitation stipulations to protect greater sage-grouse and their habitat.

GRSG-M-FMUL-ST-003-Standard – In sagebrush focal habitat management areas, there will be no surface occupancy and no waivers, exceptions, or modifications for fluid mineral leasing.

GRSG-M-FMUL-ST-004-Standard – In priority, sagebrush focal, and general management areas, when analyzing leasing of fluid mineral resources, prioritize development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse, subject to valid existing rights, law, and regulations.

Fluid Minerals – Leased

GRSG-M-FML-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, when approving the Surface Use Plan of Operation portion of the Application for Permit to Drill on existing leases that are not yet developed, require that leaseholders avoid and minimize surface disturbing and disruptive activities consistent with the rights and conditions granted in the lease.

GRSG-M-FML-ST-002-Standard – In priority, sagebrush focal, and important habitat management areas, when facilities are no longer needed or leases are relinquished, require reclamation plans to include terms and conditions to restore habitat to desired conditions as described in table 1.

GRSG-M-FML-ST-003-Standard – In general habitat management areas, authorize new transmission line corridors, transmission line right-of-ways, transmission line construction, or transmission line-facility construction associated with fluid mineral leases with stipulations necessary to protect greater sage-grouse and their habitats, consistent with the terms and conditions of the permit.

GRSG-M-FML-ST-004-Standard – Locate compressor stations on portions of a lease that are non-habitat and are not used by greater sage-grouse, and if there would be no direct, indirect, or cumulative effects on sage-grouse or their habitat. If this is not possible, work with the operator to use mufflers, sound insulation, or other features to reduce noise.

GRSG-M-FML-ST-005-Standard – In priority, sagebrush focal, and general management areas, when authorizing development of fluid mineral resources, prioritize development in non-habitat areas first and then in the least suitable habitat for greater sage-grouse, subject to valid existing rights, law, and regulations

GRSG-M-FML-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas, operators should be encouraged to reduce disturbance to greater sage-grouse habitat. At the time of approval of the Surface Use Plan of Operation portion of the Application for Permit to Drill, terms and conditions should be included to reduce disturbance to greater sage-grouse habitat, where appropriate and feasible and consistent with the rights granted to the lessee.

GRSG-M-FML-GL-002-Guideline – On Federal leases in priority, sagebrush focal, and important habitat management areas, when surface occupancy cannot be restricted due to valid existing rights or development requirements, disturbance and surface occupancy should be limited to areas least harmful to greater sage-grouse based on vegetation, topography, or other habitat features.

GRSG-M-FML-GL-003-Guideline - In priority, sagebrush focal, and general management areas, where the federal government owns the surface and the mineral estate is in non-federal ownership, coordinate with the mineral estate owner/lessee to apply appropriate stipulations, conditions of approval, conservation measures and required design features to the appropriate surface management instruments to the maximum extent permissible under existing authorities.

Fluid Minerals – Operations

GRSG-M-FMO-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, do not authorize employee camps.

GRSG-M-FMO-ST-002-Standard – In priority, sagebrush focal, and important habitat management areas, when feasible, do not locate tanks or other structures that may be used as raptor perches. If this is not feasible, use perch deterrents.

GRSG-M-FMO-GL-001-Guideline – In priority, sagebrush focal, and important habitat management areas, closed-loop systems should be used for drilling operations with no reserve pits, where feasible.

GRSG-M-FMO-GL-002-Guideline – In priority, sagebrush focal, important, and general habitat management areas, during drilling operations, soil compaction should be reduced and soil structure should be maintained using the best available techniques to improve vegetation reestablishment.

GRSG-M-FMO-GL-003-Guideline – In priority, sagebrush focal, important, and general habitat management areas, dams, impoundments and ponds for mineral development should be constructed to reduce potential for West Nile virus. Examples of methods to accomplish this include:

- Increase the depth of ponds to accommodate a greater volume of water than is discharged.
- Build steep shorelines (greater than 2 feet) to reduce shallow water and aquatic vegetation around the perimeter of impoundments to reduce breeding habitat for mosquitoes.
- Maintain the water level below that of rooted aquatic and upland vegetation. Restrict flooding terrestrial vegetation in flat terrain or low-lying areas.
- Construct dams or impoundments that restrict down-slope seepage or overflow by digging ponds in flat areas rather than damming natural draws for effluent water storage or lining constructed ponds in areas where seepage is anticipated.
- Line the channel where discharge water flows into the pond with crushed rock or use a horizontal pipe to discharge inflow directly into existing open water.

- Line the overflow spillway with crushed rock and construct the spillway with steep sides.
- Fence pond sites to restrict access by livestock and other wild ungulates.
- Remove or re-inject produced water.
- Treat waters with larvicides to reduce mosquito production where water occurs on the surface.

GRSG-M-FMO-GL-004-Guideline – In priority, sagebrush focal, important, and general habitat management areas to keep habitat disturbance at a minimum, a phased development approach should be applied to fluid mineral operations, wherever possible, consistent with the rights granted under the lease. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.

Coal Mines - Unleased

GRSG-M-CMUL-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, do not authorize surface disturbances (e.g., appurtenant facilities) for new underground coalmines.

Coal Mines – Leased

GRSG-M-CML-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, do not authorize new appurtenant facilities for existing underground mines unless no technically feasible alternative exists. If new appurtenant facilities associated with existing mine leases cannot be located outside of priority, sagebrush focal, and important habitat management areas, co-locate them with any existing disturbed areas, if possible. If co-location is not possible, then construct new facilities to minimize disturbed areas while meeting mine safety standards and requirements, as identified by MSHA mine-plan approval process, and locate the facilities in an area least harmful to greater sage-grouse habitats based on vegetation, topography, or other habitat features.

GRSG-M-CML-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas, when coal leases are subject to readjustment, additional requirements should be included in the readjusted lease to protect and reduce threats to greater sage-grouse and their habitats to conserve, enhance, and restore habitat for long-term viability.

Locatable Minerals

GRSG-M-LM-ST-001-Standard – In priority, sagebrush focal, and important habitat management areas, approve Plans of Operation with mitigation to protect greater sage-grouse and their habitats, consistent with the rights of the mining claimant as granted by the General Mining Act of 1872, as amended.

GRSG-M-LM-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas to keep habitat disturbance at a minimum, a phased development approach should be applied to operations consistent with the rights granted under the General Mining Act of 1872, as amended. Disturbed areas should be reclaimed as soon as they are no longer needed for mineral operations.

GRSG-M-LM-GL-002-Guideline - In priority, sagebrush focal, important, and general habitat management areas, abandoned mine sites should be closed or mitigated, subject to valid or existing rights, to reduce predation of greater sage-grouse by eliminating tall structures that could provide nesting opportunities and perching sites for predators.

Non-energy Leasable Minerals

GRSG-M-NEL-GL-001-Guideline – In priority, sagebrush focal, important, and general habitat management areas, at the time of issuance of prospecting permits, exploration licenses and leases, or readjustment of leases, the Forest Service should provide recommendations to the Bureau of Land Management for the protection of greater sage-grouse and their habitats.

GRSG-M-NEL-GL-002-Guideline - In priority, sagebrush focal, and general habitat management areas, the Forest Service should recommend to the Bureau of Land Management that expansion or readjustment of existing leases avoid, minimize, or mitigate the effects to greater sage-grouse and their habitat

Mineral Materials

GRSG-M-MM-ST-001-Standard – In priority and sagebrush focal management areas, do not allow new mineral material disposal or development.

GRSG-M-MM-ST-002-Standard – In priority, sagebrush focal, and important habitat management areas, free-use mineral material collection permits may be issued and expansion of existing active pits may be allowed, except from March 1 to April 30 between 6 pm and 9 am within 2 miles from the perimeter of occupied leks, if doing so is within the Biologically Significant Unit and does not exceed the disturbance cap.

GRSG-M-MM-ST-003-Standard - In priority, sagebrush focal, important, and general habitat management areas, any permit for existing mineral material operations must include appropriate requirements for operation and reclamation of the site to restore or maintain desired habitat conditions (table 1).

Glossary of Terms as Used in this Plan

Active lek - Any lek that has been attended by male greater sage-grouse during the most recent strutting season.

Adjacent – Installation of new linear improvements parallel, near, or next to existing linear improvements.

Administrative access - Access for resource management and administrative purposes such as fire suppression, cadastral surveys, permit compliance, law enforcement, and military in the performance of their official duty, or other access needed to manage National Forest System lands or uses.

Allotment management plan - A written program of livestock grazing management, including supportive measures, if required, designed to attain specific, multiple-use management goals in a grazing allotment. The Plan is prepared in consultation with the permittee(s), lessee(s), and other affected interests. Livestock grazing is considered in relation to other uses of the range and to renewable resources, such as watershed, vegetation, and wildlife. The Plan establishes seasons of use, the number of livestock to be permitted, the range improvements needed, and the grazing system.

Ambient (noise level) - Sometimes called background noise level, reference sound level, or room noise level is the background sound pressure level at a given location, normally specified as a reference level to study a new intrusive sound source.

Anthropogenic disturbances – Human-created features include but are not limited to paved highways, graded gravel roads, transmission lines, substations, wind turbines, oil and gas wells, geothermal wells and associated facilities, pipelines, landfills, agricultural conversion, homes, and mines.

Appurtenant (minerals) - A piece of equipment (e.g., pump jack, separator, storage tank, compressor station, metering equipment) necessary for production.

Authorized uses - An activity (i.e., resource use) occurring on the public lands that is either explicitly or implicitly recognized and legalized by law or regulation. The term may refer to activities occurring on the public lands for which the Forest Service has issued a formal authorization document (e.g., livestock grazing permit, special use authorization, approved plan of operation, etc.). Formal authorized uses can involve both commercial and noncommercial activity, facility placement, or event. These authorized uses are often spatially or temporally limited. Unless constrained or bounded by statute, regulation, or an approved land use plan decision, legal activities involving public enjoyment and use of the public lands (e.g., hiking, camping, hunting, etc.) require no formal Forest Service authorization.

Biologically significant unit - A geographical/spatial area within greater sage-grouse habitat that contains relevant and important habitats that is used as the basis for comparative calculations to support evaluation of changes to habitat. A biologically significant unit or subset of the unit is used in the calculation of the anthropogenic disturbance threshold and in the adaptive management habitat trigger.

The biologically significant unit is defined as:

- Idaho: All of the modeled nesting and delineated winter habitat, based on 2012 data, within priority and/or important habitat management areas within a Conservation Area.
- Montana: All of the priority and sagebrush focal management areas.

Co-locate - Installation of new linear improvements in or on existing linear improvements.

Communication tower site - Sites that include broadcast types of uses (e.g., television, AM/FM radio, cable television, broadcast translator) and non-broadcast uses (e.g., commercial or private mobile radio service, cellular telephone, microwave, local exchange network, passive reflector).

Compensatory mitigation – Compensating for the residual impact of a certain action or parts of an action by replacing or providing substitute resources or environments(s).

Compensatory mitigation projects – The restoration, creation, enhancement, and/or preservation of impacted resources, such as on-the-ground actions to improve and/or protect habitats (e.g. chemical vegetation treatments, land acquisitions, conservation easements)

Conservation area - Areas determined to be necessary to monitor population objectives to evaluate the disturbance density and adaptive regulatory triggers and engage adaptive management responses. Conservation Areas may contain priority, sagebrush focal, important, and general habitat management areas. Specifically, these areas are Mountain Valleys, Desert, West Owyhee, and Southern and Southwestern Montana.

Disruptive activities - Land resource uses/activities that are likely to alter the behavior, displace, or cause excessive stress to greater sage-grouse populations occurring at a specific location and/or time. Actions that alter behavior or cause the displacement of individuals such that reproductive success is negatively affected, or an individual's physiological ability to cope with environmental stress is compromised.

Distribution line - An electrical utility line with a capacity of less than 100kV or a natural gas, hydrogen, or water pipeline less than 24" in diameter.

Diversity (species) – The number, distribution, and geographic ranges of plant and animal species including focal species and species-at-risk.

Durable (protective and ecological) - The administrative, legal, and financial assurances that secure and protect the conservation status of a compensatory mitigation site, and the ecological benefits of a compensatory mitigation project, for at least as long as the associated impacts persist.

Enhance - The improvement of habitat by increasing missing or modifying unsatisfactory components and/or attributes of the habitat (e.g., road commissioning) to meet greater sage-grouse objectives.

Exception (minerals) - A case-by-case exemption from a lease stipulation. The stipulation continues to apply to all other sites within the leasehold to which the restrictive criteria apply. The authorized officer (any employee of the Forest Service to whom has been delegated the authority to perform the duties described in the applicable Forest Service manual or handbook) may grant an exception if an environmental record of review determines that the action, as proposed or conditioned, would not impair the function or utility of the site for the current or subsequent seasonal habitat, life-history, or behavioral needs of greater sage-grouse.

Feasible – see technically/economically feasible.

Fluid minerals - Oil, gas, coal bed natural gas, and geothermal resources.

General habitat management areas - Areas identified by the Forest Service, in coordination with respective state wildlife agencies, as those areas outside of priority and sagebrush focal management areas and occupied by greater sage-grouse seasonally or year-round.

Grazing system - Scheduled grazing use and non-use of an allotment to reach identified goals or objectives by improving the quality and quantity of vegetation. Include, but are not limited to, developing pastures, utilization levels, grazing rotations, timing and duration of use periods, and necessary range improvements.

Habitat - An environment that meets a specific set of physical, biological, temporal, or spatial characteristics that satisfy the requirements of a plant or animal species or group of species for part or all of their life cycle.

Hard triggers - Thresholds indicating that immediate action is necessary to stop a severe deviation from sage grouse conservation objectives set forth in the land and resources management plan.

High-voltage transmission line – An electrical power line that is 100 kilovolts or larger.

Holder – An individual or entity that holds a valid special use authorization.

Impact - The effect, influence, alteration, or imprint caused by an action.

Important habitat management areas - High value habitat and populations that provide a management buffer for the priority and sagebrush focal management areas and connect patches of priority and sagebrush focal management areas. The areas encompass areas of generally moderate to high conservation value habitat and/or populations and, in some conservation areas, include areas beyond those identified by USFWS as necessary to maintain redundant, representative, and resilient populations. The areas are typically adjacent to priority and sagebrush focal management areas but generally reflect somewhat lower greater sage-grouse population status and/or reduced habitat value due to disturbance, habitat fragmentation, or other factors. No important habitat management areas are designated within the southwestern Montana conservation area.

Indicators - Factors that describe resource condition and change and can help the BLM and the Forest Service determine trends over time.

Isolated parcel - An individual parcel of land that may share a corner, but does not have a common border with another parcel.

Invasive species (invasives plant species, invasives) - An alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health. The species must cause, or be likely to cause, harm, and be exotic to the ecosystem it has infested before considered invasive.

Landscape – A distinct association of land types that exhibit a unique combination of local climate, landform, topography, geomorphic process, surficial geology, soil, biota, and human influences. Landscapes are generally of a size that the eye can comprehend in a single view.

Lease – A type of special use authorization (usually granted for uses other than linear rights-of-way) that is used when substantial capital investment is required and when conveyance of a conditional and transferable interest in National Forest System lands is necessary or desirable to serve or facilitate authorized long-term uses, and that may be revocable and compensable according to its terms.

Leasable minerals - Those minerals or materials designated as leasable under the Mineral Leasing Act of 1920. These include energy-related mineral resources such as oil, natural gas, coal, and geothermal, and some non-energy minerals, such as phosphate, sodium, potassium, and sulfur. Geothermal resources are also leasable under the Geothermal Steam Act of 1970.

Lessee - A person or entity authorized to use and occupy National Forest System land under a specific instrument identified as a lease. Forest special use leases are limited to authorize certain wireless communication uses. Leases are also used for certain mineral leasable activities.

Lek - A courtship display area attended by male greater sage-grouse in or adjacent to sagebrush dominated habitat. For management purposes, leks with less than five males observed strutting should be confirmed active for 2 years to meet the definition of a lek (Connelly et al 2000, Connelly et al. 2003, 2004).

Locatable minerals - Mineral disposable under the General Mining Act of 1872, as amended, that was not excepted in later legislation. They include hardrock, placer, industrial minerals, and uncommon varieties of rock found on public domain lands.

Major pipeline – A pipeline that is 24 inches or more in outside-pipe diameter (Mineral Leasing Act of 1920 30 U.S.C. § 181; 36 CFR 251.54(f)(1)).

Mineral - Any naturally formed inorganic material, solid or fluid inorganic substance that can be extracted from the earth, any of various naturally occurring homogeneous substances (as stone, coal, salt, sulfur, sand, petroleum, water, or natural gas) obtained usually from the ground. Under Federal laws, considered as locatable (subject to the general mining laws), leasable (subject to the Mineral Leasing Act of 1920), and salable (subject to the Materials Act of 1947).

Mineral materials - Common varieties of mineral materials such as soil, sand and gravel, stone, pumice, pumicite, and clay that are not obtainable under the mining or leasing laws but that can be acquired under the Materials Act of 1947, as amended.

Minimization mitigation - Minimizing impacts by limiting the degree or magnitude of the action and its implementation.

Mitigation - Includes specific means, measures, or practices that could reduce, avoid, or eliminate adverse impacts. Mitigation can include avoiding the impact altogether by not taking a certain action or parts of an action, minimizing the impact by limiting the degree of magnitude of the action and its implementation, rectifying the impact by repairing, rehabilitation, or restoring the affected environment, reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, and compensating for the impact by replacing or providing substitute resources or environments.

Modification (oil and gas) - A fundamental change to the provisions of a lease stipulation, either temporarily or for the term of the lease. A modification may include an exemption from or alteration to a stipulated requirement. Depending on the specific modification, the stipulation may or may not apply to all other sites within the leasehold to which the restrictive criteria applied.

Native plant species - Species that were found here before European settlement, and consequently are in balance with these ecosystems because they have well developed parasites, predators, and pollinators.

No surface occupancy (NSO) - Use or occupancy of the land surface for fluid mineral exploration or development prohibited to protect identified resource values. The NSO stipulation includes stipulations that may be worded as “No Surface Use/Occupancy,” “No Surface Disturbance,” “Conditional NSO,” or “Surface Disturbance or Surface Occupancy Restriction (by location).”

Occupied Lek - A lek that has been active during at least one strutting season within the prior 10 years.

Opportunity (allotment closure) - A suitable or favorable time to abolish or close an allotment because of nonuse violations, term permit waivers where the permit is waived back to the government, resource protection, or permit actions resulting in cancellation of the permit.

Permit — A special use authorization that provides permission, without conveying an interest in land, to occupy and use National Forest System land or facilities for specified purposes, and which is both revocable and terminable.

Persistent woodlands – Long-lived pinyon-juniper woodlands that typically have sparse understories and occur on poor substrates in the assessment area.

Plan of Operation - A Plan of Operation is required for all mining activity conducted under the General Mining Act of 1872, as amended, if the proposed operations will likely cause significant disturbance of surface resources. The Plan of Operation describes the type of operations proposed and how they would be conducted, the type and standard of existing and proposed roads or access routes, the means of transportation to be used, the period during which the proposed activity will take place, and measures to be taken to meet the requirements for environmental protection (36 CR 228.4).

Prescribed fire - Any fire ignited by management actions to meet specific objectives. A written, approved prescribed fire plan must exist and NEPA requirements, where applicable, must be met before ignition.

Priority management areas - Areas identified by the Forest Service, in coordination with respective state wildlife agencies, as having the highest conservation value to maintaining sustainable greater sage-grouse populations. These areas include breeding, late brood-rearing and winter concentration areas.

Reclamation plans – Plans that guide the suite of actions taken within an area affected by human disturbance, the outcome of which is intended to change the condition of the disturbed area to meet pre-determined objectives and/or make it acceptable for certain defined resources (e.g., wildlife habitat, grazing, ecosystem function, etc.).

Residual impacts - Impacts from an implementation-level decision that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

Restoration - Implementation of a set of actions that promotes plant community diversity and structure that allows plant communities to be more resilient to disturbance and invasive species over the long term. The long-term goal is to create functional, high quality habitat that is occupied by greater sage-grouse. Short-term goal may be to restore the landform, soils and hydrology and increase the percentage of preferred vegetation, seeding of desired species, or treatment of undesired species.

Right-of-way - Land authorized to be used or occupied for the construction, operation, maintenance, and termination of a project or facility passing over, upon, under or through such land.

Road or trail - A road or trail wholly or partly within or adjacent to and serving the National Forest System that the Forest Service determines is necessary for the protection, administration, and utilization of the National Forest System and the use and development of its resources.

Sagebrush focal areas – A subset of priority greater sage-grouse habitat, as identified by the U.S. Fish and Wildlife Service, which are considered most vital to the species persistence and therefore, have the strongest levels of protection.

Soft triggers - An intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.

Special use authorization - A written permit, term permit, lease, or easement that authorizes use or occupancy of National Forest System lands and specifies the terms and conditions under which the use or occupancy may occur.

Stipulation (general) - A term or condition in an agreement, contract, or written authorization.

Stipulation (oil and gas) - A provision that modifies standard oil and gas lease terms and conditions in order to protect other resource values or land uses and is attached to and made a part of the lease.

Soft trigger - An intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.

Surface disturbing and disruptive activities - Actions that alter the vegetation, surface/near surface soil resources, and/or surface geologic features, beyond natural site conditions and on a scale that affects other public land values. Examples of surface disturbing activities may include operation of heavy equipment to construct well pads, roads, pits and reservoirs; installation of pipelines and power lines; and the conduct of several types of vegetation treatments (e.g., prescribed fire, etc.). Surface disturbing activities may be either authorized or prohibited

Surface use - Activities that may be present on the surface or near-surface (e.g., pipelines) of public lands. When administered as a use restriction (e.g., no surface occupancy), this phrase prohibits all but specified resource uses and activities in a certain area to protect particular sensitive resource values and property. This designation typically applies to small acreage sensitive resource sites (e.g., plant community study enclosure, etc.), and/or administrative sites (e.g., government ware-yard, etc.) where only authorized, agency personnel are admitted.

Tall structures - A wide array of infrastructures (e.g., poles that support lights, telephone and electrical distribution, communication towers, meteorological towers, high-tension transmission towers, and wind turbines) that have the potential to disrupt lekking or nesting birds by creating new perching/nesting opportunities and/or decreasing the use of an area. A determination as to whether something is considered a tall structure would be based on local conditions such as vegetation or topography.

Technically/economically feasible - Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the Forest Service's sole responsibility to determine what actions are technically and economically feasible. The Forest Service will consider whether implementation of the proposed action is likely given past and current practice and

technology; this consideration does not necessarily require a cost-benefit analysis or speculation about an applicant's costs and profit.

Temporary special use permit – A type of permit that terminates within 1 year or less after the approval date. All other provisions applicable to permits apply fully to temporary permits. Temporary special use permits are issued for seasonal or short-duration uses involving minimal improvement and investment.

Term permit – An authorization to occupy and use National Forest System land, other than rights-of-way for a specified period that is both revocable and compensable according to its terms.

Timely - The conservation benefits from compensatory mitigation accruing as early as possible or before impacts have begun.

Transmission line - An electrical utility line with a capacity greater than or equal to 100kV or a natural gas, hydrogen, or water pipeline greater than or equal to 24" in diameter.

Travel management system – Planned and authorized roads, trails, and areas for motor vehicle use on National Forest System lands that are managed in a controlled, sustained manner.

Utility-scale and/or commercial energy development – A project that is capable of producing 20 or more megawatts of electricity for distribution to customers through the electricity-transmission-grid system.

Valid existing rights - Documented, legal rights, or interests in the land, which allow a person or entity to use said land for a specific purpose and that are still in effect. Such rights include but are not limited to fee title ownership, mineral rights, and easements. Such rights may have been reserved, acquired, granted or otherwise authorized under various statutes of law.

Vegetation treatments - Management practices that are designed to maintain current vegetation structure or change the vegetation structure to a different stage of development. Vegetation treatment methods may include managed fire, prescribed fire, chemical, mechanical, and seeding.

Viability - For purposes of the National Forest Management Act and its enabling regulations, viability is the availability of habitat that allows a species to persist on landscapes for long-periods (multi-generational) of time. It assumes that populations are abundant (sufficient numbers) and well-distributed (sufficient redundancy of populations) to provide for long-term population persistence on a landscape.

Waiver (oil and gas) - Permanent exemption from a lease stipulation. The stipulation no longer applies anywhere within the leasehold.

West Nile virus - A virus that is found in temperate and tropical regions of the world and most commonly transmitted by mosquitoes. West Nile virus can cause flu-like symptoms in humans and can be lethal to birds, including greater sage-grouse.

Wildfire suppression - An appropriate management response to wildfire, or prescribed fire that results in curtailment of fire spread and eliminates all identified threats from the particular fire.

Subject: Adaptive Management

Here is Idaho's adaptive management information. We've had some beginning talks about incorporating sw Montana into this approach if necessary, although Montana is working through their own approach which we expect to incorporate into the subregional plan when done.

Idaho and Southwest Montana Adaptive Management Strategy

The Adaptive Management Strategy in Idaho is consistent with the NPT AM guidance and incorporates elements associated with scale and evaluation and response for both hard and soft triggers – see Table. Soft triggers and hard triggers would be used at the level of Conservation Area and triggers are based on a monitoring strategy agreed upon by the State of Idaho, USFWS, and Forest Service.

The Adaptive Management Strategy was developed in close coordination with our conservation partners (e.g., State of Idaho, USFWS, Forest Service), and is based on biologically sound sage-grouse data (e.g., maps, lek data, published and unpublished scientific studies). For example, Conservation Areas were delineated based on breeding bird density, habitat connectivity and persistence, similarity of habitat and common threats. The strategy also use mapped vegetation and habitat maintained through the Key habitat map and annual updates which are made each winter by BLM in coordination with the FS and Idaho Department of Fish and Game (IDFG). The BLM and Forest Service would maintain GRSG habitat information, through use of the Key Habitat map or latest sagebrush/vegetation map, which would be used to track and identify habitat changes to assess the habitat trigger in the adaptive management approach.

Responses to soft triggers are conducted at the implementation level and include consideration of the inclusion of various design features during project implementation. The hard triggers in the Idaho plan are numeric and quantifiable; they are tied to trends in population changes or habitat losses and have been developed in cooperation with the State of Idaho, US FWS and Forest Service. The BLM, in coordination with the Idaho Department of Fish and Game (IDFG) would utilize population data collected and maintained by the IDFG to track and identify population changes to assess the population triggers. Responses to the hard triggers would implement more restrictive measures (identified within the proposed plan and consistent with more restrictive aspects of other alternatives) and further focus suppression and restoration priorities in areas beyond critical habitats.

Adaptive Management Trigger Rationale

Adaptive management triggers have been developed to appropriately respond to unexpected events (e.g., wildfire, West Nile Virus) that may result in a substantial loss of habitat or decline in sage-grouse populations. These triggers are intended to improve sage-grouse population trends, protect the overall baseline population, preserve a buffer population, and conserve sage-grouse habitat. The adaptive management strategy is composed of both population and habitat components.

Population

Population components consider population growth and change in lek size. Lek size has been related to population change in numerous studies (Connelly and Braun 1997, Connelly et al. 2004, Baumgart 2011, Garton et al. 2011). Garton et al. (2011) used both characteristics as well as number of active leks to assess change for sage-grouse populations throughout the west. The adaptive management triggers set at a lambda (change or trend of population) value less than one, a 10% (soft trigger) and 20% (hard trigger) decline in males counted on lek routes.

Although populations cannot be accurately estimated, lek counts of males provide a robust method for assessing population trend and estimating population growth (λ) in an unbiased fashion. Calculating lambda (λ finite rate of change) between successive years for a sage-grouse population is

described in Garton et al. (2011). The ratio of males counted in a pair of successive years estimates the finite rate of change (λ_t) at each lek site in that one-year interval. These ratios can be combined across leks within a population for each year to estimate λ_t for the entire population (or Conservation Zone) or combined across all leks to estimate λ_t for the state between successive years.

Because small game populations (including sage-grouse) typically fluctuate among years due to weather and other environmental variables, a λ_t for any given year is not very meaningful. However, a series of years where λ_t remains at or above 1.0 indicates a stable to increasing population. Moreover, this situation would also provide strong evidence of the effectiveness of conservation actions that may have been employed.

Lek attendance by males has been used as an indicator of population trend in some areas since at least the early 1950s. For many years it was the only indicator used to assess status of sage-grouse populations. However, recent research has shown that male attendance at leks can be affected by severity of the previous winter, weather, timing of counts during spring, and a variety of other factors (Emmons and Braun 1984, Hupp 1987, Baumgart 2011). Baumgart (2011) indicated the probability of male sage-grouse attending leks in south-central Idaho varied among years and appeared to be tied to winter severity. Although lek data provide a powerful data set for assessing population trends over time (Garton et al. 2011), counts for a single year may not reflect trends very well. Thus using lek counts as a trigger must consider the inherent variation in these counts. Moreover, males counted on leks appear to have the most value for assessing population change when used in conjunction with other indicators of population status (e.g., finite rate of change). Published information suggests that a change in maximum number of males counted on leks of say 10-15% cannot confidently be considered a reflection of population status. However, a 20% decline in maximum number of males counted on leks would likely not be related to lek attendance patterns but instead would reflect a population decline. Thus, the trigger was set at 20%.

Habitat

The habitat component considers loss of breeding and/or winter habitat. A variety of researchers (Swensen et al. 1987, Connelly et al. 2000a, Miller et al. 2011) have shown that loss of winter or breeding habitats resulted in decreased sage-grouse populations. The adaptive management triggers are set at a 10% (soft trigger) and a 20% (hard trigger) loss of breeding or winter habitats.

Numerous studies have documented the negative effects of habitat loss including fire and energy development on sage-grouse (Connelly et al. 2000b, Fischer et al. 1996, Nelle et al. 2000, Doherty et al. 2008), but few studies have related the amount of sagebrush habitat lost to population change. Based on current scientific findings a 30% loss of breeding and winter habitat is thus far the lowest amount of habitat loss for which a population response could be detected and landscapes with < 30% area in sagebrush within 6.4 km of lek center have the lowest probability of lek persistence. Idaho is taking a more conservative approach than suggested by the literature. A soft trigger is set at a 10% loss of breeding or winter habitat in Core or Important management zones of a Conservation Area, which initiates a review of the management approach. A hard trigger is set at a 20% loss of breeding or winter habitat within a Core Habitat Zone of a Conservation Area, which automatically causes a change in management status of the corresponding Important Habitat Zone.

Table – Idaho Adaptive Management Strategy and the National Policy Guidance

Adaptive Management Sideboards			
AM Element	How the AM element was addressed in the concept paper (February 2014)	Sideboards (April 2014)	Sub-regional ADPP Approach
Scale	“Each plan will include an overarching adaptive management strategy that includes soft and hard triggers for specific populations.”	<ul style="list-style-type: none"> ✓ Recommend that the scale used to monitor the adaptive management hard triggers is at the population level. If the scale used to monitor the trigger is smaller than the population level (such as a population management unit or PAC), ensure that the information collected at this smaller scale can be aggregated up to the population level. ✓ Recommend that the scale used to monitor the adaptive management soft trigger is at the project/implementation scale and local population level. 	<ul style="list-style-type: none"> ✓ The scale for evaluation of the adaptive management hard and soft triggers are: 1) Habitat – the modeled nesting (6.2 mile buffer around leks) and winter habitat within Core or Important Management Zones by Conservation Area; 2) Population – designated leks and lek routes within Core or Important Management Zones by Conservation Area. ✓ Conservation Areas were delineated based on breeding bird density, habitat connectivity and persistence, similarity of habitat and common threats. Smaller population areas are typically contained within a broader Conservation Area where larger population areas are split across several Conservation Areas. ✓ The triggers are evaluated within a Conservation Area by Core and Important Management Zones separately, further refining the sensitivity of the measure, so that losses can be measured and responded to at a level finer than the population.

			<ul style="list-style-type: none"> ✓ The responses to the hard triggered are implemented at the Conservation Area scale while responses to the soft trigger are implemented at the project level. ✓ The sampling and monitoring design for population is consistent with the Conservation Area breakdown to make evaluation of the triggers appropriate at the level for which data is collected.
Soft Triggers	<p>“Soft triggers represent an intermediate threshold indicating that management changes are needed at the implementation level to address habitat or population losses.”</p>	<ul style="list-style-type: none"> ✓ Recommended that if a numeric soft trigger is not outlined in the land use plan/plan amendment, the soft trigger should be any anomaly that is observed at a project/implementation and/or local population level. <p><i>Example of an anomaly: Population monitoring data indicates the number of male sage-grouse found on a local lek has decreased. Annual land use plan implementation monitoring data indicates that the majority of land use authorizations taking place in this area are rights-of-way for overhead transmission lines and there is reason to believe some loss of sage grouse has occurred from guy-wire collision. The plan implementation level response by the BLM/FS would be to require flagging guy-wires for all future transmission line authorizations within this local population area, in order to decrease the amount of sage-grouse collisions.</i></p>	<ul style="list-style-type: none"> ✓ Soft triggers are included in the plan.
Soft trigger responses	<p>“If a soft trigger is tripped, the BLM/FS will apply more conservative or restrictive implementation conservation measures to mitigate for the specific causal factor in the decline of populations and/or</p>	<ul style="list-style-type: none"> ✓ Responses to soft triggers may require the adjustment of future project level/plan implementation activities in the short- or long-term, as consistent with the individual site specific NEPA analyses. Soft trigger responses can come in the form of design features, BMPs, or site specific mitigation measures. <p><i>Examples of soft trigger responses could include (but are not</i></p>	<ul style="list-style-type: none"> ✓ Responses to soft triggers are conducted at the implementation level and include consideration of the inclusion of various design features during project implementation.

	habitats, with consideration of local knowledge and conditions.”	<p><i>limited to) the following for future BLM/FS implementation level actions:</i></p> <ul style="list-style-type: none"> • <i>Extending seasonal restrictions for seasonal surface disturbing activities (provided as stipulations to a ROW grant or a Condition of Approval to an oil and gas lease),</i> • <i>Reprioritizing wild horse and burro gathers;</i> • <i>Applying sequential development after reclamation;</i> • <i>Temporary area closures related to travel management; (2-year maximum);</i> • <i>Modifying seasons of use for livestock grazing through annual permit authorizations; and/or</i> • <i>Applying additional restrictions on discretionary activities, or reject the authorization if mitigation criteria cannot be met.</i> 	
Hard triggers	“Hard triggers represent a threshold indicating that immediate action is necessary to stop a severe deviation from sage grouse conservation objectives set forth in the BLM and FS plans.”	<ul style="list-style-type: none"> ✓ Recommend that there be numeric hard triggers for both population and habitat declines. ✓ Recommend that numeric hard triggers identified in the plans are tied to a specific trend (e.g., a percent range of normal variation or a number of standard deviations from normal variation). ✓ Recommend that the hard triggers be developed in cooperation with state and FWS partners. 	✓ The hard triggers in the Idaho plan are numeric and quantifiable; they are tied to trends in population changes or habitat losses and have been developed in cooperation with the State of Idaho, US FWS and Forest Service.
Hard trigger responses	“The Proposed RMPs/Final EISs will include a “hard-wired” plan-level response; that is, it will provide that, upon reaching the trigger, a more restrictive alternative, or an appropriate component of a more restrictive alternative... in the event that new scientific information becomes	<ul style="list-style-type: none"> ✓ The hard trigger response will be an entire restrictive alternative, or one or more appropriate components of a more restrictive alternative such as the immediate cessation of authorizing land use authorizations (within the area/scale in which we will be implementing the responses to these triggers). After the hard-trigger is tripped, the BLM or FS will determine the causal factor and develop and implement a recovery strategy. 	✓ The hard trigger responses are implemented for a Conservation Area and included additional restrictions that were considered and analyzed within the Proposed Plan as well as in design features in other more restrictive alternatives. A causal factor determination and evaluation is also included as part of the evaluation and response for both

	available demonstrating that the hard wired response would be insufficient to stop a severe deviation from sage grouse conservation objectives set forth in the BLM and FS plans, the BLM or FS will immediately implement a formal directive akin to BLM IM 2012-043 to protect greater sage-grouse and its habitat and to ensure that conservation options are not foreclosed.”		hard and soft triggers.
“How to incorporate in the document”	Do we want to provide sideboards which articulate how the AM elements should be presented in the plan?	<ul style="list-style-type: none"> ✓ Consistent chapter 2 introductory template language (see section 2.X below) is recommended to be included in each of the 14 FEISs. This language will replace the language that was presented in the DEISs and is consistent with the language presented in the adaptive management concept paper. ✓ It is recommended that the numeric hard trigger, hard trigger response, and the scale in which we will be implementing the responses are presented as a management action in the PRMP/FEIS. ✓ Ensure that the chapter 4 impact analysis is updated to support the adaptive management responses. 	✓ Language has been included in Chapter 2 consistent with or identical to the language indicated.

<p>WAFWA Management Zone Greater Sage-Grouse Conservation Team</p>	<p>While not articulated in the concept paper, both the draft monitoring and draft mitigation frameworks reference this group.</p>	<ul style="list-style-type: none"> ✓ The WAFWA Management Zone Greater Sage-Grouse Conservation Team is the same team that will be referenced in the Mitigation and Monitoring Frameworks. ✓ The WAFWA Management Zone Greater Sage-Grouse Conservation Team would be responsible for: (1) evaluating the adaptive management responses made by each sub-regional plan in a WAFWA MZ, (2) evaluating the effectiveness of these responses in the context of the overall zone, (3) evaluating the monitoring data that is being collected to inform the triggers, and (4) providing overall adaptive management recommendations to the surface management agencies based on their evaluations. If there is an existing state adaptive management working group already in place, the working group agreement between the state, BLM, and FWS, would not be impacted by the responsibilities provided to this WAFWA MZ or any of the above sideboards. 	<ul style="list-style-type: none"> ✓ Yes, this is the intent within Idaho. There are still some specific details to be worked out – primarily the composition membership of these teams. In Idaho several key stakeholders and developers of the State Mitigation Framework and the Adaptive Management Framework that the States intend to remain involved are not Government employees (state or Federal) which raises a potential FACA concern which we are trying to resolve.

Hi Johanna - we sure did (as part of the Great Basin tables since it is the area that is associated with the Idaho/SW MT EIS). It is attached.

Thanks,

Matt

Idaho Southwest Montana Response Friday December 5, 2014.

1. Mapping PPH and PGH: When initially mapping preliminary priority and preliminary general habitat for your sub-region with your respective state wildlife agency (per IM-2012-044), were distances from leks part of this mapping exercise? If so, what distance from the lek was used? Please provide the citation if available. If not, what was the criteria/basis for mapping priority and general habitat?

Response: Distances from leks were used to map PPH and PGH. The distances used were 6.4 km (4 mile) to construct 75% breeding bird density and 8.5 km (5.3 mile) to capture the 76-100% breeding bird density (Doherty et al., 2010). Additional factors were also incorporated including a lek connectivity model, winter habitat, key habitat, etc.

Doherty, K.E., J.D. Tack, J.S. Evans, and D.E. Naugle. 2010. Mapping breeding densities of greater sage-grouse: A tool for range-wide conservation planning. BLM Completion Report. Interagency Agreement # L10PG00911.

2. Rationale for existing buffer distances: We recognize that sub-regions provided this information to the WO prior to the Federal Family Meetings, but in order to reflect any changes that have been made since then, what buffer distances and their supportive scientific references are identified in your ADPP for both PHMA (Core and IHMA) **and** GHMA (please note if they are seasonal or year-round buffers)? Do these distances fall within the Report's interpreted range for surface disturbance, linear features, and energy development (3.1 miles to 5 miles), tall structures (2 miles to 5 miles), and low structures (1.2 miles to 5 miles)?

If the sub-regional buffers do not fall within the Report's interpreted ranges, do you feel you need to make changes to your existing ADPP buffers? If not, why?

Response: Please see the attached table for buffer distances, relationship to the USGS buffers, rationale for differences and the corresponding ADPP language. The team will meet to consider changes to the transmission buffer (currently 600m considering 2 mile), and unleased fluid minerals buffer (currently 2 mile considering 3 mile).

3. Application of buffer distances in your ADPP: Do you attach any BLM land use plan allocations (NSO, ROW exclusions/avoidances, or closures for example) within the buffer distances from leks in your ADPP for both PHMA (Core and IHMA) **and** GHMA? If so, are these buffer allocations depicted in the data that you will be using for cumulative effects analysis and mapping purposes?

If no land use plan allocations are associated within a buffer distance from a lek, how does the sub-region plan to implement the conservation actions associated with the buffer distance?

Response: The buffers are not considered allocations. The allocations are made through the ADPP decisions, based on the type of Habitat Management Area designation. For example the ADPP makes

Pre-decisional Deliberative Document – Not for Distribution

priority and important habitat (PHMA, IHMA) NSO for fluid minerals; and commercial scale wind and solar are excluded in PHMA. These are the types of allocations that will be considered in the cumulative effects analysis. The buffers and Required Design Features (RDFs) are applied at the site specific implementation phase to mitigate effects. These are not allocations because the lek data are not static- i.e, leks may disappear or new leks may be located over time.

4. If a 3.1 mile buffer was to be applied to every occupied lek present in the sub-region’s planning area, would BLM managed PHMA and GHMA within this 3.1 mile buffer area be covered by restrictive land use plan allocations? In order to effectively respond to this question, please work with your GIS specialist to develop the following:
 - a. A map of your planning area with the following layers: 1) all known leks with a 3.1 mile buffer (shown as a circle), ADPP PHMA (Core and IHMA), and ADPP GHMA.
 - b. Acreage figures populated for the below categories.

	Acres
Acres of BLM/FS managed PHMA (Core and IHMA) within a 3.1 mile buffer from a lek.	4,496,036
Acres of BLM/FS managed GHMA within a 3.1 mile buffer from a lek.	342,340
Acres of BLM/FS lands within 3.1 mile from a lek that is not managed as PHMA or GHMA.	243,859

Buffer Review Meeting – 12-09-14

Powell; Pyron, Makela, Beck; Bockting; Colt; Ellsworth; and Sutter

Objective: Informational Meeting: Review the buffer table provided to the WO for the buffer data call. Discuss any inconsistencies with ADPP buffers and USGS buffer paper.

Background: When assembling the data for the WO buffer data call we noticed that six of the twelve total buffers are below the USGS recommended minimum. The team concluded that the allocation decisions in the ADPP combined with the exception criteria, and the buffers should provide adequate protection to GRSG habitat and populations in most cases. Although the team provided sound rationale in the buffer table explaining the reason for selecting those buffers, and we feel our buffers are adequate when taken in context with the rest of the ADPP, unleased Fluid minerals and Transmission differed enough to trigger further discussions.

This was a proactive meeting to start buffer conversations in anticipation of possible direction based on the Buffer data call and to contemplate how to best streamline the Buffer and RDF appendices.

Discussion Items:

1. Unleased fluid mineral buffers in our buffer table (2 mile) are below the USGS minimum (3 mile). Possible solution: add BMP or RDF that would increase the buffer area.
2. The transmission lines RDF buffer in Priority and Important and General habitat is below the USGS recommendation (600m vs 2 miles). Possible solution: Keep as is and rely on other decisions (i.e, exceptions criteria and ADPP allocations and 2 mile buffer BMP) to protect sage grouse habitat.
3. The team would like to consider combining the RDF appendix with the Buffer Table so there is one place for managers to look when they implement these decisions.
4. The Buffer table BMPs could be added into the RDF table in the “as appropriate” column.

<p>USGS Interpreted Range (low-high) Surface Disturbance 3.1-5.0 mi (5.0-8.0 km)</p>			
<p>Salable Minerals</p>	<p>Buffer Table: Salables-BMP: Important and General: Do not construct new salable development within 0.8 mile (1.3 km) of leks</p>	<p>NO: Salables- No literature specific to salables but buffer distance is based on the noise literature for roads. See Patricelli et al. 2012 (WY recommendations for interim noise protections) that recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat. Chose BMP in Important and General habitat since new Salable pits (e.g., gravel) may be necessary to support road maintenance or improvement for access by fire operations or for other locally important factors.</p>	<p>Salable Minerals Salable Minerals (SAL)-1: Priority: No new site authorizations would be approved. Important: New site authorizations could be considered provided the Anthropogenic Disturbance Development Criteria (AD-4) can be met, and subject to RDFs, buffers and seasonal timing restrictions. Sales from existing community pits within PHMA and IHMA would be subject to seasonal timing restrictions.</p>

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
			General: Open to new site authorizations subject to RDFs, buffers and seasonal timing restrictions. Existing sites Open to new sales subject to seasonal timing restrictions.
USGS Interpreted Range (low-high) Linear Features 3.1-5.0 mi (5.0-8.0 km)			
Pipelines	Buffer Table: BMP: Priority, Important, General. Minimize removal of sagebrush within 0.6 miles of leks.	NO: However, application of this measure is designed to minimize loss of sagebrush in the vicinity of the lek. The main concern was with loss of sagebrush in the vicinity of a lek that is used by GRSG for cover. The 0.6 mile buffer is based on rationale in the Colorado GRSG Conservation Plan as below: BACKGROUND INFORMATION: From Colorado GRSG Conservation Plan Appendix B: [Lek Habitat (March through mid-May) - The basis and rationale for the first radius, 0.6 miles from a lek (Fig. B-1), is developed by summarizing data from 5 separate studies of daytime movements of adult male sage-grouse during the breeding season (Carr 1967, Wallestad and Schladweiler 1974, Rothenmaier 1979, Emmons 1980, Schoenberg 1982), because daytime movements of adult male GRSG during the breeding season do not vary greatly. Wallestad and Schladweiler (1974) found daily movements of adult males ranged between 0.2 and 0.8 miles from leks, with a maximum cruising radius of 0.9 - 1.2 miles. Ellis et al. (1987) reported that dispersal flights of male GRSG (to day-use areas) ranged from 0.3 – 0.5 miles, with the longest flights ranging from 1.2 – 1.3 miles. Carr (1967) recorded a cruising radius for male GRSG that ranged from 0.9-1.1 miles. Rothenmaier (1979) found that 60-80% of male GRSG locations were within 0.6 - 0.7 miles of a lek. Emmons (1980) reported that male dispersal	Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
		<p>distances to day use areas of 0.1 miles were common and that 67% of all use areas were greater than 0.3 miles from the lek. In addition, Schoenberg (1982) found that male daily movements averaged 0.6 miles, but ranged from 0.02 - 1.5 miles.</p> <p>Male GRSG activity patterns during the breeding season include strutting during the early morning hours, feeding and loafing during the day, and roosting on the lek during the night. Grouse attending the lek do not always roost on the exact location where the strutting occurs the next morning. Occasionally (this is lek-dependent), grouse roost in adjacent sagebrush cover. Ultimately, male GRSG require an open area for strutting, and sagebrush immediately adjacent for feeding and loafing. Sagebrush adjacent to the lek is also used as escape cover from predators or other types of disturbance. Female GRSG that attend the lek also use the area in this zone in the same fashion as do males (Patterson 1952, Barnett and Crawford 1994, Coggins 1998).] Study locations noted above: Carr- Colorado; Wallestad and Schladweiller- Montana; Emmons- Colorado; Schoenberg- Colorado; Rothenmaier – unable to locate Univ. WY Thesis but study area not defined.</p>	
Roads	<p>Buffer Table: NESTING BMP: Priority, Important, General: Avoid construction of new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of nesting habitat.</p> <p>Buffer Table-LEK BMP: BMP: Priority, Important, General: Do not construct new paved or high volume traffic gravel roads within 0.8 mile (1.3 km) of leks.</p>	<p>NO: The 0.8 mile BMP is based on noise/GRSG literature (see below). Rationale for BMP is that we may need to construct a gravel or two track road for fire access or other reasons such as access to private lands. Use of a large lek buffer may force new road further into important nest/winter habitat increasing risk of fire/other impacts including more linear disturbance.</p> <p>Patricelli et al. 2012 (Recommendations for interim</p>	<p>TM-5: Conduct road construction, upgrades, and maintenance activities to avoid disturbance during specific times at different seasons – see seasonal and timing restrictions section.</p>

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
		<p>protections in WY) We apply it here as a lek-centric BMP because we may need to construct a road near a lek (perhaps for fire operations/ access or to allow access to private lands or per ROW need). If we buffer roads in the Priority or Important Areas via a large lek buffer, it may lead to disturbance of a much larger area of nesting habitat in the course of avoiding the lek and buffers. The BMP would at least allow for siting to avoid the lek, and reducing road noise near the lek, without compromising broader landscapes.recommended siting roads 0.7 to 0.8 miles from crucial seasonal habitat.</p>	
USGS Interpreted Range (low-high) Energy Development 3.1-5.0 mi (5.0-8.0 km)			
Unleased Fluid Minerals	<p>Buffer Table: Stipulation: Priority, Important, General: Do not allow wells, pads, facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek.</p>	<p>NO: Considering working with the team to update. This impact may have a population level effect and trip a population trigger therefore we recommended this be an RDF. Recent literature says 0.25 mile and 0.6 mile buffers are not sufficient (Harju et al. 2010). Hess (2011 MS Thesis) found statistical evidence that oil/well pad influence extended as far as 1.6 km from grouse leks. The 1/640 density per based on consideration of 1) Harju et al. (2010) who found pad density of 1.54 pad/sq km (1 pad/247 ac) had 13-74% lower attendance at leks and 2) Doherty (2008 page iii and 79) who noted potential impacts from oil and gas development were indiscernible at ~1 well/640 acres. IDswMT biology team recommended a more conservative approach to minimize risk of tripping a population trigger, hence the 1/640.</p>	<p>Fluid Minerals (FLM)-1: Idaho and Montana: Areas within Priority Habitat Management Areas and Important Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to no surface occupancy with a limited exception</p> <p>(FLM-3). General Habitat Management Areas would be open to mineral leasing and development and geophysical exploration subject to CSU which includes buffers, seasonal timing restrictions and standard stipulations.</p>
USGS Interpreted Range (low-high) Tall Structures 2.0-5.0 mi (3.3-8.0 km)			

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
Transmission	<p>Buffer Table: RDF: Priority, Important, General: Do not allow transmission line construction within 600 m of a lek.</p> <p>BMP Priority, Important, General: Avoid transmission line construction within 2 miles (3.2 km) of a lek.</p>	<p>NO: Considering working with the team to update. A 600 m GRSG avoidance zone reported per Gillan et al. (2013). No other spatial buffer supported by literature. While 600 m is a citable buffer, a 2 mile zone as BMP for Transmission is recommended as well. Based on Connelly et al. 2000 Guidelines to avoid tall structures in important seasonal habitats.</p>	<p>Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.</p>
Distribution	<p>Buffer Table: BMP: Priority, Important and General-Avoid distribution line construction within 600 m of a lek or bury where possible</p>	<p>NO: 600 m, based on Gillan et al. BMP as this may not always be feasible.</p>	
Solar	<p>RDF: Important- Do not allow new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek4.</p> <p>BMP-General: Avoid new facilities or associated above ground infrastructure within 2 miles (3.2 km) a lek4.</p>	<p>YES: No specific literature available relative to solar development. Recommended buffer is based on recent literature (Harju et al 2010) that 0.6 or 0.25 mile buffers are not. The 2 mile buffer is consistent with Connelly et al. 2000 regarding energy facilities (page 978).</p>	<p>Consistent with USGS and literature. Priority:</p> <p>LR-2: Designate and manage Priority Habitat Management Areas as exclusion areas for utility scale (20 MW) Wind and Solar testing and development, nuclear and hydropower energy development. Important: Designate and manage Important Habitat Management Areas as avoidance areas for Wind and Solar testing and development, nuclear and hydropower development. General: Designate</p>

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
			and manage General Habitat Management Areas as open for Wind and Solar testing and development and nuclear and hydropower development subject to RDFs, buffers and seasonal timing restrictions.
Communication Towers	<p>Buffer Table: RDF: Priority -Do not allow communication tower construction within 3 miles (5 km) of a lek unless needed to address public safety needs.</p> <p>BMP- Important and General--Avoid communication tower construction within 3 miles (5 km) of a lek unless needed to address public safety needs.</p>	YES: Johnson et al. (2011 pg. 427) noted "Analogously, across all management areas there was a steady downward pattern of trends of lek counts as the number of towers increased, either within 5 km (Fig. 21) or within 18 km (Fig. 22)."	Lands and Realty (LR)-1: Priority: Designate and manage Priority Habitat Management Areas as ROW avoidance areas, consistent with AD-3 and subject to RDFs, buffers and seasonal timing restrictions (Appendix A, B & C). Important: Designate and manage Important Habitat Management Areas as ROW avoidance areas, consistent with AD-4 and subject to RDFs, buffers and seasonal timing restrictions. General: Designate and manage General Habitat Management Areas as open with proposals subject to RDFs, buffers and seasonal timing restrictions.
USGS Interpreted Range (low-high) Low Structures 1.2-3.2 mi (2.0-5.1 km)			
Fences	RDF 104: Avoid building new wire fences within 2 km of occupied leks (Stevens 2011). If this is not feasible, ensure that high risk segments are marked with collision diverter devices or as latest science indicates.	YES: Consistent with USGS and literature	RM-12: Design any new structural range improvements, following appropriate cooperation, consultation and coordination, to minimize and/or mitigate effects to GRSG habitat. Any new structural range improvements should be placed

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
			along existing disturbance corridors or in unsuitable habitat, to the extent practical, and are subject to RDFs (Appendix A). Structural range improvement in this context, include, but are not limited to: fences, exclosures, corrals or other livestock handling structures; pipelines, troughs, storage tanks (including moveable tanks used in livestock water hauling), windmills, ponds/reservoirs, solar panels and spring developments.
Miscellaneous anthropogenic structures/ activities (e.g., corrals, water windmills, apiaries, signs, informational kiosks, etc.)	<p>RDF 105: Place new, taller structures, including corrals, loading facilities, water storage tanks, windmills, out of line of sight or at least one kilometer (preferably 3 km) from occupied leks, where such structures would increase the risk of avian predation.</p> <p>Buffer Table: BMP Priority, Important, General: Avoid human activities or placement of new structures as noted within 2 miles (3.2 km) mi of a lek or ensure they are out of the view shed of the lek.</p>	<p>YES: This is a catch all to reduce impact of miscellaneous structures where possible (some are tall, such as water windmill, some are small, but have human activity- such as kiosks) or activities not otherwise addressed in this table. Based on biology team discussion and input, and Connelly et al. 2000 Guidelines that state, “avoid building powerlines and other tall structures that provide perch sites for raptors within 3 km of seasonal habitats” (page 977). Avoiding “seasonal habitats” entirely by 3 km would preclude any of these activities at all in Priority, Important or General, but siting 2 miles + from leks as a BMP would nonetheless help protect leks from disturbance.</p> <p>Adding the “view shed” caveat can help with siting in cases where topography or such screens view of the activity or structure.</p>	<p>LR-5: Consistent with LR-2, LR-3 and LR-4, Rights-of-way for development of new or amended ROWs and land use authorizations in PHMA would only be considered when consistent with the Anthropogenic Disturbance Exception Criteria (AD-3); Rights-of-way for development of new or amended ROWs and land use authorizations in IHMA could be considered consistent with the Important Habitat Management Area Anthropogenic Disturbance Development Criteria. (AD-4). General: New ROW and land use authorizations could be considered.</p>
USGS Interpreted Range (low-high) Activities (w/o habitat loss) 0.12-3.0 mi (400 m-4.8 km)			
Livestock	RDF 108: During lekking periods, as determined locally (approximately	YES: No literature. BMP based on biology team	RM-11: Incorporate RDFs into Terms and Conditions for

Category	ID/swMT Proposed Plan Buffer Table or RDF	Within USGS Range? & Rationale and Literature Referenced	Wording from Latest ADPP
	<p>March 15-May 1 in lower elevations and March 25-May 15 in higher elevations), livestock trailing will be avoided to the extent possible within 1 km (0.62 mile) of occupied leks between 6:00 p.m. and 9:00 a.m. to avoid disturbance to lekking and roosting sage-grouse. Over-nighting, watering and sheep bedding locations on public lands must be at least 1 km from occupied leks during the lekking season to reduce disturbance from sheep, human activity and guard animals.</p> <p>Buffer Table: BMP Priority, Important, General: Avoid bedding sheep and placing camps within 0.6 mi of a lek during the lekking season.</p>	<p>consensus.</p>	<p>crossing permits to limit disturbance of occupied leks when trailing livestock across BLM- and Forest Service - administered lands in the spring. Work with permittees in locating over-nighting, watering and bedding locations to minimize impacts to seasonal habitats</p>
<p>Organized Recreational Events</p>	<p>Buffer Table: RDF Priority and Important-Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.</p> <p>BMP General- Do not schedule disruptive recreational events (e.g., motorized races) within 2.0 miles (3.2 km) of occupied leks during the lekking season.</p>	<p>YES: Biology team consensus. No specific literature relative to buffers for recreational events but can manage this through avoiding the appropriate season. This threat (organized recreational events) is a short term, typically one-day event, with temporary disruption from noise the main issue.</p>	<p>REC-1: Manage existing recreation uses and sites to minimize adverse effects on GRSG or their habitat through incorporation of RDFs, buffers and seasonal restrictions.</p>

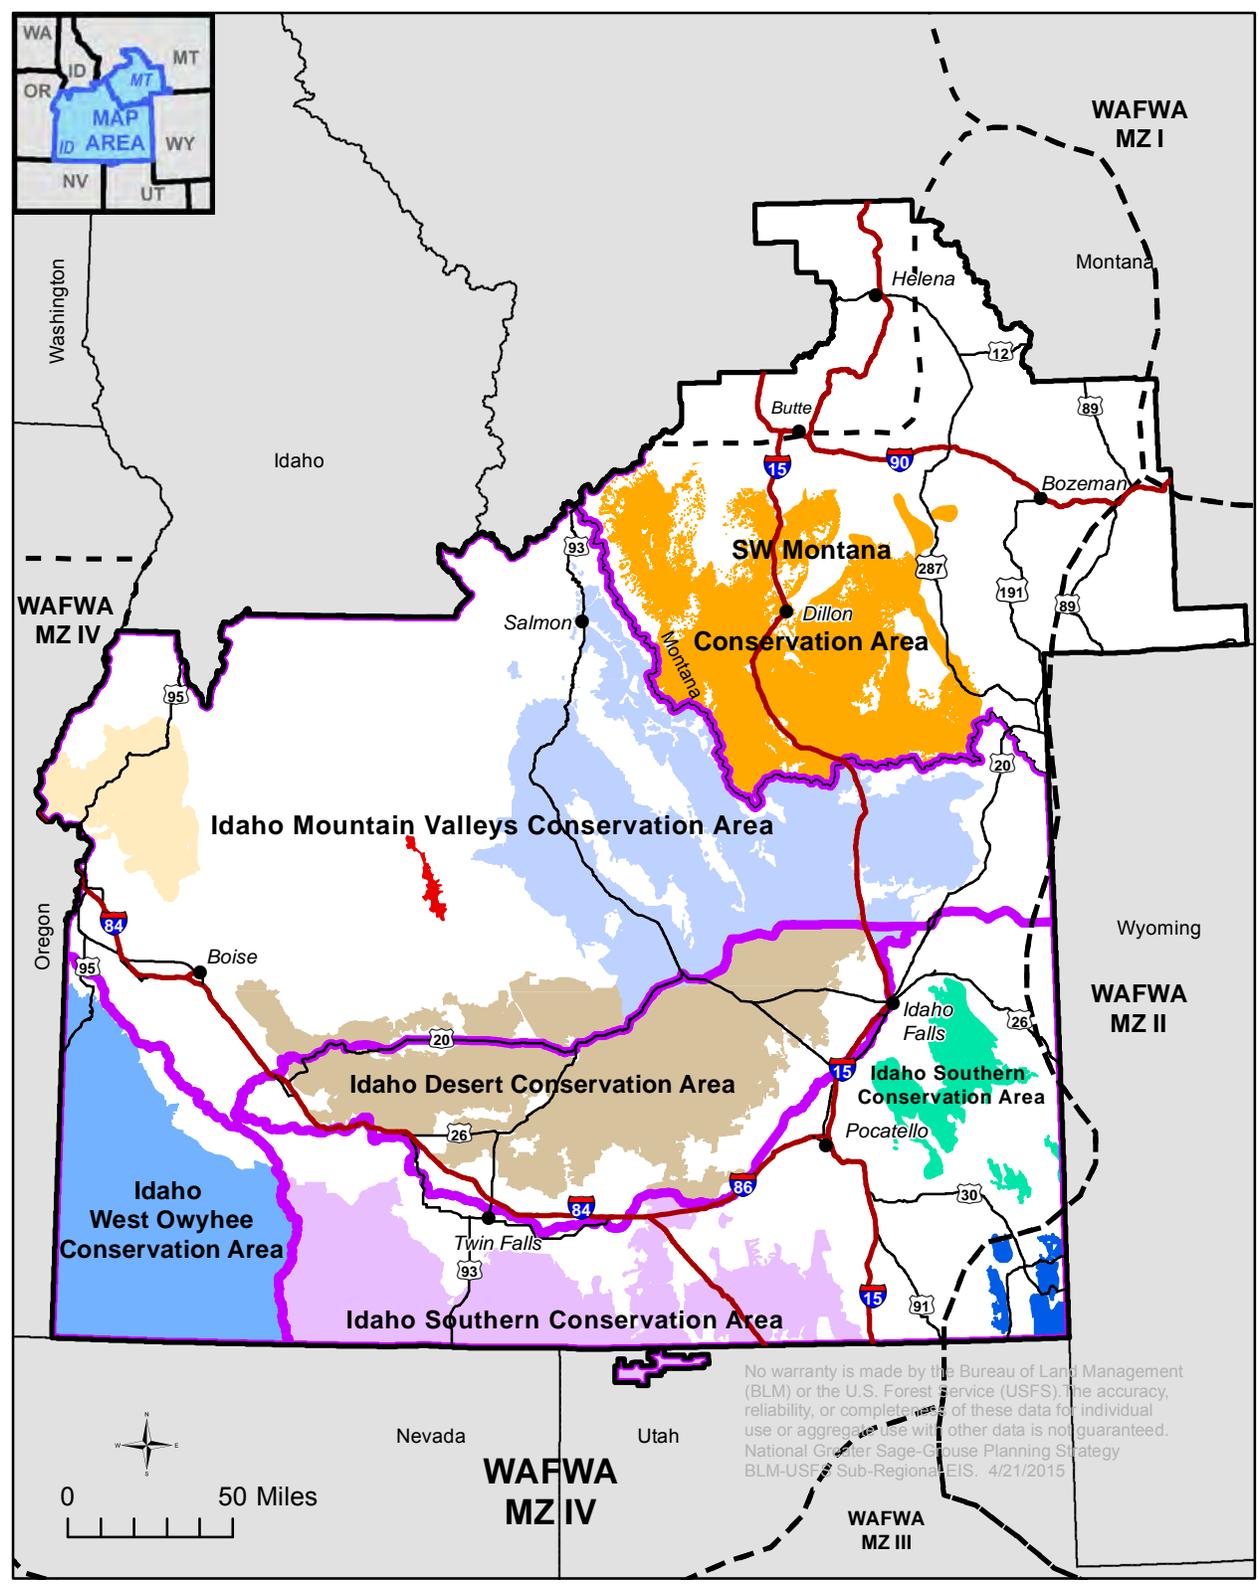

Definitions:

Heavy equipment includes but is not limited to: tractors, discs, drills, mowers, Lawson aerators, large sprayers, masticators, dozers, graders, large trucks, excavators, backhoes cranes.

Occupied lek as per IDFG definitions (active during at least one of past 5 years). Undetermined status leks will be evaluated on a case by case at the site specific scale during project-level NEPA.

Definition of “tall structure”: Any structure that has the potential to disrupt lekking or nesting GRSG and/or decrease the use of an area. This includes but is not limited to communication towers, meteorological towers, electrical transmission or distribution towers, etc.

Administrative Draft
Cooperating Agency Review

1 **Changes to Chapter 3 between Draft LUPA/EIS and Proposed LUPA/Final EIS**

- 2 • General corrections (e.g., typographical errors), clarifications, and acreage recalculations were
3 included. No update was available for the tables from “Summary of Science, Activities,
4 Programs and Policies that Influence the Range-Wide Conservation of Greater Sage-Grouse
5 (*Centrocercus urophasianus*)” (Manier et al. 2013).
6 • The special status species list was updated in Section 3.5.1.
7

Administrative Draft
Cooperating Agency Review

1 **Chapter 3. Affected Environment**

2 **3.1 Introduction**

3 This chapter documents the existing conditions and trends of resources in the planning area
4 that may be affected by implementing any of the proposed alternatives described in **Chapter**
5 **2, Alternatives.** The affected environment provides the context for assessing potential
6 impacts, which are described in **Chapter 4, Environmental Consequences.**

7 For this LUPA/EIS, the planning area is the entire sub-region within Idaho, southwestern
8 Montana, and the portion of the Sawtooth National Forest within Utah. Specifically, the
9 planning area is the sum of the GRSG population areas within this sub-region, regardless of
10 landownership.

Table
Acres of GRSG Habitat by Surface Management

1-1

Surface Land Management	Acres PPH	Acres PGH	Acres Outside Habitat	Total Acres
BLM Total	7,272,100	1,971,800	3,205,100	12,449,000
BLM – Idaho	6,811,400	1,749,900	2,982,900	11,544,200
Bruneau Field Office	1,001,000	184,700	262,900	1,448,600

Source: BLM 2013

1 , **Error! Reference source not found.**, provides a detailed breakdown of landownership
2 status in the planning area. A map of the planning area is provided in **Chapter 1, Figure 1-3,**
3 **Planning Area.**

4 The decision area includes the portions of the planning area that are composed of BLM,
5 Forest Service, and Bankhead Jones surface estates, as well as the mineral estates
6 administered by the BLM or Forest Service. Though the planning area includes private lands,
7 direction provided in this LUPA only applies to BLM and Forest Service surface and
8 minerals. Management direction and actions outlined in this EIS apply only to these BLM-
9 administered and National Forest System lands in the planning area and to federal mineral
10 estate under BLM jurisdiction that may lie beneath other surface ownership. The federal
11 government does not always own every type of mineral in a given acre of federal mineral
12 estate. For example, in some areas, the federal government will only own the coal rights,
13 while a private or state entity might own the oil and gas rights. For this reason, the federal
14 mineral estate for any specific mineral type in the decision area is different than that for all
15 other mineral types in the decision area.

16 While not a part of the planning area in the Idaho and Southwestern Montana GRSG Sub-
17 Region, the Jarbidge and Bruneau Field Offices in Idaho will implement GRSG decisions on
18 77,800 acres of BLM-administered lands in Elko County, Nevada, located north of the
19 Humboldt-Toiyabe National Forest and south of the Idaho-Nevada state line adjacent to the
20 Bruneau and Jarbidge Field Offices in Idaho. For purposes of the GRSG plan amendments
21 in Idaho and in Nevada, planning for these lands will occur through the Nevada and
22 Northeastern California GRSG LUPA, and the regulatory measures and decisions that are
23 put in place for the GRSG through the ROD will be implemented and administered by the
24 Jarbidge and Bruneau Field Offices in Idaho. Due to their remoteness from other BLM-
25 administered lands in Nevada, and because they are contiguous with major blocks of BLM-
26 administered lands in Idaho, a Memorandum of Understanding (MOU) between BLM
27 Nevada and BLM Idaho transfers administration of those lands to BLM Idaho.

1 To augment this planning document at a biologically meaningful scale for GRSG, the BER
2 was produced by the USGS for the BLM and Forest Service (Manier et al. 2013). The BER
3 is a science support document that provides information to put planning units and issues
4

Source: BLM GIS 2015

into the context of the larger WAFWA management zones. The BER examines each threat identified in USFWS' listing decision published on March 15, 2010. For each threat, the report summarizes the current scientific understanding of various impacts on GRSG populations and habitats. When available, patterns, thresholds, indicators, metrics, and measured responses that quantify the impacts of each specific threat are reported. Data from the BER are presented throughout this chapter to illuminate the location (e.g., PPH and PGH), magnitude, and extent of the threats within each WAFWA management zone that comprises the planning area.

Because the BER focuses on threats to GRSG at the WAFWA management zone (or range-wide) scale, it provides biologically meaningful data for larger-scale analyses, such as the cumulative effects analysis for GRSG in **Chapter 5**.

Chapter 3 also presents data that are available at a finer scale than used in the BER's larger-scale, WAFWA management zone focus. These fine-scale, local data are incorporated into the affected environment discussion to complement the BER's biologically meaningful data, characterize the relative contributions of threats in the planning area versus the WAFWA management zones, and to set the stage for the cumulative effects analysis for GRSG (**Chapter 4**). However, it should be noted that the tables presented in the Regional Context discussions of each Chapter 3 resource and resource use discussion are from the BER (Manier et al. 2013) and extend outside of the planning area to WAFWA management zone boundaries. Those tables present information for the WAFWA management zones that would be affected by the direction provided in this sub-regional EIS.

3.1.1 Organization of Chapter 3

Certain types of resources that may be present in the LUPA planning area, such as cave and karst resources, are not addressed in this LUPA because issues relating to the management of these resources were not identified during scoping by the public, or by the BLM or Forest Service as relevant to GRSG, or they are not included in the planning area (e.g., coal). Information from broad-scale assessments was used to help set the context for the planning area. The information and direction for BLM and Forest Service resources and resource uses has been further broken down into fine-scale assessments and information. The level of information presented in this chapter is commensurate with and sufficient to assess potential effects discussed in **Chapter 4**, based on the alternatives presented in **Chapter 2**.

1 The following resources and resource uses are specifically addressed in **Chapter 3** and
2 **Chapter 4**, of the Idaho and Southwestern Montana Greater Sage-Grouse LUPA/EIS.

- 3 • Greater Sage-Grouse
- 4 • Vegetation (including noxious weeds; riparian and wetlands)
- 5 • Fish and wildlife
- 6 • Other special status species
- 7 • Wild horse and burro management
- 8 • Wildland fire ecology and management
- 9 • Livestock grazing
- 10 • Recreation
- 11 • Travel management
- 12 • Lands and realty
- 13 • Minerals
 - 14 – Leasable minerals
 - 15 – Locatable minerals
 - 16 – Salable minerals
 - 17 – Nonenergy leasable minerals
- 18 • Special Designations
 - 19 – Designated Wilderness/Wilderness Study Areas
 - 20 – Areas of Critical Environmental Concern
 - 21 – Research Natural Areas
 - 22 – Other special designations
- 23 • Soil resources
- 24 • Water resources
- 25 • Cultural resources and tribal interests
- 26 • Visual resources
- 27 • Lands with wilderness characteristics
- 28 • Air quality and climate change
- 29 • Social and economic conditions (including environmental justice)

1 Each resource section in this chapter contains a discussion of existing conditions, including
2 trends.

- 3 • Existing conditions describe the location, extent, and current condition of the
4 resource in the planning area in general, on BLM-administered and National
5 Forest System lands. Conditions for a resource can vary, depending on the
6 resource. The Idaho and Southwestern Montana Sub-Region planning area
7 contains 18,147,500 acres, regardless of land status. Within the Idaho and
8 Southwestern Montana Sub-Region planning area, there are 15,260,200 acres of
9 BLM-administered lands and 1,861,100 acres of National Forest System lands
10 that are managed according to the BLM and Forest Service plans being amended
11 by this LUPA/EIS. For each resource, a general description of the existing
12 conditions is provided for the Idaho and Southwestern Montana Sub-Region
13 planning area, regardless of land status. This is done to provide a regional
14 context for the resource. More detailed discussion of the existing conditions on
15 various scales may be provided depending on the resource topic. This is done to
16 provide an area-specific description of the existing conditions for the resource.
17 When possible, greater emphasis is placed on describing the existing conditions
18 of the resource as it pertains to GRSG and their habitat.
- 19 • Trends identify the degree and direction of resource change between the present
20 and some point in the past. Not all resource topics will have trends. For example,
21 soil resources may not undergo notable resource change. If there is change, the
22 degree and direction of resource change is characterized as moving toward or
23 away from the current desired conditions, and the reasons for the change are
24 identified. Trends can also be described in quantitative or qualitative terms.
25 Identifying the trends is done to provide an understanding of how BLM and
26 Forest Service management influences the desired condition of the resource over
27 time. It can be difficult to analyze trends for certain resources, because changes
28 to the resource often occur due to factors beyond the control of the BLM and
29 Forest Service. For those resource topics that can be affected by climate change,
30 a discussion of the effects from climate change on the resource is provided.

31 The BLM and Forest Service reviewed the LUPs being amended under this LUPA/EIS and
32 other relevant information sources (such as other LUPAs, maps, and state GRSG
33 conservation assessments) for existing conditions and trends for the resources listed above
34 with respect to GRSG and their habitat. This affected environment information is
35 summarized below and, where appropriate, noted when the information is incorporated by
36 reference.

37 Acreage figures and other numbers used are approximate projections; readers should not
38 infer that they reflect exact measurements or precise calculations. Acreages were calculated
39 using Geographic Information Systems (GIS) technology, and there may be slight variations
40 in total acres between resources.

1 **3.2 Special Status Species – Greater Sage-Grouse**

2 **3.2.1 Conditions within the Planning Area**

3 In 2006, the WAFWA used floristic characteristics to organize the diverse sagebrush habitat
4 areas into seven GRSG management zones within the species' distribution (Stiver et al.
5 2006). The Idaho and Southwestern Montana Sub-Region contains portions of 2 of the 7
6 zones (MZs II and IV) (**Figure 3-1**, Western United States WAFWA Zones). The vast
7 majority of the Idaho and Southwestern Montana Sub-Region lies within WAFWA's GRSG
8 MZ IV (Stiver et al. 2006); a small portion of southeastern Idaho occurs within MZ II and is
9 associated with the Wyoming Basin population. Populations of GRSG in MZ IV are
10 projected to decline by 55 percent from 2007 to 2037 and by 66 percent in MZ II if current
11 trends in populations and habitat activities continue (USFWS 2010a; Garton et al. 2011).

Administrative Draft
Cooperating Agency Review

Figure 3-1 Western United States WAFWA Zones

1 Periods of decline in GRSG populations rangewide have occurred since the late 1800s
2 (USFWS 2010, p. 13921). More recently, Connelly et al. (2004) reported long-term declines
3 (1965-2004) for GRSG in MZs II and IV. WAFWA (2008) reported declines in MZs II and
4 IV from 1965-2007 of -2.7 percent and 3.8 percent, respectively; Garton et al. (2011)
5 reported annual rates of decline of -3.5 percent and -4 percent for MZs II and IV,
6 respectively.

7 Within the sub-region, GRSG occupy all or portions of ten populations and eight
8 subpopulations described in Connelly et al. (2004). Two large populations (Great Basin Core
9 and Wyoming Basin) encompass portions of Oregon, Nevada, Utah, and Wyoming that
10 extend beyond the sub-regional boundary.

11 Population estimates are not available for all GRSG populations due to limited data in some
12 areas; however, Garton et al. (2011) estimated a minimum male GRSG population in 2007
13 of 9,114 for the Northern Great Basin population (analogous to the Great Basin Core
14 population and inclusive of habitats in Idaho and associated portions of Nevada, Oregon,
15 and Utah), and 5,457 for the Snake-Salmon-Beaverhead population. Estimates for the
16 Bannack and Red Rocks Montana populations were 304 and 448 males, respectively. GRSG
17 in southwestern Montana are migratory, moving between separate summer and winter areas.
18 Migratory movements of GRSG also have been documented between eastern Idaho and
19 southwestern Montana from the Bannack and Red Rock populations. Telemetry data from
20 1999 to 2012 show that seasonal movements (including both distance and duration) vary
21 significantly between groups of GRSG.

22 ***Availability of Sagebrush Habitat (Mid-Scale Indicator)***

23 The distribution of GRSG is closely aligned with the distribution of sagebrush-dominated
24 landscapes (Schroeder et al. 2004). Occupancy by GRSG is strongly associated with
25 measures of sagebrush abundance and distribution. Sagebrush area was the single best
26 discriminator between occupied and extirpated ranges among 22 variables evaluated by
27 Wisdom et al. (2011). In the sub-region, large expanses of sagebrush still occur in portions of
28 southwestern and south-central Idaho, in association with the Northern Great Basin
29 population shared with Nevada, Oregon, and Utah, as well as in portions of the Snake-
30 Salmon-Beaverhead population north of the Snake River.

31 In 2012, the BLM completed the range-wide delineation of PPH and PGH in cooperation
32 with respective state wildlife agencies (see **Figure 1-4**). The BLM national office Instruction
33 Memorandum 2012-043 defined PPH as GRSG habitat having the highest conservation
34 value to maintaining sustainable GRSG populations. PGH includes areas of occupied
35 seasonal or year-round habitat outside of priority habitat.

36 At finer scales, PPH and PGH encompass areas of intact sagebrush suitable for GRSG
37 habitat needs as well as areas of conifer encroachment and perennial grass-dominated areas,
38 generally occupied by GRSG or potentially suitable for future restoration.

39 In Idaho, PPH and PGH were identified by the BLM and Forest Service based on a model
40 incorporating GRSG breeding bird density and lek connectivity models, informed with

1 additional ancillary broad-scale habitat data, seasonal habitat maps, connectivity
2 information/expert opinion, population persistence model, local priority areas, and
3 agriculture/conifer filters (Makela and Major 2012).

4 In general, GRSG habitats in Idaho and the portion of the Sawtooth National Forest in
5 northern Utah are composed of a variety of species and subspecies of sagebrush, including
6 mountain big sagebrush, Wyoming big sagebrush, Great Basin big sagebrush, low sagebrush,
7 black sagebrush, three-tip sagebrush, and early sagebrush. Conifer encroachment into GRSG
8 habitats, mainly from Utah juniper and western juniper, occurs primarily in south-central and
9 southwestern Idaho and in northern Utah, although encroachment of Douglas-fir and other
10 conifers also occurs at higher elevations. Large areas of native, introduced, or mixed
11 native/introduced perennial grasslands as well as annual grasslands are also present in
12 portions of the Snake River Plain in southern Idaho as a result of recent wildfires and
13 associated rehabilitative efforts or from other rangeland seeding efforts during the 20th
14 century.

15 In Montana, PPH was delineated based on MFWP prior modeling of GRSG Core Areas
16 using a lek-centric model based on male lek attendance and refined with seasonal habitat,
17 telemetry, connectivity information, and field review. Documentation for the Montana Core
18 area analysis is summarized at:

19 [http://www.mt.nrcs.usda.gov/technical/ecs/biology/sagegrouse/sagegrouse_strategy_attac](http://www.mt.nrcs.usda.gov/technical/ecs/biology/sagegrouse/sagegrouse_strategy_attachments/appendix1.html)
20 [hments/appendix1.html](http://www.mt.nrcs.usda.gov/technical/ecs/biology/sagegrouse/sagegrouse_strategy_attachments/appendix1.html).

21 Montana PGH was mapped based on the Schroeder et al. (2004) GRSG distribution map.

22 Sagebrush steppe habitat across southwest Montana consists of diverse species and multiple
23 successional stages, providing for all life stages. Species or subspecies composition consists
24 primarily of mountain big sagebrush, Wyoming big sagebrush, three-tip sagebrush, basin big
25 sagebrush, and low sagebrush, as well as multiple other species at lower densities. These
26 occur in mixed as well as pure stands throughout southwestern Montana. Tilling and aerial
27 spraying over 12,000 acres in the 1960s and early 1970s (about 1 percent of BLM-
28 administered lands in the Dillon Field Office) reduced sagebrush canopy on large areas of
29 BLM-administered, mostly in the area inhabited by the Bannack Population. These areas
30 were reseeded with nonnative herbaceous species that further altered natural communities.
31 Sagebrush canopy has recovered, but the herbaceous understory composition is a mix of
32 native species and nonnative wheat grasses. Large areas of sagebrush in the Dillon Field
33 Office appear to provide suitable habitat for GRSG but are unoccupied.

34 To facilitate analysis for the Idaho and Southwestern Montana LUPA/EIS, the GRSG
35 population areas were clipped to the Idaho and Southwestern Montana Sub-regional
36 boundary to eliminate portions occurring outside the sub-region. Boundaries were then
37 adjusted to encompass associated PPH and PGH. Small populations within southwestern
38 Montana were combined into a single analysis area and, in portions of Idaho, some
39 subpopulations were delineated separately or grouped due to similarities in threats or

1 geography. The resulting population areas, used in the analysis below, reflect discrete
2 geographic portions of the sub-region.

3 Based on GIS analysis, there are approximately 18,114,000 acres of PPH and PGH, inclusive
4 of all landownerships, in the sub-regional analysis area (**Table 3-2**, Acres of GRSG Habitat
5 by Population Area within the Idaho and Southwestern Montana Planning Area). This is
6 inclusive of habitats in Idaho, southwestern Montana, and a small portion of northern Utah
7

2 **Predation**

3 The GRSG is potential prey to a variety of predator species, such as the golden eagle (*Aquila*
4 *chrysaetos*), ferruginous hawk (*Buteo regalis*), common raven (*Corvus corax*), American badger
5 (*Taxidea taxus*), coyote (*Canis latrans*), red fox (*Vulpes vulpes*), weasels (*Mustela* spp.), and others
6 (Schroeder et al. 1999; Coates 2007), but none of these species prey especially upon GRSG
7 (Hagen 2011). Adults are susceptible to predation while on leks or nests, and eggs are
8 vulnerable as well (Schroeder et al. 1999; Coates 2007; Hagen 2011). Predation is the most
9 commonly identified cause of direct mortality for GRSG during all life stages (Connelly et al.
10 2011; USFWS 2010a citing others), but studies suggest that predation is not limiting
11 populations (Hagen 2011). As a result, there is little scientific support for predator
12 management over broad geographic or temporal scales (Hagen 2011).

13 Information on the numbers of GRSG taken by specific predators is not readily available;
14 however, some studies report overall predation rates on age-classes, sex, and nests. Connelly
15 et al. (2000), in a review of long-term data, reported 83 percent of male GRSG deaths and 52
16 percent of female deaths were attributed to predation. Gregg et al. (2007), cited in USFWS
17 (2010a), reported mortality of GRSG chicks from predation during the first few weeks after
18 hatching was 82 percent. Coates and Delehanty (2010) monitored 87 GRSG nests, and 42.5
19 percent were preyed upon. Of these nests, an increase of 1 raven per 10 km (3.86 mi) of
20 survey transect monitored was associated with a 7.5 percent increase in the odds of nest
21 failure. Coates (2007) documented predation at 17 GRSG nests; ravens accounted for 10
22 nests (59 percent) and badgers 7 nests (41 percent).

23 In areas where habitat is not limited and of good quality, predation is not a threat to the
24 persistence of the species (USFWS 2010a). However, predation may limit population growth
25 in fragmented habitats or areas where predator populations have supplemental food sources,

1 such as where landfills or other human factors attract and concentrate scavengers (Coates
2 2007), or where electrical transmission or other human-made structures facilitate nesting and
3 perching by avian predators such as ravens (Howe 2012; Hagen 2011).

4 As land-management agencies, the primary role of the BLM and Forest Service is the
5 management of habitats, land uses, and associated authorizations. Therefore, the reduction
6 of predator effects on GRSG in this conservation strategy is best accomplished through the
7 appropriate management, improvement, or restoration of sagebrush habitats and the siting
8 and design of human-made structures in a way that eliminates or reduces risk from predators
9 that may utilize them to their advantage. Direct predator control would occur under the
10 purview of the states of Idaho and Montana and the USDA APHIS Wildlife Services, in
11 cooperation with the USFWS.

12 3.2.2 Habitat Conditions and Trends

13 The general condition and trend of habitats on BLM-administered and National Forest
14 System lands varies by geographic area within the sub-region and is a result of various
15 threats that are currently occurring or that have occurred historically.

16 In Idaho, threats to GRSG were ranked by an independent science panel and addressed in
17 the *Conservation Plan for the Greater Sage-grouse in Idaho* (Idaho Sage-grouse Advisory Committee
18 2006). Highest ranking threats, in order of relative score, included wildfire, infrastructure,
19 annual grasslands, livestock impacts, human disturbance, and West Nile virus.

20 West Nile virus has acted as an important source of mortality for GRSG and the virus was
21 an important new source of mortality in low and mid-elevation GRSG populations range-
22 wide from 2003 to 2007 (Walker and Naugle 2011). The highest confirmed elevation at
23 which GRSG have been infected with WNV is approximately 7,500 feet (2,300 meters) in
24 the Lyon-Mono population of eastern California (Naugle et al. 2005). Individual GRSG in
25 populations exposed to the virus during July to August 2003 were 3.3 times more likely to
26 die than birds in uninfected populations (Naugle et al. 2004). West Nile virus mortality of
27 GRSG has been documented as ranging from 5 to 44 percent with most mortality occurring
28 in July and August (Walker and Naugle 2011, Kaczor, 2008). West Nile virus has been
29 documented in GRSG in Idaho and in 2006, the GRSG hunting season was closed in
30 western Owyhee County due to concerns of West Nile virus impacts (Idaho Sage-grouse
31 Advisory Committee, 2008).

32 Additional habitat-associated threats of concern in portions of southern Idaho included
33 conifer encroachment, seeded perennial grasslands, sagebrush control, urban and exurban
34 development, and mines, landfills and gravel pits. In 2012, the Idaho Governor's Sage-
35 Grouse Task force reiterated concerns about wildfire, invasive species and infrastructure, as
36 well as recreation, improper livestock grazing and West Nile virus (Idaho Governor's Sage-
37 grouse Task Force 2012). Landscape conditions and trend of BLM-administered and
38 National Forest System lands in the sub-region are summarized in **Table 3-4**, Habitat
39 Conditions, Trends and Primary Threats to GRSG Habitat in the Idaho and Southwestern
40 Montana Planning Area.

1 **3.2.3 Regional Context**

2 As stated above, the majority of the Idaho and Southwestern Montana planning area is
3 within Management Zone IV; a small portion in the southeast is within MZ II.

4 ***Management Zone IV (Snake River Plain Management Zone)***

5 Management Zone IV covers nearly all of Idaho’s GRSG habitat, with the majority of
6 occupied habitat within the Northern Great Basin (South Side Snake) and Snake River Plain
7 population areas (Mountain Valleys, North Side Snake, and Southwest Idaho), as well as
8 southwestern Montana, on both BLM-administered and National Forest System lands. MZ
9 IV also includes eastern Oregon and northern Nevada, and the Box Elder population in
10 Utah, outside the planning area. This area supports the largest population of GRSG outside
11

Administrative Draft
Cooperating Agency Review

1 of the Wyoming Basin and has high connectivity between populations, though small
2 populations such as Weiser and East-Central Idaho are at risk of fragmentation (USFWS
3 2013). This MZ population is moderately vulnerable, with a 10.5 percent chance of falling
4 below 200 males by 2037 (Garton et al. 2011). The area has a long history of agricultural land
5 use, which has left the residual sagebrush ecosystem drier than the historical condition
6 (Manier et al. 2013). Across this MZ, 63 percent of land is federally managed. Primary
7 threats include wildfire, infrastructure development, and invasive weeds (USFWS 2013). Fire
8 risk is high across 81 percent of the region, and cheatgrass high risk areas are widespread
9 (Manier et al. 2013). Though oil and gas development potential is low, geothermal energy
10 potential is high along with development of utility infrastructure in designated corridors,
11 such as Gateway West (Manier et al. 2013).

12 ***Management Zone II (Wyoming Basin Management Zone)***

13 Management Zone II in Idaho is located in the southeastern part of the state. It covers the
14 portion of the Wyoming Basin (Bear Lake) population area within Idaho. The Wyoming
15 Basin population area stretches into Colorado and Utah and has the highest abundance of
16 GRSG relative to other management zones across GRSG range (more than 20,000 males),
17 one of the largest areas of habitat, and the most highly connected GRSG lek network
18 (USFWS 2013). Although long-term trends are slightly downward, populations in the
19 Wyoming Basin are considered stable, with a 0.3 percent chance of declining below 200
20 males by 2037 (Garton et al. 2011). The northern portion of this MZ, including the Idaho
21 portion, has high connectivity between habitats across the Wyoming Basin (Knick and
22 Hanser 2011). Federal land comprises 54 percent of sagebrush habitat. The major threat to
23 GRSG in this MZ is energy development, primarily oil and gas, in Wyoming (USFWS 2013).
24 Impacts from infrastructure development, fire, cheatgrass spread, and improper grazing also
25 pose threats in this region (Manier et al. 2013).

26 ***Population Metrics***

27 GRSG population estimates for the sub-region or individual population areas are not
28 currently available, however the Idaho Department of Fish and Game, Montana Department
29 of Fish, Wildlife, and Parks, and Utah Division of Wildlife Resources compile monitoring
30 data annually for hundreds of leks in the sub-region. Not all leks or geographic areas are
31 monitored or surveyed annually or with the same intensity due to logistical, financial,
32 weather, or staffing constraints, however the leks that are surveyed do provide useful
33 information that can help provide additional context for the description of the affected
34 environment. **Table 3-5, Occupied^a Leks by GRSG Population Area within the Idaho and**
35 **Southwestern Montana Sub-Region, shows the total number of occupied leks and**
36 **proportion by population area.**

Table 3-5
Occupied^a Leks by GRSG Population Area within the Idaho and Southwestern Montana Sub-Region

Population Area	Number of Occupied Leks ^b	Proportion of Occupied Leks Within the Sub-region
East-Central Idaho	15	1.31%
Mountain Valleys	278	24.28%
SW Montana	82	7.16%
North Side Snake	344	30.04%
Southwest Idaho	169	14.76%
South Side Snake (Includes the Sawtooth National Forest in Utah)	229	20.0%
Sawtooth	0	0%
Bear Lake	15	1.31%
Weiser	13	1.14%
TOTAL	1,145	100%

^a Definitions for lek attributes vary by state wildlife agency protocols. For purposes of analysis here, an “occupied” lek is defined using the respective Idaho, Montana and Utah definitions to retain the integrity of the state wildlife agency data to the extent possible. In all cases, data shown are inclusive of all land ownerships.

Idaho (IDFG): “Occupied” is defined as a lek that has been active during at least one of the past 5 years. An active lek is one attended by more than 1 male GRSG during the breeding season (for a particular year). For this analysis, occupied leks encompass the timeframe 2010-2014.

Montana (MFWP): “Confirmed Active” is a lek that has been attended during the past 10 years. An active lek is one where there have been 2 or more males lekking on the site followed by evidence of lekking within 10 years of that observation. For consistency, the term “occupied” is used in this analysis as a synonym for the term “confirmed active.” Data shown encompass the timeframe 2005-2014.

Utah: “Occupied” is defined as a lek which has been active at least once within the last 10 years. An active lek is one that has been attended by 2 or more males during the annual strutting season. For this analysis, occupied leks encompass the timeframe 2004-2013.

9

In comparing lek occupancy information between population areas, it is important to recognize that population areas vary greatly in size, with some, such as the Southwest Idaho, South Snake, and North Snake, being quite large, while others, such as the Sawtooth, and Bear Lake areas, are considerably smaller. Large areas may inherently harbor a larger number of leks by virtue of their scale, and smaller areas may have fewer leks.

Within the sub-region’s population areas, there are a total of 1,145 occupied GRSG leks, inclusive of all landownerships. Of the nine population areas in the sub-region, the North Side Snake, South Side Snake and Mountain Valleys population areas encompassed the

1 largest number of occupied leks, collectively harboring approximately about 74 percent of
2 the occupied leks in the subregion.

3 **3.3 Vegetation**

4 The composition and distribution of plant communities in the planning area are influenced
5 by many factors, including climate, elevation, topography, soils, drought, insects, fire,
6 cultivation, invasive plants, and livestock grazing. As a result, a wide variety of plant
7 communities occur, many of which play a role in providing seasonal or year-round habitat
8 for GRSG. The major plant communities providing GRSG habitat are further detailed
9 below. These plant communities vary greatly in their relative ecological health as a result of
10 stressors that influence the distribution and abundance of the plant components within the
11 general community. GRSG are a sagebrush obligate species and rely on a variety of
12 sagebrush dominated communities to meet various needs throughout their lifecycle (Miller et
13 al. 2011). In winter, GRSG feed almost exclusively on sagebrush leaves (Patterson 1952;
14 Wallestad et al. 1975). A healthy vegetative understory complete with perennial grasses and a
15 variety of forbs provide important components of nesting and brood rearing habitat (Barnett
16 and Crawford 1994; Gregg et al. 1994). These vegetative communities also support a wide
17 variety of insects which provide additional food sources for rearing habitat. Some plant
18 communities play a role in seasonal habitat such as riparian areas, or in the case of annual
19 grasses, or conifer stands, may influence the quality and abundance of habitat over time.

20 **3.3.1 Conditions within the Planning Area**

21 ***Northern Sagebrush-Steppe***

22 Two major sagebrush communities that provide GRSG habitat occur within the planning
23 area: the Snake River Plain and Wyoming Basin. The Snake River Plain sagebrush
24 community makes up the vast majority of the habitat with a small portion of the Wyoming
25 Basin community on the eastern side of the planning area. These communities are
26 considered part of the northern sagebrush-steppe where sagebrush typically co-dominates
27 with perennial bunchgrasses (Miller et al. 2011). Human alterations, uses, and impacts
28 coupled with natural stressors (e.g., drought and fire) have changed the extent, condition,
29 and distribution of sagebrush-steppe and the ecosystem services these communities provide
30 (Meinke et al. 2009); current GRSG range is estimated to be 56 percent of distribution prior
31 to Euro-American contact (Schroeder et al. 2004). Three of the fundamental characteristics
32 of the sagebrush community that have been altered from prior to European contact
33 conditions include: (1) the total area of sagebrush shrublands has been reduced; (2) the
34 composition and structure of sagebrush communities has been changed, with increased
35 abundance and vigor of invasive species and decreased abundance and vigor of native
36 species; and (3) fragmentation created by roads, power-lines, fences, energy developments,
37 urbanization, and other anthropogenic features (Connelly et al. 2004). Much of the
38 sagebrush-steppe occurring on private lands with deeper soils has been converted to
39 agricultural croplands (Connelly et al. 2004). Intense, historic land use in the late 19th and
40 early 20th centuries reduced the dominance of native grasses, trampled microbiotic crusts,
41 and encouraged expansion of Eurasian grasses (Anderson and Inouye 2001; Ponzetti et al.
42 2007; Root and McCune 2012). These changes are most intense at low elevations near valley

1 floors and may have disproportionate effects on GRSG populations reliant on these habitats
2 during critical portions of the year (Leu and Hanser 2011).

3 Some portions of the planning area contain relatively intact sagebrush-steppe communities.
4 Plant communities such as these are in good to excellent ecological condition and maintain
5 adequate forb and perennial grass in the understory to supply habitat requirements for
6 GRSG.

7 Data available for analysis in this effort are limited to general overstory vegetation classes of
8 tall shrub (e.g., basin big sagebrush, Wyoming big sagebrush, and mountain big sagebrush)
9 and low shrub (e.g., black sagebrush and low sagebrush). This information can be further
10 stratified based upon landscape characteristics to approximate the relative proportion of the
11 various types of sagebrush plant communities. Data are not widely available concerning the
12 relative ecological health of the plant communities within the project area.

13 ***Riparian and Wetlands***

14 Riparian vegetation includes plants that require higher amounts of available water supply
15 then those found in adjacent upland areas and are generally associated with water courses
16 and wet meadow areas. Riparian areas, wetlands, and wet meadows provide valuable GRSG
17 late summer brood rearing habitat because these areas provide succulent forbs and insects
18 later in the summer when most forbs in upland habitats have dried out and are senescent.
19 These communities make up a small percentage of the vegetation in relation to other types
20 but are quite important in providing the seasonal habitat mentioned.

21 ***Forest and Woodland***

22 The conversion of sagebrush-steppe communities into conifer woodlands is a factor
23 contributing to GRSG habitat decline in portions of the planning area. Trees increase raptor
24 perch and nest sites, potentially making GRSG more vulnerable to predation. Conifer
25 expansion is generally attributed to fire suppression reducing fire frequency and allowing
26 conifers to expand into riparian areas, shrublands, and grasslands. This conversion is mostly
27 an issue in the mountain big sagebrush types where reduced fire frequency has allowed the
28 invasion of juniper (Utah, Rocky Mountain, or Western) and in some areas Douglas-fir and
29 pine may be expanding into shrub habitats.

30 ***Noxious Weeds and Invasive Species***

31 Noxious weeds and invasive species include plants listed as “noxious” by state laws and also
32 those plants known to be altering the dynamics of native plant communities by replacing
33 native plants through competition or altering some ecological process to the detriment of the
34 native plant community such as in the case of annual bromes increasing fire frequency.

35 Specific noxious weeds causing localized impacts within the planning area include rush
36 skeletonweed, leafy spurge, diffuse knapweed, and spotted knapweed. Although not yet well
37 established in the planning area, yellow starthistle is known to have a similar range as
38 cheatgrass, and many of the areas currently supporting annual grass communities could
39 support this noxious weed. Other weeds listed as noxious occur within the planning area but
40 are not as widespread or detrimental as those listed.

1 Invasion by exotic annual grass species has resulted in dramatic increases in number and
2 frequency of fires with widespread, detrimental effects on habitat conditions (Young and
3 Evans 1978; West and Young 2000; West and Yorks 2002; Connelly et al. 2004). Increased
4 fire frequency typically results in removal of the sagebrush canopy in affected areas with
5 replacement by annual species that provide little to no habitat value (Knapp 1996; Epanchin-
6 Niell et al. 2009; Rowland et al. 2010; Baker 2011; Condon et al. 2011). Invasive annuals
7 include numerous species of annual bromes, most notably cheatgrass (*Bromus tectorum*) as well
8 as medusahead rye (*Taeniatherum caput-medusae*). An annual species that may be a threat in
9 higher elevation communities providing GRSG habitat is ventenata (*Ventenata dubia*).
10 Wyoming sagebrush plant communities are particularly susceptible to conversion to annual
11 grasslands after fire when the understory contains higher densities of annual grass.

12 Once converted to exotic annual grasses, these plant communities have crossed a threshold
13 that precludes their returning to traditional plant community composition through normal
14 plant succession processes. These areas are essentially lost in their ability to provide GRSG
15 habitat unless significant investment in restoration inputs are undertaken. Even then, these
16 projects may fail if conditions do not exist for successful establishment of desired species.
17 The potential for cheatgrass occurrence has been modeled, which can help discern locations
18 and habitats that have the greatest risk of cheatgrass dominance after disturbance events
19 such as fire.

20 ***Modified Grasslands***

21 Some portions of the planning area formerly composed of sagebrush plant communities
22 currently support introduced perennial bunchgrasses, or in some cases a mixture of
23 introduced and native bunch grasses. These communities can include common native forbs
24 and over time may develop a sagebrush overstory. Introduced bunchgrasses that may inhabit
25 these areas include a numerous crested wheatgrass varieties (e.g., Fairway, Ephraim, Douglas,
26 Nordan, and Hycrest) as well as Siberian wheatgrass and, in the case of higher precipitation
27 zones, pubescent or intermediate wheatgrass. In some cases, nonnative grasses were seeded
28 to increase livestock forage, but were also be better adapted in competing with and
29 suppressing invasive annual grasses. These plant communities also provide habitat for
30 GRSG once the overstory of sagebrush is re-established.

31 ***Permanent Conversion***

32 Within the planning area, portions have been permanently converted to uses that preclude
33 them from providing GRSG habitat. This includes conversion to agricultural lands as well as
34 development or urbanization. In much of the Snake River Plain, these lands were at one
35 time supporting sagebrush plant communities.

36 **3.3.2 Conditions on BLM-Administered Lands**

37 The habitat most important to BLM-administered lands in this planning effort is the
38 overstory vegetation component. As described above, GRSG are a sagebrush obligate
39 species, so an overstory component of sagebrush is a good indicator of potential habitat.
40 Perennial grasslands are also an important component to track as they are still capable of
41 providing habitat if the overstory of sagebrush is returned. Tracking the relative expansion
42 or reduction in annual grass dominated lands is also a potential indicator of our success in

1 protecting GRSG habitat. These broad-scale vegetation types are currently being tracked
2 through various efforts.

3.3.3 Conditions on National Forest System Lands

In general the plant communities and disturbance factors that influence them are the same on National Forest System lands as on BLM-administered lands. As a general rule, the National Forest System lands with GRSG habitat in the planning area tend to be on the higher end of the precipitation and elevation gradient. Therefore, the relative proportion of sagebrush plant communities on National Forest System lands would be higher for the mountain big sagebrush plant communities, at the higher elevation and precipitation gradient, and lower for Wyoming big sagebrush plant communities which occur at the lower end of the precipitation range for big sagebrush. Due to the more resilient nature of mountain big sagebrush communities after disturbance, it is less likely they will be impacted by invasive annual grass and convert to annual grass plant communities.

3.3.4 Trends

The main disturbance factors with the potential to alter vegetation providing GRSG habitat over a majority of the planning area include conversion to annual grassland following fire disturbance, modification of plant communities due to livestock grazing, and the potential impacts of climate change. To a lesser extent, some permanent conversion to agriculture or urbanization may occur, but typically these areas are already highly disturbed and not likely to be providing high-quality GRSG habitat.

5

6

7

8

9

10

The BLM-administered and National Forest System lands in the Idaho and Southwestern Montana planning area provide a variety of habitats. Landownership ranges from mostly sagebrush habitats in Owyhee County, Idaho, to scattered BLM-administered and National Forest System lands with intermingled private and state lands composed of sagebrush habitats in southwestern Montana. On BLM-administered and National Forest System lands, these habitats can be segregated into four major habitats groups: sagebrush steppe, riparian/wetlands, nonnative grasslands, and conifer woodlands/forests. These habitats serve as a basis, to the extent practical, for describing existing conditions, and for developing and comparing management alternatives throughout the planning effort.

11

12

13

14

15

16

Sagebrush Steppe Habitats

Sagebrush steppe habitats in the planning area are found in the Snake River Plain and minor portions in the Wyoming Basins floristic provinces identified by West (1983). These sagebrush habitats are the dominant habitat within the planning area. Riparian and wetland habitats, nonnative grasslands, and conifer/woodland forest habitats are interspersed within and adjacent to sagebrush habitats.

17

18

19

20

Sagebrush habitats occur from lower elevation (2,500 feet) drier salt desert shrub communities to mountain shrub communities at 10,100 feet in elevation. Sagebrush habitats support a wide diversity of generalist wildlife species, as well as sagebrush-dependent wildlife species.

21

22

23

24

25

26

27

28

29

At mid- to lower elevations, Wyoming big and basin sagebrush are the dominant habitat types that provide important winter habitat for wildlife species such as mule deer, pronghorn, and GRSG, and localized yearlong habitat by sagebrush-obligate species such as pygmy rabbit. Much of the basin big sagebrush habitats are limited to deeper soils near ephemeral drainages. Intermingled occurrences of basin big sagebrush, mountain big sagebrush, tall three-tip sagebrush, and several low sagebrush's such as low (little) and black sagebrush add to the diversity of vegetation and habitat structure. At higher elevations, moist mountain big sagebrush communities provide elk calving and GRSG brood-rearing habitat along with dispersed spring, summer, and fall habitat for numerous other species, often in

1 association with conifer woodland/forested habitat. Mixed sagebrush communities and
2 localized dominance by other sagebrush species on specific sites within the broader
3 sagebrush types often support uniquely dependent wildlife uses, such as pygmy rabbits.

4 Many sagebrush steppe habitats have been modified or disturbed throughout the planning
5 area during the past 150 years; therefore the species dependent upon them have usually been
6 negatively affected. Primary factors causing change in sagebrush steppe habitats are wildfire
7 and changes in fire regimes, invasive species, anthropogenic development, and livestock
8 grazing (Miller et al. 2011, Knick et al. 2011). Wildfire and changes in fire regimes effects
9 xeric sagebrush steppe and is highly influenced by the spread of invasive species, especially
10 exotic annual grasses such as cheatgrass or medusahead. In these lower elevation habitats,
11 fire return intervals are greatly shortened and prevent the reestablishment of sagebrush.
12 Large areas of the Snake River Plain in southern Idaho have undergone these habitat
13 changes, thus making habitats less suitable for wildlife.

14 Past management activities that reduce sagebrush habitats include herbicide application,
15 plowing, or other techniques followed by seeding of nonnative perennial grasses. These land
16 treatments or burned areas following wildfire have historically been seeded to highly
17 competitive introduced species such as crested wheatgrass, desert wheatgrass, and Siberian
18 wheatgrass. The characteristics that made these introduced species effective for seeding
19 establishment also created communities dominated by near monocultures, which resulted in
20 poor quality habitats for wildlife lacking sagebrush or forbs (Pyke 2011). Recent policies
21 have encouraged native seed mixes, but many times native seed supplies are limited or not
22 affordable within current budgets. Seed in some seed mixes used in these treatments may
23 have been selected for other wildlife species and not specifically for GRSG (Knick et al.
24 2011).

25 In higher elevations of sagebrush steppe, conifer woodlands/forests have encroached into
26 sagebrush habitats. Miller and Rose (1999) identified that the encroachment of conifer
27 woodlands/forests was the result of longer fire return intervals that permitted woodland
28 expansion to occur into sagebrush steppe. Conifers greater than 50 years old on productive
29 sites and greater than 90 years on nonproductive sites results in reduced fire frequency,
30 permitting the establishment of conifers on the site (Burkhardt and Tisdale 1976; Bunting
31 1984; Miller and Rose 1999). A number of studies identified a widespread decline in fires at
32 the sagebrush/conifer interface with the coincidence of large numbers of livestock in the late
33 1800s (Miller and Rose 1999; Heyerdahl et al. 2006; Swetnam et al. 2001). These large
34 numbers of cattle may have reduced the current year's fuel loads and changed the structure
35 and abundance of fuels, thus reducing the frequency of wildfires (Miller et al. 2011).
36 Increased tree dominance by conifers results in a decline of cover by sagebrush and other
37 shrubs.

38 Anthropogenic development has reduced the amount and quality of sagebrush steppe
39 habitat across much of the planning area. The activities have occurred on private lands but
40 infrastructure to support urbanization and agriculture along the Snake River Plain and other
41 waterways has occurred on BLM-administered and National Forest System lands. Many of
42 these types of facilities or uses include railroads, roads, power lines, pipelines, irrigation

1 canals, communication towers, military training, and off-highway vehicle use (Knick et al.
2 2011).

3 Livestock grazing is the most widespread land use across sagebrush steppe habitats from the
4 1880s to present. Livestock numbers and use of these habitats was greatest from the late
5 1880s through the 1930s. During this period the greatest change occurred to these habitats
6 as a result of heavy livestock use and drought that resulted in loss of soil and depleted native
7 vegetation communities that greatly impacted these habitats (Knick et al. 2011). From the
8 1940s until the 1980s, plowing, herbicides, and burning followed by seeding nonnative
9 perennial grasses to increase forage for livestock production occurred, thus impacting many
10 sagebrush habitats in southern Idaho.

11 In recent decades, management emphasis has shifted towards maintaining healthy,
12 functioning native ecosystems and reducing the spread of nonnative species. Grazing
13 regulations enacted in 1995 mandated that public land grazing allotments conform to the
14 Fundamentals of Rangeland Health, as well as subsequent Standards and Guidelines (S&Gs),
15 and that changes to grazing management be made if livestock management is determined to
16 be a significant causal factor in failing to meet Fundamentals of Rangeland Health or S&Gs.
17 Since that time, the BLM has been reviewing rangeland health conditions and modifying
18 livestock grazing management as necessary to conform to the Fundamentals of Rangeland
19 Health and S&Gs. In addition, vegetation treatments have occurred on many allotments in
20 an effort to restore functionality of impacted sagebrush steppe habitats. For more
21 information about livestock grazing, see **Section 3.8**, Livestock Grazing.

22 *Riparian/Wetland Habitats*

23 Riparian habitats are regarded as one of the most important habitats for wildlife due the
24 availability of water and the structural diversity of the vegetation communities.
25 Approximately 75 percent of all wildlife species utilize riparian habitats for at least some
26 portion of their annual life cycle (USEPA 1990). Riparian habitats are estimated to make up
27 approximately 1 percent of all habitats in the planning area. The riparian habitats in the
28 planning area are composed of lotic systems that are associated with running water or
29 lentic/wetland habitats associated with standing water.

30 Riparian habitats in the planning area have been subject to many activities that have affected
31 their functionality and their ability to support wildlife. These activities include dewatering for
32 irrigation, domestic cattle grazing, road construction, dam construction, and land treatments.
33 The impacts from these activities include changes in plant species composition and structure,
34 vegetative cover, sedimentation, changes in water quality and temperature, streambank
35 alteration, and duration of available water.

36 Wildlife habitat values are degraded on riparian habitats with functional-at-risk or
37 nonfunctional conditions. Information on proper functioning condition is not available at
38 the sub-regional planning scale.

1 *Big Game*

2 The planning area hosts a wide variety of big game species including mule deer, pronghorn,
3 and elk that use habitats associated with sagebrush steppe and riparian habitats. Other big
4 game species that are found in these habitats but in lesser amounts include bighorn sheep,
5 moose, and white-tailed deer. The planning area provides habitat for all seasonal use periods
6 for mule deer, pronghorn, elk, bighorn sheep, and other species. These species are generally
7 widespread across the entire planning area.

8 Mule deer are the most abundant and widely distributed big game animal. Mule deer
9 populations and mule deer habitat have changed greatly during the past 100 years. Loss of
10 shrub-steppe habitats, conversion of native landscapes to agriculture or residential
11 development, and past and current grazing management are key management issues for mule
12 deer populations throughout the planning area (Cox et al. 2009).

13 Within the planning area mule deer populations vary greatly from current population
14 objectives. In southeast Idaho populations have undergone declines following the winters of
15 1992-1993 and have been slow to respond to changes in management activities (IDFG
16 2011a). This has resulted in IDFG developing an initiative to target this area of the state to
17 modify management strategies and improve habitat conditions for mule deer. In other
18 portions of the planning area, including south-central Idaho and southwestern Montana,
19 populations appear to be stable or increasing but are below levels observed in the late 1980s
20 and early 1990s (IDFG 2011a; MFWP 2012).

21 Mule deer are primarily browsers and their diet is composed mostly of leaves and twigs of
22 shrubs, especially during the winter. Grasses and forbs are also crucial components of their
23 diet in the spring and summer. The quality and quantity of nutritious forage in spring (April
24 through July) has major implications on the production and survival of fawns. Summer and
25 fall ranges are important because this is where deer produce fat reserves that will allow
26 survival through winter. The quality of summer-fall forage also directly influences pregnancy
27 and ovulation rates and, therefore, fawn production (Cook et al. 2001; Tollefson et al. 2010;
28 Vavra 1992). Much of Idaho's historic mule deer winter range has been developed for other
29 uses and is now occupied by man. Residential, commercial, and industrial developments
30 located in the foothills and at lower elevations have eliminated winter range (IDFG 2011a).

31 Pronghorn distribution has changed relatively little since the early 1980s but numbers have
32 trended downward since the winters of 1993-1994 (IDFG 2011b). Pronghorn are typically
33 associated with sagebrush habitats but readily use grasslands if there are adequate amounts of
34 forbs (Yoakum 2004a). In sagebrush habitats, pronghorn diets consist of sagebrush and
35 other shrubs during all seasons, but particularly in the fall and winter (Yoakum 2004a). Forbs
36 are preferred by pronghorn when available (Yoakum 2004b). The availability of forbs in
37 sagebrush habitats may have important implications for pronghorn because they are rich in
38 nutritional values required for reproduction (Pyrah 1987; Yoakum 2004b). Large landscape
39 level fires have reduced the availability of sagebrush in parts of their range. In portions of
40 the planning area, extensive fencing has contributed to the inability of some populations to
41 access otherwise suitable habitats. Noxious weeds, livestock grazing, and drought has also
42 impacted current pronghorn populations and their habitat.

1 Elk are found throughout the planning area in sagebrush steppe and associated
2 conifer/forested woodlands. Elk are considered generalists and are not totally dependent
3 upon sagebrush steppe, but they do require food, water, and where hunted, hiding cover and
4 security areas. The combination of the resources determines the distribution and number of
5 elk within sagebrush steppe. Elk populations in the planning area are generally at or above
6 state wildlife management agencies objectives (IDFG 2011c; MFWP 2004).

7 Other big game species, such as moose, bighorn sheep, and white-tailed deer are also found
8 in the planning area. Moose and white-tailed deer are generally associated with
9 riparian/wetland habitats. Bighorn sheep usually are found near escape terrain composed of
10 steep rugged slopes and make use of sagebrush steppe year round in southwest Idaho. In
11 east-central Idaho and southwestern Montana, bighorn sheep generally make use of
12 sagebrush steppe near escape terrain during the winter and spring.

13 *Migratory Birds*

14 There are numerous species of migratory birds that use the planning area during part of the
15 year, including over 40 species of greatest conservation need in Idaho and in Montana
16 (IDFG 2005; BLM 2006a). These birds are as diverse as the Calliope hummingbird, green-
17 tailed towhee, Brewer's sparrow, ferruginous hawk, mallard, and sandhill crane. Most of
18 these birds are summer residents that use habitats ranging from low elevation wetlands to
19 high elevation forests for breeding and raising young. Some species such as American robin
20 and mallard are migratory, but small populations may be present yearlong depending on
21 seasonal conditions. Winter residents such as the rough-legged hawk, snow buntings, and
22 rosy-crowned gray finches arrive from arctic breeding grounds, or high elevation alpine areas
23 to utilize winter habitats in sagebrush steppe, seasonally replacing summer residents.

24 The 1988 amendment to the Fish and Wildlife Conservation Act mandates the USFWS to
25 "identify species, sub species, and populations of all migratory nongame birds that, without
26 additional conservation actions, are likely to become candidates for listing under the
27 Endangered Species Act of 1973." Birds of Conservation Concern 2008 (USFWS 2008) is
28 the most recent effort to carry out that mandate and identifies those species in greatest need
29 of conservation action in specific geographic bird conservation regions. The planning area
30 overlaps three bird conservation regions. These regions include the Great Basin, Northern
31 Rockies, and a very small portion of the Southern Rockies/Colorado Plateau. The list of
32 species likely to inhabit sagebrush steppe and riparian/wetlands of this planning area for
33 these three conservation regions can be found in **Appendix O**. This mandate was
34 emphasized with the issuance of Executive Order 13186, which directs federal land
35 management agencies to develop cooperative plans to protect and manage habitat for all
36 migratory birds. Expansion of funding opportunities under the North American Wetlands
37 Conservation Act and other partnership opportunities through the North American Bird
38 Conservation Initiative will support increased management consideration for these species.

39 *Furbearers/Upland Game/Non-Game*

40 A large variety of other wildlife species use sagebrush steppe, riparian/wetland habitats, and
41 nonnative grasslands and conifer woodland/forests habitats within and adjacent to
42 sagebrush steppe in the planning area. Furbearers commonly found in these habitats include

1 red fox, bobcat, muskrat, beaver, and mink. River otter may be present, but the species is
2 generally associated with larger river riparian systems. Cottontail and pygmy rabbits are
3 found throughout the planning area and their numbers are variable as populations are cyclic
4 (USFWS 2010b). Pygmy rabbits, a species of greatest conservation need in Idaho and
5 southwestern Montana, are found in sagebrush habitats with relatively deep, loose soils that
6 provide food and shelter. Upland game birds common or locally abundant in the planning
7 area include Columbian sharp-tailed grouse, pheasant, mourning dove, chukar, gray
8 partridge, California quail, dusky (blue) grouse, and ruffed grouse.

9 Many other species of nongame wildlife have limited information on their distribution or life
10 history requirements. Information on these species is maintained by the Idaho, Montana,
11 Utah, and Nevada Natural History Programs within each state. Site-specific inventories have
12 not been conducted for many of the species but information about species distribution and
13 relative abundance continues to be modified as funding becomes available.

14 *Amphibians/Reptiles*

15 Amphibians, specifically frogs and toads, have been recognized as important indicators of
16 ecosystem health, as many populations are declining in the western US. Amphibians are
17 generally found near some form of water. There are eight species of salamanders, frogs, and
18 toads found in the planning area, including three species of greatest conservation need in
19 Idaho; there are three amphibian species on the BLM special status species list in Montana
20 (IDFG 2005; Montana Natural Heritage Program 2013).

21 There are 16 species of reptiles occurring in sagebrush habitats and riparian/wetland habitat
22 in the planning area. These include seven lizard species, one turtle species, and eight snake
23 species. The sagebrush lizard and short-horned lizard are two of the most common species
24 associated with sagebrush habitats. Two snake and two reptile species found in the planning
25 area are species of greatest conservation need in Idaho (IDFG 2005). There are no BLM
26 special status reptile species in the southwestern Montana portion of the sub-region
27 (Montana Natural Heritage Program 2013).

28 *Insects*

29 Insect occurrence and distribution are not generally specifically considered in land
30 management activities. Three species of insects that are identified as sensitive species due to
31 their limited distribution occur in or immediately adjacent to sagebrush habitats. These
32 species include Idaho pointheaded grasshopper, St. Anthony Sand Dunes tiger beetle, and
33 Bruneau Dunes tiger beetle (See **Section 3.5**, Other Special Status Species).

34 Insects provide important food sources for many species of wildlife including adult and
35 juvenile GRSG. Although there are thousands of species of insects occurring in sagebrush
36 and riparian and wetland habitats, species in the *Scarabeidae* and *Tenebrionidae* (beetle) families,
37 *Formicidae* (thatch ants) family, and *Orthoptera* (grasshopper) family play a crucial role in the
38 diet of many wildlife species (including GRSG) as a high protein food source (Klebenow and
39 Gray 1968; Peterson 1970; Johnson and Boyce 1990; Pyle 1993; Fischer 1994; Drut et al.
40 1994).

1 **3.4 Fish and Wildlife**

2 **3.4.1 Terrestrial Wildlife**

3 ***Conditions within the Planning Area***

4 The BLM and Forest Service manage wildlife habitat, and the state wildlife management
5 agencies manage wildlife populations. These habitats reflect the influence of a variety of past
6 and ongoing human activities and disturbances, resulting in increases in some species
7 populations, declines in others, and the modification of large blocks of habitat. These
8 habitats and the wildlife species that rely on them rarely exist solely on BLM-administered or
9 National Forest System lands, and often extend across administrative boundaries to other
10 federal, state, and private lands. Further information regarding wildlife on National Forest
11 System lands is provided in **Appendix CC**.

12 **3.4.2 Aquatic Wildlife**

13 ***Conditions within the Planning Area***

14 Fish of interest within the planning area consist primarily of cold-water species. The
15 condition of aquatic habitat is influenced by upland and riparian processes. Uplands
16 influence aquatic habitat primarily through hydrologic processes. For example, the arid
17 nature of the planning area makes the influence of groundwater on surface water particularly
18 important. Therefore, impacts on uplands, such as compaction, that reduce water infiltration
19 have the potential to reduce the amount of groundwater being released into streams. Water
20 in compacted areas can pond on the surface and be lost into the atmosphere through
21 evaporation or be delivered rapidly to channels during high flows. The amount of water and
22 whether it enters stream channels via surface flow or subsurface flow have a significant
23 effect on sediment delivery and deposition, streamside vegetation, and water quality.
24 Riparian areas influence aquatic habitat more directly due to their proximity to water. For
25 example, riparian vegetation shades streams from solar radiation which reduces increases in
26 water temperature, and provides organic material to streams which act as a food source for
27 aquatic macroinvertebrates. Well-vegetated floodplains dissipate energy of flood flows,
28 provide velocity refugia for juvenile and adult fish during flood events, filter sediment during
29 floods, and store water for release during lower flows. Fine sediment deposition within the
30 substrate; and water quality, including, temperature, turbidity, and dissolved oxygen affect
31 fish and fish habitat.

32 Aquatic habitat within the planning area includes perennial and intermittent streams, springs,
33 lakes, and reservoirs that support fish during at least a portion of the year.

34 The majority of the planning area within Idaho is within the Snake River basin, while the
35 portion of the planning area within Montana is within the Missouri River basin. The portion
36 of the southeast corner of Idaho is located within the Bear River basin which flows into the
37 Great Salt Lake.

38 The climate throughout the planning area is generally arid, with runoff being dominated by
39 spring snowmelt. Summer flows are provided by snowmelt, subsurface storage, and

1 thunderstorm events. Native fish species consist primarily of salmonids, sculpin, and
2 minnows, and suckers.

3 ***Conditions on BLM-Administered and National Forest System Lands***

4 Fish-bearing streams, and lakes, ponds, and reservoirs within the planning area provide
5 habitat for a variety of native and nonnative game and nongame fish species. **Table 3-17,**
6 **Native and Nonnative Fish Species Found within the Planning Area and their Status,**
7 displays the various fish species that occur within the planning area.

Table 3-17
Native and Nonnative Fish Species Found within the Planning Area and their Status

Common Name	Scientific Name	Status
Native Fish Species		
Sockeye salmon	<i>Oncorhynchus nerka</i>	ESA Endangered
Chinook salmon	<i>O. tshawytscha</i>	ESA Threatened
Steelhead	<i>O. mykiss</i>	ESA Threatened
Bull trout	<i>Salvelinus confluentus</i>	ESA Threatened
Redband trout	<i>O. mykiss gairdneri</i>	BLM Sensitive
Westslope cutthroat	<i>O. clarki lewisi</i>	BLM Sensitive
Yellowstone cutthroat	<i>O. clarki bouvieri</i>	BLM & Forest Service Sensitive
Bonneville cutthroat	<i>O. clarki utah</i>	BLM Sensitive
Bear Lake whitefish	<i>Prosopium abyssiicola</i>	BLM Sensitive
Bonneville whitefish	<i>P. spilonotus</i>	BLM Sensitive
Bonneville cisco	<i>P. gemmiferum</i>	BLM Sensitive
Big Lost River whitefish	<i>P. williamsoni</i>	Forest Service Sensitive
Mountain whitefish	<i>P. williamsoni</i>	No status
White sturgeon	<i>Acipenser transmontanus</i>	BLM Sensitive
Bear Lake sculpin	<i>Cottus extensis</i>	BLM Sensitive
Shoshone sculpin	<i>C. greenei</i>	BLM Sensitive
Wood River sculpin	<i>C. leiopomus</i>	BLM Sensitive
Paiute sculpin	<i>C. beldingii</i>	No status
Shorthead sculpin	<i>C. confusus</i>	No status
Mottled sculpin	<i>C. bairdii</i>	No status
Northern leatherside chub	<i>Lepidomeda copei</i>	BLM & Forest Service Sensitive
Utah chub	<i>Gila atraria</i>	No status
Chiselmouth	<i>Acrocheilus alutaceus</i>	No status
Redside shiner	<i>Richardsonius balteatus</i>	No status
Speckled dace	<i>Rhinichthys osculus</i>	No status
Utah sucker	<i>C. ardens</i>	No status
Bluehead sucker	<i>Catostomus discobulus</i>	No status
Bridgelip sucker	<i>C. columbianus</i>	No status
Largescale sucker	<i>C. macrocheilus</i>	No status
Mountain sucker	<i>C. platyrhynchus</i>	No status
Nonnative Fish Species		
Brook trout	<i>S. fontinalis</i>	No status
Brown trout	<i>Salmo trutta</i>	No status
Tadpole madtom	<i>Noturus gyrinus</i>	No status

Table 3-17
Native and Nonnative Fish Species Found within the Planning Area and their Status

Common Name	Scientific Name	Status
Black bullhead	<i>Ameiurus melas</i>	No status
Brown bullhead	<i>A. nebulosus</i>	No status
Blue catfish	<i>Ictalurus furcatus</i>	No status
Channel catfish	<i>I. punctatus</i>	No status
Flathead catfish	<i>Pylodictis olivaris</i>	No status
Common carp	<i>Cyprinus carpio</i>	No status
Grass carp	<i>Ctenopharyngodon idella</i>	No status
Goldfish	<i>Carassius auratus</i>	No status
Eastern mosquitofish	<i>Gambusia holbrooki</i>	No status
Western mosquitofish	<i>G. affinis</i>	No status
Fathead minnow	<i>Pimephales promelas</i>	No status
Spottail shiner	<i>Notropis hudsonius</i>	No status
Green swordtail	<i>Xiphophorus hellerii</i>	No status
Guppy	<i>Poecilia reticulata</i>	No status
Black crappie	<i>Pomoxis nigromaculatus</i>	No status
White crappie	<i>P. annularis</i>	No status
Yellow perch	<i>Perca flavescens</i>	No status
Bluegill	<i>Lepomis macrochirus</i>	No status
Green sunfish	<i>L. cyanellus</i>	No status
Pumpkinseed	<i>L. gibbosus</i>	No status
Largemouth bass	<i>Micropterus salmoides</i>	No status
Smallmouth bass	<i>M. dolomieu</i>	No status
Walleye	<i>Sander vitreus</i>	No status
Muskellunge	<i>Esox masquinongy</i>	No status
Northern pike	<i>E. lucius</i>	No status
Tiger musky	<i>E. masquinongy</i> × <i>E. lucius</i>	No status
Convict cichlid	<i>Archocentrus nigrofasciatus</i>	No status
Mozambique tilapia	<i>Tilapia mossambica</i>	No status
Redbelly tilapia	<i>T. zilli</i>	No status
Oriental weatherfish	<i>Misgurnus anguillicaudatus</i>	No status

1

2 ***Status of Aquatic Species in the Planning Area***

3 The following discussion on status of aquatic species focuses on native species and
 4 particularly special status species. Twelve of the seventeen special status species are
 5 salmonids, three are sculpin, one is the white sturgeon, and one is the northern leatherside
 6 chub. None of the special status species are ubiquitous across the planning area. Each
 7 species is found in a particular portion of the planning area with some of the species being
 8 endemic to a particular water body or portion of a water body.

9 Three of the 12 salmonids are anadromous fish found in the BLM Challis and Salmon field
 10 offices and the Payette, Salmon-Challis, and Sawtooth national forests, and each is listed

1 under the ESA. Snake River Basin steelhead and Snake River spring/summer-run Chinook
2 salmon are listed as threatened under the ESA and Snake River sockeye salmon are listed as
3 endangered under the ESA. Adults passing Lower Granite dam on the Snake River are
4 counted for all three of these species (Columbia Basin Research 2013). The 10-year average
5 number of adults passing Lower Granite dam from 2003 through 2012 for steelhead is
6 190,535, for spring/summer-run Chinook salmon is 67,241, and for sockeye salmon is 610.

7 Bull trout within the planning area are found in the BLM Salmon, Challis, Jarbidge, and
8 Upper Snake field offices and the Boise, Payette, Salmon-Challis, and Sawtooth national
9 forests, and are listed as threatened under the ESA. Bull trout in the planning area largely
10 occupy higher elevation areas with cold water temperatures.

11 The native range of redband trout within the planning area is the Snake River and its
12 tributaries up to Shoshone Falls and the upper Salmon River basin. The current distribution
13 of redband trout has been significantly reduced relative to the historical distribution, and it is
14 likely that across its range slightly more than 44 percent of the occupied stream miles contain
15 redband that have been genetically altered due to extensive stocking of hatchery fish (Wild
16 Trout Enterprises 2012). Conditions for occupied redband trout habitat across its range was
17 rated as part of the 2012 redband trout status assessment (Wild Trout Enterprises 2012).
18 Approximately 5 percent of habitats were judged to be in excellent condition, 27 percent
19 were judged to be in good condition, 34 percent in fair condition, 18 percent in poor
20 condition, and 16 percent of the occupied habitats were not rated.

21 Three cutthroat trout species occur within the planning area: Westslope cutthroat,
22 Yellowstone cutthroat, and Bonneville cutthroat. In Idaho, Westslope cutthroat only occur
23 in the Salmon River portion of the planning area, while they occur in the entire portion of
24 the planning area within Montana. Wild Trout Enterprises (2009) estimated that Westslope
25 cutthroat currently occupy 58 percent of the stream miles they historically occupied across
26 their range. Conditions for occupied Westslope cutthroat habitat across its range were rated
27 as part of the 2009 Westslope cutthroat status assessment (Wild Trout Enterprises 2009).
28 Approximately 18 percent of habitats were judged to be in excellent condition, 41 percent
29 were judged to be in good condition, 24 percent in fair condition, 4 percent in poor
30 condition, and 13 percent of the occupied habitats had an unknown condition. Within the
31 planning area, Yellowstone cutthroat occur in the Snake River system above Shoshone Falls
32 and within the Yellowstone River system. May et al. (2007) determined that Yellowstone
33 cutthroat currently occupy 43 percent of the stream miles they historically occupied.
34 Conditions for occupied Yellowstone cutthroat habitat across its range were rated as part of
35 the 2006 Westslope cutthroat status assessment (May et al. 2007). Approximately 14 percent
36 of habitats were judged to be in excellent condition, 52 percent were judged to be in good
37 condition, 20 percent in fair condition, 5 percent in poor condition, and 9 percent of the
38 occupied habitats had an unknown condition. In the planning area, Bonneville cutthroat
39 trout only occur within the Bear River drainage in southeast Idaho. An adfluvial population
40 occurs in Bear Lake. The range-wide status of Bonneville cutthroat improved considerably
41 from 1980 to 2000 (Lentsch et al. 2000).

1 Seven of the remaining nine special status fish species are endemics. Four species, Bear Lake
2 whitefish, Bonneville whitefish, Bonneville cisco, and Bear Lake sculpin are endemic to Bear
3 Lake. While the Big Lost River whitefish is endemic to the Big Lost River system, the
4 Shoshone sculpin is endemic to springs and spring creeks in the Hagerman Valley, and the
5 Wood River sculpin is endemic to the Wood River system.

6 The white sturgeon occurs in the Snake River below Shoshone Falls. Their numbers have
7 been greatly reduced largely due to the lack of passage at dams and reduced spawning habitat
8 due to the reservoirs behind the dams. The sturgeon fishery in the Snake River is popular,
9 but no harvest of white sturgeon is allowed.

10 The northern leatherside chub has a patchy distribution within the planning area. The
11 species occupies habitat within the Goose Creek and Salt River systems. They are generally
12 found sporadically, in low numbers, and in the presence of other minnow species, such as
13 reidside shiners and speckled dace. The USFWS completed a status review for the species in
14 2011, and found that they were not warranted for listing under the ESA.

15 In general, the remaining fish in **Table 3-17** are more broadly distributed within the planning
16 area. Special status aquatic mollusks are discussed in the Special Status Species section of the
17 EIS.

18 **3.5 Other Special Status Species**

19 **3.5.1 Conditions within the Planning Area**

20 The list of special status species for BLM-administered lands in Idaho and the Western
21 Montana District; the Beaverhead-Deerlodge, Boise, Caribou, Challis, Payette, Salmon,
22 Sawtooth, and Targhee National Forests; and the Curlew National Grassland includes
23 mammals, birds, reptiles, amphibians, fish, invertebrates, and plants. There are 383 special
24 status species. Of these, 28 species are mammals, 51 are birds, 4 are reptiles, 8 are
25 amphibians, 25 are fish, 21 are invertebrates, and 246 are plants.

26 The BLM's objectives for special status species are to conserve and recover ESA-listed
27 species and the ecosystems on which they depend so that ESA protections are no longer
28 needed for these species, and to initiate proactive conservation measures that reduce or
29 eliminate threats to BLM sensitive species to minimize the likelihood of and need for listing
30 of these species under the ESA. The BLM 6840 Manual, Special Status Species Management,
31 sets policy for the management of candidate species and their habitat. The 6840 manual
32 directs the BLM to undertake conservation actions for such species before listing is
33 warranted and also to "work cooperatively with other agencies, organizations, governments,
34 and interested parties for the conservation of sensitive species and their habitats to meet
35 agreed on species and habitat management goals."

36 The BLM 6840 Manual requires the BLM to identify strategies, restrictions, management
37 actions, and provisions necessary to conserve or recover ESA-listed species and conserve
38 BLM sensitive species. The 6840 Manual also requires managers to determine to the extent
39 practicable, the distribution, abundance, population condition, current threats, and habitat

1 needs for sensitive species, and evaluate the significance of actions in conserving those
2 species.

3 Similarly, Forest Service direction for threatened and endangered species is to manage
4 habitats and activities to achieve recovery of these species so that special protection
5 measures provided under ESA are no longer necessary. Direction for sensitive species is to
6 develop and implement management practices to ensure that these species do not become
7 threatened or endangered because of management actions. Additionally, the Forest Service
8 Manual 2670 directs the Forest Service to maintain viable populations of all native and
9 desired nonnative wildlife, fish, and plant species.

10 Activities within the planning area are likely to primarily affect sagebrush habitat. Areas of
11 conifer encroachment (primarily western or Utah juniper; Douglas-fir in some limited areas)
12 targeted for sagebrush restoration to benefit GRSG will also be affected to varying degrees
13 depending on time and scale. Therefore, only those species that depend on sagebrush habitat
14 or that are strongly associated with juniper will be analyzed. **Table 3-18**, Special Status
15 Species within the Planning Area, identifies these species, their status, and where the
16 designations apply. There are a total of 215 special status species that depend on sagebrush
17 habitat. Of these, 16 species are mammals, 20 are birds, 4 are reptiles, 3 are amphibians, 3 are
18 invertebrates, and 169 are plants.

Table 3-18
Special Status Species within the Planning Area

Common Name (<i>Scientific Name</i>)	Status*	Federal Land	
		BLM	Forest Service
Mammals			
Grizzly bear (<i>Ursus arctos</i>)	ESA Threatened	X	X

15

16

The Wild Free-Roaming Horses and Burros Act of 1971, as amended by FLPMA and the Public Rangeland Improvement Act of 1978, direct the protection and management of wild horses and burros on BLM-administered and National Forest System lands. Both the BLM and Forest Service have responsibility for managing Wild and Free Roaming Horses and Burros. Under the Act, the BLM identified herd areas as places used as habitat by a herd of wild horses at the time the Act was passed. To carry out its duties under the 1971 law, the BLM periodically evaluates each herd area to determine if it has adequate food, water, cover, and space to sustain healthy and diverse wild horse and burro populations over the long-term. The areas that meet these criteria are then designated as HMAs, where horses or burros can be viably managed as a component of the BLM-administered lands. The BLM designates an appropriate management level (AML) and specifies an allowable range in horse numbers for each HMA based upon available forage and other resources necessary to sustain the horse or burro populations, as well as resource objectives and other designated uses of the BLM-administered lands.

17

18

19

20

Wild horse and burro management areas on National Forest System lands are called territories. However, no active territories exist within the planning area. There are two inactive territories in Idaho on the Challis National Forest which no longer have any wild horses.

21

3.6.1 Conditions on BLM-Administered Lands

22

23

24

25

26

27

Within the planning area, the BLM manages six HMAs, all in the state of Idaho: four in the Boise District, one in the Twin Falls District, and one in the Idaho Falls District. Additionally, there are nine herd areas within the planning area, five of which are in southwestern Montana, and four of which are in Idaho (see **Figure 3-2**, Wild Horse and Burro Herd Management Areas and Herd Areas). The HMAs encompass approximately 361,900 acres of BLM-administered lands, and support between 424 and 617 head of horses

1 when populations are within AML. Approximately 551 horses are on BLM-administered
2 lands within these HMAs based upon current population estimates (**Table 3-19**, HMAs
3 within the Planning Area). It is assumed that a wild horse consumes 12 AUMs per year; as
4 such, the AML can be multiplied by 12 to determine the number of AUMs utilized by wild
5 horses.

6 **3.6.2 Conditions on National Forest System Lands**

7 The Forest Service does not manage any wild horses or burros within the planning area.

8 **3.6.3 Regional Context**

9 **Table 3-20**, Acres of Wild Horse and Burro Areas within GRSG Habitat in the Planning
10 Area, displays acres of wild horse and burro territories in GRSG habitat (Manier et al. 2013).
11 In the table, data are presented by surface management agency and their occurrence within
12 occupied habitat in the planning area.

3.7 Wildland Fire Management

The Federal Wildland Fire Management Policy was developed by the Secretaries of the Departments of the Interior and Agriculture in 1995 in response to dramatic increases in the frequency, size, and catastrophic nature of wildland fires in the US. The 2001 review and update of the 1995 Federal Wildland Fire Management Policy consists of findings, guiding principles, policy statements, and implementation actions, and replaces the 1995 Federal Wildland Fire Management Policy. Known as the 2001 Federal Wildland Fire Management Policy (DOI et al. 2001), this update recommends that federal fire management activities and programs include the following:

11

- 1 • Provide for firefighter and public safety
- 2 • Protect and enhance land management objectives and human welfare
- 3 • Integrate programs and disciplines
- 4 • Require interagency collaboration
- 5 • Emphasize the natural ecological role of fire
- 6 • Contribute to ecosystem sustainability

7 The Federal Wildland Fire Management Policy provides nine guiding principles fundamental
8 to the success of the federal wildland fire management program and the implementation of
9 review recommendations. These umbrella principles compel each agency to review its
10 policies to ensure compatibility.

11 The wildland fire management program encompasses the full range of hazardous fuels,
12 management of wildfire, and the rehabilitation of lands affected by wildfire.

13 The wildfire suppression program utilizes a coordinated effort to respond to all unplanned
14 ignitions (wildfire) with a preplanned, appropriate response. Each response is guided by LUP
15 and fire management plan direction. As the severity and number of wildfires escalates, the
16 further response and prioritization of fire suppression resources becomes a collaborative
17 effort with all management levels within BLM and Forest Service working closely with
18 interagency partners.

19 Trend analysis of fire starts and acres burned in the sage steppe ecosystem is very general
20 and dependent predominately upon weather and fuels conditions. The relative fuel
21 conditions of live fuel moistures and fine fuel loadings coupled with weather conditions such
22 as relative humidity, wind speed, and days since last rainfall drive large fire growth in the
23 grass fuel type.

24 Fire occurrence is weighed towards human causes, especially around urban centers and along
25 major highway corridors. However, lightning is the major contributor to multiple large fire
26 days and high numbers of acres burned. Lightning storms generally track from southwestern
27 towards eastern Idaho, leaving successive lightning starts across all three southern districts,
28 often times in remote or difficult to reach areas. These lightning events are commonly
29 associated with strong winds, which contribute to rapid large fire growth. Summer storms
30 commonly lack significant rainfall. It should be reasonably expected that the majority of
31 large fire days correspond to high percentile Burning Index days. Burning Index is a number
32 related to the contribution of fire behavior to the effort of containing a fire. The Burning
33 Index rates fire danger related to potential flame length over a fire danger rating area.

34 Since 2006, emphasis upon the protection of GRSG habitat during suppression actions has
35 taken center stage in planning and operational discussions. High numbers of PPH and PGH
36 acres were burned in 2007 and 2012. The majority of these acres were burned during

1 corresponding high Burning Index days or periods. Fire season generally extends from early
2 June thru October, and large fires can be expected during that time.

3 *Fire Regime Condition Class*

4 Natural Fire Regime: A natural fire regime is a general classification of the role fire would
5 play across a landscape without modern human mechanical intervention (Agee 1993; Brown
6 1995). The five natural fire regimes are classified based on average number of years between
7 fires (fire frequency) combined with the severity of the fire on the dominant overstory
8 vegetation (amount of vegetation replacement). These five regimes include:

9 I – 0 to 35 year frequency and low (surface fires most common) to mixed (less than
10 75 percent of the dominant overstory vegetation replaced) severity

11 II – 0 to 35 year frequency and high severity (greater than 75 percent of the
12 dominant overstory vegetation replaced)

13 III – 35 to 100+ year frequency and mixed severity (less than 75 percent of the
14 dominant overstory vegetation replaced)

15 IV – 35 to 100+ year frequency and high severity (greater than 75 percent of the
16 dominant overstory vegetation replaced)

17 V – 200+ year frequency and high severity (greater than 75 percent of the dominant
18 overstory vegetation replaced)

19 Fire regime condition class (FRCC) is a classification of the amount of change in fire
20 frequency and severity from the natural fire regime (Hann and Bunnell 2001). The three
21 classes are based on low (FRCC 1), moderate (FRCC 2), and high (FRCC 3) change from the
22 natural fire regime (Hardy et al. 2001; Schmidt et al. 2002). The change in natural fire regime
23 results from changes to one or more of the following fire regime attributes: vegetation
24 characteristics (e.g., species composition, structural stages, stand age, canopy closure, and
25 mosaic pattern); fuel composition, fire frequency, severity, and pattern; and other associated
26 disturbances (e.g., insect and disease mortality, grazing, and drought).

27 Characteristic vegetation and fuel conditions are considered to be those that occurred within
28 the natural fire regime. Uncharacteristic conditions are considered to be those that did not
29 occur within the natural fire regime. Examples of uncharacteristic conditions include
30 invasive species (e.g., weeds, insects, and diseases) or excessive vegetation removal. The
31 amount of change is based on comparison of the fire regime attributes as identified above to
32 the natural fire regime. The amount of change is then classified to determine the FRCC.

33 **3.7.1 Conditions within the Planning Area**

34 The Hazardous Fuels Reduction Program (HFR) involves a variety of treatments to
35 accomplish the following:

- 1 • Modify vegetation to provide for firefighter safety
- 2 • Reduce the potential of wildfire spread
- 3 • Reduce the detrimental effects of wildfire on a landscape
- 4 • Restore ecosystem resiliency
- 5 • Allow the natural role of fire on the landscape
- 6 • Protect private holdings and infrastructure
- 7 • Decrease the costs of rehabilitation efforts after a wildfire has occurred

8 Depending on the specifics of the overall project, multiple treatment types may be involved
9 over several years to obtain the specifications for the project. One example of this would be:
10 For an annual grass dominated area, prescribed fire will be used to remove existing layers of
11 the annual grass and reduce the seed source. Chemical applications would be utilized to
12 further reduce the seed source and the resulting new annual grass plants. Mechanical
13 seedings of perennial (native or nonnative, grass/shrub/forb) mixtures would occur,
14 pending the most successful time of year for applications.

15 Examples of treatment types include:

- 16 • **Prescribed Fire (Treatment)** – An HFR Treatment Category for any fire
17 ignited by management actions to meet specific objectives and to achieve Fire
18 Management objectives.
- 19 • **Mechanical (Treatment)** – An HFR Treatment Category that describes work
20 that manually or mechanically removes or modifies fuel load structures to
21 achieve Fire Management objectives.
- 22 • **Other (Treatment)** – An HFR Treatment Category that describes work
23 involving the use of chemicals and biological methods to achieve Fire
24 Management objectives.

25 In Idaho, the HFR Program has been in place since the start of the 2000 National Fire Plan
26 identified the need and funding source to develop and maintain the program. Within the last
27 5 years, which would represent the most current treatments on the existing landscape, the
28 following acreage and types of treatments are shown below. The prescribed fire acreages
29 have decreased from historical levels due to multiple large scale wildfires accomplishing the
30 removal of undesirable vegetation in areas planned for future projects. Mechanical
31 treatments have increased in, both, seeding and mechanical reductions of conifer
32 encroachment throughout PPH and PGH areas. The use of chemical or “Other” types of
33 treatments has grown to increase the probability of success of seeding(s) of perennial (native
34 or nonnative, grass/shrub/forb) mixtures by removing the dominance and competitiveness
35 of the undesirable annual grass and weed species. Biological or “Other” treatments (insects,
36 goat, and specific pathogens) have recently been of interest in very specific areas due to the

1 “high risk” in areas that may have significant values should accidents occur during
2 implementation of mechanical treatments (e.g., rocks and windows).

3 As described in Section 4.2.2, cheatgrass can dramatically alter sagebrush ecosystems and
4 their fire frequencies. Increasing exotic annual grasses, primarily cheatgrass, are resulting in
5 sagebrush loss and degradation (USFWS 2010a, p. 13,932). Cheatgrass can more easily
6 invade and create its own feedback loop in areas that are: 1) dry with understory vegetation
7 cover that is not substantial, or 2) experiencing surface-disturbing activities (e.g., road
8 construction). It can facilitate short fire return intervals by outcompeting native herbaceous
9 vegetation with early germination, early moisture and nutrient uptake, prolific seed
10 production, and early senescence (Hulbert 1955; Mack and Pyke 1983; Pellant 1996).
11 Furthermore, by providing a dry, fine fuel source during the peak of fire season, cheatgrass
12 increases the likelihood of fire, which increases the likelihood of further cheatgrass spread
13 (Pellant 1990). While research and management efforts are focused on developing means of
14 controlling cheatgrass on a large scale, the only current management actions under the fire
15 program to minimize the spread of fire in GRSG habitat are: fuels treatments, pre-
16 suppression planning, and effective fire suppression geared toward protecting GRSG habitat.
17 Reducing the spread of cheatgrass and the scale of wildfire through appropriate conservation
18 actions associated with other BLM and Forest Service post-fire programs, such as ES&R or
19 BAER, could also result in more or improved habitat for GRSG.

20 3.7.2 Trends

21 **Table 3-21**, BLM Treatment Types and Acreages Over the Past Five Years, presents fuel
22 treatment types and acreages over the past 5 years.

Table 3-21
BLM Treatment Types and Acreages Over the Past Five Years

Treatment Type	2008	2009	2010	2011	2012
Prescribed Fire	11,199 acres	8,647 acres	7,189 acres	6,398 acres	3,021 acres
Mechanical	46,073 acres	38,992 acres	33,975 acres	30,987 acres	30,725 acres
Other	59,003 acres	47,991 acres	36,500 acres	39,895 acres	71,666 acres

Source: BLM GIS 2015

23
24 Over the past few years, the focus of the HFR program was to treat acreages within the
25 WUI. This was specific to protecting private in-holdings in the attempt to decrease the
26 detrimental effects of wildfire to human structures and the associated infra-structure for the
27 communities.

28 ***Emergency Stabilization and Rehabilitation (ESR)***

29 Alteration to the historic fire regime has substantially reduced the sagebrush steppe
30 communities of the Sub Unit and the larger Great Basin. The exclusion of wildfire within the
31 upper elevations shrub steppe communities (primarily mountain big sagebrush) has
32 converted GRSG habitat into juniper woodland.

1 The greatest loss of GRSG habitat however has been from cheatgrass proliferation and
2 wildfire within the lower elevation sagebrush communities (primarily Wyoming big
3 sagebrush). Historically, wildfire was not a common occurrence within the Wyoming big
4 sagebrush sites. Current literature estimates the fire interval at approximately 100 years.
5 When these sites did burn, the discontinuous fuels of the scattered native bunch grasses
6 likely resulted in small, discontinuous fires. Conversely, cheatgrass is highly flammable due to
7 its uniform fine fuels which dry out early in the growing season. Each recurring fire set the
8 stage for further cheatgrass expansion, resulting in an ever increasing cheatgrass/fire cycle
9 and loss of GRSG habitat. On many of these sites, fire-return intervals have been shortened
10 to between 2 and 4 years (Whisenant 1990).

11 Lower elevation shrub steppe communities within the subunit (even those containing
12 minimal cheatgrass understories) will cross a threshold into fire maintained cheatgrass
13 dominated communities unless they are successfully rehabilitated within the first couple
14 years following wildfire. Such areas are also highly susceptible to noxious weed invasions.
15 Therefore, successfully reestablishing perennial vegetation within this narrow time frame is
16 essential for reducing the loss of low elevation GRSG habitat.

17 Fire rehabilitation consists of mitigating damaging effects from wildfire and in restoring
18 vegetative structure and function to recently burned fire damaged areas which cannot
19 recover on their own. These efforts consist of seeding perennial grasses, shrubs, and forbs.
20 The seeding technique is based largely on seed size. Most grasses (which have relatively large
21 seeds) are drill seeded to effectively cover the seed, whereas sagebrush and many forbs
22 (which consist of small seeds) are most successful broadcast seeded.

23 Drought and invasive annual grass competition are the two biggest challenges to
24 reestablishing perennial vegetation following wildfire on the low elevation sites. Seedings are
25 most successful during years of adequate precipitation and on sites where cheatgrass
26 competition is minimal such as recently burned sagebrush stands in good condition, or
27 sagebrush stands with cheatgrass in the understory which burned hot enough consume
28 cheatgrass seed lying on the soil surface underneath the sagebrush canopy. Accordingly, the
29 higher the density of sagebrush cover prior to the burn, the greater the likelihood for
30 seedings success. Because sagebrush fires burn hotter and slower than grassland fires, the
31 cheatgrass seed lying on the soil surface underneath the sagebrush canopy is usually
32 consumed, whereas the seed laying outside of the sagebrush canopy or other shrub free areas
33 (such as previously burned cheatgrass-dominated sites) is not consumed and remains viable.
34 Accordingly, the areas underneath the burned sagebrush canopy create a cheatgrass free
35 “clean” seedbed which allows seeded species to establish relatively free of cheatgrass
36 competition. Although the areas outside of the canopies will remain dominated by
37 cheatgrass, the established plants underneath the former sagebrush canopy will usually
38 outcompete the adjacent cheatgrass over time. However, strong wind-driven fires often
39 prevent consumption of cheatgrass seed, thereby require cheatgrass control. Seeding
40 previously burned cheatgrass-dominated sites devoid of a brush overstory, is not usually
41 successful because these rapid cheatgrass driven fires do not provide enough heat to
42 consume cheatgrass seed lying on the soil surface.

1 Herbicides have proven to be the most effective and noninvasive method for controlling
2 annual grasses prior to seeding. Before 1991, the use of herbicides to control invasive annual
3 grasses was prohibited on public land. Therefore, various tilling methods such as plowing
4 and disking were the only available options. Unfortunately, these treatments damaged
5 remaining native vegetation and biologic soil crusts, increased site susceptibility to wind
6 erosion and often resulted in seed being drilled too deeply, thereby opening the site for total
7 cheatgrass domination when seedings were unsuccessful. Prescribed fire was used in
8 attempts to kill cheatgrass seed while still on the plant. Although such fires kill some seed
9 still on the plant, they do not burn hot enough to kill cheatgrass seed on the soil surface.

10 Intensive livestock grazing is often suggested for controlling cheatgrass competition.
11 Although targeted grazing may have some applications for fuels management, it is not
12 effective in reducing cheatgrass competition (Hempy-Mayer and Pyke 2008). During the
13 short time when cheatgrass is highly palatable in the spring, a sufficient number of livestock
14 cannot be concentrated on a small enough area to reduce the cheatgrass seed significantly or
15 reduce cheatgrass seed lying on the soil surface. In addition, this type of grazing can be
16 detrimental to remaining perennial grasses, opening the site up for further cheatgrass
17 expansion in the future.

18 The BLM and Forest Service are authorized to use various approved contact and pre-
19 emergent herbicides for controlling invasive annual grasses. Both types of herbicides have
20 their advantages and shortcomings.

21 Contact herbicides such as Glyphosate have been widely and successfully used within the
22 Boise, Twin Falls, and Idaho Falls Districts in Idaho. These herbicides must be applied
23 during the short period that cheatgrass is actively growing, and before seed development
24 occurs. When numerous cheatgrass crops occur on a given year, repeated applications are
25 required. Additionally, application rates must be tuned to minimize damage to existing
26 perennial plants while effectively controlling the invasive annuals. Glyphosate binds quickly
27 to soil particles and is inactivated. Unbound glyphosate is degraded by soil bacteria.

28 Pre-emergent herbicides such as imazapic and sulfometuron methyl are highly effective in
29 controlling invasive annual grasses while having minimal impacts on most established
30 perennial species. They are also classified as nontoxic to fish and wildlife. These herbicides
31 do not require the specific application timing needed with glyphosate, and their residual
32 action in the soil controls annual grasses whenever they happen to germinate. The residual
33 action lasts from 1 to 3 years, depending on soil moisture, pH, and temperature. In addition
34 to controlling invasive annual grasses prior to seeding, these herbicides could be used to help
35 maintain and protect existing native plant communities which have been invaded with
36 annual grasses. Such treatments would allow the natives to gain a competitive advantage over
37 the exotic annuals, and the associated reduction in annual grass fuels would reduce the site's
38 risk to wildfire. A limitation of these herbicides is their potential to damage crops at
39 extremely low concentrations. Accordingly, these herbicides must be used in accordance to
40 the label and/or other appropriate restrictions in such situations.

1 Recent research on naturally occurring fungi and bacteria for controlling cheatgrass is
2 encouraging and may prove to be an effective future control method. Examples include
3 Dooley and Beckstead's (2010) *Characterizing the interaction between a fungal seed pathogen and a*
4 *deleterious rhizobacterium for biological control of cheatgrass*; Stewart's (2009) *The grass seed pathogen*
5 *Pyrenophora semeniperda as a biological agent for annual Brome grasses*; and Meyer et al.'s (2008).
6 *Cheatgrass (Bromus tectorum) biocontrol using indigenous fungal pathogens*.

7 Selecting plant materials which can establish and persist in these arid cheatgrass competitive
8 environments is essential for restoring GRSG habitat lost through wildfire. Prior to the mid-
9 1980s, fire rehabilitation funds could not be used for sagebrush seeding. Since that time,
10 sagebrush is included in most fire rehabilitation seedings on its respective ecological sites.
11 Occasionally, during busy fire years, sagebrush seed shortages restrict its use to priority
12 burned GRSG habitat.

13 Native grasses and forbs are preferred over introduced species when they can meet the
14 above requirements. Historically, few adapted native grass seed was available which could
15 persist in these desert environments, thereby requiring the use of durable introduced species
16 such as crested wheatgrass. Over time, selections of native blue bunch wheatgrass, basin
17 wildrye, Snake River wheatgrass, squirreltail, Indian ricegrass, and Sandberg bluegrass have
18 become increasingly available and are now used extensively in fire rehabilitation seedings for
19 areas that receive at least 10 inches of annual precipitation in recently burned sagebrush
20 communities. For the past ten years, the BLM has been funding the interagency Great Basin
21 Native Plant Selection and Increase Project for increasing native seed availability, especially
22 native forbs important to GRSG, and to improve the success of land managers in
23 establishing native plants (Forest Service 2013b).

24 However, some important native grasses (such as Thurber's needlegrass) are still not widely
25 available and or effective in competing with cheatgrass in the harshest environments. In
26 these areas, durable introduced species as Siberian wheatgrass and Russian wild rye are still
27 the only viable option. Even those species are often unsuccessful on those sites.
28 Additionally, restoring native plant communities in repeatedly burned annual dominated
29 grasslands has proven largely unsuccessful. Considerable speculation and research has
30 attempted to understand why. A lack of mycorrhiza, soil nutrients, and other changes to the
31 soil environment from years of invasive annual grass domination is believed to be at least
32 partially responsible.

33 The theory of "assisted succession" is suggested as a method for ultimately restoring these
34 areas by first vegetating with resilient introduced species to break the fire cycle, removing
35 annual grass dominance and deplete annuals' seed source, and restore soil characteristics
36 which may in time make the site more hospitable to restoring the native community,
37 followed by eventual seeding with natives. Accordingly, this is a long term costly process
38 which cannot begin to be implemented until the fire cycle has been broken. Until the
39 majority of annual grass dominated landscapes can be rehabilitated to less fire prone species
40 in the long-term, these short fire cycles will result in a continual loss of these investments,
41 and in the remaining native sagebrush steppe communities.

1 Seeded areas require rest from livestock use to become fully established, followed by
2 livestock management which will maintain plant health and vigor. BLM policy traditionally
3 prescribes a minimum of two growing seasons rest from livestock grazing, and until plant
4 establishment objectives are met. Depending on moisture and other site conditions, longer
5 rest is often needed before grazing can be resumed. However, a true native restoration could
6 require years of rest from grazing to become successfully established (depending on plant
7 materials used and site characteristics). Such large-scale treatments could have significant
8 repercussions to grazing permittees, and may also necessitate more restrictive management
9 to maintain the native seeded species over the long term.

10 The ability to protect these areas from recurring wildfire is crucial to maintaining the
11 reestablished sagebrush component. Successful fire rehabilitation seeding can contribute to
12 this goal by changing the fuels from highly flammable annual grasses with high fuel
13 continuity, into less-fire-prone perennial bunch grasses, which stay greener longer and which
14 provide much less fuel continuity (Pellant 1992). Accordingly, when fire does return to these
15 rehabilitated areas, the fires are often spotty and leave substantial unburned sagebrush
16 islands and a seed source for naturally reestablishing sagebrush. Additionally, the burned
17 perennial grasses quickly re-sprout and compete effectively with annual weeds.

18 Also warranted is a system of effectively managed fuel breaks consisting of durable, fire-
19 resistant vegetation, such as forage kochia, placed primarily along roads or other appropriate,
20 strategic features. In general, vegetative fuel breaks have characteristics that disrupt fuel
21 continuity, harbor lower fuel loads, and have lower volatile compounds and increased
22 moisture content (Pellant 1992). Fuel breaks help provide defensible anchor points for
23 facilitating fire suppression activities and can allow fires to be compartmentalized, ultimately
24 reducing potential fire size.

25 ***Burned Area Emergency Response***

26 The Forest Service's Burned Area Emergency Response (BAER) program is designed to
27 address emergency situations through its key goals of protecting life, property, and critical
28 natural and cultural resources. The objective of the program is to determine the need for and
29 to prescribe and implement emergency treatments on federal lands to minimize threats to
30 life or property resulting from the effects of a fire or to stabilize and prevent unacceptable
31 degradation to natural and cultural resources. Loss of vegetation exposes soil to erosion;
32 runoff may increase and cause flooding, sediments may move downstream and damage
33 houses or fill reservoirs, and put endangered species and community water supplies at risk.

34 BAER teams are staffed by specially trained professionals, and BAER assessments usually
35 begin before a wildfire has been fully contained. There are a variety of emergency
36 stabilization techniques that the BAER team might recommend. Reseeding of ground cover
37 with quick-growing or native species, mulching with straw or chipped wood, construction of
38 straw, rock or log dams in small tributaries, and placement of logs to catch sediment on hill
39 slopes are the primary stabilization techniques used. The team also assesses the need to
40 modify road and trail drainage mechanisms by installing debris traps, modifying or removing
41 culverts to allow drainage to flow freely, adding additional drainage dips and constructing
42 emergency spillways to keep roads and bridges from washing out during floods.

1 **3.7.3 Regional Context**

2 **Table 3-22**, Acres of Wildland Fire within GRSG Habitat, and **Table 3-23**, Acres with High
3 Probability for Wildland Fire within GRSG Habitat, display wildland fire data for GRSG
4 habitat in the planning area (Manier et al. 2013). **Table 3-23** also uses data from the Forest
5 Service’s fire simulator, FSim. FSim generates burn probabilities by simulating fires using
6 historical weather data and current landcover data. **Figure 3-3**, Fire History in the Planning
7 Area, and **Figure 3-4**, Fire Frequency in the Planning Area, illustrate fire issues in the sub-
8 region.

9 **3.8 Livestock Grazing**

10 The foremost authority that provides for grazing of BLM-administered lands is the Taylor
11 Grazing Act which was passed on June 28, 1934, to protect public rangelands and their
12 resources from degradation, to provide for orderly use to improve and develop public
13 rangelands, and to stabilize the livestock industry. Following various homestead acts, the
14 Taylor Grazing Act established a system for allotting grazing privileges. The FLPMA and the
15 Public Rangeland Improvement Act (1978) also provide authority for managing grazing on
16 public rangelands managed by the BLM. BLM grazing administration, excluding of Alaska, is
17 governed by 43 CFR Part 4100.

18 The primary laws that govern grazing on National Forest System lands are the Organic
19 Administration Act of 1897, Granger-Thye Act of 1950, Multiple Sustained Yield Act of
20 1960, FLPMA, Forest Rangeland Renewable Resources and Planning Act of 1974, National
21 Forest Management Act of 1976, and Public Rangelands Improvement Act of 1978. The
22 Forest Service manages livestock grazing under direction in 36 CFR Part 222, Forest Service
23 Manual 2200, and Forest Service Handbook 2209.13. In addition, LUPs identify the
24 suitability of land on National Forest System units to produce forage for grazing animals and
25 establish programmatic direction for grazing activities, including goals, objectives, desired
26 conditions, standards, guidelines, and monitoring requirements. Although an area may be
27 deemed suitable for use by livestock in a LUP, a project-level analysis evaluating the site-
28 specific impacts of the grazing activity, in conformance with NEPA, is required in order to
29 authorize livestock grazing on specific allotments.

30 The BLM grazing administration regulations were revised in 1995 to include Fundamentals
31 of Rangeland Health and Standards and Guidelines for Grazing Administration (43 CFR
32 4180). In accordance with 43 CFR 4180.2, both the Idaho Standards for Rangeland Health
33 and Guidelines for Livestock Grazing Management, and the Standards for Rangeland Health
34 and Guidelines for Livestock Grazing Management for Public Lands Administered by the
35 BLM for Montana and the Dakotas were placed in effect on August 12, 1997, and
36 subsequently apply to grazed BLM-administered lands in the planning area. Standards are
37 integrated into the BLM’s land management through incorporation into grazing permits and
38 LUPs, as a basis for environmental assessments and through NEPA analysis, and as a basis
39 for monitoring. Guidelines are integrated into land management by incorporating them into
40 livestock grazing authorizations and management practices. The standards and guidelines
41 provide a clear statement of agency policy and direction for those who use BLM-
42 administered lands for livestock grazing and for those who are responsible for their

3 management and accountable for their conditions. In accordance with 43 CFR Part 4180, if
4 it is determined that grazing management practices or levels of grazing are significant factors
5 in failing to achieve the standards and conform with the guidelines, appropriate action shall
6 be taken prior to the next grazing season to make progress towards Standards and conform
7 to the Guidelines.

8 3.8.1 Conditions within the Planning Area

9 Grazing permits and leases are the documents that authorize livestock grazing on BLM-
10 administered lands (43 CFR 4100.0-5). The kind and number of livestock, the period of use
11 (seasonal), the allotment to be used, and the amount of use in animal unit months (AUMs)

are mandatory terms and conditions of every grazing permit or lease (43 CFR 4130.3). An AUM is the amount of forage necessary for the sustenance of one cow or its equivalent for one month and an allotment is an area of land designated and managed for grazing of livestock (43 CFR 4100.0-5). Livestock graze on approximately 12,129,800 acres of BLM-administered land within 2,654 allotments in the planning area.

Grazing on National Forest System lands is permitted through term grazing permits that authorize grazing on National Forest System lands. The term grazing permit authorizes the number, kind, and class of livestock as well as the period of use and grazing allotment on which livestock are permitted to graze. Permit holders may not assign or transfer grazing privileges in whole or part (36 CFR 222.1-4). There are 319 allotments on 9,646,900 acres on National Forest System land in the planning area.

Table 3-24, Idaho and Southwestern Montana Sub-Region Planning Area – Allotments, provides information on the allotments managed in the planning area.

Facilities for livestock management on BLM-administered and National Forest System lands in the planning area occur at varying densities based upon management needs, landownership patterns and other factors. These facilities include, but are not limited to fences, cattle guards, corrals, pipelines, water troughs, wells and reservoirs. Fences are used to delineate allotment boundaries, pastures within allotments, landownerships, and to exclude the impact of ungulate grazing from certain resources. Corrals are smaller fenced

1 areas that are occasionally located on BLM-administered and National Forest System lands
2 for the purposes of gathering, sorting and handling livestock. Watering facilities are used to
3 improve livestock distribution in areas where naturally occurring surface water is not
4 available, and to reduce livestock use of naturally occurring springs and streams. In addition,
5 supplemental salt, mineral, and protein may be provided for livestock grazing on BLM-
6 administered and National Forest System lands, to aid with distribution of authorized
7 livestock.

8 Since 1999, an assessment of rangeland health standards and guidelines has been made on
9 2,219 BLM allotments comprising 9,978,899 acres within the planning area. Of the
10 allotments which have been assessed, 1,403 allotments comprising 3,509,733 acres are
11 meeting all applicable standards and guidelines. An additional 451 allotments comprising
12 4,581,851 acres are not achieving one or more of the applicable standards and guidelines due
13 to livestock grazing management, but management actions have been implemented to
14 correct the identified issues. On 61 allotments comprising 660,901 acres, standards are not
15 being achieved due to livestock management, but management actions have not yet been
16 taken to make progress towards meeting standards. On 293 allotments comprising 1,226,179
17 acres, one or more applicable standards was not met due to factors other than livestock
18 management. Standards and guidelines assessments have not been completed on 528
19 allotments comprising 2,406,238 acres within the planning area. The Forest Service does not
20 have an equivalent assessment to the BLM's rangeland health standards and guidelines, nor
21 are similar assessment data available for National Forest System lands.

22 3.8.2 Regional Context

23 **Table 3-25**, Acres of Grazing Allotments within GRSG Habitat, through **Table 3-27**, Miles
24 of Fences within GRSG Habitat, display grazing data for GRSG habitat in the planning area
25 (Manier et al. 2013). In each table, data are presented by surface management agency and
26 their occurrence within occupied habitat in the planning area. It should be noted that for
27 **Table 3-26**, Acres of BLM Allotments Not Meeting Land Health Standards within GRSG
28 Habitat, data were assembled in 2008 from available records, and progress has been made
29 towards meeting standards and guidelines since this time. In addition, this table reflects only
30 those allotments not meeting Idaho Standards for Rangeland Health and Guidelines,
31 Standard 8 (Threatened and Endangered Plants and Animals).

3.9 Recreation

4

The diverse planning area offers multiple settings for a wide range of opportunities for recreation requiring no permits and no or minimal fees on BLM-administered and National Forest System land.

5

6

7

3.9.1 Conditions within the Planning Area

8

BLM Recreation

9

Objectives of the BLM recreation program are to: (1) provide broad spectrum of resource dependent recreation opportunities to meet the needs and demands of public land visitors, (2) foster agency-wide efforts to improve service to the visiting public, (3) maintain high quality recreation facilities to meet public needs and enhance the image of the agency, and (4) improve public understanding and support of the BLM by effectively communicating the

10

11

12

13

14

1 agency's multiple use management programs to the recreation visitor. The BLM
2 accomplishes these objectives by focusing on visitor services, information and interpretation,
3 resource enhancement and protection, facility maintenance and development, tourism
4 programs, improved accessibility, and essential administrative functions. In meeting these
5 objectives, the BLM also considers the presence of other federal, state and local, and private
6 recreation opportunities; the need to assist states and local communities served by the
7 agency to broaden and improve their economic base; and the need to continually monitor
8 recreation trends, customer preferences, and technological advances to improve short,
9 medium and long range strategic planning efforts.

10 BLM recreation planning and management is based on the establishment of Recreation
11 Management Areas. Recreation management areas fall into two categories: 1) Special
12 Recreation Management Areas (SRMA) and 2) Extensive Recreation Management Areas
13 (ERMA). The BLM Recreation Planning Manual 8320 was released in 2011. Manual 8320
14 made policy changes to how BLM addresses planning for recreation management areas.
15 Because the policy changes are recent, there are currently no LUPs that have recreation
16 decisions based on the new policy. Consequently, the management decisions described here
17 are done so in the context of the previous recreation policy.

18 Recreation management areas are administrative sub-units that serve as the basic land unit
19 for recreation management. Each area is identified and managed as a unit based on similar or
20 interdependent recreation values, homogenous or interrelated recreation use, land tenure and
21 use patterns, or administrative efficiency.

22 SRMAs are established to direct recreation program priorities, including the allocation of
23 funding and personnel, to those BLM-administered lands where a commitment has been
24 made to provide specific recreation activity and experience opportunities on a sustainable
25 basis. This includes a long term commitment to manage the physical, social, and
26 administrative settings to sustain these activities and experience opportunities. Delineation is
27 based on administrative/management criteria, including the existence of congressional
28 designations, similar or interdependent recreation values, homogenous or interrelated
29 recreation uses, land tenure and use patterns, transportation systems, administrative
30 efficiency, intensity of use, high resource values, public concerns, or interagency
31 considerations. These areas usually require a high level of recreation investment and/or
32 management. They include recreation sites, but recreation sites alone do not constitute a
33 SRMA. SRMAs established to reflect a congressional designation may be larger than the
34 designation boundary when significant recreation issues or management concerns occur
35 outside the designated area.

36 ERMAs are where recreation management is only one of several management objectives and
37 where limited commitment of resources is required to provide extensive and unstructured
38 type of recreation activities. They may contain recreation sites. The areas consist of the
39 remainder of land areas not included in SRMAs within a field office.

40 The number of SRMAs and ERMAs are listed in **Table 3-28**, Recreation Management
41 Areas, and are mapped in **Figure 3-5**, Special Recreation Management Areas.

Administrative Draft
Cooperating Agency Review

Figure 3-5 Special Recreation Management Areas

1 Within the recreation management are, there are approximately 400 recreation sites. These
2 sites range in size and intensity of use from intensely used OHV areas (e.g., St Anthony Sand
3 Dunes), boat ramps, and campgrounds to lightly used overlooks, trailheads and interpretive
4 wayside exhibits.

5 BLM-administered lands received over 6 million visits in 2012. The BLM estimates that 20
6 to 25 percent of recreation visits were related to OHV use (e.g., motorcycles, all-terrain
7 vehicles, and trucks). OHV use on BLM-administered lands has seasonal variations. In early
8 spring when the forests often still have snow, BLM-administered lands will get recreational
9 OHV use. As the temperatures rise and the lower elevation areas get hotter, OHV users will
10 migrate to higher elevations where temperatures are cooler (often making more use of
11 national forests). Use on BLM-administered lands in the fall will increase as temperatures
12 cool and hunting season starts. There are BLM-administered lands that see little recreation
13 use except during hunting season. OHV use is low during the cold winter months.

14 Depending on the OHV designation, use will be on routes in limited areas or possibly off
15 routes where the area is designated as open (see **Section 3.10**, Travel Management, for OHV
16 designations).

17 Other types of recreation activity that occur include bicycling, camping, hiking, horseback
18 riding, skiing, snowmobiling, rafting/floating, power boating, fishing, swimming,
19 photography, wildlife viewing, and hunting.

20 ***Forest Service Recreation***

21 The Forest Service provides and manages a myriad of recreation opportunities for the
22 visiting public. The National Forests and Grasslands provide the greatest diversity of
23 outdoor recreation opportunities in the world, connecting visitors with nature in an
24 unmatched variety of settings and activities. Visitors can hike, bike, ride horses, and drive
25 OHVs; picnic, camp, hunt, fish, and navigate waterways; view wildlife and scenery; and
26 explore historic places. Visitors glide through powder at world class alpine resorts and
27 challenge themselves on primitive cross-country ski or snowmobile routes. With many
28 partners, the recreation program strives to promote healthy lifestyles, support local
29 economies, and connect citizens to their public lands. The Intermountain Region of the
30 Forest Service manages over 34 million acres of forests and grasslands (5.8 million in
31 Wilderness), with almost all of it open for public use and enjoyment. In 2012, over 11.5
32 million visitors came to enjoy the resources provides within the region.

33 ***BLM Special Recreation Permits***

34 The BLM manages organized, commercial, and competitive recreation activities on BLM-
35 administered lands and related waters with special recreation permits (SRPs). As a
36 management tool, SRPs reduce user and resource conflicts, mitigate adverse impacts on
37 resources, provide opportunities for monitoring activities, enhance visitor experience
38 opportunities, and, with user fee requirements, allow for a fair return for these types of land
39 uses. Issuance of an SRP is discretionary, with proposed activities subject to NEPA
40 compliance and mitigation requirements specific to the proposed activity. The BLM may
41 deny a permit request if assessment indicates unacceptable impacts; if an approved

1 moratorium or restricted allocation system exists for the proposed activity, location, or time-
2 frame; if there are serious health and safety concerns; or if past performance by an applicant
3 has been deemed unacceptable and problematic. The BLM may require an applicant to
4 possess appropriate insurance, bonding, certifications of training, and state permits/licenses
5 to protect resource values, the served public, and the federal government.

6 In 2012, the BLM had 341 active SRPs. Of those SRPs, 241 were commercial river permits
7 and 24 are commercial big game hunting permits. The remaining SRPs are for organized
8 groups, competitive events, or other types of commercial recreation outfitters (e.g., bike
9 tours).

10 ***Forest Service Special Use Permits***

11 The Forest Service manages trail, river, and similar recreation opportunities and their access
12 and supports facilities under the principles enumerated in FSM 2303. Special Use Permits are
13 issued for specific types of recreation activities on Forest Service managed land and may be
14 required when extra measures are needed to protect natural or cultural resources. The
15 following are recreation special uses that involve facilities:

- 16 • Recreation special use permits involving privately owned facilities include resorts,
17 marinas, ski areas, target ranges, organization camps, recreation residences, and
18 other facilities. These permits are typically authorized under term permits and
19 users pay a land use fee based on a percent of revenue or appraised value of the
20 land.
- 21 • Recreation special uses involving government-owned facilities are concession
22 campgrounds, resorts, organization camps, and some other facilities.
- 23 • Recreation special uses involving commercial public services are outfitting and
24 guiding for a broad range of activities, groomed cross-country ski trails, and
25 recreation events (including competitive races, eco-challenges, dog trails,
26 adventure games, and endurance races). These uses are usually authorized under
27 the Recreation Enhancement Act, which allows fees to be retained by the
28 administrative unit that collected them.

29 Additionally, noncommercial group use permits are required for groups of 75 or more
30 people. These users do not pay fees.

31 The Forest Service has 910 active recreation special use permits within the planning area
32 (197 at Boise National Forest, 258 at Sawtooth National Forest, 114 at Salmon-Challis
33 National Forest, 29 at Payette National Forest, and 312 at Caribou-Targhee National Forest).

34 No permits are required for private, non-commercial use of public lands for camping,
35 fishing, hiking, hunting, horseback riding, or similar activities.

36 In 2012, the Intermountain Region of the Forest Service had 2335 recreation special use
37 permits and 267 recreation special use permits for group activities and recreation events. Of
38 the total recreation special use permits about 1400 were for recreation residences, 796 were

1 for outfitter and guiding services, 53 were for organizational camps, 42 were for resort and
2 marina permits, 28 were for concessionaires, and 16 were for ski areas.

3 **3.9.1 Trends**

4 Recreation use is expected to continue to grow throughout the planning area. The proximity
5 of many recreation opportunities to the area surrounding Boise has dramatically increased
6 recreational visitation within portions of the planning area and is expected to continue to do
7 so.

8 Five key drivers are causing changes to recreation in the planning area:

- 9 1. Increased urbanization as a result of population growth and changing
10 demographics
- 11 2. Changing public expectations and demand for outdoor recreation opportunities,
12 especially for dispersed recreation
- 13 3. Increased energy development in portions of the planning area
- 14 4. Close proximity of BLM-administered lands to private property, and the growing
15 use of BLM-administered lands as a community-based recreation asset
- 16 5. Technological advances, such as all-terrain or utility vehicles and mountain bikes,
17 affordable global positioning system (GPS) units, as well as better outdoor
18 equipment and clothing

19 These drivers will impact the activity opportunities that can be offered and the recreation
20 experience and benefit opportunities that can be produced by land managers and partners.

21 ***Hunting***

22 Although hunting licenses issued have dropped over the last decade, hunting remains a
23 popular recreation activity within the region. While deer and elk are the most popular game
24 in the planning area, of more relevance to this analysis are falconry and upland bird hunting.

25 ***Falconry***

26 Falconry permit holders were surveyed after the fall 2010-Spring 2011 hunting season
27 (Table 3-29, Falconry Permits).

**Table 3-29
Falconry Permits (Fall 2010-Spring 2011)**

Species	# Hunters	# Days	# Harvest	Birds/Hunter	Days/Hunter	Birds/Day
Forest Grouse	1	3	0	0.00	2.0	0.00
Chukar	8	95	4	0.49	12.3	0.04
California Quail	5	46	4	0.76	8.8	0.09
Gray Partridge (Huns)	42	1,261	86	2.04	30.0	0.07
Pheasant	27	850	117	4.35	31.7	0.14

**Table 3-29
Falconry Permits (Fall 2010-Spring 2011)**

Species	# Hunters	# Days	# Harvest	Birds/ Hunter	Days/ Hunter	Birds/ Day
Rabbit	15	467	83	5.69	32.1	0.18
Sage-Grouse	25	551	58	2.28	21.8	0.10
Sharp-tailed Grouse	8	149	13	1.67	19.8	0.08
Mourning Doves	6	173	8	1.16	26.6	0.04
Ducks	42	1,173	340	8.05	27.8	0.29
Geese	1	3	0	0.00	2.0	0.00
	180	4,770	711	3.94	26.4	0.15

159 hunters purchased Idaho falconry permits which would allow hunting in Fall 2010-Spring 2011.

Upland Birds

Idaho offers a multitude of upland game bird hunting opportunities on millions of acres of BLM-administered and National Forest System land.

Hunters can pursue three species of forest grouse – dusky, ruffed, and spruce – and two species of prairie grouse – Columbian sharp-tailed grouse and GRSG – all native to Idaho. Forest grouse hunting opportunities exist across the state, while Columbian sharp-tailed grouse and GRSG hunting is limited to certain areas only.

While GRSG are widely distributed in areas with large blocks of sagebrush, the hunting season is generally short (1 week during 2012) and opportunities are limited to areas of southern Idaho.

Idaho also offers chukar and gray partridge hunting, and has robust populations of California quail. Chukar and gray partridge (huns) thrive on large tracts of public ground and are available to everyone willing to make the effort to hunt them.

Chukar are typically found in rocky, arid areas covered with cheatgrass and sagebrush. Gray partridge (huns) are often found in close proximity to chukar and adjacent to cultivated land across the state. Expect to find the best populations of chukar and gray partridge in the Clearwater, Magic Valley, and Southwest regions.

California quail occur from south-central Idaho, west to the Oregon border and north to the Palouse Prairie. Good populations live along rivers and streams with brushy cover below 3,500 feet in elevation.

Historically, Idaho was a destination pheasant hunting location, but populations have declined because of changes in farming practices and the resultant loss of habitat.

Upland game population trends are monitored through harvest surveys, August roadside counts, August helicopter flush counts, mourning dove coo counts, hunter check stations, and wing barrel harvest data. Each region collects data using various methods based on

1 regional bird densities and sampling constraints. Statewide, telephone surveys assess overall
2 hunter activity and harvest of upland game species. From 1996-2000, telephone surveys
3 estimated statewide rather than regional trends (except turkey) due to budget constraints. A
4 separate telephone survey has been conducted since 2000 for GRSG and sharp-tailed grouse
5 to improve sample size for these two species that have been considered for listing under the
6 ESA.

7 In 2009, approximately 40,100 resident hunting license buyers hunted upland game and
8 approximately 5,300 nonresident hunting license buyers hunted upland game. This
9 represents 18 percent of all resident hunting license buyers and 16 percent of all nonresident
10 hunting license buyers.

11 For GRSG, the season framework was altered in 1996 to provide three different types of
12 seasons: liberal, conservative, and closed. In 2002, the season framework was modified. The
13 Birch Creek Valley and the Big Desert areas, closed to GRSG hunting from 1995 to 2001,
14 were reopened. Research suggested that the closed season did not have any measurable
15 effect on GRSG populations, as measured by number of GRSG counted on lek routes. In
16 2009, there was a 7-day season with a 1-bird daily bag limit in Zone 2, and a 23-day season
17 with a 2-bird daily bag limit in Zone 3.

18 Starting in 2000, GRSG hunters were required to purchase a GRSG hunting validation. This
19 requirement provided a means to collect better harvest estimates from a sample of GRSG
20 hunters through a telephone survey. Approximately 4,400 hunters harvested 7,200 GRSG in
21 2009.

22 Numerous check stations are run in the state to gather information on reproductive success
23 in different areas. In general, the sample size has decreased at these check stations in recent
24 years due to shortened seasons and reduced hunter participation.

25 **3.10 Travel Management**

26 **3.10.1 Conditions on BLM-Administered Lands**

27 Travel and transportation are integral parts of virtually every activity that occurs on BLM-
28 administered lands. The BLM has taken a comprehensive approach to travel and
29 transportation management (TTM). It is an interdisciplinary approach to travel and
30 transportation planning and management that addresses resource uses and associated access
31 to BLM-administered lands and waters, including motorized, nonmotorized, mechanical, and
32 animal-powered modes of travel.

33 Travel and transportation management planning means providing clear and specific direction
34 that addresses public and administrative access needs on the proper levels of land and water
35 for all modes of travel. The TTM process addresses variability among landscapes, users'
36 interests, equipment options, and cultural and biological resource constraints. The primary
37 goal of TTM is to develop a systematic network of routes with appropriately designated uses
38 that provides opportunities for a diverse set of activities to occur on BLM-administered
39 lands, such as recreation, energy development, grazing, and wildlife management. Travel

1 management objectives serve as the foundation for appropriate travel and access
2 prescriptions.

3 There is considerable overlap between travel management and all other uses on BLM-
4 administered lands. For example, many people visit BLM-administered lands for recreation
5 purposes. For these visitors, a route system may serve as either a means to reach a
6 destination where the activity occurs (e.g., a road to a trailhead or parking area) or as the
7 focus of the recreation activity itself (e.g., four-wheel driving, hiking, or horseback riding
8 trails).

9 To reduce the duplication of narrative between travel management and the other sections of
10 this document, this section addresses only public travel and access (i.e., OHV management
11 area designations, route designations, types of travel, and seasonal area limitations). The
12 interrelated recreation components, such as OHV use, are addressed under **Section 3.9,**
13 **Recreation.**

14 ***Modes of Travel***

15 Visitors to BLM-administered lands use roads and trails for a variety of activities involving
16 various modes of travel. Motorized travel in the planning area ranges from standard
17 passenger vehicles driving on maintained roads to OHVs operating on primitive roads and
18 trails. OHV is synonymous with off-road vehicle, as defined in 43 CFR 8340.0-5(a):

19 Off-road vehicle means any motorized vehicle capable of, or designed for, travel on
20 or immediately over land, water, or other natural terrain, excluding: 1) Any
21 nonamphibious registered motorboat; 2) Any military, fire, emergency, or law
22 enforcement vehicle while being used for emergency purposes; 3) Any vehicle whose
23 use is expressly authorized by the authorized officer or otherwise officially approved;
24 4) Vehicles in official use; and 5) Any combat or combat-support vehicle when used
25 in times of national defense emergencies.

26 OHVs commonly used in the planning area include off-road motorcycles, all-terrain vehicles,
27 utility terrain vehicles, jeeps, specialized 4-by-4 trucks, and snowmobiles. Other modes of
28 travel include mountain biking, cross-country skiing, snowshoeing, horseback riding, pack
29 animal driving, hiking, boating, hang-gliding, paragliding, ballooning, and wheelchairs. The
30 type and amount of use and the location of roads and trails influence physical, social, and
31 administrative recreation setting and the overall quality of the recreation experience.

32 ***Travel Designations***

33 Executive Order 11644 and 43 CFR 8340 both require the BLM to designate all BLM-
34 administered lands nationally as open, closed, or limited for OHV use.

35 *Open*

36 Areas designated as Open are areas where all types of vehicle use are permitted at all times
37 anywhere in the area. Use is subject to any operating regulations and vehicle standards
38 established in other parts of the CFR.

1 *Limited*

2 Areas designated as Limited are areas restricted at certain times, in certain areas, or to certain
3 vehicular use. These restrictions may be of any type but can generally be accommodated
4 within the following categories: numbers of vehicles; types of vehicles; time or season of
5 vehicle use; permitted or licensed use only; use on existing roads and trails; use on designated
6 roads and trails; and other restrictions.

7 *Closed*

8 Areas designated as Closed are areas restricted at certain times, in certain areas, and to
9 certain vehicular use. These restrictions may be of any type but can generally be
10 accommodated within the following type of categories: numbers of vehicles; types of
11 vehicles; time or season of vehicle use; permitted or licensed use only; use on existing roads
12 and trails; use on designated roads and trails; and other restrictions.

13 ***Federal Regulations***

14 Route designation criteria are described in 43 CFR 8342.1 and state:

15 The authorized officer shall designate all public lands as open, limited, or closed to
16 off-road vehicles. All designations shall be based on the protection of the resources
17 of the public lands, the promotion of the safety of all the users of the public lands,
18 and the minimization of conflicts among various uses of the public lands; and in
19 accordance with the following criteria:

20 (a) Areas and trails shall be located to minimize damage to soil, watershed,
21 vegetation, air, or other resources of the public lands, and to prevent impairment of
22 wilderness suitability.

23 (b) Areas and trails shall be located to minimize harassment of wildlife or significant
24 disruption of wildlife habitats. Special attention will be given to protect endangered
25 or threatened species and their habitats.

26 (c) Areas and trails shall be located to minimize conflicts between off-road vehicle
27 use and other existing or proposed recreational uses of the same or neighboring
28 public lands, and to ensure the compatibility of such uses with existing conditions in
29 populated areas, taking into account noise and other factors.

30 (d) Areas and trails shall not be located in officially designated wilderness areas or
31 primitive areas. Areas and trails shall be located in natural areas only if the authorized
32 officer determines that off-road vehicle use in such locations will not adversely affect
33 their natural, esthetic, scenic, or other values for which such areas are established.

34 ***National Guidance***

35 On a national level and in response to increasing demand for motorized and mechanized
36 recreation trails on BLM-administered lands, the BLM first developed an OHV strategy and
37 then a mountain bike strategy. These strategies emphasize that the BLM should be proactive

1 in seeking travel management solutions that conserve natural resources while providing for
2 ample recreation opportunities.

3 The BLM released the current version of the Land Use Planning Handbook (H-1601-1) in
4 March 2005. Guidance on determining Open, Limited, and Closed OHV Area designations
5 during the planning process was incorporated into the Comprehensive Trails and Travel
6 Management Section (Appendix C, Section II D).

7 Additional TTM guidance continued to be developed and culminated with the release of the
8 Travel and Transportation Management Manual (1626) in July 2011. Current policy states
9 that Open areas will be limited to a size that is geographically identifiable and can be
10 effectively managed and that expansive open areas allowing cross-country travel will not be
11 designated in LUP revisions or new travel management plans.

12 The Travel and Transportation Handbook (H-8342) was released in March of 2012. It
13 provides detailed guidance using the designation criteria in 43 CFR 8342.1 for area and route
14 selection. It includes guidance for developing other implementation plans including but not
15 limited to sign plans, education and outreach plans, law enforcement plans, and maintenance
16 plans.

17 **3.10.2 Conditions on National Forest System Lands**

18 The Forest Service published its Travel Management Rule in 2005. It required each national
19 forest to designate roads, trails, and areas open or closed to motor vehicles. Designations
20 were made in accordance with criteria described in Executive Order 11644 and included the
21 type of vehicle and, if appropriate, time of year for motor vehicle use. A given route, for
22 example, could be designated for use by motorcycles, ATVs, or street-legal vehicles. Once
23 designation was complete, the rule prohibited motor vehicle use off the designated system.

24 In addition to its formal regulations, the Forest Service developed TTM planning guidance,
25 including the Travel Management Manual, FSM 7700 (2008), and the Travel Planning
26 Handbook, FSH 7709.55 (2008).

27 ***Federal Regulations***

28 The criteria for Forest Service route designation are found in 36 CFR 212.55 (a), General
29 criteria for designation of National Forest System roads, trails, and areas on National Forest
30 System lands and state:

31 In designating National Forest System roads, National Forest System trails, and areas
32 on National Forest System lands for motor vehicle use, the responsible official shall
33 consider effects on National Forest System natural and cultural resources, public
34 safety, provision of recreational opportunities, access needs, conflicts among uses of
35 National Forest System lands, the need for maintenance and administration of roads,
36 trails, and areas that would arise if the uses under consideration are designated; and
37 the availability of resources for that maintenance and administration.

(b) Specific criteria for designation of trails and areas. In addition to the criteria in paragraph (a) of this section, in designating National Forest System trails and areas on National Forest System lands, the responsible official shall consider effects on the following, with the objective of minimizing:

(1) Damage to soil, watershed, vegetation, and other forest resources;

(2) Harassment of wildlife and significant disruption of wildlife habitats;

(3) Conflicts between motor vehicle use and existing or proposed recreational uses of National Forest System lands or neighboring Federal lands;

(4) Conflicts among different classes of motor vehicle uses of National Forest System lands or neighboring Federal lands. In addition, the responsible official shall consider:

(5) Compatibility of motor vehicle use with existing conditions in populated areas, taking into account sound, emissions, and other factors.

3.10.3 Current Conditions

Travel planning is complete for all lands administered by the Forest Service in the planning area. National Forest System lands with a designated route system are considered the same as the Limited designation on lands administered by BLM.

The BLM has not conducted travel management planning throughout the sub-region. In areas with a designation of Limited, motorized use will be limited to existing roads until individual route selection and designation occurs during subsequent implementation-level planning. Current travel management designations are presented by field office in Table 3-30, Travel Management Designations within the Planning Area.

3.11 Lands and Realty

The primary goal of the BLM Lands and Realty program is to enhance the administration of public landownership to provide the most effective configuration of lands and interests in land, consistent with land use plans developed through a full and open public involvement process, and to further the purposes of FLPMA. The objectives of the Forest Service landownership adjustment program are to achieve the optimum landownership pattern for the protection and management of resource uses, settle land title claims, and provide resource administrators with title information about the use of and resources on the land they administer.

Lands and realty actions can generally be divided between land tenure adjustments and land use authorizations. Land tenure adjustments focus on land exchange, acquisition (including purchase and easement acquisition), and disposal. Withdrawals, while managed as part of land and realty, are administrative actions that do not affect land tenure. Land use authorizations consist of ROWs and other leases or permits for the use and occupancy of public land.

12
13
14
15
16
17

1 Forest Service land use plan prescriptions are similar to BLM exclusion and avoidance areas.
2 Prescriptions can restrict or prohibit certain uses in a planning area. It should also be noted
3 that the Forest Service grants special use authorizations (granting ROWs, permits,
4 easements, and leases), while the BLM grants ROWs on their respective agency lands. Lastly,
5 the Forest Service completes landownership adjustments (purchase, exchange, donation, and
6 ROW acquisition), while the BLM conducts land tenure adjustments (exchanges, disposals,
7 and acquisitions).

8 3.11.1 Conditions within the Planning Area

9 The lands within the planning area are owned and may be managed by multiple federal, state,
10 and local agencies, as well as private landowners. The configuration of landownerships and
11 their proximity to each other is an important factor when considering land tenure
12 adjustments and evaluating land use authorization applications. The planning area contains
13 lands managed by several federal and state agencies, the Bureau of Indian Affairs (in trust for
14 Native American tribes), and private lands. Error! Reference source not found., Error!
15 Reference source not found., shows the acreage and overall percent ownership for each land
16 manager in the planning area.

Source: BLM GIS 2015

1 Within the planning area, BLM-administered lands have been classified for retention or
2 disposal pursuant to Section 7 of the Taylor Grazing Act (43 USC 315f), FLPMA, and 43
3 CFR Parts 2400 and 2500; BLM-administered lands have also been identified as ROW
4 exclusion or avoidance areas, and ROW corridors, pursuant to FLPMA and 43 CFR Part
5 2800. Section 205 of the FLPMA authorizes the Secretary of Agriculture to acquire access
6 (lands or interest therein) over non-federal lands to units of the National Forest System by
7 purchase, exchange, donation, or eminent domain. Several acts of Congress authorize
8 occupancy and use of National Forest System lands and interests in lands administered by
9 the Forest Service. The applicable statutory authority determines the appropriate special use
10 authorization. For example, some permits and temporary permits are issued under the
11 provisions of the Organic Administration Act of June 4, 1897 (16 USC 477-482, 551), while
12 some easements and leases and other types of permits are issued under the provisions of
13 Title V, Federal Lands Policy and Management Act of October 21, 1976 (43 USC 1761-
14 1771), and the Forest Roads and Trails Act of 1964.

15 **Table 3-32**, Land Classifications/Designations in Planning Area (Acres), lists the number of
16 acres identified with land tenure classifications and ROW designations in the planning area.
17 **Figure 3-6**, Authorized Rights-of-Way in the Planning Area, and **Figure 3-7**, Pending and
18 Expired Rights-of-Way in the Planning Area, provide an overview of the extent of lands
19 currently occupied by ROWs.

Table 3-32
Land Classifications/Designations in Planning Area (Acres)

Land Status	Acres within Planning Area
Withdrawals (Total)	4,032,400
Withdrawals (BLM)	3,827,900
Withdrawals (Forest Service)	204,500
ROW Avoidance (Total)	8,306,100
ROW Avoidance (BLM)	1,134,300
ROW Avoidance (Forest Service)	7,171,800
ROW Exclusion (Total)	3,333,200

Land Tenure Adjustments

22 Landownership (or land tenure) adjustment refers to those actions that result in the disposal,
23 acquisition, purchase, exchange, or donation of land or acquisition or grant of ROW by the
24 BLM; or purchase, exchange, or donation of land, or ROW acquisition by the Forest Service.
25 Section 102(a) of FLPMA requires that land be retained in federal ownership unless, as a
26 result of land use planning, it is determined that disposal of certain parcels will service in
27

Figure 3-6 Authorized Rights-of-Way in the Planning Area

Figure 3-7 Pending and Expired Rights-of-Way in the Planning Area

1 the national interest. In all land tenure adjustments, keeping the surface and mineral estate
2 intact on both the lands disposed of and acquired would benefit the future owners and their
3 use of the land.

4 *Disposals*

5 Disposal areas include tracts of land that are economically difficult to manage, and/or
6 parcels that could serve important public objectives, including, but not limited to, expansion
7 of communities and economic development. These lands are usually disposed of through
8 exchanges or land sales.

9 The Forest Service has very limited authority to sell or otherwise dispose of National Forest
10 System lands. Most authorities allowing the sale of lands have specific criteria or identify
11 only a small number of properties for sale or disposal in a limited geographical area. The tool
12 used most often for conveyance of lands within National Forest boundaries is land
13 exchange.

14 LUPs relevant to the planning area identify 1,812,300 acres of BLM-administered land for
15 disposal. Of these, 559,300 acres lie within PPH, while 257,400 acres lie within PGH. No
16 National Forest System land has been identified for disposal in the planning area.

17 Exchanges. Exchange is the process of trading lands or interests in lands and serves as a
18 viable tool for the BLM to accomplish its goals and mission. Exchanges must be in the
19 public interest and conform to applicable BLM LUPs. The lands to be exchanged must be of
20 approximately equal monetary value and located within the same state. BLM-administered
21 lands may be exchanged for lands or interests in lands owned by corporations, individuals, or
22 government entities. Except for those exchanges that are congressionally mandated or
23 judicially required, exchanges are voluntary and discretionary transactions with willing
24 landowners.

25 Land exchanges are used to bring lands and interests in land with high public resource values
26 into public ownership, consolidate land and mineral ownership patterns to achieve more
27 efficient management of resources and BLM programs, and dispose of BLM-administered
28 land parcels identified for disposal through the planning process.

29 National Forest System lands are exchanged to achieve a desired national forest
30 landownership pattern that supports forest land and resource goals and objectives, addresses
31 fragmentation, reduces future management costs, and responds to urban and community
32 needs. The objective of the Forest Service land exchange program is to use land exchanges
33 as a tool, in concert with the purchase program, to implement Forest land and resource
34 management planning and direction; to optimize National Forest System landownership
35 patterns; to further resource protection and use; and to meet the present and future needs of
36 the American people.

37 There are land exchanges pending on 76,982 acres (37,141 federal acres and 39,841
38 nonfederal acres) within the planning area. One land exchange totaling 52 acres has been
39 identified on National Forest System land in the planning area.

1 Land Sales. Section 203 (a) of FLPMA provides for sale of public lands if one of the
2 following criteria is met: (1) the tract is difficult and uneconomic to manage as part of the
3 public lands and is not suitable for management by another federal agency; (2) such tract was
4 acquired for a specific purpose and the tract is no longer required for that or any other
5 federal purpose; or (3) disposal of such tract will serve important public objectives, including
6 but not limited to, expansion of communities and economic development that cannot be
7 achieved prudently or feasibly on land other than public land. Public lands that have been
8 identified for consideration for disposal by sale in the approved LUPs meet one or more of
9 these criteria. Public lands must be sold at fair market value.

10 Section 209 of FLPMA authorizes the conveyance of federal minerals through sale and
11 specifies the conditions under which the mineral rights would be conveyed. The mineral
12 rights could be sold with the land surface, sold as a separate transaction, or retained.
13 Conveyance of mineral rights has occurred only in conjunction with the sale of land.

14 The Forest Service has very limited authority to sell or otherwise dispose of National Forest
15 System lands. Most authorities allowing the sale of lands have specific criteria or identify
16 only a small number of properties for sale or disposal in a limited geographical area. The tool
17 used most often for conveyance of lands within National Forest boundaries is land
18 exchange. Thus, no National Forest System land has been identified for sale in the planning
19 area.

20 Withdrawal. Withdrawal are formal actions that accomplish one or more of the following
21 actions:

- 22 • Transfers total or partial jurisdiction of federal land between federal agencies
- 23 • Segregates (closes) public lands to appropriation under public land laws including
24 mineral laws
- 25 • Dedicates public land for a specific public purpose

26 There are three major categories of formal withdrawals: (1) congressional withdrawals, (2)
27 administrative withdrawals, and (3) Federal Power Act or Federal Energy Regulatory
28 Commission (FERC) withdrawals. Congressional withdrawals are legislative withdrawals
29 made by Congress in the form of public laws (acts of Congress). Administrative withdrawals
30 are made by the President, Secretary of the Interior, or other authorized officers of the
31 executive branch of the federal government. Federal Power Act or FERC withdrawals are
32 power project withdrawals established under the authority of the “Federal Power Act” of
33 1920. Such withdrawals are automatically created upon filing an application for a
34 hydroelectric power development project with FERC.

35 Federal policy now restricts all withdrawals to the minimum time and acreage required to
36 serve the public interest, maximize the use of withdrawn lands consistent with their primary
37 purpose, and eliminate all withdrawals that are no longer needed. Management and
38 adjustment of withdrawals focuses on the establishment, management, modification, and
39 revocation of withdrawals.

1 The purpose of a withdrawal is to withhold National Forest System land from operation of
2 various federal laws, to either reserve the area for some future use or to maintain other
3 public values of the area. A withdrawal may prevent the land from leaving federal ownership,
4 may prevent mineral leasing or may prevent entry under the mining laws. In recent years
5 most withdrawals prevent entry under the mining laws since it is a nondiscretionary action.

6 The main object of a Forest Service withdrawal is to protect administrative sites and other
7 capital improvements, and to protect designated management areas not compatible with
8 mining activity. Other agencies such as FERC and the Bureau of Reclamation often request
9 withdrawal of National Forest System land for their purposes. The Department of Defense
10 use of National Forest System lands is by special use authorization, agreement, or the
11 Interchange Act of 1956.

12 There are currently 28 withdrawals in the planning area, encompassing 4,025,900 acres of
13 BLM-administered lands. Of these withdrawals, 1,437,200 acres reside on PPH, and 782,000
14 acres reside on PGH. There are approximately 584,100 acres of Forest Service withdrawals
15 in the planning area.

16 *Acquisition*

17 Acquisition of and interests in lands are important components of the BLM's land tenure
18 adjustment strategy. Acquisition of lands can be pursued to facilitate various resource
19 management objectives. Acquisitions, including easements, can be completed through
20 exchanges (see above), land purchases, or donations.

21 The Forest Service purchases lands through the Land and Water Conservation Fund to
22 protect critical resource areas and provide increased public recreation opportunities. Land
23 donations are accepted to consolidate National Forest System lands and protect critical
24 resource areas. The legal public use of National Forest System lands is improved by
25 acquiring ROWs for roads and trails.

26 Lands and interests in lands are acquired for the following actions:

- 27 • Improve management of natural resources through consolidation of federal,
28 state, and private lands
- 29 • Secure key property necessary to protect endangered species, promote biological
30 diversity, increase recreational opportunities, and preserve archeological and
31 historical resources
- 32 • Implement specific acquisitions authorized or directed by acts of Congress

33 Forest Service objectives in lands or interests in lands through purchase, donation, and
34 rights-of-way are to:

- 35 • Enhance the multiple use and sustained yield of the goods and services from
36 National Forest System lands

- 1 • Protect and improve the quality of renewable resources
- 2 • Protect and preserve important historic, cultural, and natural aspects of the
- 3 national heritage
- 4 • Provide for access, use, and enjoyment of the forest resources by the public
- 5 • Improve administrative efficiency and effectiveness of National Forest System
- 6 lands

7 One Forest Service land exchange is proposed in Idaho that would affect 52 acres of land
8 within PGH.

9 Purchases. The BLM has the authority, under Section 205 of FLPMA, to purchase lands or
10 interests in lands. Similar to other acquisitions, purchase is used to acquire key natural
11 resources or to acquire legal ownership of lands that enhance the management of existing
12 public lands and resources. Acquiring lands and interests in lands through purchase helps
13 consolidate management areas to strengthen resource protection. Acquisitions are used
14 primarily to enhance recreational opportunities and acquire crucial wildlife habitats.

15 ***Land Use Authorizations***

16 The most common form of authorization to permit uses of BLM-administered lands by
17 commercial, private, or governmental entities is the ROW grant. A ROW grant is an
18 authorization to use a specific piece of BLM-administered land for certain projects such as
19 roads, pipelines, transmission lines, or communication sites.

20 Some uses of BLM-administered lands are short-term uses and authorized through land use
21 permits such as filming activities or apiary sites (bee hives).

22 Authorizations grant rights and privileges for a specific use of the land for a specific period
23 of time. The BLM's objective is to grant land use authorizations to any qualified individual,
24 business, or government entity, and to direct and control the use of authorizations on BLM-
25 administered lands in a manner that:

- 26 • protects the natural resources associated with BLM-administered lands and adjacent
- 27 lands, whether private or administered by a government entity
- 28 • prevents unnecessary or undue degradation to BLM-administered lands
- 29 • promotes the use of authorizations in common, considering engineering and
- 30 technological compatibility, national security, and area LUPs
- 31 • coordinates, to the fullest extent possible, all BLM actions with local, state, Native
- 32 American, and other federal agencies; interested individuals; and appropriate quasi-
- 33 public entities (43 CFR 2801.2)

34 Forest Service special use permits authorize and administer use of National Forest System
35 lands by individuals, companies, organized groups, other federal agencies and state or local
36 levels of government in a manner that protects natural resource values and public health and

1 safety. For example, special use permits authorize uses that contribute to the nation's
2 infrastructure for generating and transmitting energy resources, such as: electric transmission
3 facilities, oil and gas pipelines, hydropower facilities, and wind and solar facilities. They
4 authorize uses for communications, commerce, public health and safety, and homeland
5 security, such as fiber-optic and wireless telecommunications, water development systems,
6 federal, state, and local highways.

7 The Forest Service objectives of granting ROWs for roads and trails are to:

- 8 • Provide ROWs for the public road system, including the federal-aid system,
9 when such roads cross National Forest System lands or interests in lands
- 10 • Accommodate the access needs for the protection, development, and utilization
11 of lands and resources owned by private interests or administered by public
12 agencies when the planned forest development road system and public road
13 system do not meet those needs adequately
- 14 • Protect and enhance the quality of air, water, soil, and natural beauty of National
15 Forest System lands in the granting of any ROW
- 16 • Cooperate with intermingled and adjacent landowners in developing roads that
17 serve the needs of both parties through the exchange of ROWs
- 18 • Provide access across National Forest System lands to private land that is
19 adequate to secure the owners thereof of reasonable use and enjoyment of their
20 land without unnecessarily reducing the management options of the Forest
21 Service or damaging National Forest System lands or resources

22 *ROW Avoidance and Exclusion Areas*

23 Areas closed to mineral leasing, having a no surface occupancy restriction, or otherwise
24 identified as unsuitable for surface disturbance or occupancy are generally identified as
25 avoidance or exclusion areas for ROW authorizations. Restrictions and mitigation measures
26 could be modified on a case-by-case basis for avoidance areas, depending on impacts on
27 resources, while exclusion areas are strictly prohibited from ROW development. See **Table**
28 **3-32** for the number of acres currently identified as ROW avoidance and exclusion areas.

29 *ROW Corridors*

30 Designated utility corridors are developed to concentrate the effects of utility lines in
31 manageable locations on BLM-administered and National Forest System lands, which often
32 provide suitable locations for utility transmission lines. The corridors may contain power
33 line, transcontinental fiber optic communications cables, and trans-state gas pipelines.
34 Designated utility corridors are designated in BLM and Forest Service LUPs. Such corridor
35 designations are relatively uncommon in the sub-region. The mere presence of a
36 transmission line or pipeline does not imply that it is within a formally designated corridor.
37 Under this planning effort there are no undesignations or changes to the character of
38 previously existing designated corridors; for example, all West-Wide Energy Corridors in

1 Idaho allow for both overhead and buried utilities; those designations will not change. Also,
2 this plan does not attempt to establish any new formally designated ROW corridors.

3 For PPMA, new utility pipelines or transmission lines exceeding 50kV are excluded, unless
4 they can be sited within a utility corridor previously designated in a BLM or Forest Service
5 LUP (and subject to appropriate BMPs and siting considerations for GRSG). See **Table 3-**
6 **32** for the number of acres currently identified as ROW avoidance and exclusion areas.

7 ***Renewable Energy***

8 Solar, wind, biomass, and geothermal (which is managed as a fluid leasable mineral) are
9 considered renewable energy resources. Renewable energy resources all have different
10 requirements related to economic development; however, some issues are common to all
11 renewable energy resources, including connection to the existing power transmission
12 facilities and compatibility with existing federal land use.

13 Wind and solar resource facilities are permitted with ROW authorizations, through the
14 Lands and Realty Program. Geothermal resources, as mentioned above, are considered fluid
15 leasable minerals (See **Section 3.12**, Mineral Resources). As a result, management actions
16 related to the Lands and Realty Program and leasable minerals could affect renewable energy
17 resources. Special management designation areas, such as ACECs and WSAs, could also
18 affect the use of renewable energy resources by limiting the location of these facilities.

19 Forest Service renewable energy generation and transmission includes wind, solar and
20 geothermal energy facilities. Section 501(a) (4) of the FLPMA authorizes the Forest Service
21 to issue ROWs for the use and occupancy of National Forest System lands for generation,
22 transmission, and distribution of electric energy. The Energy Policy Act of 2005 recognizes
23 the Forest Service's role in meeting the renewable energy goals of the US.

24 Consistent with Forest Service policies and procedures, the use and occupancy of National
25 Forest System lands for alternative energy production, such as wind energy development, are
26 appropriate and will help meet the energy needs of the US. Permits for solar energy power
27 facilities are issued only if non-National Forest System lands are not available and if adverse
28 impacts can be minimized. Permits for geothermal energy power facilities are issued only if
29 feasibility studies have determined that it is not feasible to transmit geothermal water to a
30 power-generating facility on non-National Forest System lands and if adverse impacts can be
31 minimized.

32 **3.11.2 Trends**

33 ***Land Use Authorizations***

34 Land use authorization requests are customer driven. Within the planning area most
35 authorizations processed are primarily for roads, electric distribution lines, and
36 communications sites. Major ROWs are those large-scale utility projects, such as for 500kV
37 electric transmission, wind, and solar development. Land use authorization requests are
38 customer driven.

1 Over the last 6 years in the planning area, the BLM has received a number of applications
2 for major transmission line projects to traverse the state. Prior to that time, it had been over
3 20 years since major transmission line applications were received by the BLM. The BLM has
4 not received any applications for utility-scale solar production in the planning area, nor are
5 there solar resources comparable to the areas where utility-scale solar production projects are
6 being proposed or built.

7 Over the last six years, the BLM has authorized and then relinquished a ROW for wind
8 development and has two pending applications. Wind testing sites have been authorized on
9 BLM lands in the planning area, though no wind developments have been authorized and
10 constructed.

11 3.11.3 Regional Context

12 **Table 3-33**, Acres of GRSG Habitat within City Limits, through **Table 3-40**, Acres of Wind
13 Energy Authorizations within GRSG Habitat, displays data for GRSG habitat in the
14 planning area (Manier et al. 2013). In each table, data are presented by surface management
15 agency and their occurrence within occupied GRSG habitat in the planning area and across
16 the entire MZs.

17 The conversion of sagebrush habitat to agricultural land or urban areas can result in GRSG
18 habitat becoming fragmented and increases in domestic predators such as cats and dogs
19 (Knick and Rotenberry 1995). **Table 3-33**, Acres of GRSG Habitat within City Limits,
20 illustrates the locations where agricultural or urban development could occur given the
21 location within a city boundary.

3 **3.12 Mineral Resources**

4 ***Fluid Leasable Minerals***

5 The right to drill for and develop fluid minerals, namely oil and gas and geothermal
6 resources, on federal land may only be acquired through a mineral lease, offered and
7 administered by the BLM in accordance with the Mineral Leasing Act of 1920, as amended
8 and supplemented (30 USC 181 et seq.). The limit for a competitive oil and gas lease is 2,560
9 acres in size, while a geothermal lease can be up to 5,280 acres in size. If an oil and gas lease
10 is not sold during the competitive sale, it may be sold noncompetitively and may be
11 combined with other parcels for a total of 10,240 acres, but the maximum size for a
12 geothermal lease remains 5,280 acres.

13 The leases have a 10-year term. If there is no discovery in 10 years, the leases expire. There is
14 no renewal for diligence. If there is a discovery, the lease may be held as long as there is
15 production. The BLM can modify the right conveyed by a lease by attaching a stipulation,
16 which is an enforceable condition of the lease. During the leasing process, the BLM may
17 apply stipulations (for example No Surface Occupancy, Controlled Surface Use, and Timing
18 Limitations) to all or parts of a lease in order to protect a wide range of resources including
19 soils, watersheds, cultural resources, and wildlife (e.g., GRSG). Stipulations may impact the
20 availability of fluid mineral resources on a lease by restricting the timing and/or location of
21 exploration and development activities. On National Forest System lands, the BLM cannot
22 issue a lease without Forest Service consent. Forest Service consent includes stipulations that
23 must be added to the lease to protect the resources on the Forest.

24 The issuance of a lease does not, in and of itself, authorize any surface-disturbing activities.
25 If a lessee wishes to conduct exploratory drilling, an application for permit to drill must be
26 submitted to the BLM for approval. An environmental analysis is conducted and as a result,
27 the BLM may attach additional, site-specific and activity-specific conditions, called
28 Conditions of Approval or Best Management Practices, to the drilling permit. The Forest

1 Service approves the Surface Use Plan of Operations portion of the application for permit to
2 drill, and may also add COAs. The BLM cannot deny operations on a lease unless the
3 operation would violate other nondiscretionary statutes, such as the ESA or the Clean Water
4 Act. In cases where surface operations would have unacceptable environmental impacts, the
5 BLM's authority to deny operations on the lease, if not specified in a particular statute, must
6 be established in the lease through the use of lease stipulations.

7 All leases, regardless of whether they have additional stipulations, are offered with standard
8 terms and conditions. In accordance with a 2002 Instruction Memorandum from the BLM
9 Washington Office, all fluid mineral leases must include the following stipulation:

10 *Endangered Species Act Section 7 Consultation Stipulation*

11 The lease area may now or hereafter contain plants, animals or their habitats determined to
12 be threatened, endangered, or other special status species. BLM may recommend
13 modifications to exploration and development proposals to further its conservation and
14 management objective to avoid BLM-approved activity that will contribute to a need to list
15 such a species or their habitat. BLM may require modifications to or disapprove proposed
16 activity that is likely to result in jeopardy to the continued existence of a proposed or listed
17 threatened or endangered species or result in the destruction or adverse modification of a
18 designated or proposed critical habitat. BLM will not approve any ground-disturbing activity
19 that may affect any such species or critical habitat until it completes its obligations under
20 applicable requirements of the Endangered Species Act as amended, 16 USC 1531 et seq.,
21 including completion of any required procedure for conference or consultation.

22 All geothermal and oil and gas leases in Idaho contain the ESA consultation stipulation.
23 There is also a mandatory cultural resource protection stipulation applied to all leases.

24 Stipulations to protect other resources, such as GRSG, are developed during the land use
25 planning process. Stipulations must be necessary and justifiable: If a lessee is to be prevented
26 from extracting oil and gas on a lease and the prohibition is not mandated by a specific,
27 nondiscretionary statute such as the ESA, the stipulation is necessary and is to be used. A
28 stipulation is justifiable if there are resource values, uses, and/or users present that cannot
29 coexist with fluid mineral operations, cannot be adequately managed and/or accommodated
30 on other lands for the duration of operations, and provide a greater benefit to the public
31 than that of the fluid mineral operations. If a ground disturbing activity is proposed on the
32 lease during any given year, the authorized officer may modify or waive restrictions if actual
33 conditions do not warrant them.

34 **3.12.1 Conditions within the Planning Area**

35 ***Oil and Gas***

36 There has never been a single producing oil and gas well in the entire state of Idaho, despite
37 the drilling of over 150 wildcat wells in the state since the early 1900s. As of March 16, 2015,
38 Idaho BLM has two federal oil and gas leases located on split-estate lands near Gray's Lake
39 in Bonneville County. The leases total approximately 4,000 acres, of which 40 acres is BLM
40 surface and the remainder is split estate. The leases were issued in 2006 for an initial term of
41 10 years. No drilling or exploration has occurred on any of the leases nor has any activity

1 been proposed; however, a wildcat well was drilled on private land near the Gray's Lake
2 leases in 2007. The well was drilled to approximately 11,000 feet without encountering an
3 economically viable hydrocarbon source. Additionally, a company has drilled numerous wells
4 on private lands in the New Plymouth area of southwest Idaho, and is planning to develop a
5 natural gas field. BLM-administered lands are located near this field and have been
6 nominated for leasing; however leasing is being deferred until completion of the Four Rivers
7 RMP. There is no GRSG habitat in this area.

8 The Dillon Field Office has 47 active oil and gas leases, none of which are producing,
9 according to LR2000. Approximately 50,000 acres of these leases are located in GRSG
10 habitat; however many leases likely contain timing limitations for other wildlife species, as
11 the Dillon RMP shows that much of the field office is covered by stipulations restricting
12 activities during critical seasons for other wildlife species or prohibiting all surface
13 occupancy.

14 **Figure 3-**, Oil and Gas Potential of Federal Oil and Gas Mineral Estate depicts the oil and
15 gas potential within the planning area.

16 ***Geothermal***

17 Idaho's prospects for development of geothermal resources are better than those for oil and
18 gas. There are currently 19 federal leases in Idaho, covering approximately 48,000 acres. Of
19 these, 13 are within GRSG habitat. Leases are scattered across southern Idaho, but are
20 primarily located near Raft River, Crane Creek, and Parma, Idaho. There are no active leases
21 currently in the Dillon Field Office. Seventeen of Idaho's 25 geothermal leases are located in
22 GRSG habitat, and all have existing stipulations protecting GRSG habitat during critical
23 seasons (as well as having stipulations to protect crucial habitat for other species):

- 24 • Each of the seven leases at Raft River have a stipulation restricting exploration
25 and development work in GRSG strutting/brood-rearing habitat from April 1
26 through June 15.
- 27 • Each of the four leases at Crane Creek contain a stipulation requiring that a
28 survey be conducted for the presence of active GRSG leks in key habitat, prior
29 to authorization of surface disturbing activities. If active leks are present (defined
30 as being used at least once in a five-year period), two stipulations will apply. One
31 is a timing limitation precluding exploration or drilling activities between March
32 15 and May 1 from 6 pm to 9 am within two miles of an active lek. The other
33

Figure 3-8 Oil and Gas Potential of Federal Oil and Gas Mineral Estate

1 stipulation precludes construction of wells, geothermal plants, power lines,
2 pipelines, or other such permanent structures that would fragment or degrade
3 nesting habitat within two miles of an active lek.

- 4 • Both of the geothermal leases located west of Weiser have the following
5 stipulations:
- 6 - Controlled surface and timing limitation use near GRSG leks and/or
7 nesting/early brood rearing habitat: Potentially disruptive major
8 construction and maintenance activities (e.g., infrastructure/energy
9 development and similar projects), shall be avoided within 4 miles (6.4
10 kilometers) of occupied or undetermined status GRSG leks from
11 February 15 to June 30 to reduce disturbance to lekking birds, or April 15
12 to June 30 for nesting GRSG (and/or hens with early broods). Major
13 construction and maintenance activity will be avoided in GRSG winter
14 range from December 1 to February 15. Specific dates may be earlier or
15 later, depending on local breeding chronology. The spatial buffer may be
16 increased or decreased based on site-specific factors analyzed and
17 documented in an environmental assessment or EIS and authorized via
18 the appropriate decision document. Exceptions may be granted for
19 activities involving only infrequent, short term disturbance (less than 1
20 hour within a 24-hour period in a specific area); or if there are
21 intervening topographic features or line-of-site screening that buffer the
22 lek or nesting habitat from disturbance; or if recent (within the past 5
23 years) site-specific studies or local expertise suggest that leks or nesting
24 hens are unlikely to be present within the 4-mile zone surrounding the
25 project activity.
 - 26 - For smaller-scale human disturbances, (e.g., water pipeline construction,
27 routine fence maintenance, and facility maintenance), a 0.62 mile (1
28 kilometer) lek disturbance buffer will apply between approximately
29 March 15 and May 1 in lower elevations and March 25 through May 15 in
30 higher elevations, from 6 p.m. to 9 a.m. in a specific area to minimize
31 disturbance to lekking GRSG.

32 Geothermal exploration and development activity on federal lands in Idaho has been
33 sporadic, due largely to economic factors. Idaho now has one 10 megawatt geothermal
34 power plant currently operating, as of 2007. It is located on private land at Raft River, south
35 of Burley, Idaho. Nine federal leases surround the plant and extend up the southeast flank of
36 Jim Sage Mountain. The BLM approved five geothermal drilling permits on a lease at Raft
37 River in 2010; however no drilling has occurred to date. The drilling permits have several
38 Conditions of Approval attached to protect wildlife. These include fencing reserve pits and
39 safeguarding migratory birds from hazards associated with pits and treatment facilities,
40 including but not limited to pit screening or netting, and placing protective cones over vent
41 stacks. In addition, drilling is prohibited during the GRSG strutting and brood-rearing
42 season (lease stipulation).

1 **Figure 3-9**, Geothermal Potential of Federal Geothermal Mineral Estate, depicts the
2 geothermal potential of the federal mineral estate in the planning area.

3 ***Mineral Materials***

4 Mineral materials include sand, gravel, most building and landscaping stone, pumice, and
5 other common variety materials that are not subject to mineral leasing or location under the
6 mining laws. The Materials Act of 1947, as amended (61 Stat. 681) authorizes disposal of
7 mineral materials on BLM-administered lands through a sales system, and provides for free
8 use of material by government agencies, municipalities or nonprofit organizations, if the
9 material is not to be used for commercial purposes. Permitting the removal or extraction
10 (i.e., disposal) of mineral materials on BLM-administered lands is a discretionary activity. The
11 BLM will not authorize the disposal of mineral materials if it is determined that the aggregate
12 damage to BLM-administered lands and resources would exceed the public benefits that the
13 BLM expects from the proposed disposal; nor will the BLM dispose of mineral materials
14 from areas identified in land use plans as not appropriate for mineral materials disposal (43
15 CFR 3601.11 and 3601.12). Disposal of mineral materials on National Forest System lands is
16 covered by 36 CFR 228D.

17 Most BLM-administered land in Idaho is available for consideration of mineral material
18 disposal; however, existing guidance in many of the LUPs in the planning area encourages
19 the use of existing disposal sites until the material is depleted. **Table 3-41**, Existing Mineral
20 Materials Cases, shows the numbers of mineral material disposal cases within the planning
21 area. **Figure 3-10**, Mineral Material Commodity Types in the Planning Area, shows the
22 geographic distribution of mineral materials in the planning area.

¹ Data as of April 13, 2015

Figure 3-9 Geothermal Potential of Federal Geothermal Mineral Estate

Figure 3-10 Mineral Material Commodity Types in the Planning Area

1 Community pits are sites established by the BLM and Forest Service for the public to
2 acquire mineral materials by purchasing a short-term permit over-the-counter at the field
3 office. Free Use Permits are usually sand and gravel pits, and are requested by county
4 highway districts and nonprofit organizations for road construction and maintenance of
5 county roads. A negotiated sale is an exclusive site proposed by a single party, often
6 commercial, as the party must now pay for the BLM to process the permit.

7 The number of sales out of a community pit varies by site, from less than one to more than
8 50 per year. Many of the most popular community pits are for landscaping rock and building
9 stone that is simply picked up by hand from the ground surface or from a talus slope. Most
10 of these sales are for less than one ton. Most Free Use Permit sites are used sporadically and
11 may be scattered throughout a field office or ranger district office, so that when the county
12 needs material it has a nearby source, thereby reducing haul costs. A pit may be inactive for
13 several years before it is needed for a road project in the area.

14 A gravel pit is initially developed by scraping off the vegetation and topsoil, which is then
15 stockpiled for future reclamation. Most gravel pits are 5 to 15 acres in size. No infrastructure
16 other than an access road is needed for mineral materials disposals. Most mineral material
17 removal activity occurs during the summer months and during daylight hours.

18 Very few mineral material sites have mitigation measures protecting GRSG habitat. One
19 exception is the St. Anthony Sand Dune Community Pit, which has a provision stating
20 "Proposals to remove sand between March 1st and June 15th will be evaluated to determine
21 if breeding birds are utilizing the area."

22 ***Locatable Minerals***

23 Under the General Mining Act of 1872 (17 Stat. 91), any US citizen, or person with the
24 intent to become a citizen, may stake a mining claim for locatable minerals on federal lands
25 (unless administratively withdrawn from mineral entry). This gives the claimant a possessory
26 right to develop the locatable mineral resource. Lands withdrawn from mineral entry are
27 Wilderness, ACECs, and other specially designated areas. The staking of a mining claim is a
28 nondiscretionary activity: As long as the lands are open to locatable mineral entry, and as
29 long as the claimant maintains the mining claim on an annual basis in accordance with
30 regulations at 43 CFR 3830 through 3838, the mining claim is considered active. If the
31 claimant fails to properly locate or maintain the claim on an annual basis, the claim is
32 forfeited. The BLM's role is limited to recording and adjudicating the location notices and
33 maintenance filings, and preventing undue or unnecessary degradation of the lands under
34 FLPMA. **Figure 3-11**, Locatable Mineral Potential in the Planning Area, shows areas where
35 locatable minerals are considered to be more likely to be found and **Figure 3-12** shows
36 existing Surface Management Plans or Notices in the planning area.

37 If a claimant wants to perform mining operations other than casual use on BLM-
38 administered lands, a Notice of Plan, filed under 43 CFR 3809, must be filed with the BLM
39 (or 43 CFR 3802, if the claim is located on lands under wilderness review). The Forest
40 Service has similar locatable minerals management regulations at 36 CFR 228A. For
41

Figure 3-11 Locatable Mineral Potential in the Planning Area

Administrative Draft
Cooperating Agency Review

Idaho and Southwestern Montana Greater Sage-Grouse Proposed LUPA/Final EIS
June 2015

Figure 3-12 Existing Surface Management Plans or Notices in the Planning Area

operations on National Forest System lands, a Notice of Intent must be filed. In addition, a Plan of Operations is required if the proposed activities will cause “significant disturbance of surface resources” (36 CFR 228.4[a][4]). Where there is a reference to notices or plans, it means both notices or plans on BLM-administered lands and Notices of Intent or Plans of Operation on National Forest System lands. Later in this document, the terms Notice/Notice of Intent or Plan/Plan of Operation are roughly equivalent for the purpose of this analysis. The purpose of these regulations is to prevent unnecessary or undue degradation of surface resources by operations authorized by the mining laws. The subparts establish procedures and standards to ensure that operators and mining claimants meet their obligation to prevent undue or unnecessary degradation and to reclaim disturbed areas.

The existing land use plans identify areas that are closed to mineral entry but are silent on mitigation measures to be taken in GRSG habitat. **Table 3-42**, Authorized or Pending 3809 Plans and Notices, shows the numbers of 3809 Plans and Notices that are authorized or pending in the planning area.

Table 3-42
Authorized or Pending 3809 Plans and Notices

District	3809 Plans of Operations		3809 Notices		GRSG Habitat?
	Authorized	Pending	Authorized	Pending	
Boise District	15	0	10	3	1 Plan in PH
Twin Falls	7	5	4	3	5 Plans in PH
Idaho Falls	8	1	2	2	4 Plans in PH
Dillon FO	0	0	0	0	No Plans in GRSG Habitat
Total	30	6	16	8	10 Plans in GRSG Habitat

Source: BLM GIS 2015

The Boise District currently has three 3809 Plans in GRSG habitat (one plan in PPH) for mostly small operations for zeolite and bentonite along the Owyhee Front. Development has occurred or is underway in the Castle Creek drainage south of Oreana (zeolite, bentonite); close to the Oregon border near US Highway 95 (both for zeolite); and on the Owyhee Plateau near the Upper Deep Creek area.

The Twin Falls District currently has five 3809 Plans in GRSG habitat. Development has included building stone operations south of Oakley, and the Eskridge pumice pit north of Magic Reservoir. At least three companies operate quarries on Middle Mountain south of Oakley, extracting a variety of micaceous quartzite called Oakley Stone. Oakley Stone is highly prized as a building and flooring material, as it has very high tensile strength and can be split into large, thin sheets. Building stone quarry operations have been active on Middle Mountain for over sixty years in the vicinity of active GRSG leks.

The operations are confined to discrete quarries located at mid-elevation on the west slope of Middle Mountain. The quarries expand very slowly over the years, and no infrastructure

1 such as power lines or pipelines are required. Very little mechanical equipment is used, as the
2 stone is split to the desired thickness using only small hand tools such as pry bars, hammers
3 and chisels, and is then placed on pallets by hand. However, operators also use excavators,
4 dump trucks, front end loaders, and other equipment in their daily operations, and blasting is
5 used occasionally. Most of the quarry workers are employed seasonally and are housed on-
6 site, thereby reducing traffic and dust. The quarries are strung out north-south along Middle
7 Mountain such that each quarry has a separate road to access the Goose Creek road, an
8 improved gravel road that leads to Oakley.

9 During the field season (roughly May to November), semi-truck traffic, hauling pallets of
10 Oakley Stone, can be fairly intense on the Goose Creek road, making 10 to 20 round trips
11 per day. One of the operations has a mill site adjacent to the Goose Creek Road where stone
12 is split and palletized for shipping. All of the operations shut down in the winter, so in the
13 fall pallets of stone are brought off the mountain and stockpiled in Oakley. Several of the
14 quarries have been patented and are therefore privately owned. No stipulations pertaining to
15 GRSG are currently applied to the Plans of Operations for any of these quarries. Altogether,
16 the quarries employ approximately 100 people year-round and approximately 600 seasonal
17 workers (Southern Idaho Living 2012).

18 The Eskridge pumice pit is located north of Magic Reservoir, on both sides of US Highway
19 20. The mining claimants have mined pumice for landscaping material since the 1940s.
20 Current operations are located on the south side of the highway, where disturbance consists
21 of 15 acres of quarry and staging area. A few years ago, the claimant moved the operation
22 from the north side of the highway, and reclaimed (sloped and seeded) 34 acres of previous
23 disturbance. The operation is active throughout the year, but activities rotate approximately
24 every 3 years, depending on demand for the material. In the first year of the cycle, bulldozers
25 are used to rip the material from the quarry face. In the second year, the material is classified
26 based on size and color, and stockpiled. In the third year, the stockpiles are loaded into belly
27 dump trucks and transported to Gooding, where it is loaded onto train cars and shipped to
28 Rexburg, where it is sold.

29 The Idaho Falls District currently has six 3809 Plans located in GRSG habitat, all in the
30 Challis Field Office. Development has occurred or is underway for building stone (including
31 Three Rivers Stone) and zeolite. The Three Rivers Stone quarry is a large building stone
32 quarry operation situated along the south side of US Highway 93, east of the confluence of
33 the East Fork and the Main Salmon rivers. The quarry is operated in a similar manner as
34 those on Middle Mountain: The stone (a variegated argillaceous quartzite) is split into thin
35 sheets using hand tools and is palletized at the quarry. The pallets are hauled to the mill site
36 adjacent to the highway, from which they are shipped. At peak production in 2007, there
37 were 99 people employed by the quarry's operator, L&W Stone. In January, 2013, however,
38 the company announced that it would be shutting down production at the quarry while it
39 undergoes bankruptcy proceedings.

40 In the Dillon Field Office, there are currently no 3809 Plans located in GRSG habitat.

1 On the Raft River division of the Sawtooth National Forest in Utah, there are several
2 quarries of building stone. They are located on the southern slopes of the Raft River Range,
3 in GRSG habitat.

4 ***Nonenergy Solid Leasable Minerals***

5 As with fluid minerals, the right to develop non-energy solid leasable mineral resources, such
6 as phosphate, on federal lands may only be acquired through a mineral lease, offered and
7 administered by the BLM in accordance with the Mineral Leasing Act of 1920, as amended
8 and supplemented (30 U.S.C. 181 et seq.). Lands that are known to have a valuable
9 phosphate resource have been designated by the USGS as Known Phosphate Leasing Areas
10 (KPLAs), and are leased through a competitive leasing process. Lands outside a KPLA may
11 also be leased, however the existence of a valuable phosphate resource must be proven first,
12 through an activity referred to as “prospecting.” Idaho has 8 KPLAs, totaling 80,168 acres.
13 Idaho BLM has 48 existing leases in KPLAs, totaling 31,670 acres. Therefore there are
14 48,498 acres of unleased KPLA in Idaho. There are 12,904 acres leased outside of KPLAs
15 (38 leases).

16 The Pocatello Field Office in southeast Idaho has a large non-energy solid leasable mineral
17 program, as the phosphate resource in that field office is significant. The Middle Permian
18 Phosphoria formation comprises one of the largest resources of phosphate rock in the
19 world, with the richest phosphorite accumulations being found in southern Idaho, northern
20 Utah, and western Wyoming. Compressional forces during the Cretaceous Period resulted in
21 major folding and thrust faulting of Paleozoic and Mesozoic sediments throughout the
22 Rocky Mountain region. These sediments were folded on a regional scale into north-south
23 trending anticlines and synclines, then thrust eastward 18 to 20 miles, exposing the
24 phosphate resources of the Phosphoria formation along steeply dipping fold limbs.

25 The thickest, richest accumulations of phosphate occur in southeast Idaho, centered around
26 the Soda Springs area. The BLM manages these resources on behalf of the federal
27 government. The goal in the Pocatello RMP is to manage the federal mineral estate while
28 minimizing adverse impacts to resource values. The 2012 Pocatello RMP does not have any
29 stipulations or minerals guidance for non-energy leasable minerals which specifically address
30 GRSG.

31 Phosphate has been mined commercially in southeast Idaho for over one hundred years.
32 Most of the mining has occurred east of Soda Springs, an area that has relatively little GRSG
33 habitat. Of the 86 existing federal phosphate leases that BLM administers in Idaho, only 10
34 are located in GRSG habitat. Nine of these leases are located north and west of Blackfoot
35 Reservoir and Soda Springs, in or near PGH. None of those leases have had active mining
36 operations on them, nor is any mining planned on the leases in the next 5 to 10 years. Most
37 of the leased acreage around Blackfoot Reservoir is split estate (privately-owned or state-
38 owned surface with federal minerals). The Trail Creek and Caldwell Canyon leases, located in
39 PGH east of Conda Mountain, are currently undergoing drilling. One additional lease is
40 located in PPH northwest of Bear Lake near Paris, Idaho. Exploration drilling was
41 conducted in 2012 on the lease, and on the private lands and unleased split estate lands
42 surrounding the small lease. Timing restrictions for GRSG were applied to the approval for

1 the drilling. If developed, this property would likely be developed as an underground mine,
2 due to geologic factors.

3 In total, approximately half of the federal leases in Idaho have been mined, are currently
4 being mined, or are proposed to be mined in the next 5 to 10 years. The remaining unmined
5 leases have been held for many years and are subject to valid existing rights. The Dillon Field
6 Office has one non-energy solid leasable lease, for phosphate. It is not located in GRSG
7 habitat, and is undeveloped.

8 **Figure 3-13**, Unleased Known Phosphate Leasing Areas, shows gas potential within the
9 planning area.

10 ***Coal***

11 No economically viable coal resources have ever been discovered in Idaho, and most plans
12 are silent on the subject. The Dillon RMP states its goal is to make coal resources available
13 on a site-by-site basis. A plan amendment would be required to lease coal, along with the
14 appropriate level of NEPA analysis. No specific mitigation measures for GRSG are
15 identified in any of the land use plans. Coal mining is regulated in accordance with the
16 Surface Mining Control and Reclamation Act of 1977 (30 USC 1201 et seq.). BLM's coal
17 mining regulations are found at 43 CFR 3400. According to 43 CFR 3420.1-4 (e)(1), only
18 those areas that have development potential may be identified as acceptable for further
19 consideration for leasing. As there is no development potential in the planning area, the
20 lands are determined to be unsuitable for leasing. For this reason, the impacts on GRSG
21 from the development of a coal resource will not be discussed further in this document.

Administrative Draft
Cooperating Agency Review

Figure 3-13 Unleased Known Phosphate Leasing Areas

1 **3.12.2 Trends**

2 ***Oil and Gas***

3 Interest in oil and gas leasing in Idaho has been sporadic over time, and it is expected to
4 remain so. Many leases were held in the 1970s and 1980s throughout much of Idaho, when
5 leasing was done under a noncompetitive system. After passage of the Federal Oil and Gas
6 Royalty Management Act in the early 1980s, leasing became a competitive process, and
7 BLM's standards for leasing became more rigorous. Lease nominations dropped dramatically
8 in Idaho and for many years, BLM's oil and gas program in Idaho was nonexistent. With
9 passage of the Energy Policy Act in 2005, Idaho BLM experienced an uptick in leasing
10 interest, with over 400,000 acres of federal land nominated since that time¹.

11 Interest in leasing is currently high in the Payette area, due to the recent wildcat discovery of
12 natural gas and planned development in that area (181,000 acres nominated for leasing,
13 overlapping). Much of the land nominated for leasing is split estate, and only the
14 northernmost nominated parcels are located in GRSG habitat. The Bear Lake area has been
15 nominated for leasing by several parties, most recently in 2012 (59,700 acres, overlapping
16 acreage). Interest in leasing the Bear Lake Plateau was at its highest in the early 1980s, when
17 a discovery of gas was made 10 miles south of the Idaho/Utah state line, and in adjoining
18 areas in Wyoming. Several wells were drilled in Idaho at that time, but were reported to be
19 dry. Other areas that have been nominated for leasing recently include approximately 90,000
20 acres in Twin Falls County, south of Rogerson, and approximately 60,000 acres in Clark
21 County, on the Idaho-Montana border in the Targhee National Forest. All of these
22 nominated lands have GRSG habitat.

23 Several geophysical surveys have been conducted recently in the Payette area (two-
24 dimensional and three-dimensional seismic surveys). It is likely that additional geophysical
25 surveys will be conducted in the planning area. Seismic reflection surveys are the most
26 commonly used geophysical tool. Very little surface disturbance is associated with a seismic
27 survey, as no excavating or drilling is involved. All that is required is a seismic energy source
28 and an array of receptors. The most common type of survey seen in Idaho involves
29 mechanically vibrating or "thumping" the ground using truck-mounted equipment. This
30 creates seismic waves that are recorded by a series of receptors placed on the ground surface
31 along a three- to five-mile line. This process requires a crew of about 10 to 15 people and 5
32 to 7 vehicles. No reclamation is usually required.

33 Despite the occasional interest in leasing in Idaho, no drilling permits have ever been filed
34 on BLM-administered lands in Idaho. This trend is expected to continue, however, for the
35 sake of this analysis, a description of the drilling process is included in this report, since the
36 issuance of a lease commits those lands to the possibility of exploration and development of
37 the oil and gas resource. Exploration drill holes for oil and gas range in depth from a few
38 thousand feet to many thousands of feet, but in much of Idaho would probably be 7,000 to
39 11,000 feet deep. These wells are 30 inches in diameter or larger at the surface, then narrow
40 (telescope) to 12 inches at the bottom of the well. In order to drill these deep, large-diameter

¹ Some of this acreage overlaps, due to multiple nominations for the same land

1 holes, a large drilling rig would be utilized. The top of the drill rig derrick could be as much
2 as 155 feet above the ground surface, and the rig floor could be at least 25 feet above the
3 ground surface. These rigs are typically equipped with diesel engines, fuel and drilling mud
4 storage tanks, mud pumps, and other ancillary equipment. Blow-out prevention equipment
5 would be utilized while drilling to prevent uncontrolled flow at the surface if a pressurized
6 hydrocarbon deposit is encountered.

7 Temporary roads would likely be needed to transport and maintain the drill rig and other
8 heavy equipment. Either existing roads would be improved or new roads would be
9 constructed to accommodate the traffic. Typically, roads are constructed with a 20-foot wide
10 graveled running surface with adjacent ditches and berms, for a total disturbance width of
11 about 40 feet. It may be necessary to haul in gravel to obtain a good road base, as well as a
12 base for the well pad. Based on the road density in the planning area, it is assumed that
13 access to the drill pads may require up to one mile of road construction or improvement.
14 Surface disturbance from construction of one mile of road equals about five acres.

15 Getting the rig and ancillary equipment to the site may require 15 to 20 trips by full-sized
16 tractor-trailers, with a similar amount for de-mobilizing the rig. There would be 10 to 40
17 daily trips for commuting and hauling in equipment. Drilling operations would likely occur
18 24 hours a day and 7 days a week. It takes approximately one month to drill one well. A
19 drilling operation generally has from 10 to 15 people on-site at all times, with more people
20 coming and going periodically with equipment and supplies.

21 During this exploratory or wildcat phase of drilling, it is likely that a drill pad, to
22 accommodate the rig and equipment, would be required at each well location. A drill pad is
23 usually 2.5 acres in size (300 feet by 350 feet), but it can vary considerably due to the depth
24 of the target zone, surface topography, and equipment needs for various drilling methods. In
25 order to obtain a level pad, cut and fill of the site may be required. Topsoil would first be
26 removed from the well pad site and stored on site for reclamation. In addition to the drill rig,
27 the well pad may house a reserve pit for storage or disposal of water, drill mud, and cuttings;
28 several mud pits and pumps, a tool shed, drill pipe rack, a fuel tank, a water tank, a generator
29 and several compressors, equipment storage, and several trailers for temporary lab and office
30 quarters. Depending on the contents of the reserve pit and environmental sensitivity of the
31 site, it may be lined or unlined.

32 Well drilling also requires water. As much water as possible is recycled on site, yet about
33 5,000 to 15,000 gallons of water may be needed each day depending on well conditions.
34 Initially, water would need to be provided, either by wells or trucked in, to meet demands.
35 Many oil or gas wells encounter water at depth when drilling for oil and/or gas and can be
36 utilized when production is ongoing. Any water rights required would likely need to be filed
37 in the name of the BLM.

38 Various tests are then run down the hole and data is collected to determine whether the well
39 is capable of production. At the conclusion of well testing, if paying quantities of oil and gas
40 are not discovered, the operator is required to plug the well according to federal and state
41 standards. Cement plugs are placed above and below water-bearing units with drilling mud

1 placed in the space between plugs. When abandonment is complete, the site is reclaimed,
2 which includes pad and road recontouring, topsoil replacement, and seeding with approved
3 mixtures. Erosion control measures would be incorporated into the reclamation design as
4 needed.

5 The drilling site could be active for approximately 1 year, from the start of drill pad and
6 access road construction; through drilling and well testing; to completion of production
7 facilities or plugging the hole and reclamation of the surface, which usually involves
8 removing all infrastructure, disposal of any waste generated, reshaping pads and roads, and
9 re-seeding. The total surface disturbance expected from the drilling of a single exploratory
10 well and the construction of one mile of access road is approximately eight acres.

11 If a producible quantity of oil or gas is discovered, additional development wells would be
12 drilled to confirm the discovery, establish the limits of the field, and drain the field.
13 Depending on the field characteristics, well spacing may be from 40 to several hundred acres
14 per well.

15 The speed at which a field is developed is dependent on the anticipated productivity. It may
16 take from 1 to 3 years to fully develop an oil or gas field. Large fields with several operators
17 may be unitized to reduce surface impacts. In addition, directional drilling may allow for
18 drilling more than one well per pad.

19 During field development, the road system may be greatly expanded. Temporary roads are
20 usually improved to accommodate more traffic and increased duration of use.
21 Improvements may include crowning, capping, and implementing additional erosion
22 controls. New roads would also be constructed. Depending on well location and
23 topography, a main access road is built with smaller secondary roads running to each pad. In
24 addition to roads, other facilities may also be installed including power lines, tank farms,
25 pipelines, oil/water separators, and injection wells.

26 Where oil and gas flow to the surface naturally, control valves and collection pipes are
27 attached to the well head. Otherwise pumps are installed. Oil is typically produced along
28 with water and gas. Separation facilities are constructed on site to remove water, carbon
29 dioxide, and hydrogen sulfide. The oil and natural gas are then separated. Water, usually
30 saline, is disposed of either through surface discharge, evaporation ponds or re-injection into
31 the producing formation.

32 If gas is present in economic quantities and a pipeline is located within close proximity, a
33 network of pipelines would likely be constructed to collect and transport the gas. If not, gas
34 would likely be re-injected into the reservoir. Oil would be collected in a similar manner and
35 stored in tanks in a central location. Well operators would likely have service operations (e.g.,
36 cementing, logging, bits, and testing) provided by established oil field service companies in
37 Wyoming or Utah.

38 The producing life span of an oil or gas field varies depending on field characteristics. A field
39 may produce for a few years to many decades. Commodity price, recovery technique, and

1 the political environment also affect the life of a field. Well abandonment may begin as soon
2 as it is depleted, or it may be rested for a period of time and put back into production.

3 ***Geothermal***

4 Interest in geothermal is sporadic in Idaho, depending on factors such as the economy,
5 political climate, government incentive programs, such as the renewable energy tax credit,
6 and technological advances. It is anticipated that drilling will occur on federal leases at Raft
7 River over the next 10 to 15 years, and that an additional power plant would be constructed,
8 likely on private lands, but with wells on federal land.

9 ***Mineral Materials***

10 Demand for mineral materials is expected to remain fairly steady, although the collapse of
11 the housing industry in 2008 definitely resulted in fewer sales throughout the planning area.
12 The implementation of full cost recovery for individual sales has caused a decline in that case
13 type.

14 ***Locatables***

15 While Idaho's mining claim numbers fluctuate with the price of gold, the number of plans
16 and notices remains fairly steady. Production of building stone in the Middle Mountain area
17 remains steady, however it was recently reported that L&W Stone's Three River Stone
18 quarry near Clayton has been shut down due to bankruptcy. Several Plans of Operations are
19 in the approval process on Middle Mountain.

20 ***Nonenergy Solid Leasable Minerals***

21 Demand for phosphate remains high, and the companies that mine in southeast Idaho
22 continue to develop new mines as old ones are reclaimed and remediated. There is no
23 indication that the leases west of Soda Springs in GRSG habitat will be developed in the
24 foreseeable future. It is anticipated that, over the next 10 years, new mines will be developed
25 on phosphate leases at Dairy Syncline, Husky/Dry Ridge, Caldwell Canyon, and Trail Creek,
26 as current mines are depleted of ore and are reclaimed. Only the Caldwell Canyon and Trail
27 Creek leases are located in GRSG habitat. Both of these leases are located primarily on split
28 estate lands: at Caldwell Canyon, the majority of the surface estate is privately owned (1,200
29 acres), with only 160 acres on BLM-administered lands; the Trail Creek lease is composed of
30 a mix of state and private surface estate. In the spring of 2013 it was announced that a
31 company plans to open an underground operation near Paris, Idaho, on patented lands in
32 GRSG habitat. The announcement stated that initial development would not involve federal
33 minerals; however, exploration drilling occurred on federal minerals in 2012.

34 The BLM has not offered a competitive phosphate lease since 2000 and does not currently
35 have any pending requests for competitive leasing. As the remaining existing leases are
36 developed however, demand for leasing, particularly in the unleased portions of KPLAs, is
37 expected to increase.

38 ***Coal***

39 It is highly unlikely that any coal exploration or development will occur in the planning area.

1 **3.13 Special Designations**

2 Within the planning area are a variety of lands set aside through congressional or
3 administrative action to protect certain values, such as Wilderness, Wilderness Study Areas,
4 National Landscapes, National Scenic and Historic Trails, and Wild and Scenic Rivers
5 (**Figure 3-14**, Special Designations in the Planning Area).

6 **3.13.1 Areas of Critical Environmental Concern (ACEC)**

7 An ACEC is defined in FLPMA, Section 103(a), as an area on BLM-administered lands
8 where special management attention is required to protect and prevent irreparable damage to
9 important historic, cultural, or scenic values, fish and wildlife resources, or other natural
10 systems or processes, or to protect life and ensure safety from natural hazards. BLM
11 regulations for implementing the ACEC provisions of FLPMA are found in 43 CFR 1610.7-
12 2(b).

13 ACECs differ from some other special management designations in that designation by itself
14 does not automatically prohibit or restrict other uses in the area. The special management
15 attention is designed specifically for the relevant and important values and, therefore, varies
16 from area to area. Restrictions that arise from an ACEC designation are determined at the
17 time the designation is made and are designed to protect the values or serve the purposes for
18 which the designation was made. The BLM identifies goals, standards, and objectives for
19 each proposed ACEC as well as general management practices and uses, including necessary
20 constraints and mitigation measures. In addition, ACECs are protected by the provisions of
21 43 CFR 3809.1-4(b)(3), which requires an approved plan of operations for activities resulting
22 in more than 5 acres of disturbance under the mining laws.

23 Research natural areas are areas where natural processes are allowed to predominate, and
24 that are preserved for the primary purposes of research and education. Under current BLM
25 policy, research natural areas must meet the relevance and importance criteria of ACECs and
26 are, therefore, designated as ACECs. Under current guidelines, ACEC procedures also are
27 used to designate outstanding natural areas.

28 There are portions of fifty two Idaho and 7 Montana ACECs in the planning area that
29 overlap occupied GRSG habitat (see **Figure 3-15**, Existing Areas of Critical Environmental
30 Concern with Preliminary Priority and General Habitat). Refer to **Table 3-43**, BLM Areas of
31 Critical Environmental Concern, which summarizes the acres of ACECs within GRSG
32 habitat and the identified relevant and important values for each. None of the existing
33 ACECs were designated solely for the purpose of protecting GRSG habitat.

34 As part of this effort, the BLM called for and received nominations for ACECs to protect
35 GRSG. A BLM interdisciplinary team reviewed nominations to determine which areas meet
36 the relevance and importance criteria, as defined by 43 CFR 1610.7-2(a)(1), and 43 CFR
37 1610.7-2(a)(2), and guidance in BLM Manual 1613, Areas of Critical Environmental
38 Concern. Details of the process and information on those areas found to meet the relevance
39 and importance criteria can be found in **Appendix S**, BLM ACEC Evaluation and Forest
40 Service Zoological Areas.

Cooperating Agency Review

Table 3-43
BLM Areas of Critical Environmental Concern

ACEC Name	State	Acres in PGH	Acres in PPH	Total Acres	Values
Antelope Flat RNA	Idaho	0	590	590	Unusual and uncommon plant communities
Big Beaver	Idaho	6,700	0	6,780	Natural Features (Elk Habitat)
Birch Creek	Idaho	4,460	4,180	8,660	Crucial winter range and lambing habitat for bighorn sheep. Rare plants.
Block Mountain	Montana	550	0	8,630	Geologic Resources
Boulder Creek	Idaho	880	4,190	6,980	Scenic and multiple natural resource values
Bruneau/Jarbidge River	Idaho	33,300	35,400	73,900	Cultural, Geological, Scenic, and Natural Features (Big Horn Sheep Habitat)
Buckwheat Flats RNA	Idaho	0	190	190	Special Status Plants
Centennial Mountains	Montana	0	13,100	40,800	Wildlife Resources – grizzly bear, lynx & wolf
Centennial Sandhills	Montana	0	1,050	1,050	Geological and Botanical Resources
China Cup Butte RNA	Idaho	0	160	160	Geological values.
Cinnabar Mountain	Idaho	230	0	280	Valuable Range Reference Area, Scenic Values, Special Status Animals including GRSG
Coal Mine Basin	Idaho	0	1,610	1,610	Special Status Plants and animals (only mentions that GRSG are present), scenery, paleontological resources
Cottonwood Creek	Idaho	0	330	330	Riparian Vegetation, redband trout, bighorn sheep, and scenic quality
Cronk's Canyon	Idaho	0	1,220	1,220	Wildlife and botanical resources. Relict bighorn sheep population. Pristine natural plant communities.
Cronk's Canyon RNA	Idaho	0	370	370	Wildlife and botanical resources. Relict bighorn sheep population. Pristine natural plant communities.
Dairy Hollow RNA	Idaho	0	40	40	Geological and botanical resources.
Donkey Hills	Idaho	9,280	15,400	29,700	Wildlife resources – crucial elk habitat.

Table 3-43
BLM Areas of Critical Environmental Concern

ACEC Name	State	Acres in PGH	Acres in PPH	Total Acres	Values
Dry Gulch RNA	Idaho	0	540	540	Botanical resources – unusual plant communities; several rare plant populations.
East Fork Salmon River Bench RNA	Idaho	0	90	80	Botanical resources – remnant pristine vegetation.
Elk Mountain	Idaho	760	11,900	12,700	Natural Features (Elk Habitat)
Everson Creek	Montana	0	8,820	8,820	Archaeological Resources
Geoff Hogander/Stump Creek	Idaho	2,450	0	2,470	Exceptional ecological communities
Goodrich Creek RNA	Idaho	390	0	390	Exceptional ecological communities
Goose Creek Mesa	Idaho	0	100	100	Natural Features (Vegetation)
Granite Pass	Idaho	0	90	300	Historic and Cultural Features
Herd Creek Watershed	Idaho	990	13,400	16,900	Botanical, fish and visual resources. Riparian recovery and demonstration area. Presence of rare plants. Variety of high elevation range and forest plant communities. Known spawning and rearing habitat for special status steelhead trout, bull trout, and Chinook salmon. Roadless/primitive and scenic values.
Herd Creek Watershed RNA	Idaho	0	280	1,060	Same as Herd Creek Watershed.
Hixon Columbia Sharp-Tailed Grouse Habitat	Idaho	6,780	690	11,800	Wildlife resources - Columbia Sharp-Tailed Grouse habitat.
Humbug Spires	Montana	20	0	8,370	Outstanding scenic qualities and diverse upland and aquatic habitat for plants, animals and fish.
Jim Sage Canyon	Idaho	150	490	660	Natural Features (Vegetation)

Table 3-43
BLM Areas of Critical Environmental Concern

ACEC Name	State	Acres in PGH	Acres in PPH	Total Acres	Values
Jump Creek Canyon	Idaho	340	100	610	Riparian Communities
King Hill Creek	Idaho	610	1,340	2,870	Scenic and Natural Features (Redband Trout and Riparian)
Lone Bird	Idaho	0	9,980	9,980	Cultural and botanical resources. Numerous and unique cultural resources. Rare plants.
Malm Gulch/Germer Basin	Idaho	1,070	4,400	5,640	Botanical, paleontological, geologic resources. Concentration of rare plants, unusual plant communities. Petrified forest. Fragile soils.
Malm Gulch/Germer Basin RNA	Idaho	324	1,862	2,186	Same as Malm Gulch/Germer Basin
McBride Creek	Idaho	0	260	260	Special Status Plants
McKinney Butte	Idaho	0	2,210	3,760	Geological, Scenic, and Natural Features (Bats, Unusual plants, and invertebrates)
Muddy Creek/Big Sheep Creek	Montana	680	12,400	13,100	Cultural Resources
Nine Mile Knoll	Idaho	920	18,800	41,600	Big game wildlife values.
North Fork Juniper Woodland	Idaho	370	0	4,410	Montane Western Juniper and Special Status Plants and Animals
North Menan Butte	Idaho	150	630	780	Geological values.
North Menan Butte RNA	Idaho	20	330	340	Geological and botanical values.
Oregon-California Trail Junction	Idaho	520	0	520	Historic and Cultural Features
Owyhee River/Bighorn Sheep	Idaho	46,100	154,900	201,000	Wildlife resources - bighorn sheep habitat
Peck's Canyon RNA	Idaho	0	780	780	Botanical resources – excellent condition plant communities.
Pennal Gulch	Idaho	230	5,530	5,840	Botanical resources – rare plants; unique riparian area; unique and representative vegetation.
Pine Gap RNA	Idaho	0	240	240	Botanical resources – rare plant <i>Cryptantha caespitosa</i> .

3.13.1 Wilderness

BLM

In 1964, the Wilderness Act (the Act) established the National Wilderness Preservation System to be managed by the Forest Service, National Park Service, and USFWS. In 1976, with the passage of the FLPMA, Congress made the BLM the fourth agency with wilderness management authority under the Wilderness Act.

Section 4(b) of the Act further sets forth the agencies' responsibilities in administering wilderness areas and states that the preservation of wilderness character is the primary management mandate. In the relevant part, the Act states: "Except as otherwise provided in this Act, each agency administering any area designated as wilderness shall be responsible for preserving the wilderness character of the area."

As set forth in Section 2(c) ("Definition of Wilderness") of the Wilderness Act, wilderness character is composed of four mandatory qualities and a fifth, optional, quality. These are:

- 1 i. Untrammled. The Wilderness Act states that wilderness is “an area where the
2 earth and its community of life are untrammled by man.” A “trammel” is
3 literally a net, snare, hobble, or other device that impedes the free movement of
4 an animal. Here, used metaphorically, “untrammled” refers to wilderness as
5 essentially unhindered and free from modern human control or manipulation.
6 This quality is impaired by human activities or actions that control or manipulate
7 the components or processes of ecological systems inside wilderness.
- 8 ii. Natural. The Wilderness Act states that wilderness is “protected and managed so
9 as to preserve its natural conditions.” In short, wilderness ecological systems
10 should be as free as possible from the effects of modern civilization.
11 Management must foster a natural distribution of native wildlife, fish, and plants
12 by ensuring that ecosystems and ecological processes continue to function
13 naturally. Watersheds, water bodies, water quality, and soils are maintained in a
14 natural condition; associated ecological processes previously altered by human
15 influences will be allowed to return to their natural condition. Fire, insects, and
16 diseases are allowed to play their natural role in the wilderness ecosystem except
17 where these activities threaten human life, property, or high value resources on
18 adjacent nonwilderness lands. Additional guidance on this is provided in section
19 1.6.C of this manual, which addresses the management of specific activities in
20 wilderness. This quality may be affected by intended or unintended effects of
21 human activities on the ecological systems inside the wilderness.
- 22 iii. Undeveloped. The Wilderness Act states that wilderness is an area “of
23 undeveloped Federal land retaining its primeval character and influence, without
24 permanent improvements or human habitation,” “where man himself is a visitor
25 who does not remain,” and “with the imprint of man’s work substantially
26 unnoticeable.” Wilderness has minimal evidence of modern human occupation
27 or modification. This quality is impaired by the presence of structures or
28 installations, and by the use of motor vehicles, motorized equipment, or
29 mechanical transport that increases people’s ability to occupy or modify the
30 environment. More detail on the activities that impair this quality is found in
31 Section 1.6.B of this policy.
- 32 iv. Solitude or Primitive and Unconfined Recreation. The Wilderness Act states that
33 wilderness has “outstanding opportunities for solitude or a primitive and
34 unconfined type of recreation.” Wilderness provides opportunities for people to
35 experience: natural sights and sounds; remote, isolated, unfrequented, or
36 secluded places; and freedom, risk, and the physical and emotional challenges of
37 self-discovery and self-reliance. Any one wilderness does not have to provide all
38 these opportunities, nor is it necessary that they be present on every acre of a
39 given wilderness. Where present, however, the preservation of these
40 opportunities is important to the preservation of wilderness character as a whole.
41 This quality is impaired by settings that reduce these opportunities, such as
42 visitor encounters, signs of modern civilization, recreation facilities, and
43 management restrictions on visitor behavior.

1 v. Unique, Supplemental, or Other Features. The Wilderness Act states that
2 wilderness areas “may also contain ecological, geological, or other features of
3 scientific, educational, scenic, or historical value.” Though these values are not
4 required of any wilderness, where they are present they are part of that area’s
5 wilderness character, and must be protected as rigorously as any of the four
6 required qualities. They may include historical, cultural, paleontological, or other
7 resources not necessarily considered a part of any of the other qualities. These
8 values are identified in a number of ways: in the area’s designating legislation,
9 through its legislative history, by the original wilderness inventory, in a wilderness
10 management plan, or at some other time after designation.

11 Section 4(b) of the Wilderness Act states that: “Except as otherwise provided in this Act,
12 wilderness areas shall be devoted to the public purposes of recreational, scenic, scientific,
13 educational, conservation, and historical use.” In most cases the public purposes reflect one
14 or more qualities of wilderness character and are administered so as to preserve the
15 wilderness character of the area.

16 Section 4(c) of the Wilderness Act lists uses and activities that are specifically prohibited in
17 wilderness: “Except as specifically provided for in this Act, and subject to existing private
18 rights, there shall be no commercial enterprise and no permanent road within any wilderness
19 area designated by this Act and, except as necessary to meet minimum requirements for the
20 administration of the area for the purpose of this Act (including measures required in
21 emergencies involving the health and safety of persons within the area), there shall be no
22 temporary road, no use of motor vehicles, motorized equipment or motorboats, no landing
23 of aircraft, no other form of mechanical transport, and no structure or installation within any
24 such area.”

25 The BLM Wilderness Manual 6340 states: Wildlife management within wilderness is guided
26 by all relevant laws, including the Wilderness Act, acts designating specific wilderness areas,
27 the Endangered Species Act, the Migratory Bird Treaty Act, Native American treaty rights,
28 43 CFR 6300 (Management of Designated Wilderness Areas), 43 CFR 24 (Department of
29 the Interior Fish and Wildlife Policy: State-Federal Relationships), and applicable State laws
30 and policies regarding wildlife.

31 Many wilderness areas provide important habitat for federally listed threatened or
32 endangered wildlife species. The BLM will manage wilderness areas to protect and recover
33 known populations of federally listed threatened or endangered species and to aid in their
34 recovery in previously occupied habitat. The wilderness restrictions can directly or indirectly
35 influence GRSG and their habitat.

36 The BLM has seven wilderness areas within the planning boundary (**Table 3-44**, BLM-
37 Administered Wilderness Areas). These seven areas are all within Owyhee County and were
38 designated by Congress in 2009 through the Omnibus Public Lands Management Act.

39 A wilderness management plan for the seven BLM wilderness areas will be released in draft
40 in February 2013. A final plan should be completed by mid to late 2013.

Table 3-44
BLM-Administered Wilderness Areas

BLM Wilderness Name	Wilderness Acres
Bear Trap Wilderness	6,350
Big Jacks Creek Wilderness	52,800
Bruneau-Jarbridge Rivers Wilderness	90,000
Little Jacks Creek Wilderness	50,900
North Fork Owyhee Wilderness	43,400
Owyhee River Wilderness	267,300
Pole Creek Wilderness	12,500
Total BLM Wilderness	523,250

1

2 ***Forest Service***

3 The Forest Service, National Park Service, and BLM manage wilderness areas under the
4 same legislation; the 1964 Wilderness Act. The agencies have similar objectives and policies
5 related to wilderness. Below is text from the Forest Service wilderness manual.

6 Wilderness is a unique and vital resource. In addition to offering primitive recreation
7 opportunities, it is valuable for its scientific and educational uses, as a benchmark for
8 ecological studies, and for the preservation of historical and natural features.

9 Manage the wilderness resource to ensure its character and values are dominant and
10 enduring. Its management must be consistent over time and between areas to ensure its
11 present and future availability and enjoyment as wilderness. Manage wilderness to ensure
12 that human influence does not impede the free play of natural forces or interfere with
13 natural successions in the ecosystems and to ensure that each wilderness offers outstanding
14 opportunities for solitude or a primitive and unconfined type of recreation. Manage
15 wilderness as one resource rather than a series of separate resources (FSM 2300 Sec. 2320.6).

16 *Objectives*

- 17 • Maintain and perpetuate the enduring resource of wilderness as one of the
18 multiple uses of National Forest System land.
- 19 • Maintain wilderness in such a manner that ecosystems are unaffected by human
20 manipulation and influences so that plants and animals develop and respond to
21 natural forces.
- 22 • Minimize the impact of those kinds of uses and activities generally prohibited by
23 the Wilderness Act, but specifically excepted by the Act or subsequent
24 legislation.
- 25 • Protect and perpetuate wilderness character and public values including, but not
26 limited to, opportunities for scientific study, education, solitude, physical and
27 mental challenge and stimulation, inspiration, and primitive recreation
28 experiences.

- Gather information and carry out research in a manner compatible with preserving the wilderness environment to increase understanding of wilderness ecology, wilderness uses, management opportunities, and visitor behavior.

Policy

- Where there are alternatives among management decisions, wilderness values shall dominate over all other considerations except where limited by the Wilderness Act, subsequent legislation, or regulations.
- Manage the use of other resources in wilderness in a manner compatible with wilderness resource management objectives.
- In wildernesses where the establishing legislation permits resource uses and activities that are nonconforming exceptions to the definition of wilderness as described in the Wilderness Act, manage these nonconforming uses and activities in such a manner as to minimize their effect on the wilderness resource.
- Cease uses and activities and remove existing structures not essential to the administration, protection, or management of wilderness for wilderness purposes or not provided for in the establishing legislation.
- Because wilderness does not exist in a vacuum, consider activities on both sides of wilderness boundaries during planning and articulate management goals and the blending of diverse resources in forest plans. Do not maintain buffer strips of undeveloped wildland to provide an informal extension of wilderness. Do not maintain internal buffer zones that degrade wilderness values. Use the Recreation Opportunity Spectrum (FSM 2310) as a tool to plan adjacent land management.
- Manage each wilderness as a total unit and coordinate management direction when they cross other administrative boundaries.
- Use interdisciplinary skills in planning for wilderness use and administration.
- Gather necessary information and carry out research programs in a manner that is compatible with the preservation of the wilderness environment.
- Whenever and wherever possible, acquire non-federal lands located within wildernesses, as well as non-federal lands within those areas recommended for inclusion in the system.

The Forest Service manages eight wilderness areas that are either all or portions of within the planning area (**Table 3-45**, National Forest System Wilderness Areas).

Table 3-45

11

12

The following is from the National Park Service Wilderness Management Policy 2006: The National Park Service will manage wilderness areas for the use and enjoyment of the American people in such a manner as will leave them unimpaired for future use and enjoyment as wilderness. Management will include the protection of these areas, the preservation of their wilderness character, and the gathering and dissemination of information regarding their use and enjoyment as wilderness. The purpose of wilderness in the national parks includes the preservation of wilderness character and wilderness resources in an unimpaired condition and, in accordance with the Wilderness Act, wilderness areas shall be devoted to the public purposes of recreational, scenic, scientific, educational, conservation, and historical use.

25

Section 603 of FLPMA directed the BLM to carry out a wilderness review of the BLM-administered lands. The wilderness inventory was conducted from 1978 to 1980. The original inventory focused on roadless areas of BLM-administered lands of 5,000 acres or more and on roadless islands, but also included areas of less than 5,000 acres that had wilderness characteristics in association with contiguous roadless lands managed by another agency, and areas of less than 5,000 acres that had wilderness characteristics and could practicably be managed to keep those characteristics in an unimpaired condition. Additional WSAs were designated through the BLM land use planning process under the authority of Sections 201, 202, and 302 of FLPMA after the reports to Congress were completed in 1993.

1 The inventory phase identified areas that were found to have the characteristics of
2 wilderness enumerated by Congress in Section 2 (c) of the Wilderness Act of 1964:

3 “A wilderness...(1) generally appears to have been affected primarily by the forces of nature,
4 with the imprint of man’s work substantially unnoticeable; (2) has outstanding opportunities
5 for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand
6 acres of land or is of sufficient size as to make practicable its preservation and use in an
7 unimpaired condition; and (4) may also contain ecological, geological, or other features of
8 scientific, educational, scenic, or historical value.” When these characteristics were found
9 within a defined boundary, the presence of the wilderness resource was documented and the
10 area was classified as a WSA.

11 During the study phase, all values, resources, and uses occurring within each WSA were
12 analyzed, pursuant to the NEPA, through legislative environmental impact statements.
13 When the study was completed, recommendations as to the suitability or unsuitability of
14 each WSA for designation as wilderness were submitted to the President through the
15 Secretary of the Interior, and then from the President to Congress.

16 Consistent with BLM Manual 6330 and FLPMA Section 603(c), the BLM currently manages
17 approximately 770,000 acres of WSAs within the planning boundary. This includes 10 WSAs
18 in the Dillon Field Office and 34 WSAs in the Idaho Field Offices. **Table 2-9** identifies
19 acres of WSAs that contain GRSG habitat in the decision area for this LUPA/EIS.

20 **3.13.3 National Landscapes, Monuments, and Conservation Areas**

21 ***National Landscape Conservation System***

22 The National Landscape Conservation System (NLCS) was created in 2000 through an order
23 signed by Interior Secretary Babbitt. The concept of the NLCS was for the BLM to manage
24 a system of lands with a dominant conservation mission. In the order, Secretary Babbitt
25 included lands, rivers, and trails designated by acts of Congress or presidential proclamations
26 under the 1906 Antiquities Act as units in the NLCS. In 2009, Congress passed the Omnibus
27 Public Lands Management Act, which permanently established the NLCS “... to conserve,
28 protect and restore nationally significant landscapes that have outstanding cultural,
29 ecological, and scientific values for the benefit of current and future generations.”

30 Since the creation of the NLCS, the BLM has promoted understanding of the system. As a
31 way to help the public recognize the NLCS, the BLM has developed a brand and logo:
32 National Conservation Lands.

33 Within the planning area, there are multiple units representing the National Conservation
34 Lands. These include a National Monument, a National Conservation Area, Wilderness
35 Areas, Wilderness Study Areas, Wild and Scenic Rivers, and National Scenic and Historic
36 Trails.

37 ***National Monuments and National Conservation Areas***

1 National Monuments are areas either designated by Congress or by presidential
2 proclamation (under the authority of the Antiquities Act of 1906) to protect unique historic
3 landmarks, historic and prehistoric structures, or other objects of historic or scientific
4 interest. Within the planning area, the BLM and the National Park Service jointly administer
5 the Craters of the Moon National Monument and Preserve (737,700 acres). The BLM
6 portion of the monument was designated in 2000 to protect *kipukas* (small areas surrounded
7 by lava). These are some of the last undisturbed vegetation communities on the Snake River
8 Plain and the surrounding sagebrush (*Artemisia* spp.) steppe ecosystem. They consist of
9 diverse communities of grasses, sagebrush, and shrubs that provide habitat for a variety of
10 wildlife. This area also includes lava tube caves, older volcanic formations, and volcanic
11 buttes. Craters of the Moon is managed to protect and preserve the objects and values for
12 which it was designated.

13 National Conservation Areas (NCAs) are designated by Congress to conserve, protect,
14 enhance, and manage public land areas for the benefit and enjoyment of present and future
15 generations. NCAs feature exceptional natural, recreational, cultural, wildlife, aquatic,
16 archaeological, paleontological, historical, educational, and scientific resources. Within the
17 planning area, the BLM manages the Morley Nelson Snake River Birds of Prey National
18 Conservation Area (485,000 acres). Congress established the NCA in 1993 to protect a
19 unique environment that supports one of the world's most dense concentrations of nesting
20 birds of prey. Falcons, eagles, hawks, and owls are found here in exceptional profusion and
21 variety. The NCA is managed to conserve, protect, and enhance raptor populations and their
22 associated habitats.

23 The BLM manages National Monuments and National Conservation Areas in accordance
24 with the direction provided in BLM Manual 6220. This policy will be adhered to during any
25 site-specific NEPA analyses that are conducted within either of these areas.

26 ***National Scenic and Historic Trails***

27 A National Historic Trail (NHT) is congressionally designated as an extended long-distance
28 trail, not necessarily managed as continuous. It follows as closely as possible and practicable
29 the original trails or routes of travel of national historic significance. The purpose of an
30 NHT is to identify and protect the historic route and the historic remnants and artifacts for
31 public use and enjoyment. An NHT is managed to protect the nationally significant
32 resources, qualities, values, and associated settings of the areas through which such trails may
33 pass, including the primary use or uses of the trail.

34 While National Scenic and Historic Trails cross lands managed by different agencies, trails
35 and trail segments that cross BLM-administered lands are managed in accordance with BLM
36 Manual 6280, Management of National Scenic and Historic Trails and Trails Under Study or
37 Recommended as Suitable for Congressional Designation. This manual mandates that the
38 BLM establish NHT's Management Corridors to assist in the management of the resources,
39 qualities, values, and associated settings and the primary use or uses for which the NHT was
40 designated. The designation of NHT's Management Corridors in the future may encompass
41 lands that include GRSG habitat and may include management decisions and actions that
42 likely will have positive effects on GRSG populations.

1 **Table 3-50**, National Historic Trails, lists the NHTs in the planning area, by planning
2 district.

4

3.13.4 Wild and Scenic Rivers

5

6

7

8

9

10

11

The National Wild and Scenic Rivers System was created by Congress in 1968 (Public Law 90-542; 16 USC 1271 et seq.) to preserve certain rivers with outstanding natural, cultural, and recreational values in a free-flowing condition for the enjoyment of present and future generations. The Act is notable for safeguarding the special character of these rivers, while also recognizing the potential for their appropriate use and development. It encourages river management that crosses political boundaries and promotes public participation in developing goals for river protection.

12

13

14

15

16

17

18

19

20

It is hereby declared to be the policy of the United States that certain selected rivers of the Nation which, with their immediate environments, possess outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural or other similar values, shall be preserved in free-flowing condition, and that they and their immediate environments shall be protected for the benefit and enjoyment of present and future generations. The Congress declares that the established national policy of dams and other construction at appropriate sections of the rivers of the United States needs to be complemented by a policy that would preserve other selected rivers or sections thereof in their free-flowing condition to protect the water quality of such rivers and to fulfill other vital national conservation purposes. (Wild & Scenic Rivers Act, October 2, 1968)

1 Rivers may be designated by Congress or, if certain requirements are met, the Secretary of
2 the Interior. Each river is administered by either a federal or state agency. Designated
3 segments need not include the entire river and may include tributaries. For federally
4 administered rivers, the designated boundaries generally average one-quarter mile on either
5 bank in the lower 48 states and one-half mile on rivers outside national parks in Alaska in
6 order to protect river-related values.

7 ***River Classification***

8 Rivers are classified as wild, scenic, or recreational.

- 9 • Wild River Areas – Those rivers or sections of rivers that are free of
10 impoundments and generally inaccessible except by trail, with watersheds or
11 shorelines essentially primitive and waters unpolluted. These represent vestiges
12 of primitive America.
- 13 • Scenic River Areas – Those rivers or sections of rivers that are free of
14 impoundments, with shorelines or watersheds still largely primitive and
15 shorelines largely undeveloped, but accessible in places by roads.
- 16 • Recreational River Areas – Those rivers or sections of rivers that are readily
17 accessible by road or railroad, that may have some development along their
18 shorelines, and that may have undergone some impoundment or diversion in the
19 past.

20 Regardless of classification, each river in the National System is administered with the goal
21 of protecting and enhancing the values that caused it to be designated. Designation neither
22 prohibits development nor gives the federal government control over private property.
23 Recreation, agricultural practices, residential development, and other uses may continue.
24 Protection of the river is provided through voluntary stewardship by landowners and river
25 users and through regulation and programs of federal, state, local, or tribal governments. In
26 most cases not all land within boundaries is, or will be, publicly owned, and the Act limits
27 how much land the federal government is allowed to acquire from willing sellers. Visitors to
28 these rivers are cautioned to be aware of and respect private property rights.

29 The Act purposefully strives to balance dam and other construction at appropriate sections
30 of rivers with permanent protection for some of the country's most outstanding free-flowing
31 rivers. To accomplish this, it prohibits federal support for actions such as the construction of
32 dams or other instream activities that would harm the river's free-flowing condition, water
33 quality, or outstanding resource values. However, designation does not affect existing water
34 rights or the existing jurisdiction of states and the federal government over waters as
35 determined by established principles of law.

36 The Forest Service manages two designated rivers within the planning boundary (**Table 3-**
37 **47**, National Forest System Wild and Scenic Rivers). The Middle Fork of the Salmon is
38 wholly within the planning boundary whereas only a portion of the Salmon River is within
39 the planning boundary.

7

The BLM manages 16 designated rivers that are wholly within the planning boundary (Table 3-, BLM-Administered Wild and Scenic Rivers). All of the 16 rivers are within wilderness areas. Where the wilderness policy is more restrictive than the Wild and Scenic Rivers policy regarding actions within wilderness, the wilderness policy takes precedence; however, Wild and Scenic Rivers must be administered so as to protect and enhance the values that caused it to be designated.

3.14 Soil Resources

Many resources and resource uses, including livestock grazing, wildlife habitat, riparian habitat, special status species, fisheries, recreation, water quality and forestry, depend on suitable soils. Consequently, soil attributes and conditions are important to BLM and Forest Service management direction.

Soils are defined by the processes that form them. Through time, these processes form unique soil types and influence what plants may grow upon them. Soil surveys indicate that climate and topography are the primary influences on soil formation. Soil development processes, such as rock weathering, decomposition of plant materials, accumulation of organic matter, and nutrient cycling, are controlled largely by climate. Soil moisture and temperature strongly affect the rates of addition, removal, translocation, and transformation of material within the soil. Topography influences site conditions such as precipitation amounts and effectiveness, drainage, runoff, erosion potential, and temperature.

Soils play an integral part in vegetation community development. Plants use soil as an anchor, a means to provide water for growth, and a storehouse for the nutrients needed for growth. Plant communities are most noticeably influenced where soil texture and thickness of soil horizons change, depth to restrictive layers including abrupt soil horizon boundaries exist, and by soil drainage, moisture holding capacity, or depth to water table. Native plant communities require management considerations that include the ability of the soil to produce a healthy ecosystem over the long term. Reducing the risk of erosion from water and air processes, limiting compaction from traffic source or grazing, and allowing the water to infiltrate at a normal rate for the given soil texture will allow vegetative communities to thrive and further protects the soil resources.

1 The NRCS provides soil mapping across the United States. Soil information and mapping
2 from the NRCS are provided below under existing conditions to describe soil resources.

3 Land uses strive to conform to Standards for Public Land Health on BLM-administered
4 lands, which describe conditions needed to sustain public land health and relate to all uses of
5 the BLM-administered lands.

6 **3.14.1 Conditions within the Planning Area**

7 ***Soil Productivity***

8 Soil productivity within the planning area varies widely due to the diversity of soils and site
9 characteristics, specifically differences in elevation and slope gradient. The planning area
10 landscape varies greatly from broad valleys to mountains.

11 The average annual precipitation and temperature in the project area vary greatly by
12 elevation and aspect. Some of the most productive soils are found in well drained valley
13 bottoms, toe-slopes, benches, and broad ridge tops. On uplands where rainfall is moderate
14 to low, medium-textured soils may produce favorable conditions, depending on land uses
15 such as livestock grazing. Soils that feature shallow clay pans, hardpans, or salts pose
16 substantial constraints to land use and land use management.

17 Management practices affect the ability of soils to maintain productivity by influencing
18 disturbances such as displacement, compaction, erosion, and alteration of organic matter and
19 soil organism levels. When soil degradation occurs in semiarid, high desert regions, natural
20 processes are slow to return site productivity. Prevention of soil degradation is far more
21 cost-effective and time effective than remediation or waiting for natural processes.
22 Management practices, such as proper stocking rates for livestock, rotation of grazing,
23 periodic rest from grazing, improved design, construction and maintenance of roads,
24 selective logging, rehabilitation of unneeded surface disturbance, restricting vehicles to roads
25 and trails, rehabilitating mined areas, and control of concentrated recreational activities, have
26 reduced erosion effects and improved soil conditions.

27 ***Soil Erosion***

28 Erosion is a continuing natural process that can be accelerated by human disturbances.
29 Factors that influence soil erosion include soil texture, structure, length and percent of slope,
30 vegetative cover, and rainfall or wind intensity. Soils most susceptible to erosion by wind or
31 water are typified by bare or sparse vegetative cover, noncohesive soil particles with slow
32 infiltration rates, and moderate to steep slopes. Wind erosion processes are less affected by
33 slope angle but are highly influenced by wind intensity.

34 The semi-arid planning area has a low percentage of natural plant community ground cover,
35 allowing the soils to erode naturally in wind and during infrequent rain events. In addition,
36 management actions affect the rate at which soil erodes. Activities that remove vegetative
37 cover increase the erosion rate. Some soils are particularly vulnerable to soil erosion.

1 NRCS soil map unit descriptions rate soils in the planning area according to their
2 susceptibility to water and wind erosion. Wind erosion is particularly a hazard when surface
3 litter and vegetation are removed by fire or other disturbances. Soils in the planning area
4 were screened based on several relevant characteristics that indicate potentially fragile soils
5 or high erosion hazards. These characteristics include:

- 6 • soils rated as highly or severely erodible by wind or water, as described in NRCS
7 soil survey reports
- 8 • landslide areas as identified in NRCS soil survey reports
- 9 • soils on slopes greater than 35 percent

10 ***Soil Types***

11 When making land management decisions based on soil related hazards or limitations, the
12 BLM evaluates soil surveys available from the NRCS. Soils mapped according to the
13 boundaries of major land resource areas, which are geographically associated land resource
14 units that share common characteristics related to physiography, geology, climate, water
15 resources, soils, biological resources, and land uses. Each soil survey describes the specific
16 properties of soils in the area surveyed and shows the location of each kind of soil on
17 detailed maps. The BLM evaluates soil map units to make management decisions that would
18 likely affect soils. Each soil survey applicable to the planning area describes soil map units by
19 the individual soil or soils that make up the unit. These descriptions indicate the limitations
20 and hazards inherent in each unit. Descriptions include soil depth, range of elevation, origin,
21 climate, physical properties, runoff capabilities, erosion hazard, associated native vegetation,
22 wildlife habitat use, and capability for community development and other uses.

23 Soil can be classified in many ways according to a whole host of parameters. For the
24 generalization of soils in the planning area, the taxonomy of soil order is a convenient
25 starting place. Most of the soils in the planning area are part of the largest soil order,
26 Mollisols. The remaining areas are composed of similar young developmental soils in the
27 Inceptisol, Entisol, and Andisol orders, with a very small amount of Histisols and Vertisols
28 that have particular properties that may be of importance.

29 Soil properties can provide information as to why certain plants may grow in one area and
30 not another, or why erosion occurs by wind and not water. The NRCS provides a suite of
31 risk ratings, interpretations, and basic soil data that describes soils resources. The soil texture
32 for most soils across the planning area is a loam as composed of the representative percent
33 of sand, silt and clay. Some greater or lesser amounts of these percentages produce clayey
34 loams and silty loams for the most part. The soils have very low amounts of organic matter
35 (2 percent), low available moisture content in the top 10 inches (25.4 cm) and are considered
36 well drained. The risk of erosion by water is slight, except in those very steep canyons and
37 exposed bedrock ridges that have a severe to very severe rating. The overall majority of the
38 planning area is considered to be of slight risk for erosion. The soils are prone to
39 degradation when soil is removed in excess of the ability to rebuild it. In this area of the
40 state, the amount of loss can be significant with wind exposure or increased erosion from

1 water. Only 1 to 2 tons of soil per acre per year needs to be removed in approximately half
2 of the planning area to have a loss of long term productivity.

3 The amount of sand, silt and clay in the soil alters the water infiltration. Soils with higher
4 amounts of silt and clay infiltrate water more slowly than soils with higher amounts of sand.
5 For most of the planning area water infiltrates rapidly into the soil resulting in little standing
6 water.

7 Hydric (wet) soils and unique biological soil crusts are key soil resources in the planning area.

8 Hydric Soils. Hydric soils constitute only a small portion of the planning area. Hydric soils
9 are associated with riparian areas and wetlands. Riparian-wetland soils are found throughout
10 the planning area along water courses, near springs, seeps, playas, and adjacent to reservoirs.
11 Because of the presence of water, riparian-wetland soils have properties that differ from
12 upland areas.

13 Biologic Soil Crusts. Biologic soil crusts are made up of tiny living plants and bacteria that
14 grow together on the soil surface. They help keep the soil from washing or blowing away, fix
15 nitrogen from the atmosphere into the soil, help keep out weeds, and promote the health of
16 plant communities. Loss of biological soil crusts is a contributing factor in the replacement
17 of native vascular plants by invasive species such as cheatgrass or medusa head.

18 Based on research throughout the west, parameters for the ecology and management of
19 biological soil crusts have been developed by the Department of the Interior. Factors found
20 affecting presence, density, cover, and species diversity of macrobiotic crusts include
21 elevation, soils, and topography, disturbances, timing of precipitation, vascular plant
22 community, ecological gradients and microhabitats.

23 ***Biological Soil Crusts***

24 Biological soil crusts are an important component of a broad range of ecological sites in the
25 Intermountain West. They function as a living mulch by retaining soil moisture, increasing
26 organic matter and discouraging annual weed growth (Eldridge and Greene 1994, Belnap
27 and Gillette 1997, 1998, Belnap 2001, McKenna-Neumann et al. 1996, Rosentreter et al.
28 2007). Biological soil crust communities are more prevalent at lower elevations compared to
29 higher elevations with greater precipitation where vascular plant growth precludes biological
30 crust development (Belnap 2001). Specific to soil erosion, biological soil crusts protect
31 interspatial surface areas by occupying open areas between larger plants (Belnap et al. 1997).
32 Biological crust condition and cover is also a direct function of the ecological health of the
33 plant community and the NRCS “National Range and Pasture Book” identifies biological
34 soil crusts as a critical ecological attribute to be used as an indicator of rangeland health
35 (USDA 2003). Anthropogenic disturbances have been documented to impact the diversity
36 and function of these communities (Robinson et al. 2013, Peterson 2013).

1 **3.14.2 Trends**

2 Soil resources change slowly unless catastrophic or larger scale disturbance events such as
3 landslides, floods, volcanoes, or wildfires occur. Then, erosion or deposition would change
4 the ground cover at one point or many. Thus, the degree of change in the planning area
5 would be considered low or insignificant, with the direction of change being the most likely
6 to occur naturally over time. There have been larger wildfire events and to some degree
7 restoration activities that have altered the vegetation communities where juniper has been
8 invading sagebrush communities.

9 The overall guidance for soil resources is to maintain or improve the ability of the soil to
10 support vegetation and allow water and nutrients to be cycled by either macro or
11 microorganisms, all of which promote and improve the health of the land. Degradation by
12 excessive grazing, erosion, or land developments will cause a reduction in soil function as
13 one or perhaps many of the soil properties are changed thereby affecting the functions
14 necessary for healthy soils. In the planning area, impacts on soil resources have resulted from
15 energy development, grazing, recreation, natural processes, and other activities. The potential
16 for maintaining or restoring these communities and conserving the soil resource depends on
17 the specific soil types and how resource programs are managed.

18 **3.15 Water Resources**

19 Water on BLM-administered and National Forest System lands is regulated by the Clean
20 Water Act, Safe Drinking Water Act, Public Land Health Standards, and other laws,
21 regulations, and policy guidance at the federal, state, and local levels. Water resources in
22 Idaho are regulated by the EPA, US Army Corps of Engineers, and the Idaho Department
23 of Environmental Quality.

24 The Idaho Department of Environmental Quality has granted designated management
25 agency status to the BLM. As a designated management agency, the BLM must: (1)
26 implement and enforce natural resource management programs for the protection of water
27 quality on federal lands under its jurisdiction; (2) protect and maintain water quality where it
28 meets or exceeds applicable state and Tribal water quality standards; (3) monitor activities to
29 assure that they meet standards and report the results to the State of Idaho; and (4) meet
30 periodically to recertify water quality BMPs. BMPs include methods, measure, or practices to
31 prevent or reduce water pollution, including but not limited to structural and nonstructural
32 controls, operations, and maintenance procedures. BMPs are applied as needed to projects.

33 **3.15.1 Existing Conditions**

34 The discussion of existing conditions includes a description of water resources for the
35 planning area, regardless of landownership. Where appropriate, it also includes a more
36 detailed description of water resources for just BLM-administered lands within the planning
37 area. For this, the description is limited to describing water resources associated with GRSG
38 and their habitat. Wetlands and livestock water developments are important sources of water
39 that can influence GRSG and their habitat.

1 **3.15.2 Conditions within the Planning Area**

2 The BLM is the overwhelming land manager in the planning area. The Forest Service,
3 USFWS, Bureau of Indian Affairs, and State of Idaho all have lands within the planning area
4 that also contain a suite of water resources.

5 Within the planning area, the major water features are streams, lakes, wetlands, playas, and
6 dry lakes. Streams can be ephemeral, intermittent, or perennial. Ephemeral streams do not
7 flow during an average water year, but do flow in response to large precipitation events.
8 Intermittent streams flow during spring runoff for an average water year, but generally dry
9 up later in the summer. Perennial streams contain some water all year for an average water
10 year. Lakes can be permanent or temporary. Wetlands and floodplains vary in extent and
11 depth throughout the year. Permanent waters can also be in the form of ponds and
12 reservoirs developed for human or livestock consumption.

13 Stream channels and floodplains are important because their shape and condition affect how
14 rapidly water flows through a river system, how much water is stored within the basins, the
15 quality of the water, and how much erosion occurs. These functions, in turn, affect fish and
16 wildlife habitat, agriculture, recreation, and the susceptibility of local communities and
17 landowners to floods.

18 As early land management reduced vegetation in the watershed, overland flow of water
19 increased, and stream channels deepened to match the increased supply of water and
20 sediment. Major flood events in the late 1800s were the likely immediate cause of the
21 deepening channels. Channel incisions eventually lead to bank failures and subsequent
22 channel widening. As channel widening and bank failures continued, new low flow channels
23 began to form in the debris from bank failure. Many of the stream channels in the planning
24 area were in the process of this initial buildup in the 1980s. The result of this process is that
25 new channels are usually lower than pre-disturbance channels, and the old floodplain now
26 functions primarily as a terrace. Some terraces may be the result of climatic variations and
27 associated changes in flow and sediment supply. The final stage of channel evolution results
28 in a new bankfull channel and active floodplain at a new, lower elevation. Many stream
29 channels in the planning area have new, lower elevation channels and floodplains.

30 **Surface Water**

31 The US is divided and sub-divided into successively smaller hydrologic units called regions,
32 sub-regions, accounting units (basins), and cataloging units (sub-basins). Each hydrologic
33 unit is identified by a unique hydrologic unit code consisting of two to eight digits. The
34 fourth level of classification (sub-basin) is represented by an eight-digit hydrologic unit code.

35 The historic scarcity of stream flow in the planning area has led to increased flow regulation
36 by the State of Idaho. Projects for irrigation, livestock, human use, and flood control have
37 significantly altered natural flow regimes. This has changed habitat conditions, channel
38 stability and timing of sediment and organic material transport. Stream flow has been altered
39 by management activities such as water impoundments, water withdrawals, road
40 construction, vegetation manipulation, grazing, fire suppression, and timber harvesting.

1 Most surface runoff in the planning area is from snowmelt or rainfall producing peak
2 discharges in the spring and early summer. Many of the streams in the lower elevation semi-
3 arid areas are either intermittent, with segments of perennial flow near springs, or ephemeral,
4 with flow only during spring runoff and intense summer storms.

5 *Riparian Areas and Wetlands*

6 Riparian areas are ecosystems that occur along rivers, streams or water bodies. These area
7 exhibit vegetation or physical characteristics reflective of a permanent surface or subsurface
8 water influence. Typical riparian areas include lands along, adjacent to, or contiguous with
9 perennially and intermittently flowing rivers, streams, and shores of lakes and reservoirs with
10 stable water levels. Excluded are sites such as ephemeral streams or washes that do not
11 exhibit vegetation dependent on free water in the soil. Wetlands are areas that are inundated
12 or saturated by surface or groundwater at a frequency and duration sufficient to support and
13 which under normal circumstances do support a prevalence of vegetation typically adapted
14 for life in saturated soil conditions. Wetlands include marshes, swamps, lake shores,
15 lakeshores, sloughs, bogs, wet meadows, and riparian areas. Even through riparian and
16 wetlands areas occupy only a small percentage of the planning area, these areas provide a
17 wide range of functions critical to many different wildlife species, improve water quality,
18 provide scenery, and recreational opportunities.

19 The BLM uses proper functioning condition (PFC) assessments for evaluating riparian-
20 wetland areas and uses it to supplement existing stream channel and riparian area evaluations
21 and assessments. Each riparian-wetland has to be judged against its capability and potential.
22 The capability and potential of natural riparian-wetland areas are characterized by the
23 interaction of hydrology, vegetation, and erosion/deposition. PFC is defined separately for
24 lotic (moving water systems, such as rivers, streams, and spring and lentic (standing water
25 systems, such as lakes, ponds, seeps, and wet meadows). If a riparian or wetland area is not
26 in PFC, it is placed into one of three other categories; functional at risk, nonfunctional, or
27 unknown.

28 The majority of BLM stream channels and floodplains within the planning area are not
29 meeting the BLM standard of PFC. However relatively few stream channels are
30 nonfunctioning. More intermittent stream channels are in nonfunctioning condition than
31 perennial streams but they also have more miles of stream at potential and PFC.

32 *Water Quality*

33 Water quality as defined by the Clean Water Act, includes all the physical, biological, and
34 chemical characteristics which affect existing and designated beneficial uses. The state of
35 Idaho is required to identify which beneficial uses a water body currently supports or could
36 support in the future. Water quality standards are established to protect the beneficial uses of
37 the State's waters. Beneficial uses in planning area are public and private domestic water
38 supplies, industrial water supply, irrigation, livestock watering, fish and aquatic life, and
39 recreation.

40 The State of Idaho is required by section 303(d) of the Clean Water Act to identify waters
41 which are water quality impaired because of failing to meet their designated beneficial uses.

1 Section 303(d) requires that each state develop a list of water bodies that fail to meet water
2 quality standards and delineate stream segments and listing criteria for all streams. The
3 Section 303(d) list of impaired waters is updated biannually, and the state is required to
4 develop a total maximum daily load allocation for each pollutant of concern.

5 Water quality is evaluated based on the ability of a water body to support beneficial uses of
6 the water. Generally, key water qualities are those that support native fish and wildlife and
7 support human uses such as agriculture, recreation, and domestic water supply.

8 The major water quality concern for streams in the planning area has been water
9 temperature. These water temperature concerns correlate to the beneficial use of fish
10 spawning and rearing habitat. Conditions that affect stream temperature can be summarized
11 as amount of near stream vegetation, channel shape, and hydrology. Many of these
12 conditions are interrelated, and many conditions vary considerably across the landscape. For
13 example, channel width measurements can change greatly over even small distances along a
14 stream. Some conditions vary daily and or seasonally. Stream orientation from a north-south
15 to an east-west can change solar heating considerably when stream width and vegetation type
16 remain the same.

17 Removal of riparian vegetation and the shade it provides contributes to elevated stream
18 temperatures. Channel widening can similarly increase solar loading. The principal source of
19 heat energy delivered to the water column is solar energy striking the stream surface directly.
20 Exposure to solar radiation can cause an increase in stream temperature. The ability of
21 riparian vegetation to shade the stream throughout the day depends on aspect and vegetation
22 height, width, density, and position relative to the stream, as well as aspect the stream flows.

23 Causes of stream degradation are removal of riparian vegetation and destabilization of
24 streambanks. The land use most commonly associated with these problems in the planning
25 area is livestock grazing. Other land uses associated with degraded streams include roads,
26 trails, water withdraw, reservoir storage and release, altered physical characteristics of the
27 stream and wetlands alteration.

28 ***Groundwater***

29 Groundwater is used for irrigation, domestic use, and livestock use. The quality of the
30 groundwater is a function of the chemical makeup of the underground formation containing
31 the water. Most of the planning area contains good quality water but the water is usually hard
32 and contains moderate amounts of dissolved minerals.

33 Springs and seeps occur in areas where water from aquifers reaches the surface. Many
34 springs begin in stream channels and others flow into small ponds or marshy areas that drain
35 into channels. Some springs and seeps form their own channels that reach flowing streams,
36 but other springs lose their surface expression and recharge alluvial fill material or permeable
37 stratum.

38 Springs and seeps are important to aquatic habitats because of the perennial base flow they
39 provide to a stream. The outflow from springs in summer usually helps to maintain lower

1 water temperatures. In winter, especially in small streams, base flow helps to maintain an
2 aquatic habitat in an otherwise frozen environment.

3 *Water Quantity*

4 Water balance across the US is approximately 30 percent runoff and 70 percent evaporation.
5 This may be different across the planning area due to higher temperatures and lower relative
6 humidity in some areas.

7 Peak flows are connected with the spring runoff and snow melt with a decrease to near base
8 flow during the month of July. Seasons and years of low water yield are particularly crucial
9 periods for most of the planning area's beneficial uses.

10 The annual flow patterns may have changed since the 19th century. Historical descriptions
11 indicate that streams were relatively stable with good summer streamflow and good water
12 quality and heavy riparian cover. Streambanks were covered with dense growths of aspen,
13 poplar, and willow; cottonwood galleries were thick and wide; and beaver were abundant.
14 Now peak flows are greater and late season flows are diminished. This may be the normal
15 condition of larger flowing streams in the planning area. It is suspected that these effects are
16 due to reduced rates of soil infiltration, reduced capacity for groundwater/riparian storage,
17 and loss of in channel storage in beaver ponds.

18 **3.15.3 Trends**

19 Demands on water resources have increased over the past few decades. Although most early
20 water rights were established for irrigation and mining, today's demand includes municipal
21 water supplies, commercial and industrial supplies, and maintenance of adequate streamflow
22 for fish, recreation, and water quality.

23 The availability of water in much of the planning area is limited and may hamper additional
24 developments that depend on water. Future water development for wildlife, recreation, and
25 livestock would require a State of Idaho water right before project implementation could
26 occur.

27 **3.16 Cultural Resources**

28 In this section the term "cultural resources" is used to encompass the broad scope of
29 resources that must be considered by the BLM and Forest Service and as further defined
30 below. A cultural resource is a definite location of human activity, occupation, or use
31 identifiable through field survey, historical documentation, or oral evidence (BLM Manual
32 8100). The term cultural resources is inclusive and has been adopted and widely used to refer
33 to the diverse human record found in sites, structures, objects and places created and/or
34 used by people. These may comprise archaeological, historic, or architectural sites,
35 structures, objects, or places, and may include locations of traditional cultural or religious
36 importance to a particular social and/or cultural group, often referred to as Traditional
37 Cultural Properties. The term includes "historic properties," as defined in the National
38 Historic Preservation Act of 1966, as amended (NHPA), and the implementing regulations
39 found at 36 CFR Part 800. Historic properties are cultural resources determined to be

1 eligible for listing on the National Register of Historic Places (NRHP). The term also
2 includes “archaeological resources” as defined in the Archaeological Resources Protection
3 Act of 1979, and other sites, structures, objects, items and places as addressed in other
4 statutes/regulations (e.g., American Indian Religious Freedom Act of 1978, the Antiquities
5 Act of 1906, NEPA, and the Native America Graves Protection and Repatriation Act of
6 1990).

7 Cultural resources are represented by the full temporal range of human occupation of the
8 continent, from the first peoples’ arrival and settlement in the region over 13,000 years ago
9 and subsequent tribal groups expansion and use throughout all of the sub-region and other
10 parts of the West to more recent incursions of fur trappers, homesteaders and miners and
11 ranchers of the last 200 years. Cultural resources can include surface and buried artifacts and
12 cultural features made and left by human cultures in archaeological sites; items built by past
13 cultures (e.g., houses/house remains and activity areas); and places associated with traditional
14 cultural uses.

15 **3.16.1 Considering Effects on Cultural Resources Pursuant to Section 106** 16 **of the NHPA**

17 Cultural resources are most frequently identified and recorded through federal compliance
18 with Section 106 of the NHPA and subsequent consultation with Native American tribes
19 and State Historic Preservation Offices (SHPO). Section 106 requires that federal agencies
20 that fund, approve, authorize, license, or permit actions or undertakings to consider effects
21 on “historic properties” that could occur due to the proposed undertakings. It is important
22 to emphasize again that the term “historic property” has a specific meaning under the
23 NHPA, referring only to those properties determined to be eligible for or listed in the
24 NRHP regardless of property type or period of use (e.g., traditional cultural property or
25 archaeological site, and historic or prehistoric).

26 Federal regulations define specific criterion for NRHP eligibility and provide the measures
27 for evaluating cultural resources for their eligibility. These criteria are found at 36 CFR 60.4.
28 Once a cultural resource has been determined to be eligible for the NRHP the agency must
29 consider the potential effects of the proposed action on the historic property and provide
30 measures to either reduce or mitigate any adverse effects. Consequently, compliance with
31 Section 106 provides a primary mechanism for federal agencies to assess and take into
32 account the effects of proposed federal actions or undertakings on cultural resources during
33 NEPA reviews.

34 The BLM follows alternative procedures, defined in state specific protocols, for meeting its
35 Section 106 obligations allowed for and pursuant to the implementing regulations of the
36 NHPA (36 CFR 800.14). In collaboration with the Advisory Council on Historic
37 Preservation and the National Conference of State Historic Preservation Officers, the BLM
38 developed alternative procedures that define the manner in which the agency will comply
39 with Section 106 of the NHPA. These procedures are defined in a national Programmatic
40 Agreement, revised in 2012, between the three parties. The national Programmatic
41 Agreement procedures are implemented by the state specific protocol agreements with each

1 state's SHPO. The protocols further define how the BLM will coordinate with the SHPO in
2 each state to fulfill Section 106 responsibilities.

3 Prior to initiating proposed actions for protection and enhancement of GRSG and GRSG
4 habitat, the responsible manager shall determine the area of potential effect; review existing
5 information on known and anticipated historic properties that could be affected; seek
6 information (in coordination with environmental review and land use planning processes)
7 from Native American tribes and other parties likely to have knowledge of or concern with
8 historic properties (including places of traditional cultural and religious significance);
9 determine the need for field surveys or other actions to identify historic properties; make a
10 good faith effort to identify and evaluate historic properties; assess and determine effects on
11 historic properties; and identify measures to avoid, lessen or mitigate adverse effects on
12 historic properties.

13 As the various types of GRSG/habitat improvement projects are identified, effects on
14 cultural resources can be assessed on a case by case or programmatic level; however, given
15 current information, it is assumed that all future actions will require separate NHPA
16 analyses. Any programmatic procedures not covered by the BLM's national Programmatic
17 Agreement or state protocols will require either (a) separate NHPA analysis, or (b) a separate
18 Section 106 agreement.

19 **3.16.2 Conditions of the Planning Area**

20 The planning area includes federal lands administered by the BLM Boise, Twin Falls, and
21 Idaho Falls Districts in Idaho and the Dillon Field Office of the Western Montana District
22 in Montana. National Forest System lands include lands administered by the Boise,
23 Sawtooth, Salmon-Challis, and Caribou-Targhee National Forests in Idaho, and the
24 Beaverhead-Deerlodge National Forest in Montana. A majority of the habitat is sagebrush
25 steppe on BLM-administered land, with upland sagebrush steppe and sub-alpine habitat or
26 ecotones located on National Forest System lands. The Snake and Salmon Rivers, and the
27 headwaters of the Missouri river, are three major watershed systems within the planning
28 area.

29 In general, and as extrapolated from BLM survey and site location data, on average 15
30 percent of BLM-administered lands within the planning area have been inventoried, resulting
31 in the recordation of 17,801 archaeological resources (**Table 3-50**, Recorded Cultural
32 Resource Surveys and Sites within GRSG Habitat in the Planning Area), including
33 prehistoric and historic sites. These data indicate that, on average, six to eight sites occur per
34 square mile on BLM-administered lands within the planning area. Formal determinations of
35 eligibility have not been completed for most sites in the planning area; however, recorded
36 resources are treated as eligible until determined otherwise. Based on logged eligibility
37 determinations for known sites on BLM-administered lands, roughly 14 percent of recorded
38 sites have been determined to be eligible for listing on the NRHP. These data indicate that
39 over 2,492 of the recorded sites on BLM-administered lands are eligible for the NRHP
40 (**Table 3-50**, Recorded Cultural Resource Surveys and Sites within GRSG Habitat in the
41 Planning Area).

Table 3-50
Recorded Cultural Resource Surveys and Sites within GRSG Habitat in the Planning Area

Habitat	Idaho BLM Surveys	Idaho BLM Resources	Montana BLM Surveys	Montana BLM Resources	Planning Area Totals
PPH	2,057 surveys	12,517	596 surveys	723	718,292 acres
	692,778 acres		25,514 acres		13,240 Resources
PGH	1,226 surveys	4,561	538 surveys	564	763,170 acres
	739,277 acres		23,893 acres		5,125 Resources
Totals	1,432,055 acres	17,078	49,407 acres	1,287	1,481,462 acres 18,365 Resources

5

6

7

8

The total extent of the cultural resource base is unknown for the National Forests in PPH or PGH, as the entire land base has not been inventoried. Survey coverage of GRSG habitat on the National Forests in the sub-region varies between 5 and 15 percent on most of the National Forests, with most surveys conducted for range allotment plans, wildlife habitat improvement projects, and commercial activities. The exact number of cultural resource surveys and sites located on the National Forests changes as new surveys are conducted; therefore, providing exact numerical information would not be accurate.

9

10

11

12

13

14

Several well-known historic properties and districts occur in the planning area, as listed by field office in **Table 3-51**, Well Known Historic Properties within the Planning Area. These historic properties along with other eligible properties in the planning area would need evaluation for the effects of proposed undertakings for GRSG habitat improvement prior to implementation. Areas not previously inventoried would be subjected to full cultural resources analysis for ground-disturbing actions.

Table 3-51

The Forest Service identifies their significant historic properties through identification of Priority Heritage Assets (Table 3-52, Forest Service Priority Heritage Assets and Listed Properties within the Planning Area). These are, in essence, the most significant sites on the forest.

Table 3-52
Forest Service Priority Heritage Assets and Listed Properties within the Planning Area

National Forest	Number of Priority Heritage Assets	Listed Properties
Boise NF	34	Atlanta Ranger Station Rocky Bar Townsite
Beaverhead – Deerlodge NF	45	Historic Resources of Pony, Montana Canyon Creek Charcoal Kilns Butte Anaconda and Pacific Railway Historic District Birch Creek Civilian Conservation Corps Camp Lemhi Pass National Historic Landmark
Sawtooth NF	32	Pole Creek Guard Station

15

Three cultural areas are located within the planning area. Cultural areas have often been correlated to physiographic regions, with the planning area falling within the northern Great Basin, southeastern Plateau and western Plains regions. These cultural areas roughly correspond to distinctly different indigenous groups with different languages and moderately different resource-based economic systems and social structures. While these areas are associated to cultural groups and distinct tribes, cultural boundaries are fluid and overlapping. The main homelands and cultural traits of tribal groups that inhabit the region are generally defined by the cultural areas. Tribes that inhabit the region today and in the past include Great Basin groups such as the Shoshone-Paiute Tribes, Shoshone-Bannock Tribes, and the Eastern Shoshone; the Plateauan Nez Perce, Coeur d'Alene, Pend d'Oreille, Confederated Salish-Kootenai Tribes, Confederated Tribes of the Colville Reservation, Confederated Tribes of the Umatilla Reservation; and Plains groups including the Blackfeet Tribe, Chippewa Cree Tribes, and the Crow.

Tribal members actively use BLM-administered and National Forest System lands for traditional resource procurement. The planning area contains populations of economically important plant and animal resources to tribal groups and individuals with certain species dominating depending on the region and the particular preferences of tribes or individuals. The sagebrush steppe and rocky upland flats are likely to support populations of plants such as bitterroot, biscuit root, Indian carrot, Indian rice grass and needle grass and other important root plants, such as camas in wetland areas. Modern traditional food plant gathering focuses almost entirely on root crops and wild fruits especially if they are found near the various reservations. Other types of cultural food plants such as seeds are not collected today to the degree they were collected in former times. Cultural plants for weaving appear to be collected wherever they are found. Medicinal cultural plants are undoubtedly collected today but practitioners of indigenous healing methods may not share the types of species used as readily as those collecting plants for subsistence and weaving. Rabbits, deer, elk, and fish are also important animal resources in the planning area.

1 The most common type of prehistoric site or cultural resource in Idaho and southwestern
2 Montana is the lithic scatter. These types of sites contain mainly flaked stone (debitage)
3 and/or stone tools left during the process of creating or repairing bifacial tools, such as
4 arrow points, spear points, dart points, knives or scrapers. Lithic scatters often represent the
5 remnants of prehistoric tool manufacturing/maintenance, locales created during subsistence
6 pursuits, including hunting camps, animal butchering sites, or quarries. The lithic scatter
7 comprises approximately 70 percent or more of recorded prehistoric sites in the planning
8 area. Other site types may include habitation sites with remnants of house pits, house rings
9 and hearths, as well as milling and storage equipment, such as pottery and basketry, and
10 stone circles and wickiups in far eastern Idaho and Montana. Ceremonial sites may also exist
11 in the planning area, but only a few may leave an archaeological signature, such as cairns, pits
12 (e.g., eagle catching and fasting) or stacked rock of a vision quest site, or medicine wheels,
13 and may require tribal consultation with practitioners and elders to identify. Other site types
14 include trails, such as the Oregon National Historic Trail (NHT) and Nez Perce NHT,
15 petroglyphs and pictographs, hunting drivelines and blinds, rock shelters, and caves.

16 While researchers in Idaho and Montana have developed varying cultural chronologies for
17 prehistoric human use of the region, the general periods of use are similar and are discussed
18 in very general terms here to outline prehistoric use of the planning area. The prehistoric
19 cultural chronology for both Idaho and Montana include five general periods, the Early
20 Prehistoric (Paleo-Indian), circa 13,500 to 8,000 years before the present, three sub-periods
21 of the Middle Prehistoric 8,000 to 300 years before the present and the Protohistoric/Early
22 Historic 300 to 150 years before the present. General overviews of archeological research in
23 the region are provided in studies by Butler (1978, 1986), Meatte (1990), and Plew (2008), for
24 southern Idaho, and Deaver and Deaver (1990), and Foor (1996) in southwestern Montana.

25 The most common type of historic cultural resource in the planning area relates to the
26 mining of gold, silver, lead, and copper during the latter part of the 19th century and the
27 early part of the 20th century. Such properties include mining camp remnants, ghost towns,
28 miner's cabins, mining shafts, adits, mills, smelters, and an assortment of other mining
29 related buildings, structures, and landscape features. Several comprehensive overviews of
30 historic metal mining in Idaho and Montana have been produced in recent years, and
31 provide the important context with which to evaluate such properties (McKay 2011;
32 Godfrey 2003; Warhank 1999; Herbort 1995a, 1995b). Other historic period sites include
33 transportation networks, trails, including the Oregon and California NHTs and associated
34 side trails (e.g., Goodale's and Hudspeth Cutoffs) and the Lewis and Clark NHT, notable
35 Lewis and Clark campsites, lumber mills, fur trapping shelters and cabins, homesteads,
36 historic cemeteries, irrigation ditches, cow/sheep camps, sheepherder cairns, stage stops and
37 trash dumps.

38 **3.16.3 Trends**

39 Federal lands will continue to be managed for the protection and preservation of cultural
40 resources pursuant to regulation and policy. More concerted government-to-government
41 consultation with tribes is occurring to address tribal resources and concerns. Prehistoric and
42 historic resources are nonrenewable and overtime have been diminished by unauthorized

1 collection, looting and cumulative project impacts. However, efforts have increased in public
2 education and outreach creating awareness about our nation's cultural heritage and tribal
3 interests. These efforts have improved public understanding and awareness, resulting in
4 increased preservation of cultural resources.

5 **3.17 Tribal Interests**

6 The federal government has a unique and distinctive relationship with federally recognized
7 Native American tribes as set forth in the Constitution of the US, treaties, statutes,
8 Executive Orders, judicial decisions, and agreements. This relationship is different from the
9 federal government's relationship with state and local governments or other entities. The US
10 government has a trust responsibility to federally recognized Native American tribes that
11 covers lands, resources, money, or other assets held by the federal government in trust and
12 the ability of those tribes to exercise their tribal rights. The US recognizes Native American
13 tribes as sovereign nations. The tribes maintain active interests in the planning area. Tribal
14 members use BLM-administered lands to gather plants or other native materials (e.g., stone
15 for flint-knapping), hunt animals, and fish.

16 Native American treaties are negotiated contracts made pursuant to the Constitution of the
17 US and are considered the "supreme law of the land." They take precedence over any
18 conflicting state laws because of the supremacy clause of the Constitution (Article 6, Clause
19 2). Treaty rights are not gifts or grants from the US, but are bargained for concessions.
20 These rights are grants-of-rights from the tribes rather than to the tribes. The reciprocal
21 obligations assumed by the federal government and Native American tribes constitute the
22 chief source of present-day federal Native American law.

23 The BLM, Forest Service, and other federal agencies have the responsibility to identify and
24 consider potential impacts of project alternatives identified for GRSG planning on Native
25 American trust resources, including fish, game, and plant resources, and on off-reservation,
26 treaty-reserved fishing, hunting, gathering, and similar rights of access and resource use on
27 BLM-administered lands. This also includes rights of access and use for ceremonial and
28 other traditional cultural practices. The BLM, as lead federal agency, also has the
29 responsibility to ensure that meaningful consultation and coordination concerning GRSG
30 planning is conducted on a government-to-government basis with federally recognized tribes
31 to consider tribal treaty rights and trust resources. BLM-administered lands retain social,
32 economic, and traditional value for tribal people, as well as contemporary and ongoing
33 spiritual and cultural uses. Through consultation with the tribes, the BLM is aware of their
34 treaty and trust obligations and the tribes' desire to capitalize on opportunities that maintain
35 or enhance resources critical to the exercise of treaty rights, traditional customs, subsistence,
36 and cultural uses of the land.

37 BLM and Forest Service consultation with Native American tribes, as it pertains to tribal
38 interests, treaty rights and trust responsibilities, is conducted in accordance with the
39 following direction:

- 1 • Executive Order No. 13175 – Consultation and Coordination with Indian Tribal
2 Governments, November 6, 2000
- 3 • Secretarial Order 3317 – Department of Interior Policy on Consultation with
4 Indian Tribes, December 1, 2011
- 5 • Bureau Manual Handbook H-8120-1 – Guidelines for Conducting Tribal
6 Consultation (Transmitted 12/03/04)
- 7 • The National Historic Preservation Act of 1966 as amended (PL 89-665; 80 Stat.
8 915; 16 USC 470
- 9 • Archaeological Resources Protection Act of 1979 (PL 96-95; 93 Stat. 721; 16
10 USC 470aa et seq.) as amended (PL 100-555; PL 100-588)
- 11 • American Indian Religious Freedom Act of 1978 (PL 95-431; 92 Stat. 469; 42

- 26 • Forest Service Manual Direction FSM 1500
- 27 • Forest Service Handbook Direction FSH 1509

28 The planning area is within the traditional and historical use area of the Blackfoot Tribe,
29 Chippewa Cree Tribe, Confederated Salish-Kootenai Tribes, Confederated Tribes of the
30 Colville Reservation, Confederated Tribes of the Umatilla Reservation, Crow Tribe, Eastern
31 Shoshone Tribe, Nez Perce Tribe, Shoshone-Bannock Tribes, and the Shoshone-Paiute
32 Tribes. These tribes lived, hunted, fished, gathered plant foods, buried their dead, and
33 conducted religious ceremonies on lands within the planning area.

34 During the 1850s and 1860s, the US negotiated treaties with some tribes in order to acquire
35 lands for homesteading. The treaties that apply to the project area include the Crow Treaty,
36 Fort Benton Treaty, Fort Bridger Treaty, Hell Gate Treaty, Nez Perce Treaty, and Walla

1 Walla, Cayuse, and Umatilla Treaty. More information on these specific treaties is presented
2 below. No tribal treaties were afforded to the Chippewa Cree and the Confederated Tribes
3 of the Colville Indian Reservation. The Shoshone-Paiute Tribes of the Duck Valley Indian
4 Reservation assert aboriginal rights to their traditional homelands; however, the Boise Valley
5 Treaty of 1864 and the Bruneau Valley Treaty of 1866 were never ratified. The Shoshone-
6 Paiute Tribes believe that title to these lands was not relinquished and they continue to claim
7 title, rights, and interests associated with these lands.

8 On May 7, 1868, the Crow Tribe and the US signed the Treaty with the Crows, 1868,
9 referred to as the Crow Treaty (15 Stat. 649). In the Crow Treaty, the tribes relinquished
10 ownership of thousands of acres of land to the US. The treaty also guaranteed a permanent
11 homeland for the Crow Tribe in southeastern Montana, which became known as the Crow
12 Reservation. Article 4 of the treaty also states the tribe's right to "hunt on the unoccupied
13 lands of the US so long as game may be found thereon."

14 On October 17, 1855, the Blackfeet and the US signed the Blackfeet Treaty of Fort Benton,
15 1855, referred to as the Fort Benton Treaty (11 Stat. 657). In the Fort Benton Treaty, a great
16 majority of the land was designated as common hunting ground for the Blackfeet and
17 neighboring tribes. In 1888, lands were set aside in north-central Montana for the Blackfeet
18 Indian Reservation.

19 On July 3, 1868, the Eastern Band Shoshone and Bannock Tribes and the US signed the
20 Treaty with the Eastern Band Shoshoni and Bannack, 1868, referred to as the Fort Bridger
21 Treaty (15 Stat. 673). In the Fort Bridger Treaty, the tribes relinquished ownership of
22 approximately 20 million acres to the US. The Eastern Band Shoshone were guaranteed a
23 permanent homeland in western Wyoming, which has become known as the Wind River
24 Indian Reservation. The Bannock and other bands of Shoshone were guaranteed a
25 permanent homeland as well which ended up being in southeast Idaho, known as the Fort
26 Hall Indian Reservation. Article 4 of the treaty also retains the tribes' rights to hunt, fish, and
27 gather natural resources (including timber), and provides other associative rights necessary to
28 effectuate these rights on the unoccupied lands of the US.

29 On July 16, 1855, the confederated tribes of the Flathead, Kootenay (sic), and the Upper
30 Pend d'Oreille Indians and the US signed the Treaty with the Flatheads, etc., 1855, referred
31 to as the Hell Gate Treaty (12 Stat. 975). The treaty guaranteed a permanent homeland for
32 the confederated tribes in northwestern Montana, which has become known as the Flathead
33 Reservation. Article 3 of the treaty also retains the tribes, "privilege of hunting, gathering
34 roots, and berries, and pasturing their horses and cattle upon open and unclaimed lands."

35 On June 11, 1855, the Nez Perce Tribe and the US signed the Treaty with the Nez Perces,
36 1855, referred to as the Nez Perce Treaty (12 Stat. 957). In the Nez Perce Treaty, the tribes
37 relinquished ownership of millions of acres of land to the US. The treaty also guaranteed a
38 permanent homeland for the Nez Perce Tribe in northern Idaho, which became known as
39 the Nez Perce Reservation. Article 3 of the treaty also asserts the tribe's right to "take fish at
40 all usual and accustomed places in common with citizens of the [Washington] Territory; and

1 of erecting temporary buildings for curing, together with the privilege of hunting, gathering
2 roots and berries, and pasturing their horses and cattle upon open and unclaimed land.”

3 On June 9, 1855, the Walla Wallas, Cayuses, and Umatilla tribes and the US signed the
4 Treaty with the Walla Walla, Cayuse, etc., 1855 (12 Stat. 945). In the treaty, the tribes
5 relinquished 6.4 million acres of land to the US. The treaty also guaranteed a permanent
6 homeland for the Walla Walla, Cayuse, Umatilla, and other tribes in northeastern Oregon,
7 which became known as the Confederated Tribes of the Umatilla Indian Reservation. Article
8 1 of the treaty also retained the tribes’ right to “hunt, gather roots and berries, and pasture
9 stock on unclaimed lands of the US.”

10 The BLM manages portions of these “unoccupied or unclaimed lands.” Members of the
11 tribes affected by this proposed action exercise their hunting, fishing, and gathering rights on
12 federal lands outside of the boundaries of their reservations. Currently, there is little specific
13 information available on the exact animal species hunted, plant species gathered, or locations
14 used by Native Americans exercising their treaty rights within the boundaries of the project
15 area.

16 As described in **Section 3.11.1**, lands are retained in federal ownership unless, as a result of
17 land use planning, it is determined that disposal of certain parcels will service in the national
18 interest. Land exchanges require site-specific NEPA, at which time tribes are consulted to
19 address their concerns and requests regarding specific parcels.

20 **3.18 Visual Resources**

21 Visual quality of western landscapes is an increasingly sensitive issue. Impacts on visual
22 resources are identified as a significant issue to address in RMPs, Forest Plans, and major
23 EISs such as the renewable energy and transmission programmatic environmental impact
24 statements. The general public’s increasing awareness of the vertical scale, footprint,
25 character and visible prominence associated with utility scale renewable energy and
26 transmission line development has increasing the need for Visual Resource Management
27 (VRM).

28 **3.18.1 Conditions on BLM-Administered Lands**

29 The BLM manages scenic values using the VRM program. VRM policy was initially launched
30 in 1976 in response to both NEPA requirements placed on federal land management, and
31 FLPMA requirements for scenery resource inventory and management. The BLM developed
32 the current VRM policy manual (M-8400) and handbooks (H-8410-1, H-8431-1) in the mid-
33 1980s to guide the field offices through an objective and systematic program for managing
34 scenery resources.

35 VRM requires that the BLM field offices complete a visual resource inventory of the lands
36 under their management control. The visual resource inventory is a systematic process for
37 determining the visual values on the BLM-administered lands. The inventory process has
38 three parts: scenic quality evaluation, sensitivity level analysis and delineation of distance
39 zones. Based on the combinations of the three, BLM-administered lands can then be

1 categorized as Class I (most valued and highest quality of scenery) down to Class IV (areas
2 of low scenic quality and sensitivity at most or all distance zones). These inventory classes
3 represent the existing visual resources.

4 VRM provides a way to inventory and classify visual resources, describe characteristic
5 landscapes, determine contrasts from proposed actions, and potential mitigation from
6 impacts on visual resources.

7 BLM Handbook 8410 describes the three basic landscape characteristics used to indicate
8 visual resources in VRM: 1) scenic quality; 2) sensitivity levels; and 3) distance zones. Scenic
9 quality is a measure of the visual appeal of a tract of land. Areas can be sub-divided into
10 Scenic Quality Rating Units of similar visual character on the basis of like physiographic
11 characteristics, similar visual patterns, texture, color, and variety; and areas which have
12 similar impacts from man-made modifications. The size of the Scenic Quality Rating Units
13 may vary from several thousand acres to 100 or less, depending on landscape feature
14 similarities, and the desired inventory detail. Seven key factors determine the scenic quality
15 of a unit: landform, vegetation, water, color, adjacent scenery, scarcity, and cultural
16 modifications. Resource specialists consider these factors when ranking units for scenic
17 quality (A = high, B = medium, C = low).

18 Visual sensitivity is a measure of public concern for scenic quality. BLM-administered lands
19 are assigned high, medium, or low sensitivity levels by analyzing various indicators of public
20 concern, such as: type of user, amount of use, public interest, adjacent land uses, and special
21 areas.

22 Sensitivity level rankings are not available for the planning area.

23 Landscapes can be divided into three distance zones based on relative visibility from travel
24 routes or observation points. They are foreground-middleground, background, and seldom
25 seen. The foreground-middleground zone includes areas seen from highways, rivers, or other
26 viewing locations that are less than five miles away. The background zone is generally
27 between 5 and 15 miles away. The seldom-seen zone includes areas usually hidden from
28 view.

29 During the resource management planning process, the BLM determines how the visual
30 landscape will be managed in the future. The VRM decisions that are made in the planning
31 process result in areas being assigned a VRM class. VRM classes determine how much
32 change will be allowed in the landscape. VRM Class I areas are managed to preserve the
33 existing character of the landscape and allow for limited management activity. Class II allows
34 for low levels of landscape change that do not attract attention of the casual observer. Class
35 III allows for moderate changes to the landscape that may attract attention but are not
36 dominant and Class IV areas allow for high levels of landscape change.

37 The BLM uses a VRM contrast rating system that addresses form, line, color and texture of
38 the landscape to determine if proposed projects are in compliance with the designated visual
39 resource management class.

1 These management classes are separate from the visual resource inventory classes and guide
2 management irrespective of the underlying visual resource (i.e., areas that have an inventory
3 Class II could be designated and managed as a VRM Class IV to allow for major changes in
4 the landscape).

5 In the past, especially in older management framework plans, BLM field offices would often
6 adopt the VRM inventory classes as the management class (**Table 3-53**, BLM Visual
7 Resource Management Class Acres). In some plans, the BLM did not make any decisions
8 regarding the VRM classes. In such cases, the VRM inventory class has generally been used
9 as the VRM class. A majority of the BLM-administered lands within the planning area do not
10 have a current visual resource inventory.

Table 3-53
BLM Visual Resource Management Class Acres
(approximate for offices with designated VRM classes)

VRM Class	Class I	Class II	Class III	Class IV
Acres	510,924	2,058,432	3,983,572	2,052,936

3.18.2 Conditions on National Forest System Lands

13 Forest Service Manual 2380.3 requires the agency to “inventory, evaluate, manage, and,
14 where necessary, restore scenery as a fully integrated part of the ecosystems of National
15 Forest System lands through the land and resource management and planning process.”
16 Scenery must be treated equally with other resources. The Forest Service developed a visual
17 management system to provide a mechanism for inventory and analysis of landscape
18 resources and the effects of land management activities on those resources.

19 The Forest Service established the Visual Management System in 1974 to inventory,
20 evaluate, and manage scenic resources. The Visual Management System is described in
21 Agriculture Handbook No. 462, National Forest Landscape Management. Using an
22 established physiographic character type as a frame of reference, the Visual Management
23 System determines the inherent scenic quality based on the different degrees of landscape
24 variety within an area.

25 Inherent scenic quality is a measure of the natural landscape’s scenic beauty based on
26 attributes, such as landform, vegetation, water features, and rock formations. The basic
27 assumption of the Visual Management System is that all landscapes have some inherent
28 value, but those with the most variety and diversity have the greatest potential for “high
29 scenic value.” Three variety classes, designated A, B, and C, represent inherent scenic quality.

30 Sensitivity levels are identified in the Visual Management System and are defined as the
31 measure of people’s concern for the scenic quality of the landscape. Basically, all viewed
32 landscape is rated for a level of sensitivity. Sensitivity levels are overlaid with distance zones
33 to identify all the viewed and unseen landscape within a given area. The Visual Management
34 System defines distance zones—that is, the distance from which a landscape is viewed—as

1 foreground, middleground, and background. Distance zones are important in evaluating how
2 change is perceived in the landscape because the closer the features in the landscape are to
3 the viewer, the more pronounced they appear and the more detail is observed.

4 Visual quality objectives are determined in the Visual Management System by combining the
5 sensitivity levels and scenic quality. Visual quality objectives are assigned to the landscape to
6 describe the degree of acceptable alteration of the natural landscape. The Visual quality
7 objectives classifications are Preservation, Retention, Partial Retention, Modification, and
8 Maximum Modification. Preservation allows for ecological changes only, while Maximum
9 Modification allows for landscape changes that may dominate the natural landscape
10 character.

11 ***Scenery Management System***

12 The Visual Management System process has been updated as the Scenery Management
13 System, which is being incorporated into respective Forest Management Plans. The Scenery
14 Management System is described in *Landscape Aesthetics: A Handbook for Scenery
15 Management* (Forest Service 1995). Adoption of the Scenery Management System is to
16 occur as each National Forest revises its LUP. For National Forests not currently
17 undergoing the forest-plan revision process, or for those requiring extensive time for
18 revision, application of the Scenery Management System will occur at the subforest or
19 project level.

20 In general, the Scenery Management System differs from the Visual Management System in
21 that it is integrated with ecosystem management and addresses landscape character,
22 constituent preferences, scenic integrity, and landscape visibility as key aesthetic
23 considerations. Landscape character describes the visual patterns of form, line, color,
24 texture, dominance, scale, and diversity of elements in the landscape and the cultural
25 attributes that make the landscape identifiable and give it a “sense of place.” Constituent
26 preferences convey the aesthetic experience of forest visitors, communities, and tourists and
27 the significance of scenic quality to these user groups.

28 The Scenery Management System entails identifying the landscape character, visual
29 sensitivity, and scenic integrity. The Scenery Management System provides an overall
30 framework for the orderly inventory, analysis, and management of scenery. It is a tool for
31 integrating the benefits, values, desires, and preferences regarding aesthetics and scenery for
32 all levels of land management planning. The Scenery Management System also considers
33 Concern Levels, which are a categorization of the importance of scenic resources to forest
34 visitors.

35 Three concepts of the Scenery Management System are of key importance: (1) Scenic
36 Attractiveness, (2) Landscape Character, and (3) Scenic Integrity. These concepts and
37 landscape character are defined below:

38 Scenic Attractiveness is the primary indicator of the scenic importance of a landscape based
39 on human perceptions of the intrinsic beauty of landforms, rock outcrops and forms,
40 waterforms, vegetation patterns, and cultural features. It reflects varying visual perception

1 attributes of variety, unity, vividness, intactness, coherence, uniqueness, harmony, balance,
2 and pattern. The frame of reference for scenic attractiveness (generally at the section scale) is
3 landscape character.

4 Three levels of scenic attractiveness are identified during the scenery inventory process: (A)
5 Distinctive, (B) Common or Typical, and (C) Undistinguished (FSM 2380, Landscape
6 Management).

7 Landscape character is a combination of physical, biological, and cultural images that gives
8 an area its visual and cultural identity and helps to define a sense of place. Landscape
9 character provides a frame of reference from which to determine scenic attractiveness and to
10 measure scenic integrity (FSM 2380, Landscape Management).

11 Scenic Integrity Objectives define the degrees of deviation from the landscape character that
12 occur at any given time by using the process described in Agriculture Handbook 701,
13 Landscape Aesthetics: A Handbook for Scenery Management (FSM 2380, Landscape
14 Management). When discussing Scenic Integrity Objectives, the degree of alteration is
15 measured in terms of visual contrast with the surrounding natural landscape. The objectives
16 of each Scenic Integrity Objectives classification are included below:

- 17 • Very High – Management activities, except for very low visual-impact recreation
18 facilities, are prohibited. Allows for ecological changes only. The existing
19 landscape character and sense of place is expressed at the highest possible level.
- 20 • High – Management activities are not visually evident to the casual observer. The
21 landscape character appears intact. Deviations may be present but must repeat
22 the form, line, color, texture, and pattern common to the landscape character so
23 completely and at such scale that they are not evident. Changes in the qualities of
24 size, amount, intensity, direction, pattern, etc., should not be evident.
- 25 • Moderate – Management activities remain visually subordinate to the
26 characteristic landscape being viewed. Activities may repeat form, line, color, or
27 texture common to the characteristic landscape but may not change in their
28 qualities of size, amount, intensity, direction, pattern, etc.
- 29 • Low – Management activities begin to visually dominate the original
30 characteristic landscape. However, activities of vegetative and landform alteration
31 must borrow from naturally established form, line, color, or texture so
32 completely and at such a scale that its visual characteristics are those of natural
33 occurrences within the surrounding area or character type. Structures must
34 remain visually subordinate to the proposed composition.
- 35 • Very Low – Management activities of vegetative and landform alterations may
36 dominate the characteristic landscape. While alterations may not borrow from
37 attributes such as size, shape, edge effect, and pattern of natural openings,
38 vegetative type changes, or architectural styles within or outside the landscape
39 being viewed, they must be shaped and blended with the natural terrain so that
